

MSRC Remote Sensing

The Next Significant Enhancement in Spill Response

Kevin Hoskins, Marine Spill Response Corp.
Jan Svejksky, Ocean Imaging Corp.

MSRC DWH Observations

Operations – post event interviews with all personnel (over 11,000 man days offshore)

- Encounter rate tactics
- Debris handling
- Offloading of recovered product
- Sustainability and redundancy (human element)

All of the above are downstream of the most critical observation:

- Efficiently putting resources in the right position (day and night) to recover the oil

An aerial photograph of a coastline with a blue body of water on the left and a brownish, vegetated land area on the right. Two yellow rectangular boxes are overlaid on the image. The box on the left, labeled 'Maximal Recovery', covers a large area of the coastline and includes a yellow label 'KA' near a small white object. The box on the right, labeled 'Inefficient Recovery', covers a smaller area further inland and includes a yellow arrow pointing to a small white object.

Inefficient Recovery

Maximal Recovery

MSRC Surveillance Objectives

Post DWH

Real Time Tactical Information Besides Visual Spotting

- Classification of oil targets as actionable (skim, burn, disperse) or non-actionable (i.e. sheen)
- Tracking moving oil
- Staying in/with the actionable oil as it moves
- Expanding the operating window to low-light conditions (with safety always of highest priority)

Key Criteria for MSRC's New Remote Sensing Tools

- Multiple sensors/platforms since one does not do all
- Multiple platforms given importance of height of eye
- Portability given span of U.S. coastline and lack of dedicated surveillance planes
- Real time information for tactical use
- Provide “feed” to customer Common Operating Picture (COP)

MSRC Level ABC Remote Sensing for Tactical Oil Spill Surveillance

A

AIRCRAFT

Ocean Imaging
Corporation

**Multispectral/TIR
Cameras (i.e. TRACS)**

Provides wide-area spill
detection, thickness
interpretation, and oil
distribution mapping

B

BALLOON

Maritime Robotics

**TIR & HD
Cameras**

Tethered up to 500 ft.
Medium range coverage
with long "hang" time

C

CLOSE-IN

**X Band Radar & TIR
Camera**

Optimizes close-in
recovery techniques

MSRC Level DV Remote Sensing for Tactical Oil Spill Surveillance

D

Drone
Contracted
Service

HD/TIR Cameras

Fixed and rotary wing
aircraft

V

Visual
iPhone/iPad

**Application utilizes
internal GPS and camera**

This report contains information collected from customer equipment. While this is useful for you to get a general impression of the health of your network, it is not intended to be used as a diagnostic tool. For more information on this report, please visit the MSRC website at www.msrg.com.

MSRC Level A - Aircraft

- **Three dedicated systems**
 - Portable
 - Located in Edison, NJ; Lake Charles, LA; and Long Beach, CA
- **Utilize pre-identified “Aircraft of Opportunity” (AOO)**
 - Mounting brackets developed for various class aircraft
- **High height of eye with 24-hr operations potential**
 - ~500’ to 12,500’
 - Fast speed of advance (120-200 mph)
- **Sensors**
 - Thermal Infrared (TIR)
 - Multi-spectral (color not seen with eye)

MSRC Level B - BALLOON

Maritime Robotics Aerostat

Battery powered, non-wired tether

- Up to 12-hour “hang time”
- Rechargeable battery

Package includes:

- HD Camera
- TIR Camera
- AIS Receiver

**Small, compact easily
transportable package**

**Proprietary viewing software
and gimbal**

WIFI transfer to host vessel

MSRC Level B – BALLOONS (Aerostats)

