California Fish and Game Commission Meeting Binder

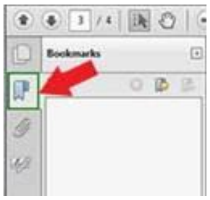
Part 2 (Items 11-29)
(Excluding Item 22)

April 17-18, 2024
San Jose

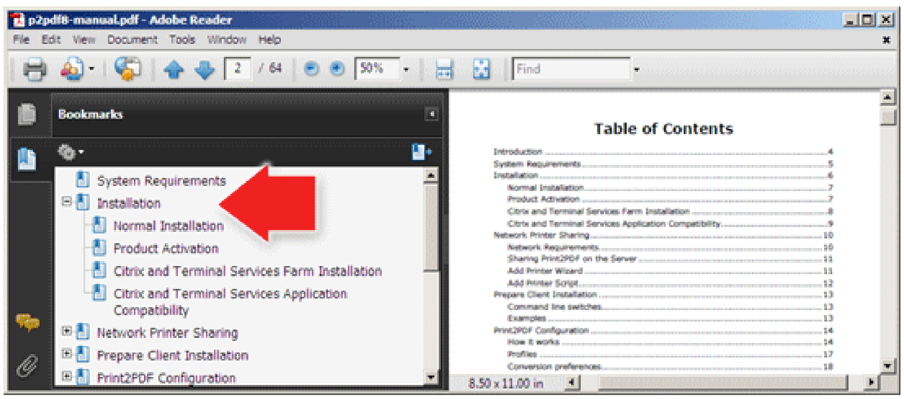
Easy Guide to Using the Binder

1. Download and open the binder document using your Adobe Acrobat program/app.

2. If a bookmark panel does not automatically appear on either the top or left side of the screen, click/tap on the “bookmark symbol” located near the top left-hand corner.



3. To make adjustments to the view, use the Page Display option in the View tab. You should see something like:



4. We suggest leaving open the bookmark panel to help you move efficiently among the staff summaries and numerous supporting documents in the binder. It’s helpful to think of these bookmarks as a table of contents that allows you to go to specific points in the binder without having to scroll through hundreds of pages.

5. You can resize the two panels by placing your cursor in the dark, vertical line  located between the panels and using a long click /tap to move in either direction.

6. You may also adjust the sizing of the documents by adjusting the sizing preferences located on the Page Display icons found in the top toolbar or in the View tab.

7. Upon locating a staff summary for an agenda item, notice that you can obtain more information by clicking/tapping on any item underlined in blue.

8. Return to the staff summary by simply clicking/tapping on the item in the bookmark panel.

9. Do not hesitate to contact staff if you have any questions or would like assistance.

Important Commission Meeting Procedures Information

Welcome to a Meeting of the California Fish and Game Commission

This year marks the 155th year of operation of the Commission in partnership with the California Department of Fish and Wildlife. Our goal is the preservation of our heritage and conservation of our natural resources through informed decision making; Commission meetings are vital in achieving that goal and we provide this information to be as effective and efficient toward that end. Welcome, and please let us know if you have any questions.

Persons with Disabilities

Persons with disabilities needing reasonable accommodation to participate in public meetings or other Commission activities are invited to contact the Department's Civil Rights Office (CRO) at civilrights@wildlife.ca.gov. Accommodation requests for facility and/or meeting accessibility and requests for American Sign Language interpreters should be submitted at least two weeks prior to the event. Requests for real-time captioners should be submitted at least four weeks prior to the event. These timeframes are to help ensure that the requested accommodation is met. If a request for an accommodation has been submitted but is no longer needed, please contact the CRO immediately.

Stay Informed

To receive meeting agendas and regulatory notices about those subjects of interest to you, visit the Commission's website, www.fgc.ca.gov, to sign up on our electronic mailing lists.

Submitting Written Comments

The public is encouraged to comment on any agenda item. Submit written comments by one of the following methods: E-mail to fgc@fgc.ca.gov; mail to California Fish and Game Commission, P.O. Box 944209, Sacramento, CA 94244-2090; deliver to California Fish and Game Commission, 715 P Street, 16th Floor, Sacramento, CA 95814 (you must call at least one business day in advance to arrange delivery); or hand-deliver to a Commission meeting. Materials provided to the Commission will be available to the general public.

Comment Deadlines

The ***Comment Deadline*** for this meeting is **5:00 p.m. on April 4, 2024**. Written comments received at the Commission office by this deadline will be made available to Commissioners prior to the meeting.

The ***Supplemental Comment Deadline*** for this meeting is **noon on April 12, 2024**. Comments received by this deadline will be made available to Commissioners at the meeting.

After these deadlines, written comments may be delivered in person to the meeting. Please bring 12 copies of written comments to the meeting and give them to the designated staff member just prior to speaking.

Petitions for Regulation Change

Any person requesting that the Commission adopt, amend, or repeal a regulation must complete and submit form FGC 1, *Petition to the California Fish and Game Commission for Regulation Change*, available at https://fgc.ca.gov/Regulations/Petition-for-Regulation-Change. To be received by the Commission at this meeting, petition forms must be delivered by the

Supplemental Comment Deadline (or delivered in person at the meeting during the regulation change petitions agenda item). Petitions received at this meeting will be scheduled for consideration at the next regularly scheduled business meeting, unless the petition is rejected under staff review pursuant to subsection 662(b).

Non-Regulatory Requests

All non-regulatory requests follow a two-meeting cycle to ensure proper review and thorough consideration of each item. All requests submitted by the ***Supplemental Comment Deadline*** (or heard during general public comment at the meeting) will be scheduled for receipt at this meeting and scheduled for consideration at the next regularly scheduled business meeting.

Speaking at the Meeting

To speak on an agenda item in-person**,** please complete a "speaker card" and provide it to the designated staff member before the agenda item is announced. Please complete one speaker card per item. Cards will be available near the entrance of the meeting room.

***To speak on an agenda item by webinar/phone**,* please "raise" your hand either through the Zoom function or by pressing *9 once on your phone when prompted at the beginning of the agenda item.

In-person and Webinar

1. In-person speakers will be identified in groups; please line up when your name is called. Speakers by webinar/phone will be identified by your Zoom display name or last three digits of your phone number; please pay attention to when your name or number is called.
2. When addressing the Commission, please give your name and the name of any organization you represent before providing your comments on the item under consideration.
3. If there are several speakers with the same concerns, please appoint a spokesperson and avoid repetitive testimony.
4. The presiding commissioner will allot between one and three minutes per speaker per agenda item, subject to the following exceptions:
    a. The presiding commissioner may allow up to five minutes to an individual speaker if a minimum of three individuals who are present when the agenda item is called have ceded their time to the designated spokesperson, and the individuals ceding time forfeit their right to speak to the agenda item.
    b. In-person participants ceding their time shall complete a speaker card and approach the staff table with the spokesperson so that staff may confirm the presence of those ceding their time. If you are participating via Zoom and ceding your time to another speaker, please notify the Commission at fgc@fgc.ca.gov prior to the start of the agenda item, including to whom you are ceding your time, and be present on Zoom during the agenda item.
    c. Individuals may receive advance approval for additional time to speak if such requests are received by email or delivery to the Commission office by the ***Supplemental Comment Deadline***. The president or designee will approve or deny the request no later than 5:00 p.m. two days prior to the meeting.

d. An individual requiring an interpreter is entitled to at least twice the allotted speaking time pursuant to Government Code Section 11125.7(c).
e. An individual may receive additional time to speak to an agenda item at the request of any commissioner.

