Exercise 1 Due January 8, 10:00pm

Examine graphs of Davis' average temperatures from satellite and ground stations to determine whether there has been a climate change trend.

For Essay 1, you will compare Davis with a city of your choice.

Quiz 1 due Friday

Get help with the Exercise TONIGHT!

Enroll in **SAS 98 Section 002, CRN 40468** for **one unit credit**. This extra unit is for a discussion session that the TAs will stream live each Thursday nights at **7 PM** and will record that covers how to do the weekly assignment for SAS 25 & SAS 25v.

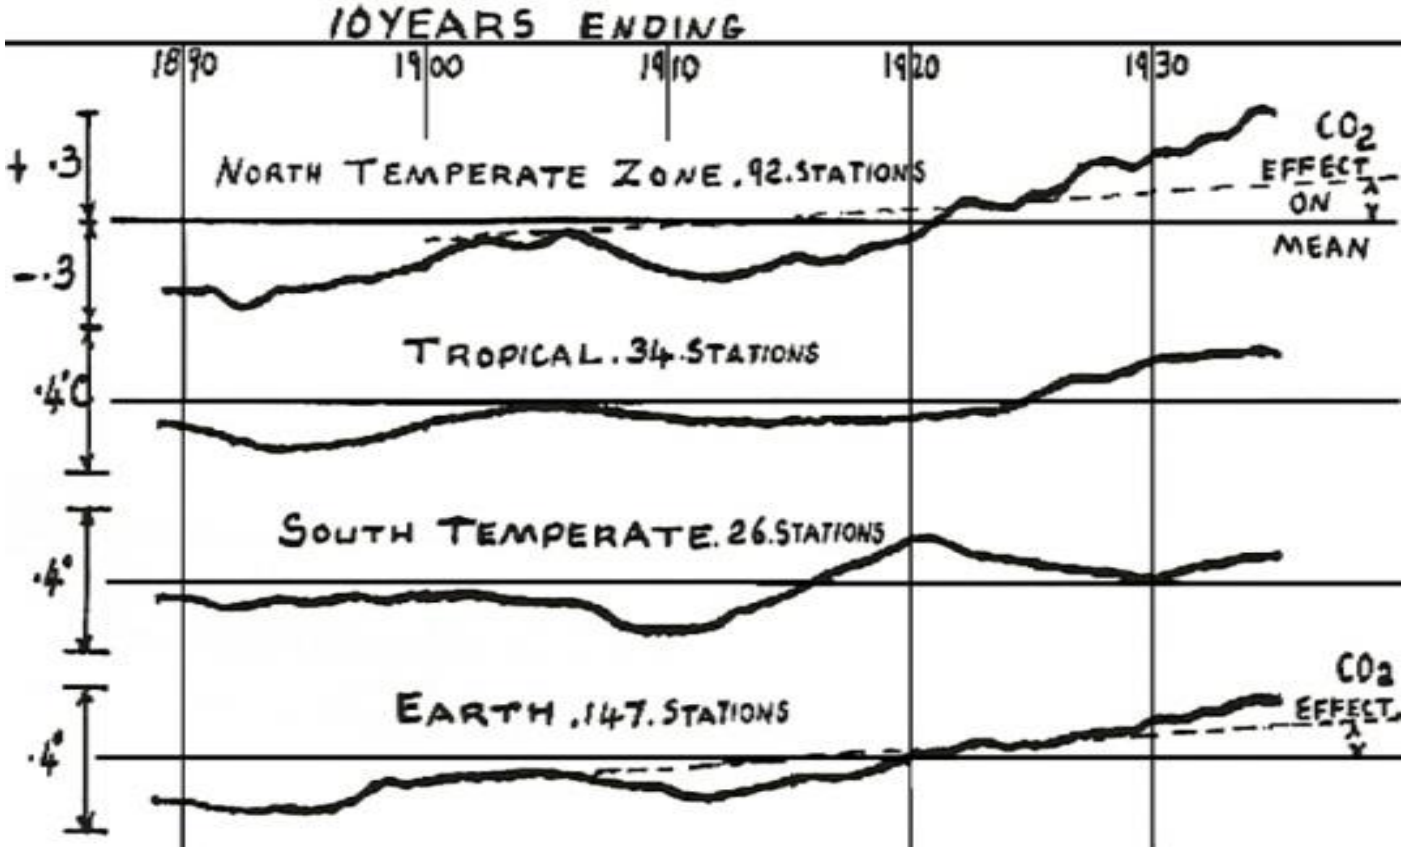
CRN	Day	Time	Online Discussion Room
40468	Thursday	7:10-8:00 PM	http://ucoe.adobeconnect.com/review/

Last Time…

- Climate vs weather
- History of climate change research
  - Guy Stewart Callendar
  - Roger Revelle and Hans Suess
  - David Keeling (Keeling Curve)

Weather Records

– **Guy Stewart** Callendar – 1st to discover recent warming trend and link it to fossil fuel emissions (1930s)



Roger Revelle and Hans Suess, 1957

Discovered ocean is not a major sink for CO_2

What Do We Know?