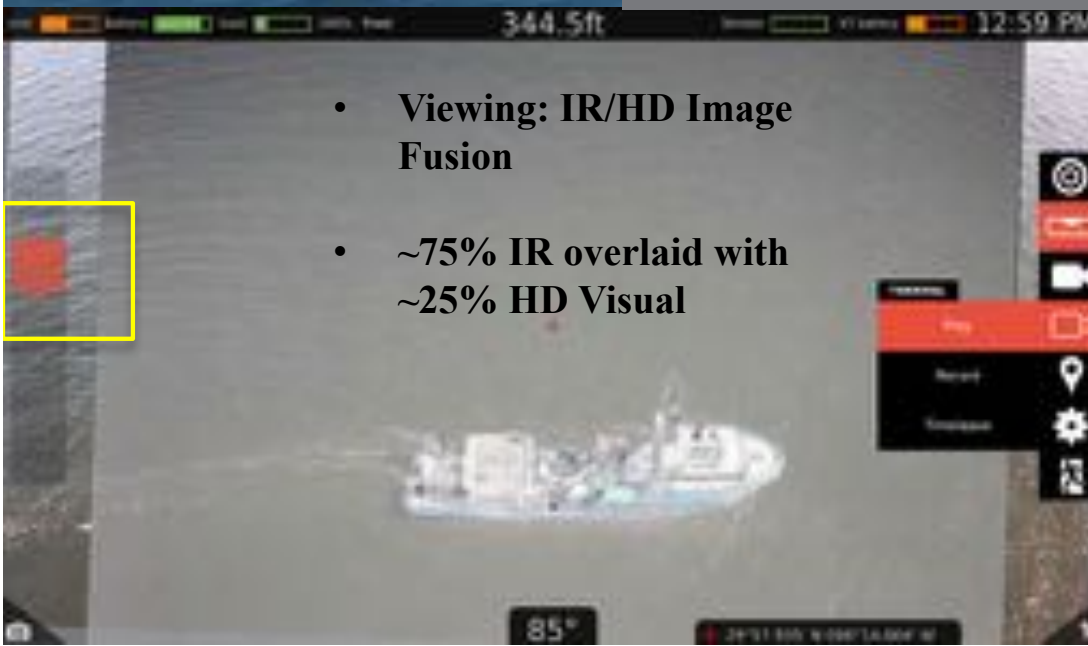

Maritime Robotics Aerostat – OOW 2013

Screen Snapshots:

- Geo-positioned display
- Data collection
- Target data e-mailable

- Viewing: IR/HD Image Fusion
- ~75% IR overlaid with ~25% HD Visual

MSRC Level C – CLOSE IN

OSRV-Mounted Systems for Tactical Optimization

NOFO: Oil On Water 2013

X Band Radar and Thermal Infrared (TIR) on Responder Class Vessels

- Oil detection (X Band Radar)
- Better view of oil
- Stack oil vs. entrainment

New Capabilities in Aerial Remote Sensing for Real-Time Tactical Use During Oil Spills

History, Technical Background &
Existing Capabilities

OI's Aerial Oil Spill Mapping System

Our approach:

Develop an easily-deployable (portable) system that utilizes the same proven thickness estimation principles as visual oil spill surveys, with additional, digital capabilities e.g. thermal imaging, near-real-time input into COP/WMS.

Advantages over visual methods:

- 1) System is more objective – does not rely on opinion or educated guessing
- 2) Extends human eye visible wavelength limitations (e.g. adds thermal IR)
- 3) Survey map is in digital GIS format – allows accurate location determinations, direct computation of oil spill area and volume, etc.
- 4) Survey provides much greater spatial detail (1-3 meters)

Based off of Multi-Agency Funded Research

California Dept. of Fish & Game (2004-2005)

Initial algorithm was developed for multispectral visible/near-IR system

MMS/BSEE (2006 – 2012) Thermal-IR imager was added, system geopositioning improved, algorithms extensively validated/improved, initial emulsion algorithm developed

BP (2013-2014) More compact/portable system integrated, field-of-view coverage vastly increased, near-real-time processing enabled, initial direct air-to-ground/boat data transfer options investigated

Combined Use of Visible Multispectral and Thermal-IR Imagery Extends Thickness Measurement Range

Visible wavelengths are most sensitive to thin oil films.

Thermal IR sees detail in thick oil films.

Multispectral
Thickness (mm)

Multispec Digital

Thermal Digital

Original System (DMSC-MkII)