Agenda items may be heard in any order and on either day pursuant to the discretion of the presiding commissioner.

Visual Presentations and Associated Materials

All electronic presentations must be submitted by the ***Supplemental Comment Deadline*** and approved by the Commission executive director before the meeting.

1. Electronic presentations must be provided by email to fgc@fgc.ca.gov. If the presentation file is too large to send via email, contact staff to identify an alternative method for submitting the file.
2. All electronic formats must be Windows PC compatible.
3. If presenting at the in-person meeting location, it is recommended that you bring a print copy of your presentation in case of technical difficulties.
4. If you have written materials to accompany your presentation, please bring 12 copies to the meeting and give them to the designated staff member just prior to presenting.

Overview of California Fish and Game Commission Meeting

- Welcome to a meeting of the California Fish and Game Commission. This is the 155th year of operation for the Commission, in partnership with the California Department of Fish and Wildlife. Both organizations originated from the Board of Fish Commissioners in 1870.

- The Commission's goals include preserving our wildlife heritage and conserving our natural resources through informed decision making. These meetings are vital in achieving those goals and, in that spirit, we provide the following information to be as effective and efficient toward that end.

- We are operating under the Bagley-Keene Open Meeting Act and these proceedings are being recorded and broadcast.

- In the unlikely event of an emergency, please note the location of the nearest emergency exits at your location.

- Items may be heard in any order pursuant to the determination of the presiding commissioner, which is President Murray today.

- The amount of time for each agenda item may be adjusted based on time available and the number of speakers.

- If you are here in the in-person location, speaker cards need to be filled out **legibly** and turned in to staff **before** we start the agenda item.

- If you are online or on the phone, you will receive additional instructions in a few minutes.

- We will ask how many speakers we have before taking public comment; please be prepared and listen closely for your name or phone number to be called.

- When you speak, please state your name and any affiliation. Please be respectful and note that disruptions will not be tolerated. Time is precious so please be concise.

- To receive meeting agendas and regulatory notices about those subjects of interest to you, please visit the Commission's website, www.fgc.ca.gov, and sign up for our electronic mailing lists.

- If you want the Commission to consider a regulation change, all petitions for regulation change must be submitted in writing on the authorized form, FGC 1, which is available on the Commission's website or directly from staff.

- For members of the public, if you have access to the Internet and are not planning to make public comment, you may listen to the meeting via our regular webcast by visiting the commission website at www.fgc.ca.gov (link is on right side).

- **Reminder!** Please silence your mobile devices and computers to avoid interruptions.

Introductions for California Fish and Game Commission Meeting

Commission Members

Samantha Murray	President (La Jolla)
Erika Zavaleta	Vice President (Santa Cruz)
Jacque Hostler-Carmesin	Member (McKinleyville)
Eric Sklar	Member (Saint Helena)
Darius W. Anderson	Member (Kenwood)

Commission Staff

Melissa Miller-Henson	Executive Director
David Thesell	Deputy Executive Director
Mike Yaun	Legal Counsel
Susan Ashcraft	Marine Advisor
Ari Cornman	Wildlife Advisor
Kimi Rogers	Environmental Scientist
Sherrie Fonbuena	Associate Governmental Program Analyst
Jenn Bacon	Associate Governmental Program Analyst
David Haug	Associate Governmental Program Analyst
Kelsey Leaird	Executive Analyst
Jessica Shaw	Seasonal Clerk
Devon Rossi	California Sea Grant State Fellow

California Department of Fish and Wildlife Staff

Chuck Bonham	Director
Chad Dibble	Deputy Director, Wildlife and Fisheries Division
Nathaniel Arnold	Acting Deputy Director and Chief, Law Enforcement Division
Josh Grover	Deputy Director, Ecosystem Conservation
Craig Shuman	Regional Manager, Marine Region
Scott Gardner	Branch Chief, Wildlife Branch
Sarah Mussulman	Acting Branch Chief, Fisheries Branch

I would also like to acknowledge special guests who are present:
(i.e., elected officials, including tribal chairpersons, and other special guest

Revised* Meeting Agenda
April 17-18, 2024

Participate in Person

San Jose Scottish Rite Center
2455 Masonic Drive
San Jose, CA 95125

or

Participate via Webinar/Phone

The meeting will be live streamed; visit www.fgc.ca.gov the day of the meeting to watch or listen. To provide public comment during the meeting, please join at the in-person location, via Zoom, or by telephone; you may join the webinar directly at https://us02web.zoom.us/j/85095560390. For complete instructions on how to join via Zoom or telephone, click here or visit fgc.ca.gov/meetings/2024.

*** This revised agenda is amended to clarify the scope of item 3, and add a sub-item to item 9(C).**

Notes: **(1)** **See important meeting deadlines and procedures, including written public comment deadlines, starting on page 11.**

(2) **Unless otherwise indicated, the California Department of Fish and Wildlife is identified as Department.**

(3) **All section and subsection references are to Title 14 of the California Code of Regulations, unless otherwise noted.**

Invitation: The Commission invites members of the public to join commissioners and staff for a field trip currently under development for Wednesday, April 17. Details will be available in advance of the Commission meeting. Members of the public are welcome to join but must provide their own transportation.

Day 1 – April 17, 2024; 10:00 AM

Call to Order and Roll Call to Establish a Quorum

1. Consider approving agenda and order of items

Discussion and Action Items

2. Commission executive director and Department reports

(A) ***Commission executive director's report***

I. Justice, equity, diversity and inclusion (JEDI) plan update

(B) ***Department director and Law Enforcement Division***

3. Commercial California halibut and white seabass set gill net

Consider authorizing publication of notice of intent to amend regulations regarding set gill net service interval, gear marking, and mesh depth in the commercial California halibut and white seabass set gill net fisheries.
(Add Section 174.1)

4. Fisheries logbook forms and fishing block charts

Consider authorizing publication of notice of intent to amend regulations regarding fisheries logbook forms and fishing block charts.
(Amend sections 120.7, 122, 165, 180, 190, 197 and 705.1)

5. Experimental Fishing Permit (EFP) Program Major Amendment Request

Consider approving a major amendment to the permit for EFP Application 2023-02 related to pop-up gear testing in the Dungeness and rock crab fisheries.
(Pursuant to Section 91)

6. Commission policies

Discuss potential amendments to five Commission policies currently under review.
(Pursuant to Section 703, California Fish and Game Code)

(A) ***Code of Conduct***

(B) ***Planting Fish in Youth Camps***

(C) ***Youth Fishing Programs***

(D) ***Research***

(E) ***Naming Installations***

7. Regulation change petitions (marine, wildlife, and inland fisheries)

(A) ***New petitions***

Receive new petitions for regulation change.
(Pursuant to Section 662)

Consideration of whether to grant, deny, or refer for additional review is expected to be scheduled for the June 19-20, 2024 meeting.

