

**California Central Valley Chinook Escapement Database Report****California Department of Fish and Wildlife****Fisheries Branch****Anadromous Fishes Conservation and Management Program****California Central Valley****Sacramento and San Joaquin River Systems****Chinook Salmon Escapement****Hatcheries and Natural Areas**

The Sacramento - San Joaquin River system in California's Central Valley is the principal producer of Chinook Salmon, *Oncorhynchus tshawytscha*, caught in California's ocean fisheries and contributes appreciably to Chinook Salmon harvest off the coasts of Oregon and Washington. This system also supports one of the largest river sport fisheries for Chinook Salmon on the Pacific Coast in the Sacramento River. Chinook Salmon in the Central Valley are comprised of four runs: late-fall, winter, spring, and fall runs. Run designation is based primarily on the season during which adult Chinook returning from the Pacific Ocean enter fresh water on their upstream spawning migration. The four Central Valley runs are distinguished as follows:

1) Late-fall run: This run of salmon spawns mainly in the upper Sacramento River and its tributaries near and upstream of Red Bluff, California. The fish arrive in this area in early November through February, with spawning occurring from January through mid-April. Adults of this run are usually larger in physical size than fall- and winter-run Chinook Salmon spawning in the same area.

2) Winter run: This run of salmon spawns almost entirely in the upper Sacramento River and its tributaries upstream of Red Bluff, arriving there as early as December, with spawning occurring from April through August.

3) Spring run: Once widespread in Central Valley streams and rivers, this run of Chinook Salmon has been extirpated from most of the streams in which dam construction has blocked access to upper watershed spawning and rearing habitat. Spring-run salmon return to the system from the ocean in late January through August; early arrivals to their natal streams oversummer in holding pools. Spawning occurs from mid-August through October.

4) Fall run: These are presently the most abundant and widely distributed salmon in the Central Valley. They return from the ocean from June through November and spawn from early October through late December.

Currently, both the ocean and river fisheries in California are managed to focus exploitation on Central Valley fall-run Chinook Salmon. The fisheries are largely possible as the result of a high level of hatchery production, both for mitigation and population supplementation. There is a small sport fishery for late-fall-run Chinook Salmon in the Sacramento River. Sacramento River winter-run Chinook are listed as endangered under both the California Endangered Species Act (CESA) and U.S. Endangered Species Act (ESA). Central Valley spring-run Chinook Salmon are listed as threatened under both the CESA and the ESA. Given their protected status, fisheries management of Chinook Salmon in California is designed to avoid incidental harvest of Central Valley winter-run and spring-run Chinook Salmon.

# **California Central Valley Chinook Escapement Database Report**

## **California Department of Fish and Wildlife**

Escapement Monitoring and Reporting: California Department of Fish and Wildlife (CDFW) and various partners conduct escapement monitoring surveys for Central Valley Chinook Salmon annually. The surveys cover the major natural spawning areas, and many minor ones, throughout the Sacramento-San Joaquin River system. Estimates are made using a variety of methods, depending upon the setting and conditions for making the most accurate estimate, given available resources. Methods include mark-recapture, or carcass, surveys, video counts at dams and in small tributaries, direct observation counts both on-ground and by snorkeling, and expanded redd counts conducted both from the ground and from the air. Counts are also made at all five anadromous hatcheries and rearing facilities in the Central Valley. Partners providing estimates and counts include CDFW, U.S. Fish and Wildlife Service, California Department of Water Resources, East Bay Municipal Utilities District, U.S. Bureau of Reclamation, Lower Yuba River Management Team, and the Fisheries Foundation of California.

CDFW compiles the annual escapement estimates and counts in the GrandTab database report. GrandTab includes the annual escapement estimate for each of the four Central Valley runs of Chinook Salmon. The numbers for each run are organized by major basin (Sacramento and San Joaquin) and then sub-basin (tributary streams and rivers) with natural spawning areas and hatcheries represented. The numbers for each run are also totaled by major basin and for the Central Valley as a whole. The fall run has been monitored and reported in GrandTab since 1952, spring run since 1960, and late-fall and winter runs since 1970.

What numbers in GrandTab represent: Estimates of escapement in GrandTab represent the number of adult Chinook Salmon that literally "escaped" the ocean and river fisheries and successfully migrated upstream to a natural spawning area or hatchery where their number is then estimated or counted. While escapement estimates represent the number of adult salmon available for spawning, these numbers may not necessarily represent the actual number of salmon that ultimately succeed in spawning. Pre-spawning mortality can result in a significant difference in the number of adult salmon that escaped to a natural spawning area and the number which eventually spawn. While pre-spawning mortality occurs in all runs to varying degrees and is often a very small proportion of the total escapement, factors such as low stream flows and high water temperatures may result in significant levels of pre-spawning mortality.

Central Valley spring-run Chinook Salmon are particularly susceptible to high levels of pre-spawning mortality, especially under drought conditions, because of their protracted summer holding period in natural spawning areas prior to spawning during late summer-early fall. As a result, the escapement numbers in GrandTab may not represent a good approximation of the number of adult salmon that actually spawned in a given stream or river. This may be an important consideration when using GrandTab data for investigating Central Valley Chinook Salmon stock-recruitment relationships, for developing production models, or for assessing spawning habitat quality. While unusual conditions and changes in methodology are noted in GrandTab, escapement estimates provided in GrandTab cannot account for what happens with the fish or their progeny beyond the point in time at which escapement is estimated. When uncertain, users of GrandTab data are advised to consult the full escapement report that may be available in conjunction with a given escapement estimate.