Global temperatures have warmed more than 0.6°C during the last 100 years

CO_2 concentrations have been increasing in correlation

Global Warming

Are rising temperatures part of normal fluctuations?

How important are human activities?

- Burning of fossil fuels
- Changes in land use

Clues:

- How did climate vary before the Industrial Revolution?
- What other factors (non-human) influence climate?

Direct measurements since 1861

1: Earth forms

29–11: Oldest known rocks

12: Oldest chemical evidence of life

1–2: Oldest fossil cells

17: First eukaryotes

1–7: First multicellular organisms (algae)

12–13: First animals with shells and limbs

26: First animals with vertebrae

30: First land plants

1: First land animals

26: Extinction of dinosaurs

31: *Homo sapiens* appears one hour before midnight. Humans set foot on Moon $^{1}/_{4}$ second before midnight

1 day = 12.6 million years
1 second = 143 years

Earth's Past Climate

- The Earth is about 4.5 billion years old
- Eukaryotic life has been here for 2 billion years
- Humans have been here for 40,000 years
- We have direct weather records for the past 150 years

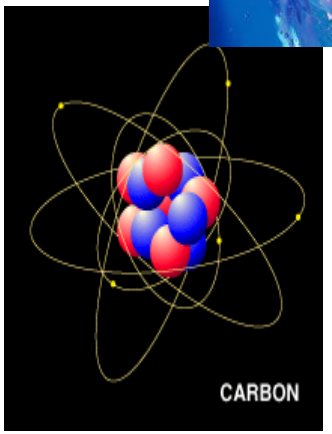
To learn about Earth's past, we have to use **Proxy Measures**

Proxy Measures of Climate

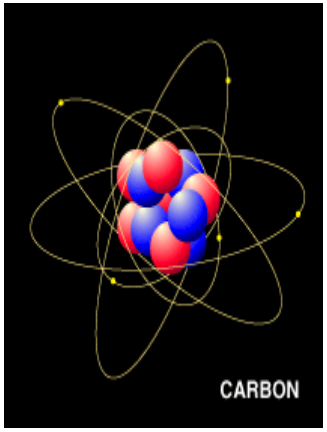
Proxy = surrogate or substitute

Proxy Measures:

- Ice Cores
- Tree Rings
- Glacial Extent
- Corral Reefs



Isotopes



A normal element has an equal number of neutrons and protons.

- Carbon (^{12}C) has 6 protons and 6 neutrons.