(B) ***Previously received petitions***

Consider whether to grant, deny, or refer for additional review, petitions for regulation change received at previous meetings.
(Pursuant to Section 662)

I. *Petition 2023-12*: Request to amend recreational groundfish regulations to require use of descending devices to protect groundfish stocks

II. *Petition 2024-01:* Request to amend sport fishing regulations to allow increased take and reduce size limitations of trout in Stony Creek in Colusa County

III. *Petition 2018-016(a):* Request to remove Hope Valley Wildlife Area from the Department Lands Pass Program

8. Non-regulatory requests from previous meetings (marine, wildlife and inland fisheries)

Consider and potentially act on requests for non-regulatory action received from members of the public at previous meetings.

9. Committee and Department reports

Receive updates on items of note since the previous Commission meeting from Commission committees and Department divisions.

(A) ***Tribal Committee***

Receive summary and consider approving recommendations from the April 16, 2024 Committee meeting. Discuss referred topics and consider revisions to topics and timing.

(B) ***Marine Resources Committee***

Receive summary and consider approving recommendations from the March 19, 2024 Committee meeting. Discuss referred topics and consider revisions to topics and timing.

(C) ***Department Marine Region***

I. Update on annual recreational ocean salmon and Pacific halibut regulations, and automatic conformance to federal regulations

II. Public discussion of action taken by the director of the Department in the recreational Dungeness crab fishery to temporarily prohibit the use of crab traps between the Sonoma/ Mendocino county line and Point Conception, Santa Barbara County (fishing zones 3, 4 and 5), and remain under a fleet advisory for all open fishing zones (1, 2 and 6), to protect marine life from entanglement risk. (Pursuant to Section 29.80)

General Public Comment

10. General public comment for items not on the agenda

Receive public comment regarding topics within the Commission’s authority that are not included on the agenda. Agenda item 28 on day 2 is an extension of this general public comment agenda item; as such, speakers may comment on one day or the other.

Note: The Commission may not discuss or take action on any matter raised during this item, except to decide whether to place the matter on the agenda of a future meeting (sections 11125 and 11125.7(a), Government Code).

Day 2 – April 18, 2024; 8:30 AM

Call to Order and Roll Call to Establish a Quorum

Consent Items

Note: Items on the consent calendar are expected to be routine and non-controversial. After public comment, the Commission will consider approving items on the consent calendar in a single vote without discussion. The presiding commissioner may choose to remove any item from the consent calendar and allow a separate discussion and potential action on that item in response to a request by a Commission member, staff, or an interested person.

11. Initial private lands wildlife habitat enhancement and management area (PLM) plan and licence (consent)
Consider approving initial PLM plan and 2024-2028 license for:
(Pursuant to Section 601)

(A) Merced
- I. Stevinson Ranch

12. Five- year PLM plans (consent)
Consider approving five-year PLM plans and 2024-2028 licenses for:
(Pursuant to Section 601)

(A) Del Norte
- I. Smith River PLM

(B) Humboldt
- I. Redwood House Ranch

(C) Mendocino
- I. Capistran Ranch
- II. Four Pines Ranch
- III. Schneider Ranch

(D) Monterey
- I. Gabilan Ranch

(E) San Luis Obispo
- I. Carrizo Ranch
- II. Herst Ranch

(F) Tehama
- I. Bell Ranch

13. Annual PLM plans (consent)
Consider approving annual PLM plans for:
(Pursuant to Section 601)

(A) Del Norte
- I. Alexandre Dairy

(B) Humboldt
- I. Big Lagoon
- II. Diamond C Outfitters
- III. Hunter Ranch
- IV. Klamath PLM
- V. Rainbow Ridge PLM
- VI. Stover Ranch
- VII. Wiggins Ranch

(C) Humboldt and Trinity
- I. Wilkinson Hunting Club

(D) Kern and San Luis Obispo
- I. Temblor Ranch

(E) Mendocino
- I. Ackerman-Southy Daughtery WMA
- II. Amann Ranch
- III. Antler Hill Ranch
- IV. Bridges Ranch
- V. Carley Ranch
- VI. Christensen Ranch
- VII. Eden Velley Ranch
- VIII. Miller-Eriksen Ranch
- IX. R-R Ranch
- X. Seven Springs Ranch
- XI. Shamrock Ranch
- XII. Six Point Ranch
- XIII. Spring Valley Ranch
- XIV. Summer Camp Ranch

(F) Merced
- I. DeFrancesco / Eaton Ranch

(G) Monterey
- I. Alexander Ranch
- II. Bardin Ranch
- III. Hartnell Ranch
- IV. Indian Valley Cattle Company – Lombardo Ranch
- V. Peachtree Ranch
- VI. San Bartolome Ranch
- VII. Sky Rose Ranch

(H) Monterey and San Benito
- I. Morisoli Ranch

(I) Monterey and San Luis Obispo
- I. Camp 5 Outfitters - Roth Ranch

(J) San Benito
- I. Lewis Ranch
- II. Lone Ranch
- III. Pine Mountain Ranch
- IV. Rancho Le Cuesta
- V. Trinchero Ranch

(K) San Joaquin
- I. Corral Hollow Ranch

(L) San Luis Obispo
- I. Avenales Ranch
- II. Carnaza Ranch
- III. Chimney Rock Ranch
- IV. Clark & White Ranch
- V. D-Rafter L Ranch

(M) Santa Clara
- I. Coon Creek Ranch

(N) Shasta
- I. Stackhouse Ranch

(O) Stanislaus
- I. Rooster Comb Ranch

(P) Tehama
- I. 3D Ranch
- II. R Wild Horse Ranch

(Q) Trinity
- I. Stewart Ranch
- II. Travis Ranch

14. Readoption of white sturgeon emergency regulation (consent)
Consider adopting a 90-day extension of emergency regulations concerning recreational take of white sturgeon (*Acipenser transmontanus*) to support recovery populations and to track fishing pressure and success.
(Amend sections 5.79, 5.80, 27.90 and 27.92)

15. Greater sage-grouse (consent)
Consider approving the Department’s request for a six-month extension to deliver the one-year status review report on the petition to list greater sage-grouse (*Centrocercus urophasianus*) as threatened or endangered under CESA.
(Pursuant to Section 2074.6 Fish and Game Code)

Discussion and Action Items

16. Inland sport fishing

Consider authorizing publication of notice of intent to amend regulations for freshwater sport fishing bag limits, gear, and low-flow information.
(Amend sections 2.30, 5.50, 7.50, 8.00, and 703)

17. White sturgeon sport fishing regular rulemaking

Consider authorizing publication of notice of intent to amend regulations through a regular rulemaking to adopt the emergency rules for the recreational take of white sturgeon.
(Amend sections 5.79, 5.80, 27.90 and 27.92)