**DGPS/
IMU Positioner**

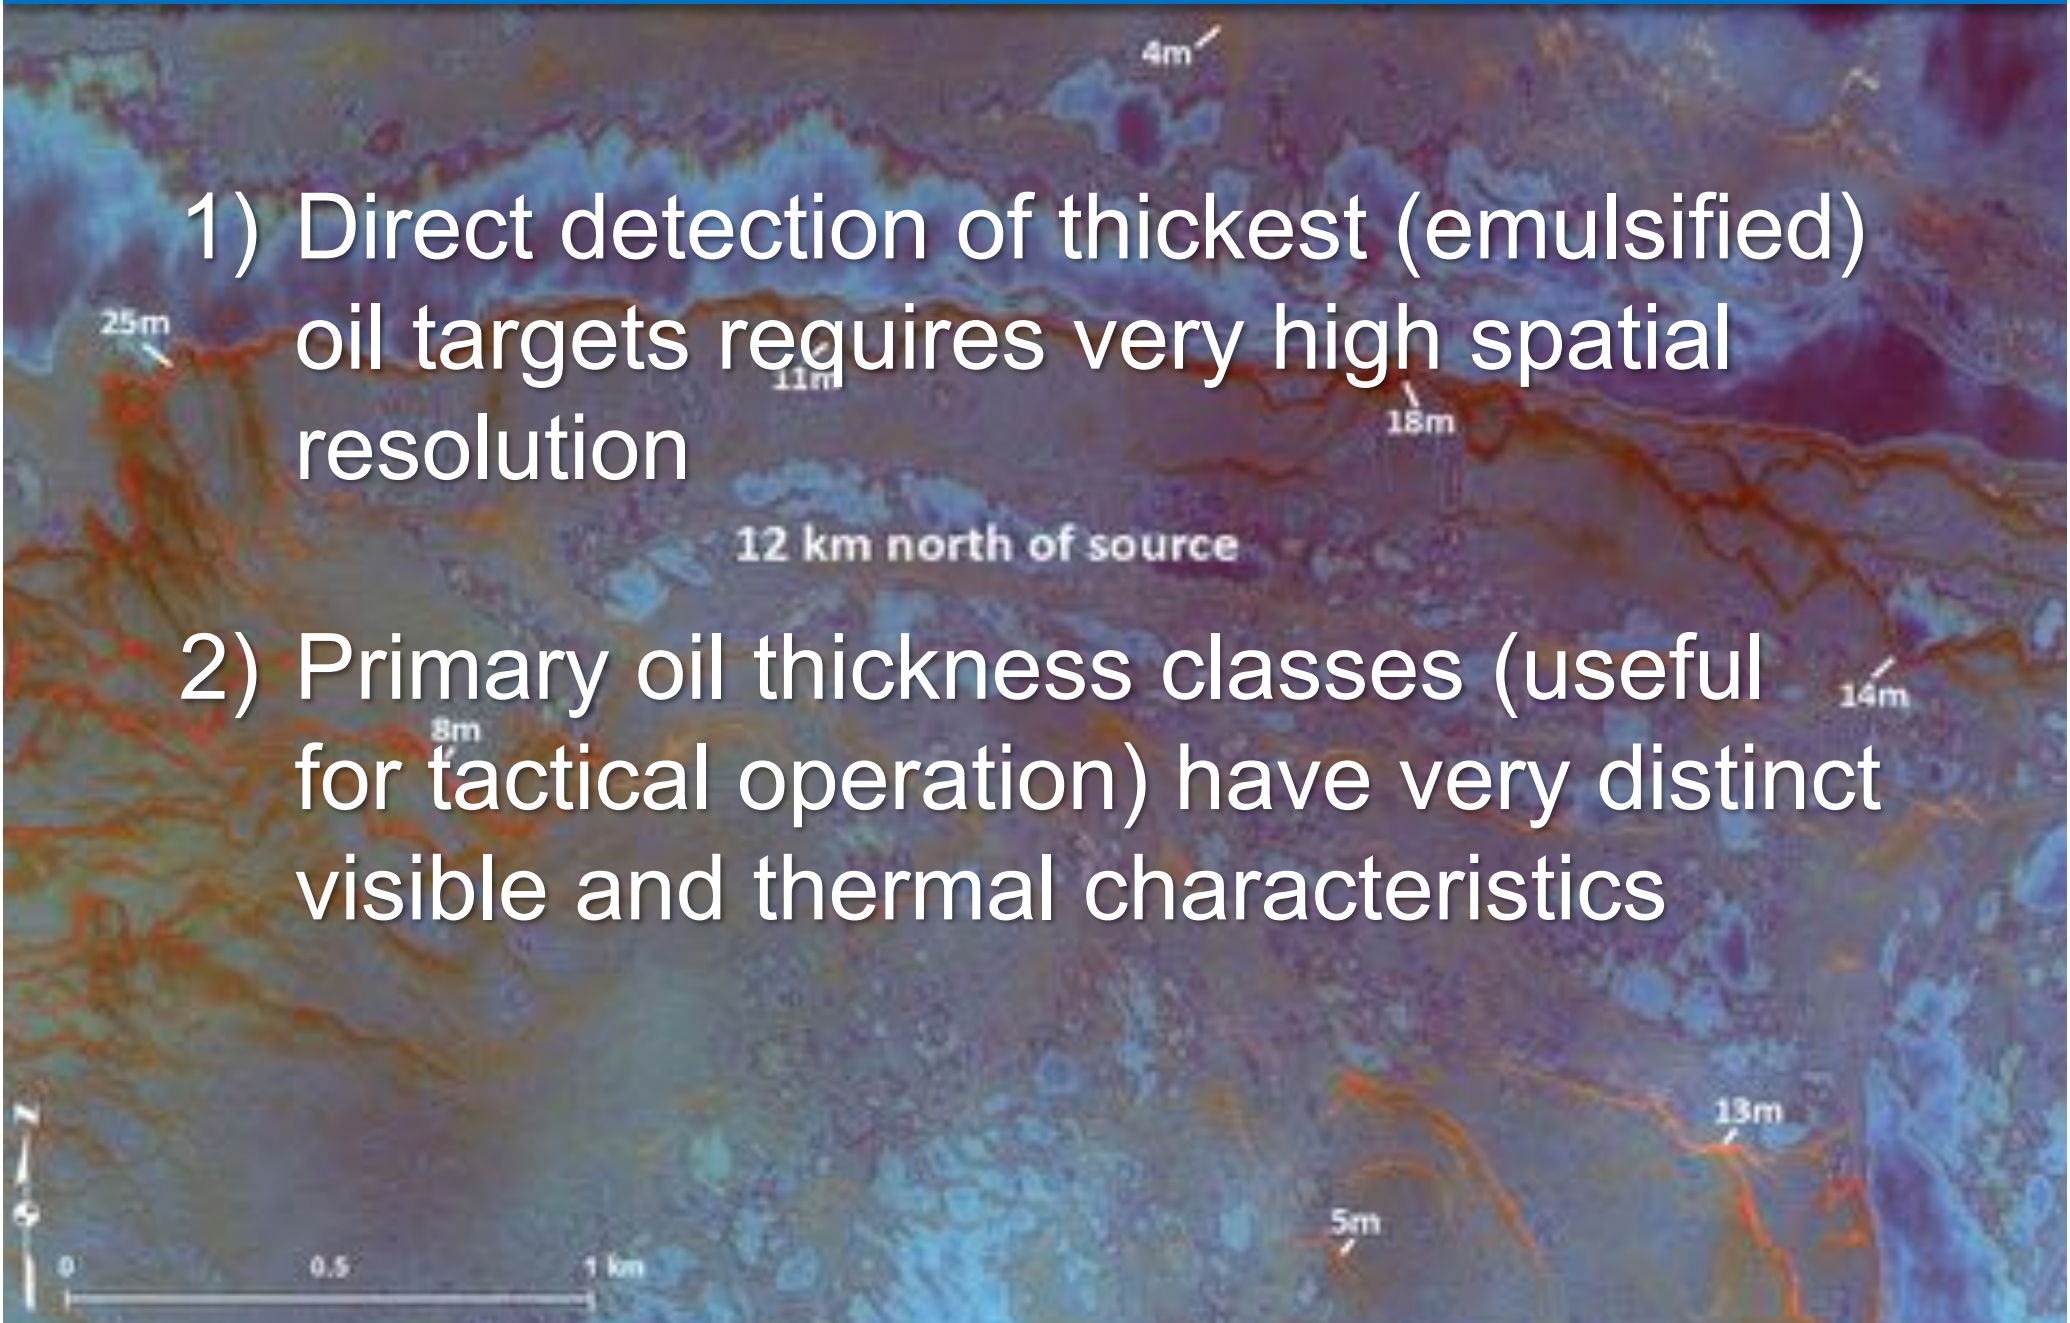

**1 Thermal-
IR Camera**

**4 Visible-NearIR
Cameras
(Filter-Selectable
Wavelengths)**

OI's analysis maps were utilized for multiple applications but a disconnect existed between their distribution and on-water OSROs.

Designing a New System for Direct OSRO Use: Deepwater Horizon Example

A satellite image showing an oil spill in the ocean. The image is color-coded to represent different oil thicknesses, with labels such as 4m, 8m, 11m, 13m, 14m, 18m, and 25m. A scale bar at the bottom left indicates distances of 0, 0.5, and 1 km. A north arrow is also present. The text "12 km north of source" is overlaid on the image.