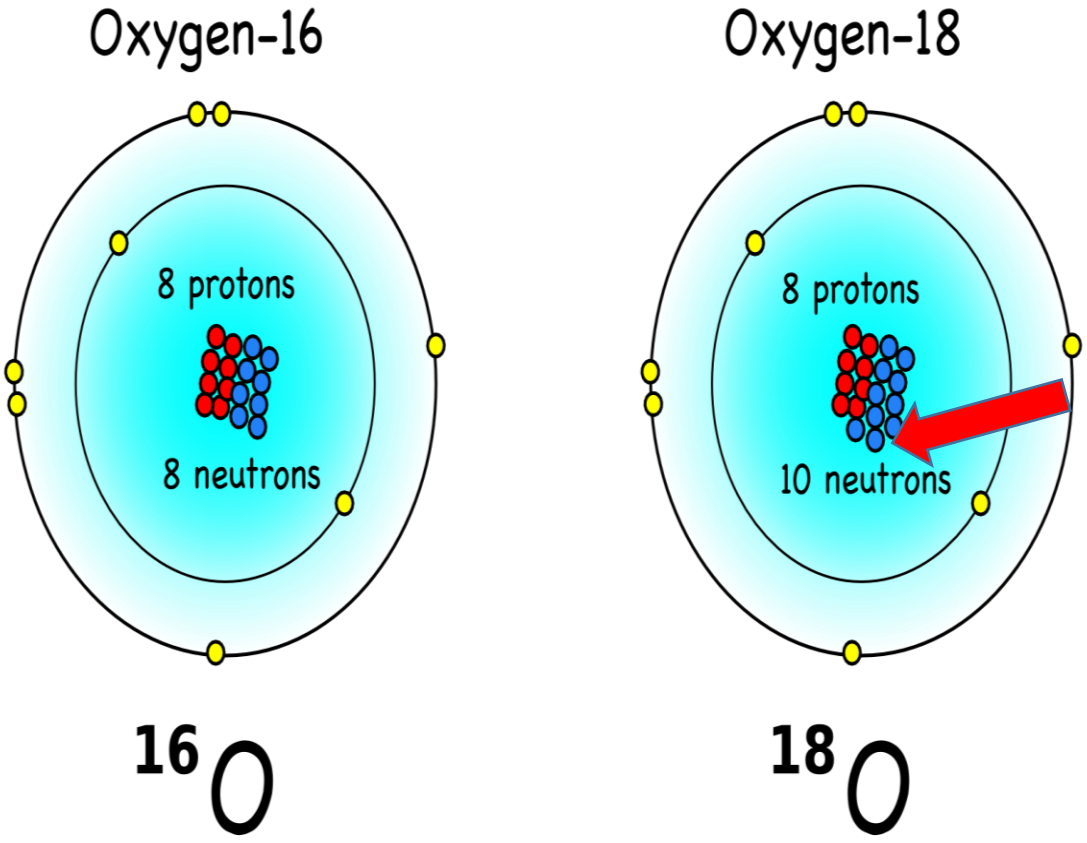
Carbon **always** has 6 protons

The number in front = the total number of protons and neutrons