18. Central Valley sport fishing

Discuss proposed amendments to Central Valley sport fishing regulations.
(Amend subsections 7.40(b)(4), (43), (66) and (80))

19. Klamath River Basin sport fishing

Discuss proposed amendments to Klamath River Basin sport fishing regulations.
(Amend subsection 7.40(b)(50))

20. Waterfowl hunting

Consider adopting proposed amendments to waterfowl hunting regulations and taking final action under the California Environmental Quality Act (CEQA).
(Amend Section 502)

21. Mammal hunting

Consider adopting proposed amendments to mammal hunting regulations and taking final action under CEQA).
(Amend sections 362, 363, 364, 364.1, 554, 555 and 708.14 and add Section 555.1)

22. Southern California steelhead

Consider the petition, Department’s status review report, and comments received to determine whether listing southern California steelhead (*Oncorhynchus mykiss*) as endangered under the California Endangered Species Act (CESA) is warranted.
(Pursuant to sections 2075 and 2075.5, Fish and Game Code)

23. Mohave desert tortoise

Consider the petition, Department’s status review report, and comments received to determine whether changing the status of Mohave desert tortoise (also known as Agassiz’s desert tortoise) (*Gopherus agassizii*) from threatened to endangered under CESA is warranted.
(Pursuant to sections 2075 and 2075.5, Fish and Game Code)

24. Ballona Wetlands Ecological Reserve

Ballona Wetlands Ecological Reserve consistency determination as to whether the visitor uses associated with the parking lots in Area A and the baseball fields in Area C are compatible with the purposes of the reserve.

25. California grizzly bear

Recognize the 100-year anniversary of the extirpation of California's state animal, grizzly bear (*Ursus arctos californicus*).

26. Committee and Department reports

Receive updates on items of note since the previous Commission meeting from Commission committees and Department divisions.

(A) ***Wildlife Resources Committee***

Discuss referred topics and consider revisions to topics and timing. Consider approving draft agenda topics and changing the meeting location for the next committee meeting on May 16, 2024.

(B) ***Department Wildlife and Fisheries Division, and Department Ecosystem Conservation Division***

27. Commission administrative items

(A) ***Legislation***

Receive updates on legislative activity and consider providing direction to staff on potential actions.

(B) ***Rulemaking timetable updates***

Review and potentially approve changes to the perpetual timetable for anticipated regulatory actions.

(C) ***Future meetings and new business – May 15, 2024 and June 19-20, 2024***

Review logistics and approve draft agenda items for the next Commission meetings, consider any changes to approved meeting dates or locations, or introduce new business for a future meeting agenda.

General Public Comment

28. General public comment for items not on the agenda

Receive public comment regarding topics within the Commission's authority that are not included on the agenda. This item is an extension of the "general public comment for items not on the agenda (Agenda Item 9); as such, speakers may comment on one day or the other.

Note: The Commission may not discuss or take action on any matter raised during this item, except to decide whether to place the matter on the agenda of a future meeting (sections 11125 and 11125.7(a), Government Code).

Adjourn

Public Receipt of Documents

This section of the agenda highlights reports or other documents received by the Commission since the previous meeting. Any Commission discussion or action on these documents will be noticed and placed on the agenda of a future meeting. Since February 15, 2024, the Commission received two documents:

1. The Department's evaluation report on the petition to list white sturgeon (*Acipenser transmontanus*) as threatened under California Endangered Species Act. Additional information about the petition is available at https://fgc.ca.gov/CESA#ws.
2. A petition from the Center for Biological Diversity, Defenders of Wildlife, Burrowing Owl Preservation Society, Santa Clara Valley Audubon Society, Urban Bird Foundation, Central Valley Bird Club, and San Bernardino Valley Audubon Society to list western burrowing owl (*Athene cunicularia hypugaea*) as threatened or endangered under the California Endangered Species Act. The petition is available at https://fgc.ca.gov/CESA#wbo.

Executive Session

(Not open to the public)

At a convenient time during the regular agenda of the meeting listed above, the Commission will recess from the public portion of the agenda and conduct a closed session on the agenda items below. The Commission is authorized to discuss these matters in a closed session pursuant to Government Code Section 11126, subdivisions (a)(1), (c)(3), and (e)(1), and Fish and Game Code Section 309. After closed session, the Commission will reconvene in public session, which may include announcements about actions taken during closed session.

(A) Pending litigation to which the Commission is a Party

- I. The Ballona Wetlands Land Trust v. California Fish and Game Commission (Ballona Wetlands Ecological Reserve petition for regulation change)
- II. Fall River Conservancy and California Trout v. California Fish and Game Commission and California Department of Fish and Wildlife (California Environmental Quality Act determination regarding amendments to inland trout regulations)
- III. United Water Conservation District v. California Fish and Game Commission (southern California steelhead "may be warranted" determination under the California Endangered Species Act and regulation authorizing limited take under Fish and Game Code Section 2084)

(B) Possible litigation involving the Commission

(C) Staffing

(D) Deliberation and action on license and permit items

- I. Consider the proposed decision in FGC Case No. 21ALJ02-FGC, regarding revocation of Attila Molnar's application to renew a restricted species exhibiting permit.

California Fish and Game Commission
Meeting Schedule

Note: As meeting dates and locations can change, please visit www.fgc.ca.gov for the most current list of meeting dates and locations. All Commission meetings will include a webinar/teleconference option for attendance and every effort will be made to ensure that committee meetings include the same.

Meeting Date	Commission Meeting	Committee Meeting
May 15, 2024	**Teleconference** Trinidad, Fairfield, Sacramento, Santa Cruz and La Jolla (see website for facility details)	
May 16, 2024		**Wildlife Resources** Yreka
June 19-20, 2024	Mammoth Lakes	
July 18, 2024		**Marine Resources** Santa Rosa area
August 13, 2024		**Tribal** River Lodge Conference Center 1800 Riverwalk Drive Fortuna, CA 95540
August 14-15, 2024	River Lodge Conference Center 1800 Riverwalk Drive Fortuna, CA 95540	
September 12, 2024		**Wildlife Resources** San Jose
October 9-10, 2024	California Natural Resources Headquarters Building Auditorium, 1st Floor 715 P Street Sacramento, CA 95814	
November 7, 2024		**Marine Resources** California Natural Resources Headquarters Building 715 P Street, 2nd Floor Sacramento, CA 95814
December 10, 2024		**Tribal** San Diego area
December 11-12, 2024	San Diego area	

Other Meetings of Interest

Association of Fish and Wildlife Agencies

- September 22-25, 2024 – Madison, WI

Pacific Fishery Management Council

- June 6-13, 2024 – San Diego, CA

- August 22, 2024 – Sacramento, CA
- November 21, 2024 – Sacramento, CA

11. Initial Private Lands Wildlife Habitat Enhancement and Management Area (PLM) Plan and License (consent)

Today's Item **Information ☐** **Action ☒**

Consider approving initial PLM plan and 2024-2028 license.