1) Direct detection of thickest (emulsified) oil targets requires very high spatial resolution

2) Primary oil thickness classes (useful for tactical operation) have very distinct visible and thermal characteristics

Design Enhancement Considerations for 2nd Gen Aerial Oil Spill Mapping System:

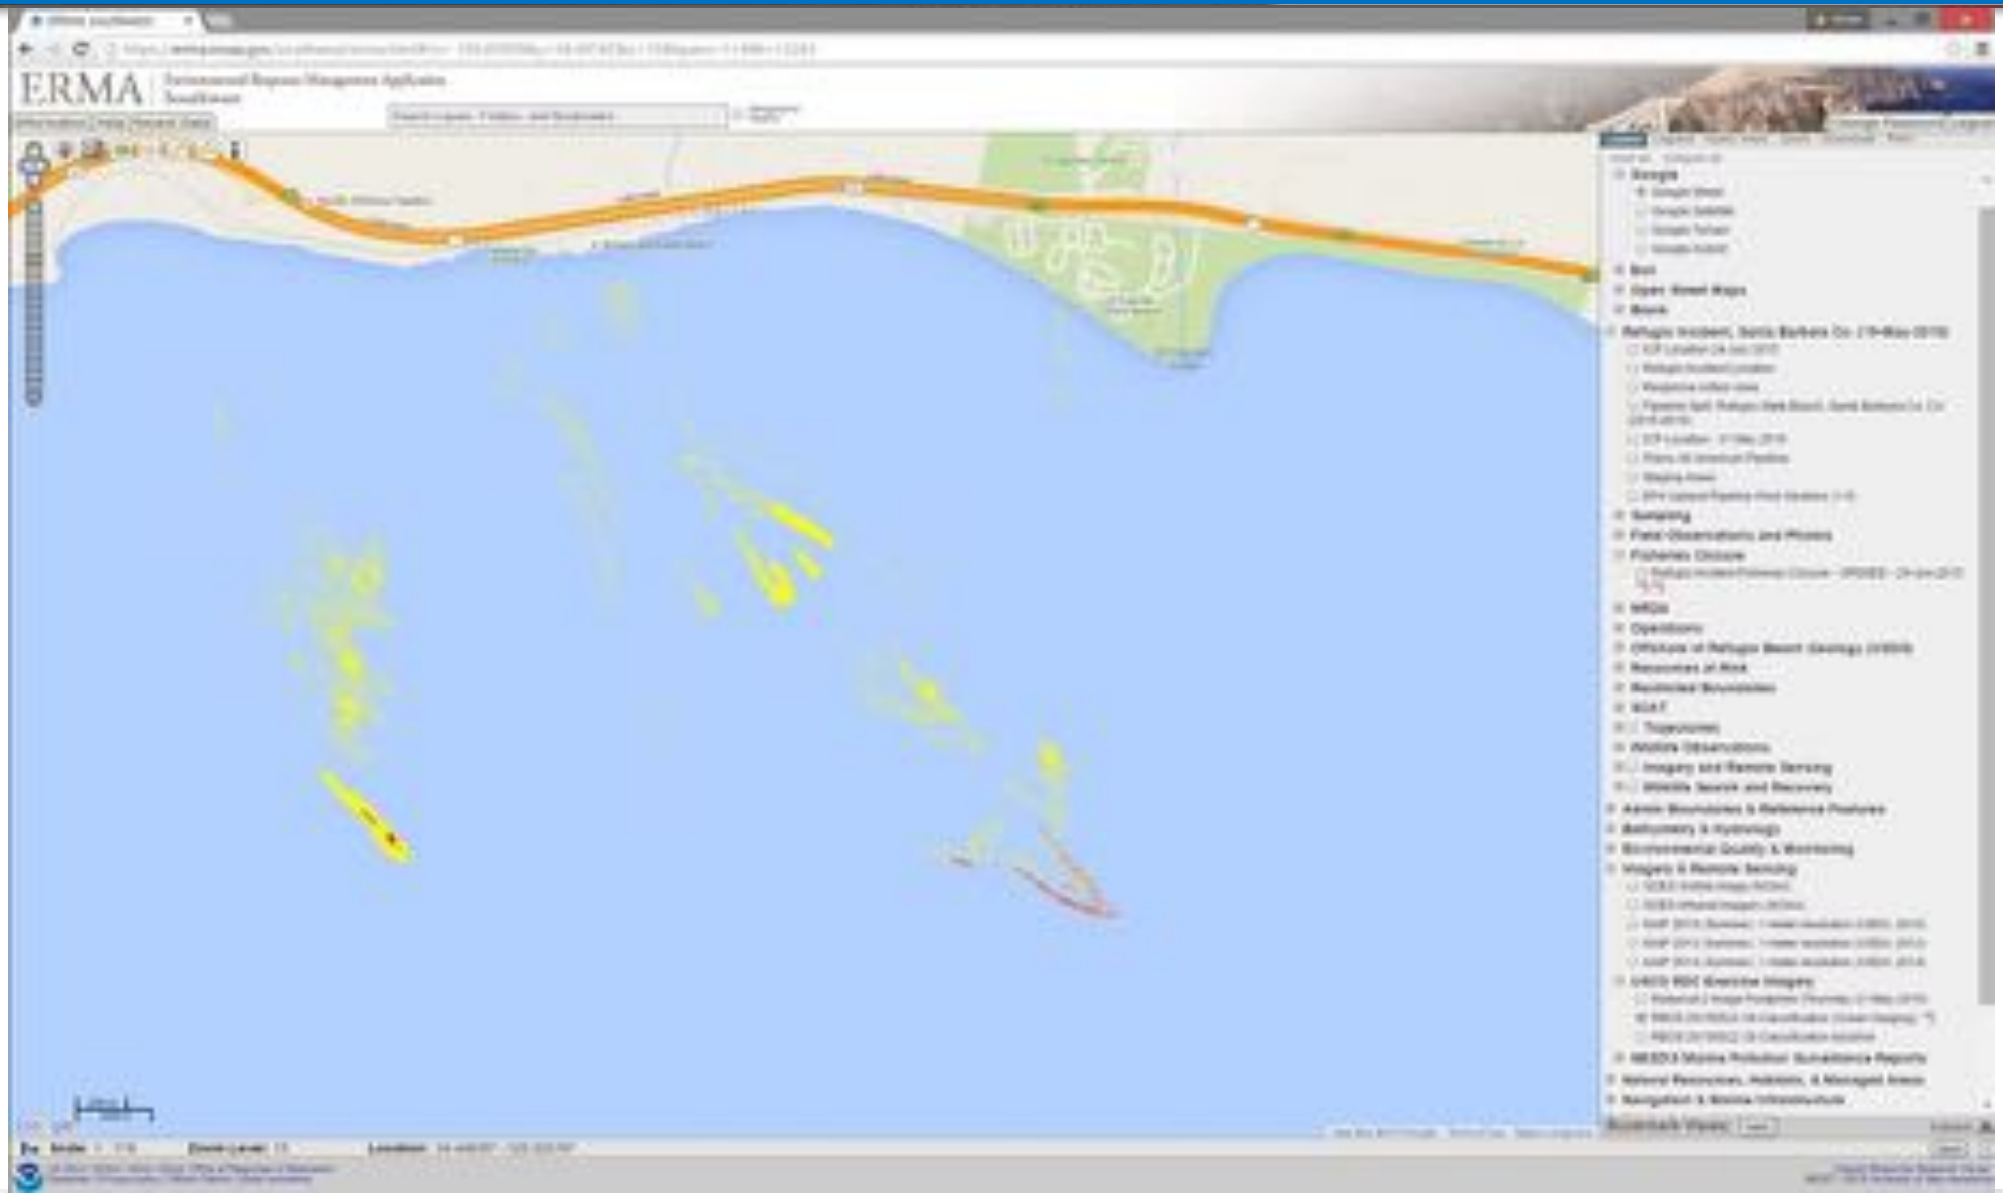

- 1) Must provide wider imaging swath
- 2) Must maintain sub-meter to <4m spatial resolution to adequately resolve existing oil targets
- 3) Hyperspectral not needed to separate main thicknesses for operations support
- 4) Single-unit portable integrated design
- 5) **Operable by trained non-specialist personnel**
- 6) Utilizable for both COP mapping and immediate tactical use (i.e. allow immediate on-board processing)