Isotopes have different numbers of neutrons.

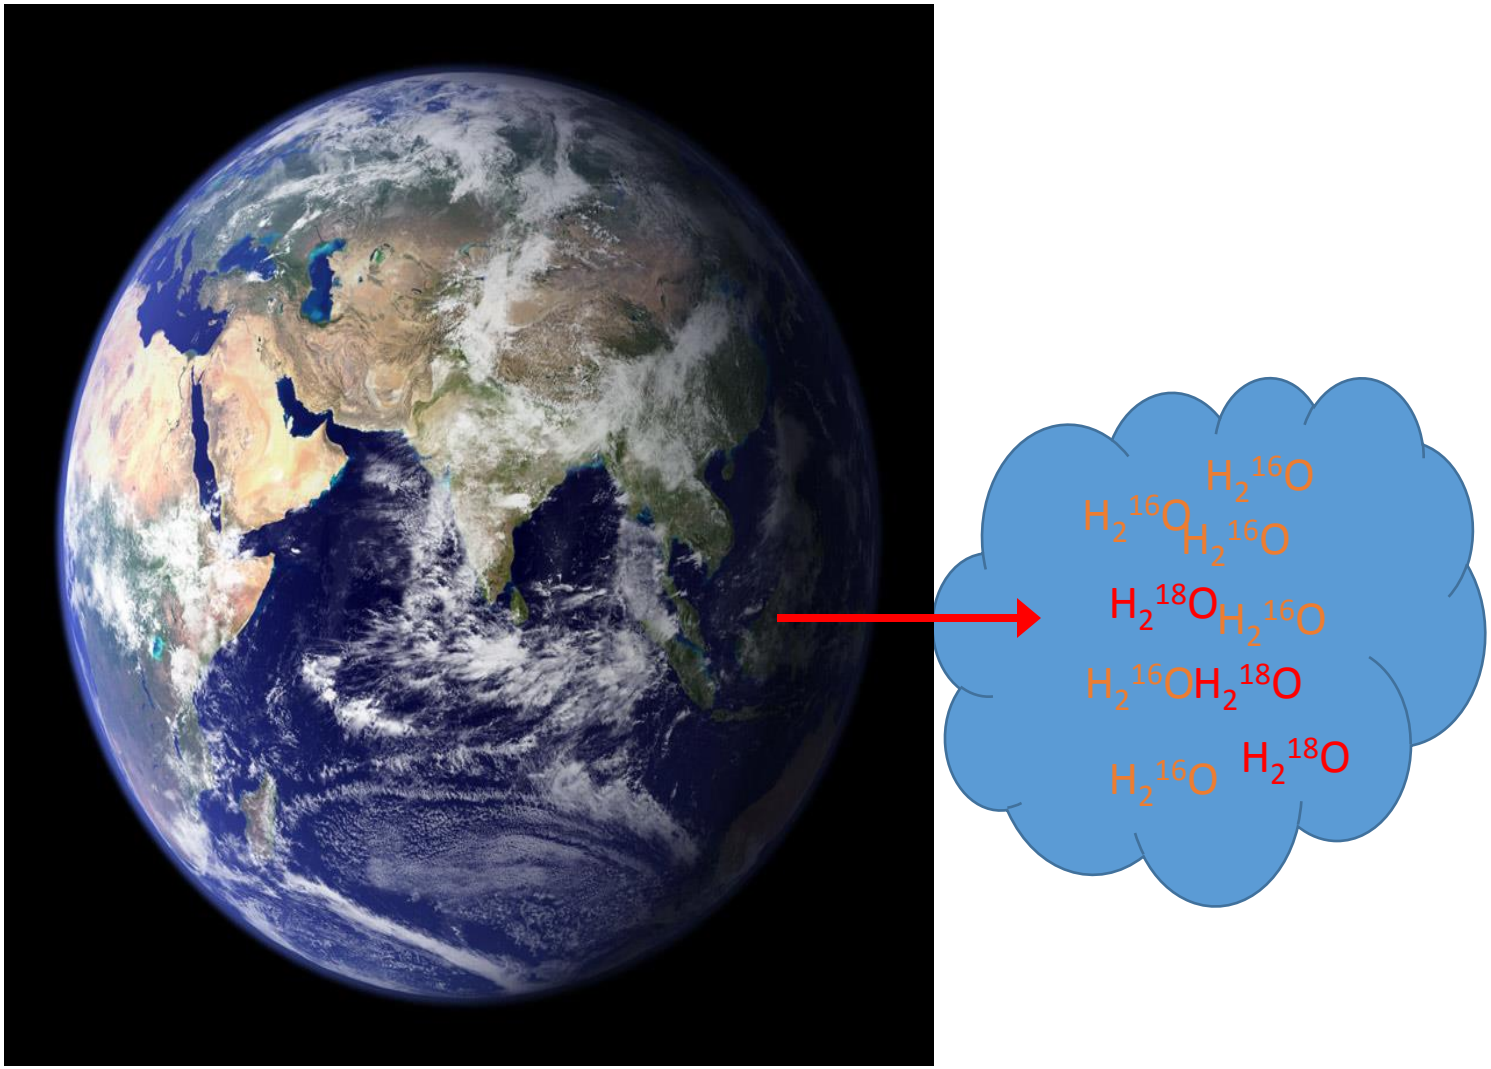
- Carbon has 14 isotopes, ranging from 2(^{8}C) to 16 (^{22}C) neutrons