Summary of Previous/Future Actions (N/A)

Background

California Fish and Game Code sections 3400-3408 and Title 14 Section 601 prescribe conditions for a PLM program that provides incentives for landholders to manage their property for the benefit of fish and wildlife in exchange for access to increased recreational opportunities, such as hunting tags or extended seasons ("harvest program"). In return for a harvest program, the landholder must prepare a biologically-sound wildlife management plan and complete specific wildlife habitat improvements on the PLM property.

The Department has reviewed the initial management plan for one new property in one county, consisting of approximately 4,988 acres.

The Department recommends that the Commission approve the wildlife management plan, license application, and 2024-2028 harvest program under conditions specified in Exhibit 2. Habitat improvements accomplished under this plan will enhance and maintain wildlife resources on and around the PLM area. The goals and objectives stated in the management plan are compatible with Department management plans for appropriate species in this area and the Department finds it is in compliance with Commission regulations and policies for PLM licenses and plans.

At the June 2024 Commission meeting, the Department will give a presentation on its PLM Program, as requested by the Commission.

Significant Public Comments (N/A)

Recommendation

Commission staff: Approve the initial PLM license for the 2024-2028 seasons and associated PLM management plan with proposed season, harvest, and habitat improvements under a motion to adopt the consent calendar.

Department: Approve the initial PLM license, and management plan and proposed season, harvest, and habitat improvements under the conditions specified in Exhibit 2.

Exhibits

1. Department memo, received March 29, 2024
2. *PLM Area License Initial Management Plans, 2024-2028, Proposed Seasons, Harvests, and Habitat Improvements*, received March 29, 2024

Motion

Moved by __________ and seconded by __________ that the Commission adopts the staff recommendations for items 11-15 on the consent calendar.

Staff Summary for April 17-18, 2024

12. Five-Year Private Lands Wildlife Habitat Enhancement and Management Area (PLM) Plans and Licenses (consent)

Today's Item **Information ☐** **Action ☒**

Consider approving five-year PLM plans and 2024-2028 licenses.

Summary of Previous/Future Actions (N/A)

Background

California Fish and Game Code sections 3400-3408 and Title 14 Section 601 prescribe conditions for a PLM program that provides incentives for landholders to manage their property for the benefit of fish and wildlife in exchange for access to increased recreational opportunities, such as hunting tags or extended seasons ("harvest program"). In return for a harvest program, the landholder must prepare a biologically-sound wildlife management plan and complete specific wildlife habitat improvements on the PLM property.

The Department has reviewed the five-year renewals for nine properties in six counties, consisting of approximately 112,818 acres.

The Department recommends that the Commission approve the five-year wildlife management plan renewals, license renewal applications, and each 2024-2028 harvest program under conditions specified in Exhibit 2. Habitat improvements accomplished under these plans will enhance and maintain wildlife resources on and around the PLM areas. The goals and objectives stated in the management plans are compatible with Department management plans for appropriate species in these areas and the Department finds them compliant with Commission regulations and policies for PLM licenses and plans.

At the June 2024 Commission meeting, the Department will give a presentation on its PLM Program, as requested by the Commission.

Significant Public Comments (N/A)

Recommendation

Commission staff: Approve five-year PLM license renewals for 2024-2028, and proposed seasons, harvests and habitat improvements for 2024-2028 as recommended by the Department for nine properties, under a motion to adopt the consent calendar.

Department: Approve five-year PLM license renewals for nine properties, under the conditions specified in Exhibit 2.

Exhibits

1. Department memo, received March 29, 2024
2. *PLM Area License 5-Year Renewals, 2024-2028, Proposed Seasons, Harvests, and Habitat Improvements*, received March 29, 2024

Motion

Moved by __________ and seconded by __________ that the Commission adopts the staff recommendations for items 11-15 on the consent calendar.

Staff Summary for April 17-18, 2024

13. Annual Private Lands Wildlife Habitat Enhancement and Management Area (PLM) Plans and Licenses (consent)

Today's Item **Information ☐** **Action ☒**

Consider approving annual PLM plans for 2024-25.

Summary of Previous/Future Actions (N/A)

Background

California Fish and Game Code sections 3400-3408 and Title 14 Section 601 prescribe conditions for a PLM program that provides incentives for landholders to manage their property for the benefit of fish and wildlife in exchange for access to increased recreational opportunities, such as hunting tags or extended seasons ("harvest program"). In return for a harvest program, the landholder must prepare a biologically-sound wildlife management plan and complete specific wildlife habitat improvements on the PLM property.

The Department has reviewed the annual reports for 52 properties in 14 counties, consisting of approximately 550,079 acres.

The Department recommends that the Commission approve the wildlife management plans, license renewal applications, and each 2024-25 harvest program under conditions specified in Exhibit 2. Habitat improvements accomplished under these plans will enhance and maintain wildlife resources on and around the PLM areas. The goals and objectives stated in the management plans are compatible with Department management plans for appropriate species in these areas and the Department finds them compliant with Commission regulations and policies for PLM licenses and plans.

At the June 2024 Commission meeting, the Department will give a presentation on its PLM Program, as requested by the Commission.

Significant Public Comments (N/A)

Recommendation

Commission staff: Approve continuing PLM licenses and approve the annual seasons, harvests, and habitat improvements for 2024-2025 as recommended by the Department for 52 properties, under a motion to adopt the consent calendar.

Department: Approve continuing the PLM licenses and approve the annual seasons, harvests, and habitat improvements for 52 properties, under the conditions specified in Exhibit 2.

Exhibits

1. Department memo, received March 29, 2024
2. *PLM Area License Annual Renewals, 2024-2025, Proposed Seasons, Harvests, and Habitat Improvements*, received March 29, 2024

Motion

Moved by __________ and seconded by __________ that the Commission adopts the staff recommendations for items 11-15 on the consent calendar.

14. Readoption of White Sturgeon Emergency Regulation (consent)

Today's Item **Information ☐** **Action ☒**

Consider adopting a 90-day extension of emergency regulations concerning recreational take of white sturgeon (*Acipenser transmontanus*) to support recovery of populations and to track fishing pressure and success.

Summary of Previous/Future Actions

- Adoption hearing for emergency regulations concerning recreational take of white sturgeon — October 11-12, 2023
- **Today consider adopting first 90-day extension of emergency regulations concerning recreational take of white sturgeon** — **April 17-18, 2024**

Background

At its October 2023 meeting, the Commission adopted emergency regulations to amend recreational take of white sturgeon to support recovery of populations and to track fishing pressure and success (see Exhibit 1 for detailed background information). The Commission adopted an emergency regulation that implemented four concepts:

1. Reduced the white sturgeon slot limit from 40 to 60 inches to 42 to 48 inches.
2. Reduced the number of fish harvested to one fish per report card per year but allowed anglers to continue catch and release fishing after they have harvested one fish.
3. Applied a seasonal closure in upper spawning grounds only from January through May.
4. Reduced the vessel limit to two fish per day per boat.

The emergency regulation went into effect on November 16, 2023 for a period of 180 days; if not extended by the Commission, the emergency regulation will expire May 15, 2024.

