Overall Catch Trends: 1999 to 2019

Bay Area Beach Seine Sampling Sites

In 1976 nine beach seining sites in San Pablo Bay and San Francisco Bay were added to the Delta Juvenile Fish Monitoring Program to expand the program's spatial coverage of juvenile Chinook salmon, but what else can we learn from an exploratory analysis of other fish species in the Bay?

1) Topsmelt 7) Bay Pipefish The 12 most 2) Pacific Herring 8) Shiner Perch commonly caught 3) Northern Anchovy 9) Yellowfin Goby 4) Pacific Staghorn Sculpin 10) Three-spine Stickleback fish species were: 5) Dwarf Surfperch 11) Inland Silverside 6) Arrow Goby 12) Barred Surfperch Topsmelt alone made up 65% of the total fish catch caught 60000 Number 6 40000 20000

Pacific herring

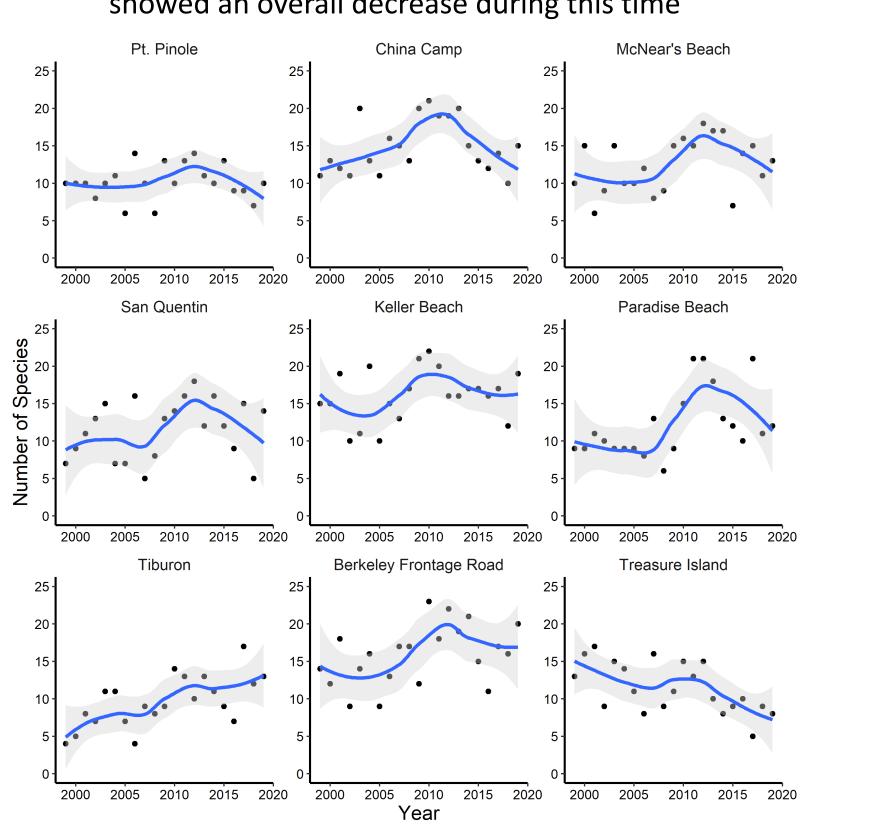

Topsmelt

Northern anchovy

All other fish

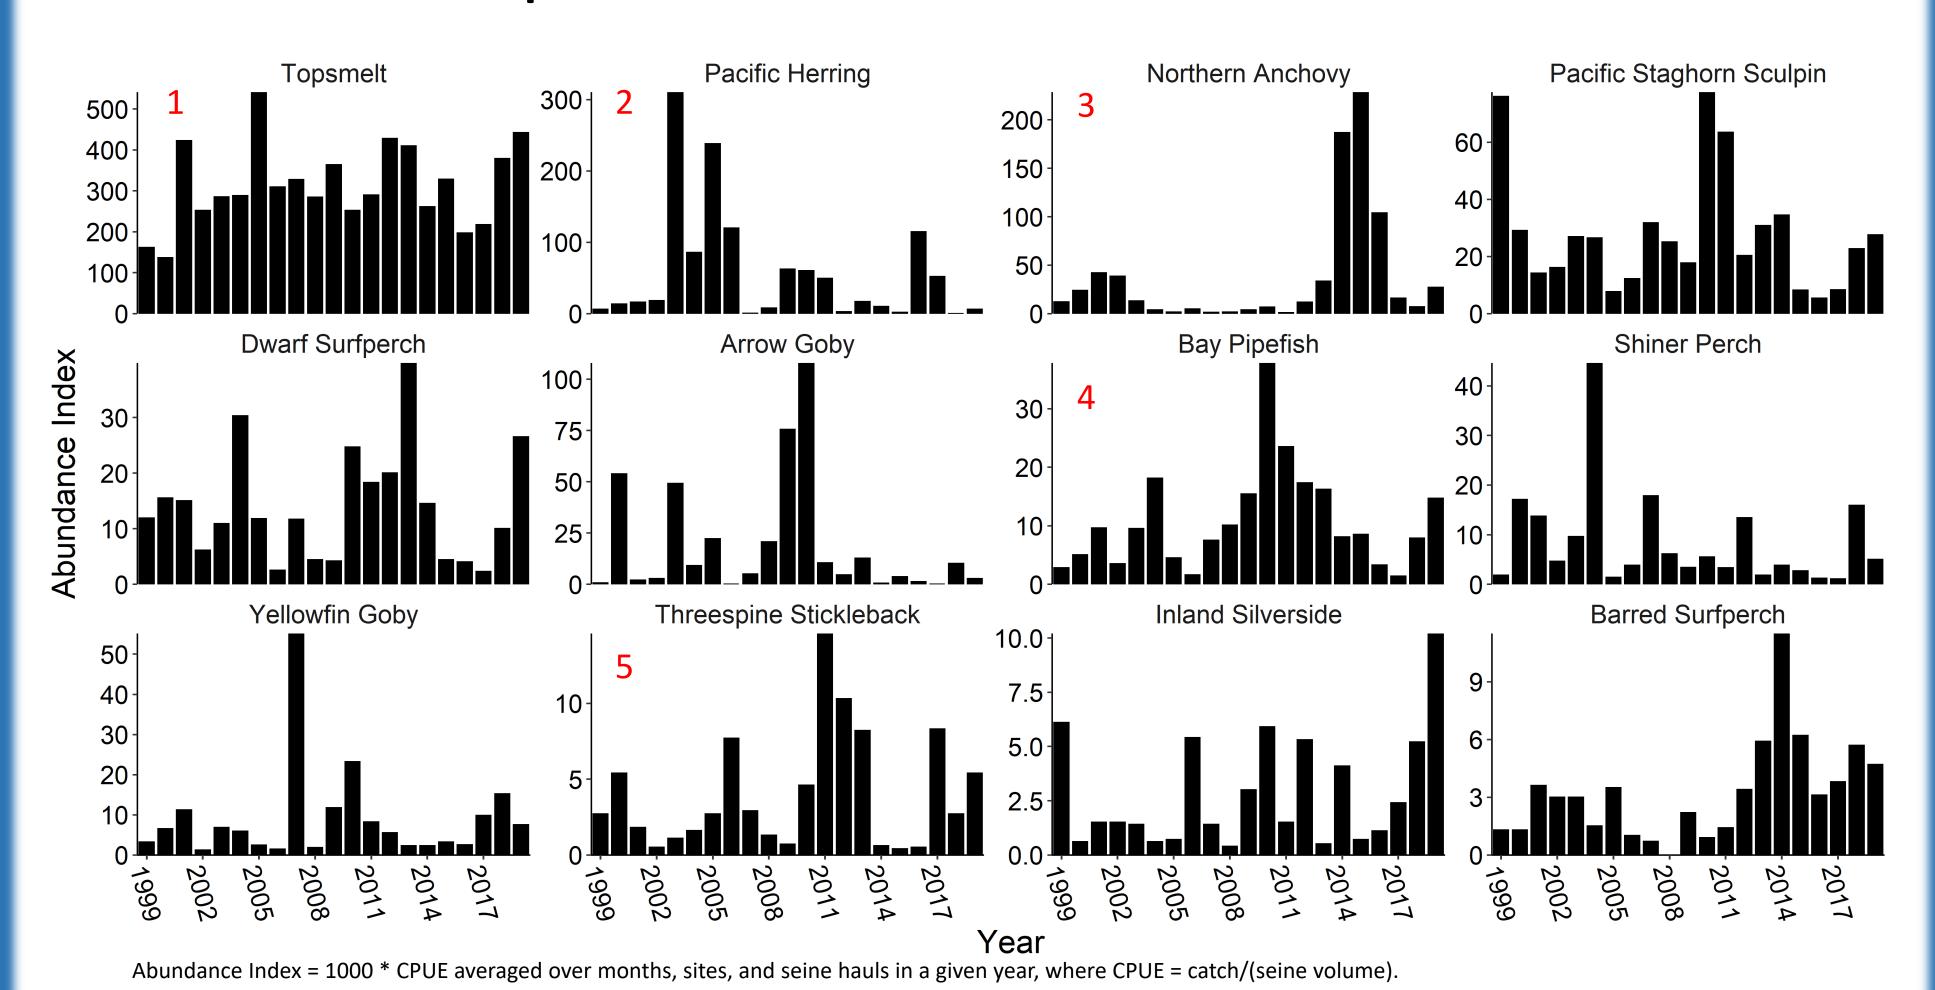

Site Trends: Number of Unique Species per Year Most sites had temporary increase in number of species observed between 2010

Most sites had temporary increase in number of species observed between 2010 and 2015. However, Tiburon showed an overall increase and Treasure Island showed an overall decrease during this time