TRACS

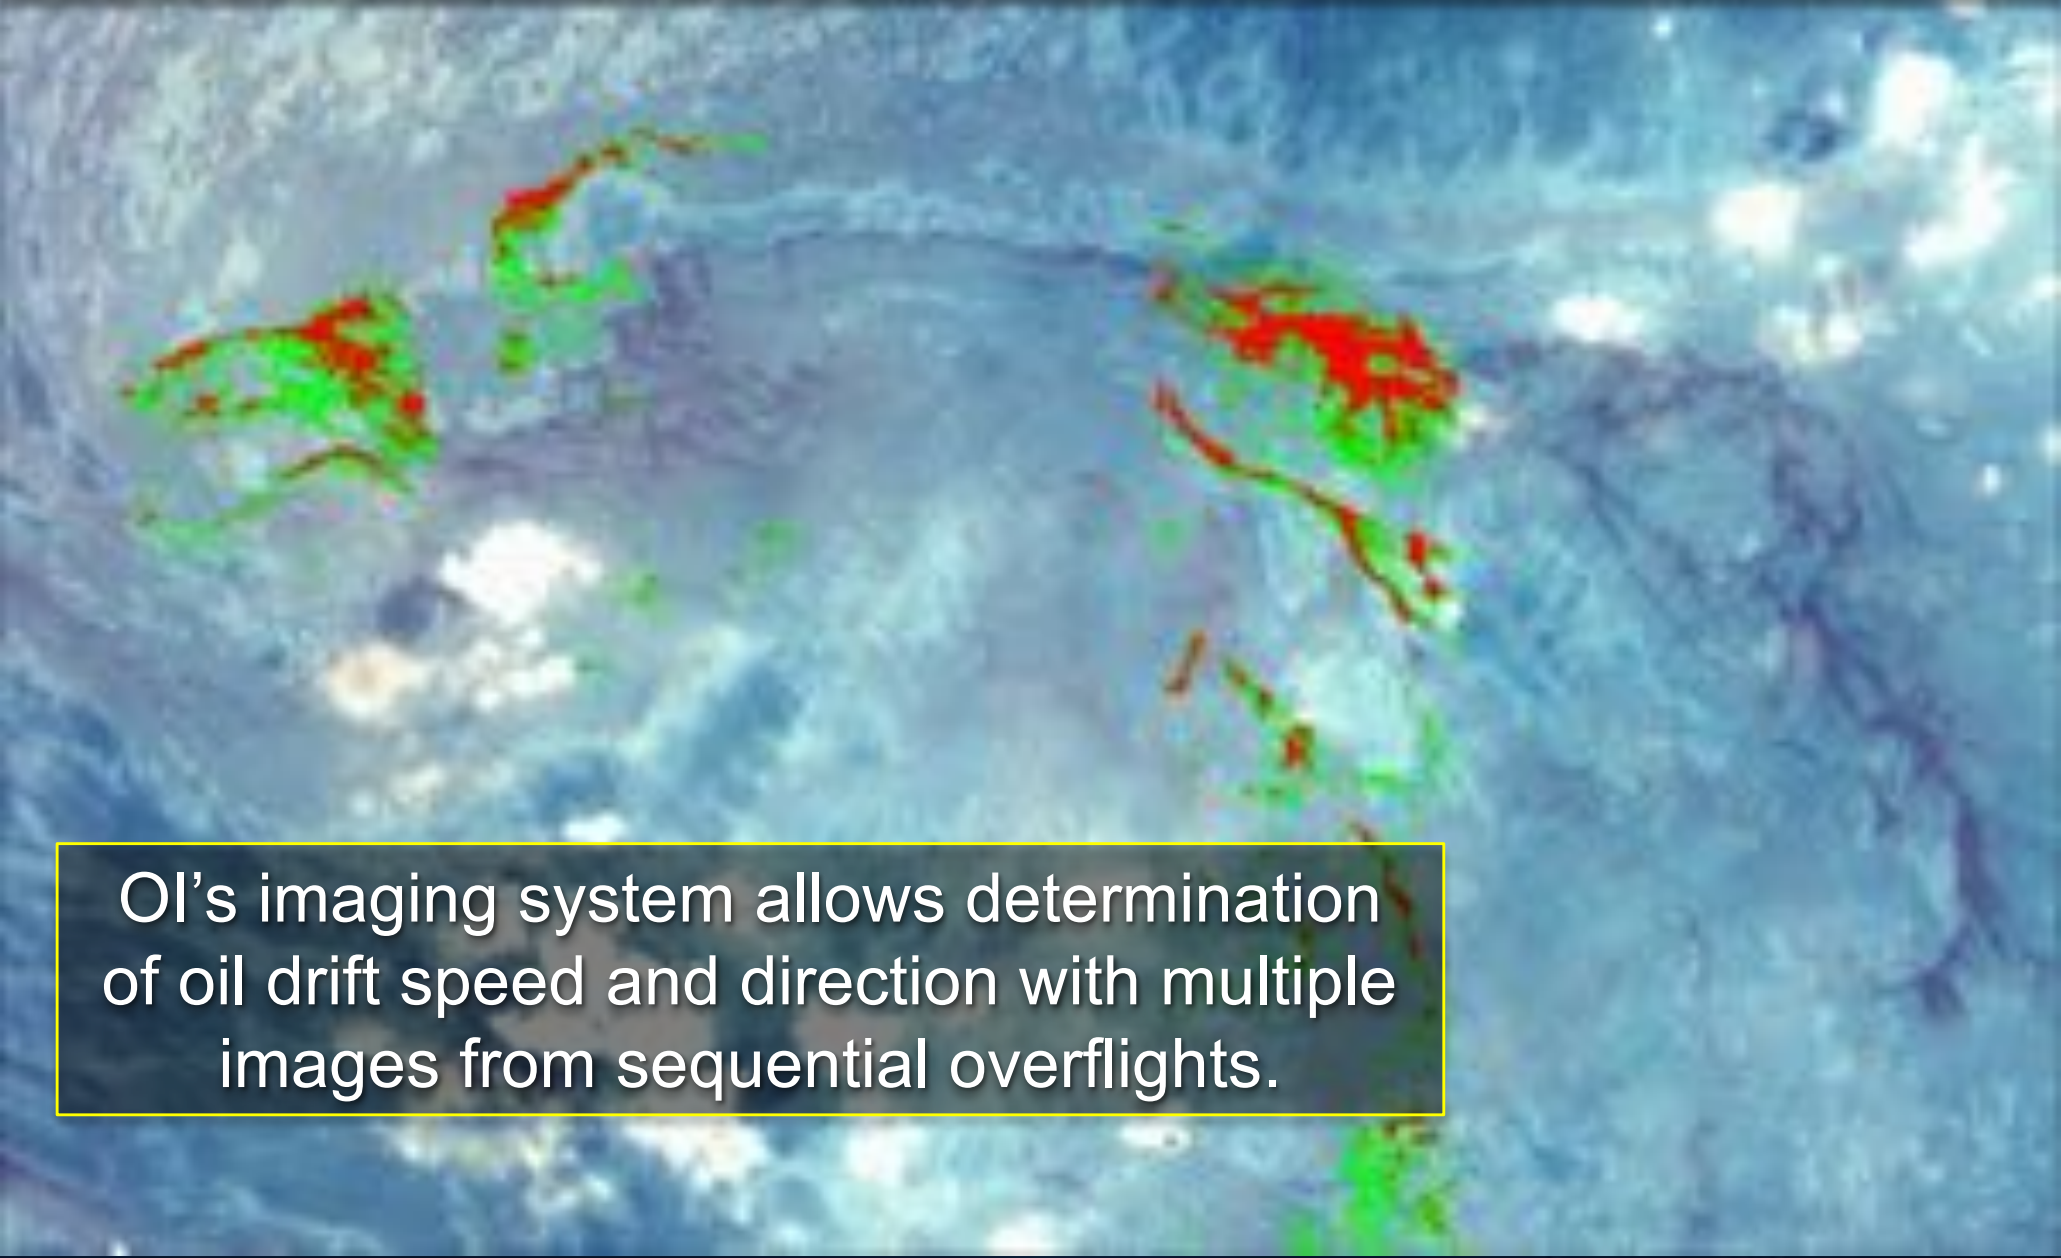

Tactical Response Airborne Classification System

TRACS Allows Real-Time Tactical Use as Well As Data Collection for COP Mapping

Tracking Moving Oil

A satellite image of the ocean surface showing an oil spill. The spill is represented by irregular, elongated shapes in red and green, indicating different concentrations or types of oil. The surrounding water is a deep blue. The text box is overlaid on the bottom left of the image.

OI's imaging system allows determination of oil drift speed and direction with multiple images from sequential overflights.

Exclusive MRSC / OI Partnership

- ✓ OI presently maintains 3 TRACS at MSRC facilities in New Jersey, Louisiana, and California.
- ✓ Systems are rapidly deployable on pre-identified aircraft of opportunity in each region.
- ✓ OI-trained MSRC remote sensing Strike Team members can independently use system(s) for tactical operations.
- ✓ MSRC can acquire imagery and forward to OI for full COP-oriented processing.
- ✓ OI is available for on and off-site expert support

On-going R&D:

Algorithm development:

- 1) Emulsified oil quantification
- 2) Real-time image mosaic product enhancements

New sensor evaluation:

- 1) UV imager
- 2) Polarimetric Thermal Imaging
- 3) “Mini-SAR”

Principles guiding R&D

Will additional sensor/algorithm increase TRACS' operational efficiency?

- 1) Improve quantitative characterization of oil targets
- 2) Improve identification of false targets

Will new sensor benefits outweigh increased complexity and cost?

Example: UV imaging

Passive UV imaging provides some potential for quantifying oil emulsions

THANK YOU!
