California Tiger Salamander

There was a time when California Tiger Salamanders were plentiful throughout the grasslands and valleys of California. But as development expanded into their habitat, their numbers declined to the point of being threatened or endangered. Now, working with developers, private landowners, non-profits, and agencies, we are setting aside conservation areas for California Tiger Salamanders and other species, to live in undisturbed. I'm Marcia Grefsrud. I'm an environmental scientist with the California Department of Fish and Wildlife. It's going to take all of us to protect California's species for the future.