Oxygen has 3 stable isotopes: ^{16}O, ^{17}O and ^{18}O

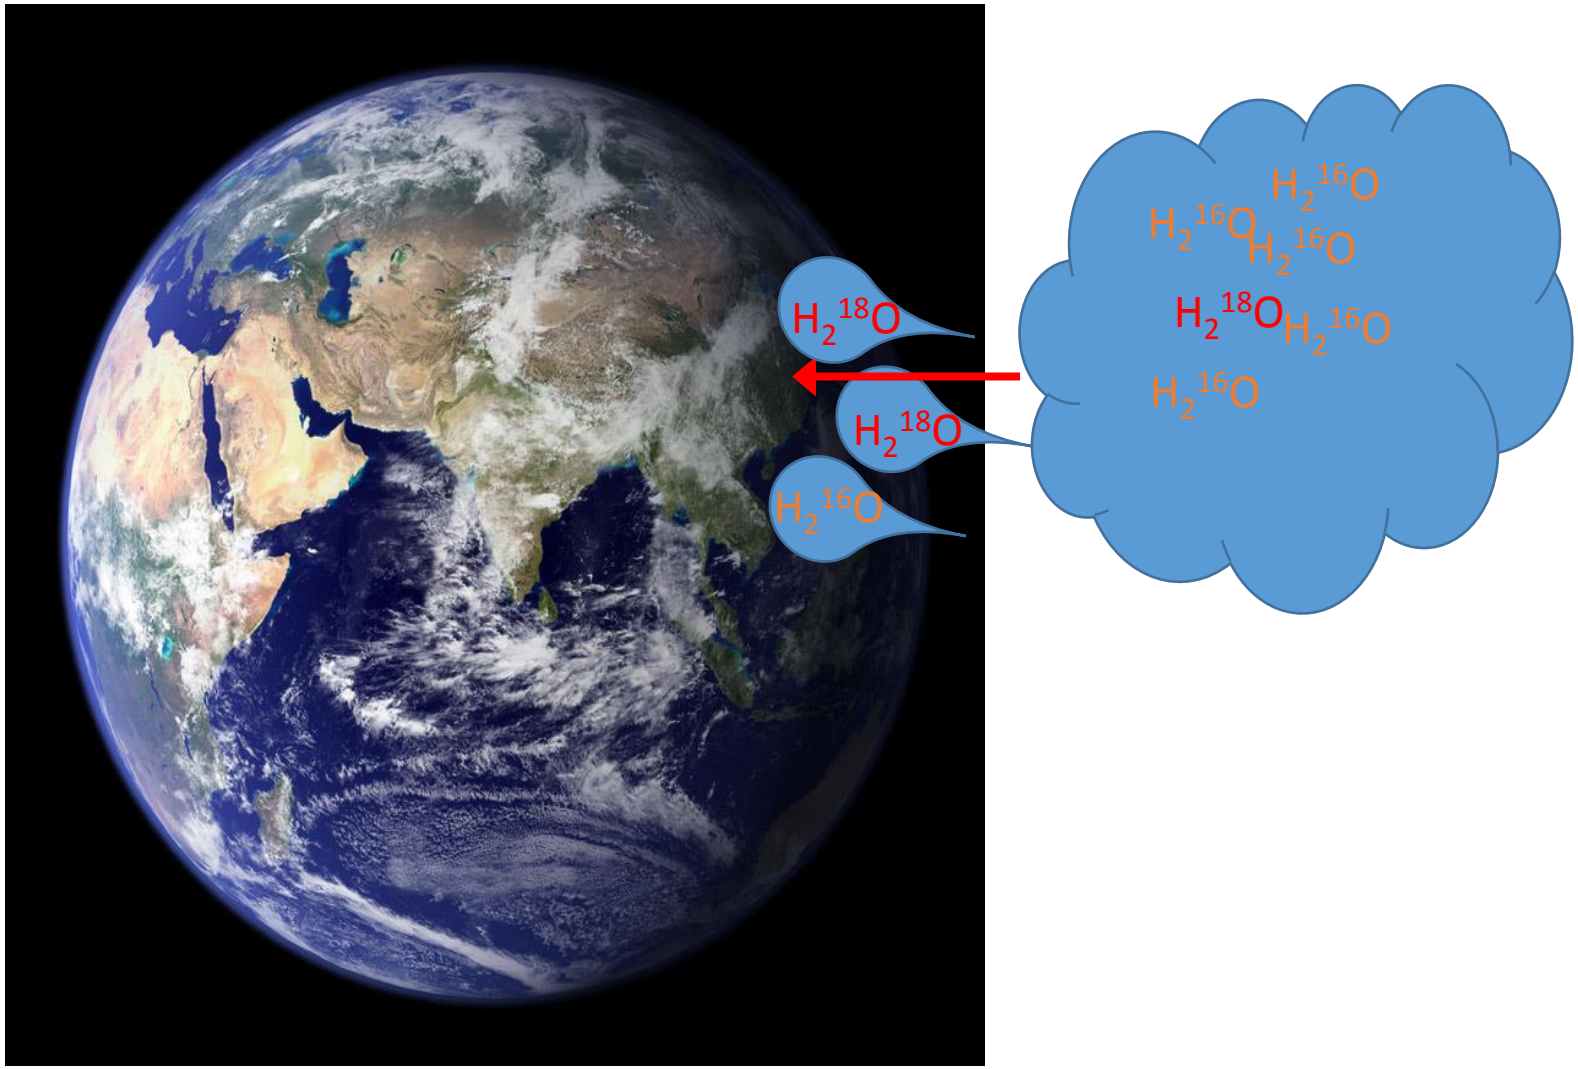


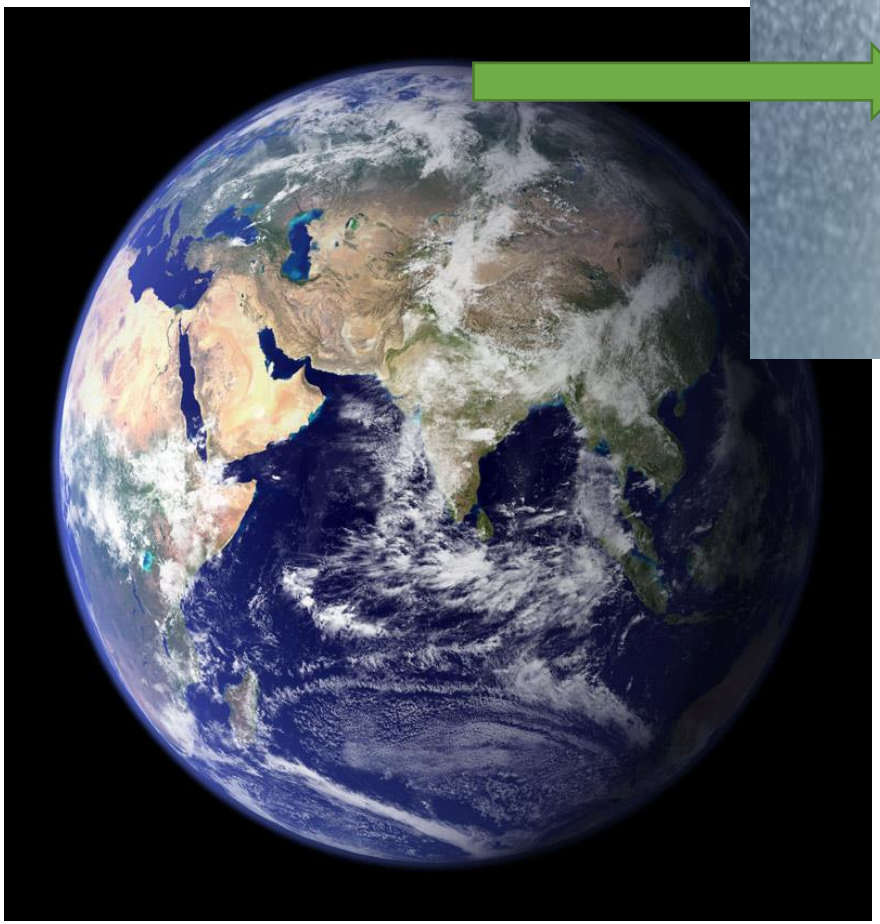
Forms LIGHT water **Forms HEAVY water**

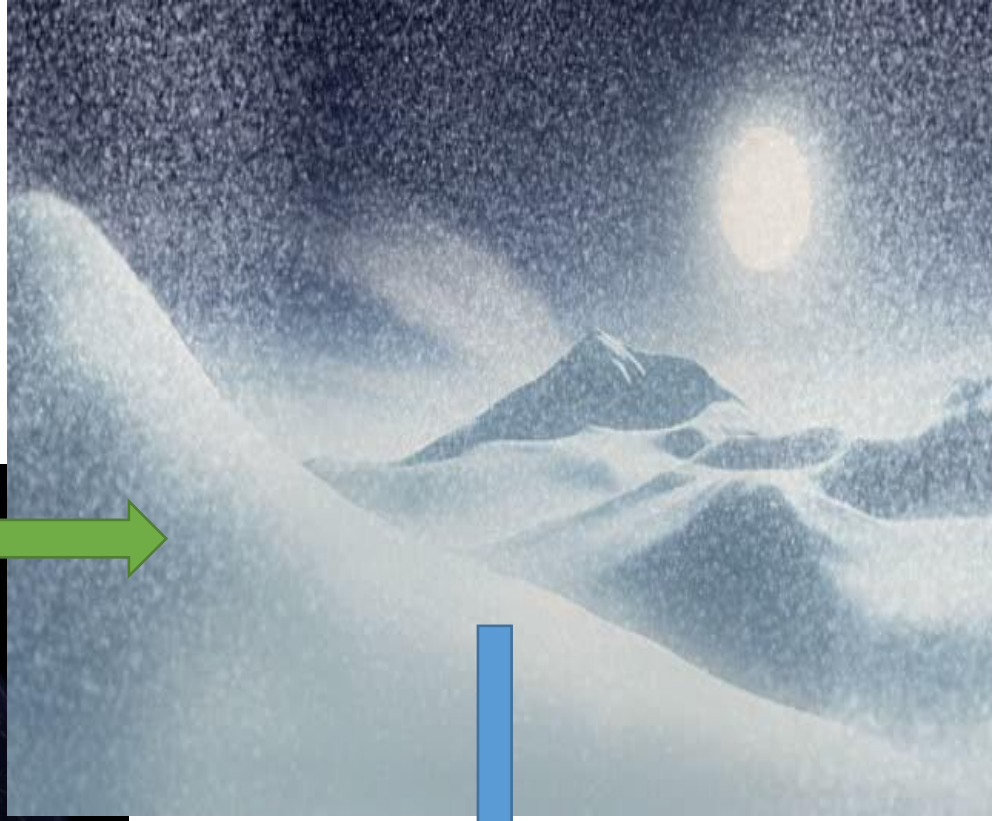
The Rainout Effect



The Rainout Effect