For today's meeting, the Department has provided a draft finding of emergency and a draft statement of proposed emergency regulatory action for the Commission to consider in re-adopting the emergency regulation (exhibits 2 and 3).

Significant Public Comments (N/A)

Recommendation

Commission staff: Under a motion to adopt the consent calendar, determine, pursuant to Section 399 of the California Fish and Game Code, that adopting these regulation changes is necessary for the immediate conservation, preservation, and protection of birds, mammals, fish, amphibians, or reptiles, including, but not limited to, their nests or eggs. Further determine, pursuant to Section 11346.1 of the California Government Code, that an emergency situation exists and that the proposed regulation changes are necessary to address the emergency. Readopt for an additional 90 days the emergency regulations amending sections 5.79, 5.80, 27.90 and 27.92, related to the recreational take of white sturgeon, as recommended by the Department.

Department: Adopt a 90-day extension of the emergency regulations amending sections 5.79, 5.80, 27.90 and 27.92.

Exhibits

1. Staff summary from October 11-12, 2024 (*for background purposes only*)
2. Department transmittal memo, received March 19, 2024
3. Draft emergency statement
4. Draft proposed regulatory language
5. Economic and fiscal impact statement (STD. 399) and addendum

Motion

Moved by ___________ and seconded by __________ that the Commission adopts the staff recommendations for items 11 through 15 on the consent calendar.

Staff Summary for April 17-18, 2024

15. Greater Sage-Grouse (consent)

Today's Item **Information ☐** **Action ☒**

Consider approving the Department's request for a six-month extension to deliver the one-year status review report on the petition to list greater sage-grouse (*Centrocercus urophasianus*) as threatened or endangered under CESA.

Summary of Previous/Future Actions

• Received petition	November 21, 2022
• Transmitted petition to Department	December 1, 2022
• Published notice of receipt of petition	January 6, 2023
• Received Department's 90-day evaluation report	April 19-20, 2023
• Determined petitioned action may be warranted, initiating Department's one-year status review	June 14-15, 2023
• **Today's consider Department's request for six-month extension**	**April 17-18, 2024**

Background

On November 21, 2022, the Commission received a petition from the Center for Biological Diversity requesting the Commission list greater sage-grouse as threatened or endangered under CESA.

At its June 2023 meeting, the Commission determined that the petition contains sufficient information to indicate that the petitioned action may be warranted. The Commission published a notice of its determination and of greater sage-grouse's protected, candidate species status on June 30, 2023. Pursuant to California Fish and Game Code Section 2074.6, the Department has one year from the date of notice to complete a status review, unless the Commission grants an extension of time.

Today the Commission will consider a request by the Department for a six-month extension to further analyze and evaluate the available science, to undergo the peer review process, and to complete its status review (Exhibit 1). The Commission must receive the Department's status review report before the Commission can make a final listing decision.

Significant Public Comments

1. The Lassen County Board of Supervisors urges the Commission to not list greater sage-grouse under CESA. The board states that conservation efforts are planned for the next few years and lists several conservation accomplishments from previous years, such as slowing juniper encroachment, enhancing spring ecosystems, riparian restoration, invasive grass control, and planting sagebrush. The board states that CESA listings work against collaborative efforts, as many partners will be reluctant to participate in conservation processes with a CESA-listed species, and current conservation work in Lassen County will be significantly reduced or cease. Lastly, the board indicates that

CESA restrictions could result in the loss of jobs, revenue and tax base for Californians. (Exhibit 2)

2. The Inyo County Board of Supervisors provides a bi-state, 10-year accomplishment report for sage-grouse that illustrates the increase in bi-state greater sage-grouse populations. The board states that the results of the study show listing sage-grouse as endangered is not warranted. (Exhibit 3)

Recommendation

Commission staff: Approve the Department's request for a six-month extension to complete the status review report for greater sage-grouse under a motion to adopt the consent calendar.

Department: Approve request for a six-month extension to complete the status review report for greater sage-grouse.

Exhibits

1. Department memo, received March 26, 2024
2. Letter from County of Lassen Board of Supervisors, received April 2, 2024
3. Letter from Inyo County Board of Supervisors, received April 4, 2024

Motion

Moved by _____________ and seconded by ______________, that the Commission adopts the staff recommendations for items 11 through 15 on the consent calendar.

16. Inland sport fishing

Today's Item **Information ☐** **Action ☒**

Consider authorizing publication of notice of intent to amend regulations for freshwater sport fishing bag limits, gear, and low-flow information.

Summary of Previous/Future Actions

- Wildlife Resources Committee (WRC) vetting — January 16, 2024; WRC
- **Notice hearing — April 17-18, 2024**
- Discussion hearing — June 19-20, 2024
- Adoption hearing — August 14-15, 2024

Background

The Department recommends the Commission amend inland sport fishing regulations to align with current fisheries management goals and objectives, improve angling opportunities, correct errors and inaccuracies in existing regulations, and improve regulatory enforcement (Exhibit 1). The proposed amendments include:

- Section 2.30: Include American shad as a species that may be taken by spearfishing in the Valley District and clarify spearfishing boundaries. These amendments incorporate regulatory changes proposed in regulation change petition 2021-028, granted by the Commission at its December 2023 meeting.
- Section 5.00: Reduce the 15-inch total length minimum size limit for black bass at Castaic Lake (Los Angeles County) to the statewide standard 12-inch total length minimum size limit.
- Section 7.50: Correct the fishing boundary for Deep Creek (San Bernardino County).
- Section 7.50: Amend trout regulations for Parker Lake (Mono County) to year-round angling, a two-fish bag limit, a 14-inch minimum size limit, and restrict gear to artificial lures only. Since Parker Lake is currently subject to the General Statewide Regulations for trout, the proposed amendments will require adding it to Section 7.50, Special Fishing Regulations for Trout.
- Section 7.50: Reduce the daily bag limit from five fish per day to catch-and-release fishing only on Willow Creek (Alpine County) upstream from the confluence with the West Fork Carson River to the main tributary of Willow Creek, and restrict gear to artificial lures with barbless hooks only. Since Willow Creek is currently subject to the General Statewide Regulations for trout, the proposed amendments will require adding it to Section 7.50, Special Fishing Regulations for Trout. These amendments incorporate regulatory changes proposed in regulation change petition 2022-13, granted in part by the Commission at its February 2024 meeting.
- Section 8.00: Remove the three different phone lines that fishers currently rely on for low-flow restriction information and replace them with a single department webpage URL.
- Section 703: Update the mailing address for the Department's Fisheries Branch.

Visual aids and further details and rationale regarding all components of the proposed changes can be found in the draft initial statement of reasons (Exhibit 2).

Significant Public Comments (N/A)

Recommendation

Commission staff: Authorize publication of a notice of intent to amend regulations related to inland sport fishing, as recommended by the Department and supported by the Wildlife Resources Committee.

Committee: Support the proposed changes related to inland sport fishing.

Department: Authorize publication of a notice of intent to amend regulations as detailed in the draft initial statement of reasons.