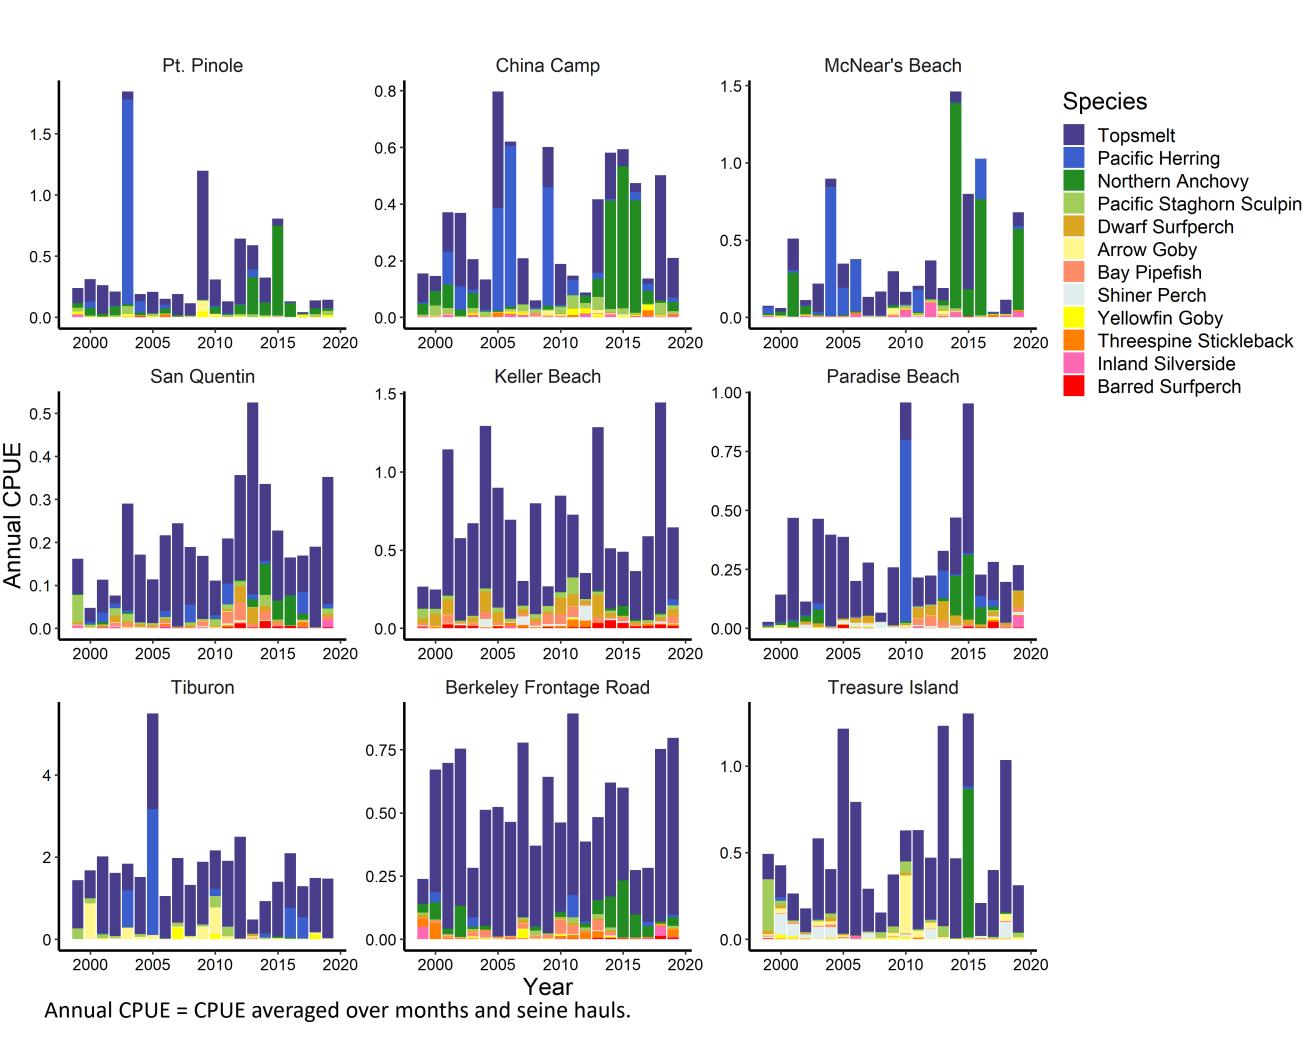

Thick blue line is a loess smoother to highlight trends over time. Gray band reflects 95% confidence interval.

Species Trends: Annual Abundance Indices

- 1. Topsmelt catches are constant over time period
- 2. Pacific Herring catch declined
- 3. Boom and bust cycles for Northern Anchovy
- 4. Bay Pipefish had a large increase in abundance between 2008-2014
- 5. Three-spine Stickleback exhibited periodic abundance

Site and Species Trends: Comparison of Annual CPUE

- Topsmelt are found at every site
- Large catches of Pacific Herring and Northern Anchovy do not overlap at any site during a given year
- Does species assemblage change based on habitat type?

Data and Methodology

- Examined beach seine data over a 20 year period (1999-2019), due to inconsistencies in sampling prior to this time period
- Nine fixed San Francisco and San Pablo Bay beach seine sites
- Sites sampled bi-monthly year-round using beach seine (15m x 1.2m) with 3mm mesh
- Data entered into Delta Juvenile Fish Monitoring Program's online database and is publicly available
 online through Environmental Data Initiative:
- https://doi.org/10.6073/pasta/41b9eebed270c0463b41c5795537ca7c

 Catch per unit effort (CPUE) calculated as Catch/Seine Volume

Future Research

- Analyze all shrimp, jellyfish, and 72 fish species that occur in dataset
- Investigate climate change effects on coastal fish assemblages
- Integrate Tidal data from NOAA observation stations into analysis
- Investigate the role of habitat on fish assemblages
 - Couple environmental data to help explain relative abundance and distribution of species in San Francisco and San Pablo Bay