Acknowledgement: Thanks to Dick Painter (CDFW retired), Bob Kano (CDFW retired), and Doug Killam (CDFW) for their work designing and maintaining GrandTab in its earlier forms. Thanks to all the cooperating partner entities that provide escapement estimates and counts in support of GrandTab.

DATA FOR [YEARS IN BRACKETS ] ARE PRELIMINARY. BLANK ENTRY INDICATES NO DATA

1/ Red Bluff Diversion Dam

2/ May include numbers of fish for tributaries where estimates were not made

3/ Coleman National Fish Hatchery. Transferred to Coleman National Fish Hatchery from Keswick Dam and / or RBDD

4/ Transferred to Tehama Colusa Fish Facility from Red Bluff Diversion Dam

5/ In 2009 USFWS conducted a comprehensive analysis of Battle Creek coded wire tag data from 2000 - 2008 to estimate numbers of fall and late-fall Chinook returning to Battle Creek. Previously, a cutoff date of December 1st was used to assign run. This changed some Battle Creek estimates.

DATA FOR [YEARS IN BRACKETS ] ARE PRELIMINARY. BLANK ENTRY INDICATES NO DATA

- 1/ Fish transferred from Red Bluff Diversion Dam (RBDD) and Keswick Trap to hatcheries
- 2/ Upstream mainstem in-river estimates prior to 2001 were based on RBDD counts. Subsequent estimates are based on carcass surveys. Numbers using RBDD data are adjusted for angler harvest.
- 3/ Downstream mainstem numbers based on upstream estimates and redd distribution.
- 4/ Not a stable breeding population.
- 5/ Fish passed upstream of Coleman Weir
- 6/ Total winter estimate includes mainstem in-river, tributaries, hatcheries, and angler harvest
- 7/ Not a stable breeding population.

- 1/ Data used (when appropriate) to determine mainstem in-river estimate.
- 2/ Based on aerial survey
- 3/ Estimated from fish counts at Red Bluff Diversion Dam (RBDD)
- 4/ Estimated angler harvest upstream of RBDD. After 1995, it was assumed that there was no harvest due to winter-run salmon angling closure.

DATA FOR [YEARS IN BRACKETS ] ARE PRELIMINARY. BLANK ENTRY INDICATES NO DATA

1/ Red Bluff Diversion Dam. Estimates for 1960 - 1968 spring run are included with fall run.

2/ Feather River Survey does not provide separate estimates for fall and spring escapement. Spring-run estimates are included with fall-run estimates. Fish were transported above Oroville Dam in 1964-1966.

3/ Feather River Hatchery implemented a methodology change in 2005 for distinguishing spring-run from fall-run. Fish arriving prior to the spring-run spawning period were tagged and returned to the river.

The spring-run escapement was the number of these tagged fish that subsequently returned to the hatchery during the spring-run spawning period.

4/ In 2009 USFWS conducted a comprehensive analysis of Battle Creek coded wire tag data from 2000 - 2008 to estimate numbers of fall and late-fall Chinook returning to Battle Creek. Previously, a cutoff date of December 1st was used to assign run. This changed some Battle Creek estimates.

5/ Butte Creek CARCASS survey estimate is included in the "Total Spring Run" INSTEAD OF the snorkel survey estimate, when the carcass survey estimate is available. Carcass survey estimates are shown alongside snorkel survey estimates for comparison.

6/ Butte Creek carcass escapement includes pre-spawn mortality. In 2021, an estimated 19,773 of 21,580 fish died in Butte Creek prior to spawning.

# CHINOOK SALMON ESCAPEMENT - FALL RUN Summary I

DATA FOR [YEARS IN BRACKETS ] ARE PRELIMINARY. BLANK ENTRY INDICATES NO DATA.

1/ For 1952-1955, the original data provided a total for the Sacramento mainstem. Data presented here is that total multiplied by the average % of the fall-run estimate above Red Bluff, from 1956-2007.

2/ Salmon from the mainstem population that were trapped at Keswick or Anderson-Cottonwood dams and transferred to Coleman National Fish Hatchery (CNFH)

3/ Salmon in Battle Creek upstream of the Hatchery

4/ The data source did not provide a breakdown of individual tributaries.

5/ In 2009 USFWS edited some 2000 - 2008 estimates of fall and late-fall Chinook returning to Battle Creek based on CWT data. Previously, a December 1st cutoff was used to assign run.

DATA FOR [YEARS IN BRACKETS ] ARE PRELIMINARY. BLANK ENTRY INDICATES NO DATA

1/ For 1952-1955, the original data source only provided a total estimate for the entire Sacramento mainstem, above and below Red Bluff combined. The data presented here is that total estimate multiplied by the average % of the fall-run estimate below Red Bluff, from 1956-2007.

2/ Salmon from the mainstem population that were trapped at Red Bluff Diversion Dam (RBDD) and transferred to Tehama-Colusa Fish Facility (TCFF)

3/ The data source did not provide a breakdown of individual tributaries. NOTE: The number of fish listed may include those for tributaries from Keswick Dam to RBDD.

DATA FOR [YEARS IN BRACKETS ] ARE PRELIMINARY. BLANK ENTRY INDICATES NO DATA

1/ No Butte Creek estimate was made in 2018 due to fire conditions.

2/ Feather River Survey does not provide separate estimates for fall and spring escapement. Spring-run estimates are included with fall-run estimates.

3/ Yuba River Survey does not provide separate estimates for fall and spring escapement. Spring-run estimates are included with fall-run estimates.

4/ In 2009 CDFW conducted a reanalysis of historic American River Fall data from 1990 - 2008 to consistently include fish taken at Nimbus Racks and exclude angler estimates.

5/ From 2018 on, the area between Nimbus Weir and Nimbus Dam is included in the American River Fall escapement estimate. In 2018 this area was closed to angling.