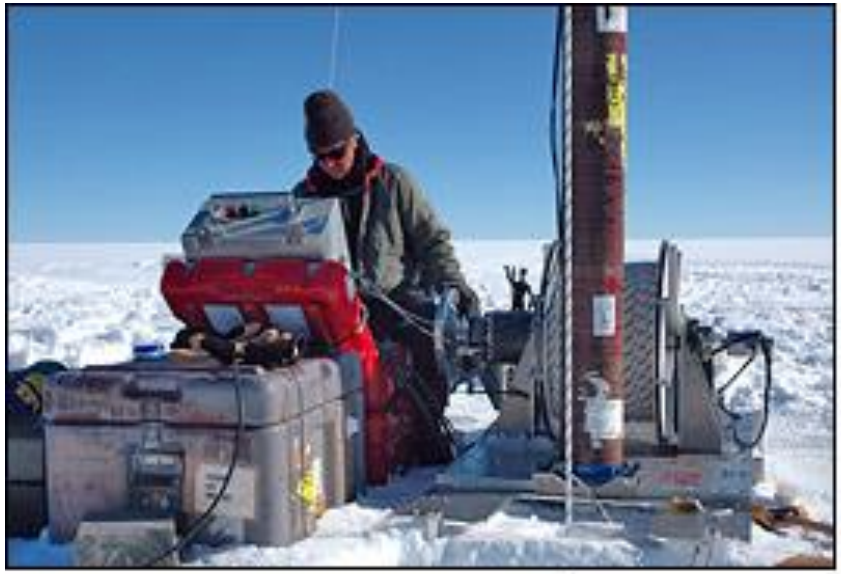


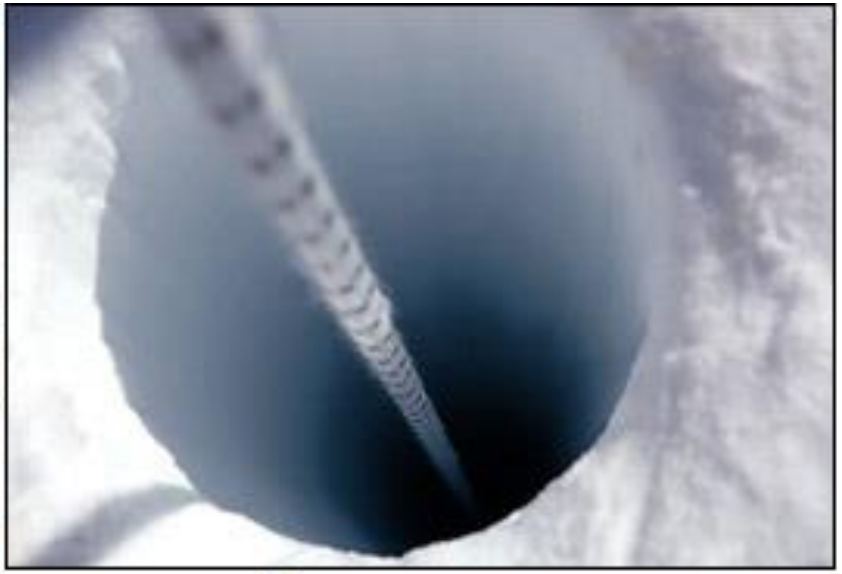
The Rainout Effect

- During a warm year, there will be a higher ratio of heavy water in the ice at the poles than during a cold year
- And, there will be a higher ratio of light water