Exhibits

1. Department memo, received March 26, 2024
2. Draft initial statement of reasons
3. Draft proposed regulatory language
4. Draft economic and fiscal impact statement (STD. 399) and addendum
5. Department presentation

Motion

Moved by ___________ and seconded by ___________ that the Commission authorizes publication of a notice of its intent to amend sections 2.30, 5.00, 7.50, 8.00 and 703 related to inland sport fishing.

Staff Summary for April 17-18, 2024

17. White Sturgeon Sport Fishing Regular Rulemaking

Today's Item **Information ☐** **Action ☒**

Consider authorizing publication of notice of intent to amend regulations through a regular rulemaking to adopt the emergency rules for the recreational take of white sturgeon.

Summary of Previous/Future Actions

• Adoption hearing for *emergency regulations* regarding recreational take of white sturgeon	October 11-12, 2023
• Wildlife Resources Committee (WRC) discussed a regular rulemaking regarding recreational take of *white sturgeon in 2025*	January 16, 2024; WRC
• Today's adoption hearing for first 90-day extension of *emergency regulations*	April 17-18, 2024
• **Today's notice hearing for *regular rulemaking* regarding recreational take of white sturgeon**	**April 17-18, 2024**
• Discussion hearing for *regular rulemaking*	June 19-20, 2024
• Notice hearing for rulemaking concerning recreational take of *white sturgeon in 2025*	June 19-20, 2024
• Adoption hearing for *regular rulemaking*	August 14-15, 2024
• Discussion hearing for rulemaking regarding recreational take of *white sturgeon in 2025*	August 14-15, 2024
• Adoption hearing for rulemaking regarding recreational take of *white sturgeon in 2025*	October 9-10, 2024

Background

Three rulemakings related to white sturgeon are actively being advanced or considered by the Commission: extension of the regulation changes first adopted through an *emergency rulemaking* in October 2023, a request to publicly notice a *regular rulemaking* for the same regulation changes that would be effective for as long as necessary once adopted and approved, and another regular rulemaking for different regulation changes to take effect for *white sturgeon in 2025*. If approved at this meeting, the *white sturgeon in 2025* rulemaking will be introduced for potential notice at the June 2024 Commission meeting.

Emergency Regulations

At its October 2023 meeting, the Commission took emergency action to amend regulations regarding inland and ocean recreational take of white sturgeon to support recovery of populations and to track fishing pressure and success. The emergency regulation went into effect on November 16, 2023 and, if not extended by the Commission, will expire May 15, 2024. The Commission will be asked to consider re-adopting the emergency regulations for an additional 90-day period during Agenda Item 14 of today's meeting. If approved, the emergency regulations will then expire August 13, 2024. Staff may recommend a second and final extension at the June 2024 Commission meeting.

Prior to the effective date of the emergency regulations, recreational anglers were permitted to keep one white sturgeon per day, and a combined total of three per year, between 40- and 60-inches fork length. The season was open year-round, with some limited regional and/or seasonal closures.

At the October 2023 Commission meeting, the Department recommended the Commission adopt regulations for recreational catch-and-release only for white sturgeon (see Exhibit 1). However, after receiving public testimony regarding the impact of a catch-and-release only fishery on the recreational fishing industry, the Commission adopted regulations that allow limited recreational harvest of white sturgeon. The emergency regulations:

- Reduced the annual bag limit for white sturgeon from three fish to one fish;
- reduced the legal slot limit from 40 to 60 inches fork length to 42 to 48 inches fork length;
- established a limit of two white sturgeon per day per vessel;
- closed white sturgeon fishing in the migrating and spawning reaches of the Sacramento and San Joaquin rivers from January 1 through May 31, and specified other portions of the Sacramento and San Joaquin rivers and ocean waters remained open year-round except for a seasonal closure in the San Fransisco Bay;
- specified that once an angler has retained and tagged a white sturgeon, they may not continue to catch-and-release white sturgeon on the same day, but may catch-and-release white sturgeon starting the day after;
- specified that once the white sturgeon vessel limit is reached, only anglers who have not retained and tagged a white sturgeon that day may continue to catch-and-release white sturgeon;
- amended white sturgeon report card and tagging requirements for consistency with the changes to the white sturgeon annual bag limit and catch-and-release restrictions;
- added a requirement to report length of sturgeon caught and released on the report card; and
- required anglers to report additional sturgeon caught and released on the back of the report card once all the lines on the front of the card are filled.

Proposed Regulations through Regular Rulemaking

The proposed regulatory action under this agenda item seeks to continue through a regular rulemaking the emergency amendments to sections 5.79, 5.80, 27.90 and 27.92 that specify report card and tagging requirements, and seasons and bag limits for white sturgeon sport fishing in inland waters and ocean waters. The intent is to continue the limited harvest regimen until the effective date of the 2025 regulations concerning recreational take of white sturgeon. Further details on the proposed changes are available in the draft initial statement of reasons (ISOR) and proposed regulatory language (exhibits 3 and 4).

Future Rulemaking for 2025

At the January 16, 2024 WRC meeting, the Department proposed for 2025 a limited-entry harvest tag system with a set number of tags for a regular rulemaking. Guides and sturgeon anglers proposed an alternative tag system with an unlimited number of tags and close monitoring of harvest levels. Discussions considered the status of white sturgeon populations and potential economic losses from businesses that support the recreational sturgeon fishery. The Department underscored the importance of protecting spawning areas to conserve white sturgeon populations in the long-term. Some stakeholders voiced reservations about the reliability of data presented by the Department and whether population declines are real.

WRC Chair Zavaleta explained the range of options, from closure through catch-and-release, to the tag system proposals, to the current emergency regulations. She expressed concerns about the status of white sturgeon as a species and requested that the Department include an option for catch-and-release fishing only in the proposal it presents to the Commission.

At its February 14-15, 2024 meeting, the Commission approved WRC's recommendation that the Commission support a future regular rulemaking regarding white sturgeon, with options for both the Department's recommendation and catch-and-release. Under Agenda Item 27 today, the Department proposes that the Commission, at its June 2024 meeting, issue a notice of intent to amend white sturgeon regulations for the 2025 rulemaking.

Significant Public Comments (N/A)

Recommendation

Commission staff: Authorize publication of notice of proposed changes to regulations regarding recreational take of white sturgeon as recommended by the Department.

Department: Authorize publication of notice of proposed changes to regulations regarding recreational take of white sturgeon as described in the draft ISOR.

Exhibits

1. Staff summary for October 11-12, 2023 Commission meeting, Agenda Item 9 (*for background purposes only*)
2. Department memo, received April 8, 2024
3. Draft ISOR
4. Draft proposed regulatory language
5. Draft economic and fiscal impact statement (STD. 399) and addendum

Motion

Moved by ___________ and seconded by __________ that the Commission authorizes publication of a notice of its intent to amend sections 5.79, 5.80, 27.90 and 27.92 related to recreational take of white sturgeon.

Staff Summary for April 17-18, 2024

18. Central Valley Sport Fishing

Today's Item **Information ☒** **Action ☐**

Discuss proposed changes to Central Valley sport fishing regulations.