in the oceans at the equator than during a cold year.

Ice Cores

Ice Cores





Snow fall compacts into ice, air bubbles get trapped in the ice

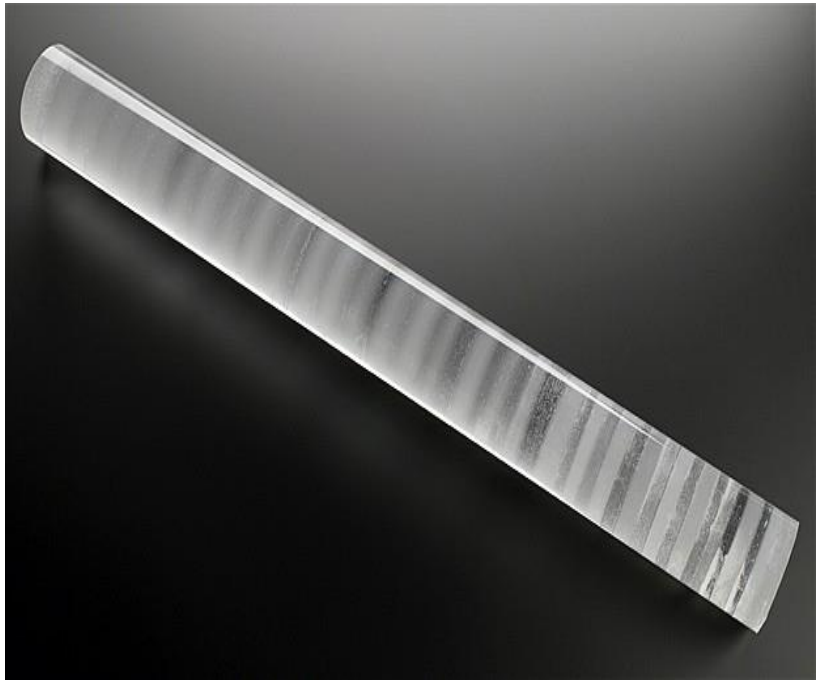
How do we know what time the air bubbles are from?

Annual layers created by:

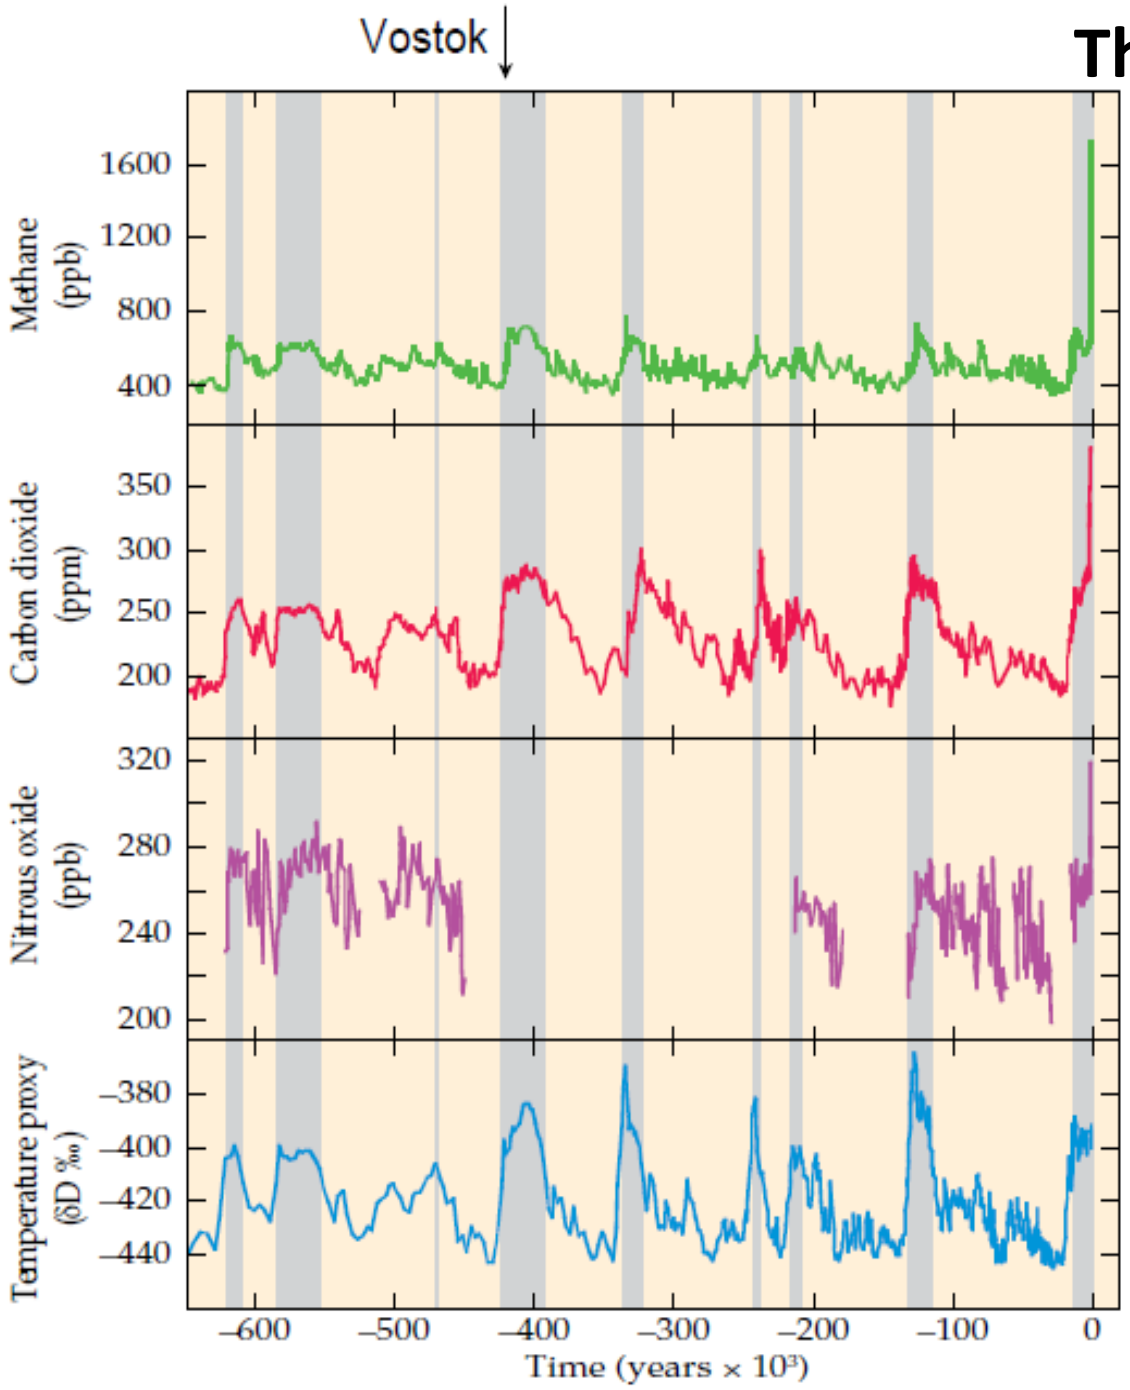
- Dust greater in summer
- Hydrogen peroxide greater in summer (UV)
- More heavy water during warm weather

Someone has to count the layers!



Parameter	Method	Certainty
CO_2	Direct analysis	More
Date	Relative $^{2}H_2{}^{18}O$ H_2O_2 dust	Some
Temperature	Absolute $^{2}H_2{}^{18}O$	Less

The Past 810,000 Years



Gray-shaded sections denote warm, interglacial periods.

Correlation between rise in temperature and concentration of greenhouse gases.