Summary of Previous/Future Actions

- Wildlife Resources Committee (WRC) vetting September 12, 2024; WRC
- Notice hearing February 14-15, 2024
- **Today's discussion hearing** **April 17-18, 2024**
- Adoption hearing May 15, 2024

Background

The Commission generally adopts Central Valley sport fishing on an annual basis, informed by Department recommendations intended to align state regulations with federal fishery management objectives set by the Pacific Fishery Management Council (PFMC). In February 2024, the Commission authorized publication of a notice of proposed changes to bag and possession limits for the Sacramento River fall-run Chinook salmon (SRFC) in the American, Feather, Mokelumne, and Sacramento rivers to reflect PFMC management objectives for SRFC stocks. The scope of the options in the initial statement of reasons (ISOR; Exhibit 1) is intentionally broad to allow flexibility during Commission adoption based on the harvest projections identified by PFMC.

In mid-April 2024, PFMC will adopt its recommendation for the upcoming ocean salmon season. At today's meeting, the Department will recommend specific regulation changes based on PFMC's final ocean salmon recommendations. Changes to state regulations are expected to be adopted at the Commission's May 15, 2024 teleconference meeting.

Options included in the ISOR may be adopted independently or in combination and would apply in the anadromous areas of and tributaries to the American, Feather, Mokelumne, and/or Sacramento rivers:

- Option 1 – Allows take of any size Chinook salmon up to the daily bag limits [0-4] and possession limits [0-12].
- Option 2 – Allows take of a limited number of adult Chinook salmon, with grilse Chinook salmon making up the remainder of the daily bag limits [0-4] and possession limits [0-12].
- Option 3 – Allows a ***grilse-only*** Chinook salmon fishery up to the daily bag limits [0-4] and possession limits [0-12].
- Option 4 – Closed to take and possession of Chinook salmon.

The four options provide the Commission flexibility; it can choose to adopt various options for each river section independently or combine them to meet PFMC SRFC management objectives and maximize recreational salmon fishing opportunities.

At today's meeting, the Department will present its recommendation.

California Environmental Quality Act (CEQA)

In compliance with CEQA, the Department prepared a draft addendum (Exhibit 3) to *2022 Negative Declaration (SCH No. 2022040250) for the Central Valley Sport Fishing - 2022*; the negative declaration was certified by the Commission in May 2022. The addendum is intended to inform Commission consideration of proposed amendments to daily bag and possession limits for Chinook salmon, as described in the proposed rulemaking.

The 2022 negative declaration concluded that there would be no significant impacts for the range of daily bag and possession limits considered under regulatory options 1, 2, and 3. Since the proposed daily bag and possession limits for 2024 fall within the previously analyzed range, and the proposed amendments use similar regulatory options, there are no anticipated new, significant, or substantially more severe environmental impacts.

Significant Public Comments (N/A)

Recommendation (N/A)

Exhibits

1. Central Valley sport fishing ISOR, dated January 9, 2024
2. Department memo, transmitting draft CEQA addendum
3. 2024 CEQA Central Valley sport fishing addendum

Motion (N/A)

Staff Summary for April 17-18, 2024

19. Klamath River Basin Sport Fishing

Today's Item **Information ☒** **Action ☐**

Discuss proposed amendments to Klamath River Basin sport fishing regulations.

Summary of Previous/Future Actions

- Wildlife Resources Committee (WRC) vetting — September 12, 2024; WRC
- Notice hearing — February 14-15, 2024
- **Today's discussion hearing — April 17-18, 2024**
- Adoption hearing — May 15, 2024

Background

The Commission annually adopts Klamath River Basin sport fishing regulations for consistency with federal fishery management objectives. As part of the annual process, specific bag, possession and size limits for Klamath River fall-run Chinook salmon (KRFC) are scheduled for adoption by the Commission after the Pacific Fishery Management Council (PFMC) reviews the status of West Coast salmon stocks and recommends fishery allocations.

At its February meeting, the Commission authorized publication of notice of its intent to amend Klamath and Trinity rivers (referred to as Klamath River Basin) sport fishing regulations; the initial statement of reasons (ISOR; Exhibit 1) includes ranges for proposed bag possession and size limits.

At its April 2024 meeting, PFMC adopted its recommendation for the upcoming ocean salmon season. At today's meeting, the Department will recommend specific regulation changes based on PFMC's final ocean salmon recommendations. Changes to state regulations are expected to be adopted by the Commission at its May 15, 2024 meeting.

Options included in the ISOR for Commission consideration are:

- Option 1: KRFC Adult Stocks (Sport Fishery Quota Management)
    - Quota range of 0-67,600 adult KRFC
    - Bag limit of [0-4] Chinook salmon – of which no more than [0-4] fish over [20-24] inches total length may be retained until the subquota is met, then 0 fish over [20-24] inches total length.
    - Possession limit of [0-12] Chinook salmon – of which no more than [0-4] fish over [20-24] inches total length may be retained when the take of salmon over [20-24] inches total length is allowed.
- Option 2: KRFC Fishery Closure
    - Closed to the take and possession of Chinook salmon

At today's meeting, the Department's will present its recommendation

California Environmental Quality Act (CEQA)

In compliance with CEQA, the Department prepared a draft addendum (Exhibit 3) to the *2022 Negative Declaration (SCH No. 2022040251) for the Klamath River Basin Sport Fishing – 2022* Rulemaking, certified by the Commission in May 2022. The addendum is intended to inform the Commission's consideration of the proposed amendments to the daily bag and possession limits for the proposed rulemaking.

The 2022 negative declaration concluded that varying the KRFC daily bag and possession limits, along with the Klamath River Basin quota, would have not significant environmental impacts. The proposed 2024 Klamath River Basin quota, and daily bag and possession for KRFC, fall within the previously analyzed scope. Therefore, amending the Klamath River Basin regulations to adjust KRFC daily bag and possession limits on the Klamath and Trinity rivers is unlikely to cause new significant or substantially more severe environmental impacts.

Significant Public Comments (N/A)

Recommendation (N/A)

Exhibits

1. Klamath River Basin sport fishing ISOR, dated January 15, 2024
2. Department memo, transmitting Draft CEQA addendum
3. Draft 2024 CEQA Klamath River Basin sport fishing addendum

Motion (N/A)

20. Waterfowl Hunting

Today's Item **Information** ☐ **Action** ☒

Consider adopting proposed amendments to waterfowl hunting regulations and taking final action under the California Environmental Quality Act (CEQA).

Summary of Previous/Future Actions

• Wildlife Resources Committee (WRC) vetting	September 19, 2023, WRC
• Notice hearing	December 13-14, 2023
• Discussion hearing	February 14-15, 2024
• **Today's adoption hearing**	**April 17-18, 2024**

Background

Waterfowl hunting regulations are reviewed annually by the U.S. Fish and Wildlife Service (USFWS) to adjust federal regulations based on waterfowl surveys, population trends, and other information. The result is a federal regulatory framework within which states may adjust their regulations. In developing the federal framework for the 2024-25 hunting seasons, USFWS published in the Federal Register (Volume 89, No. 27) on February 8, 2024 a proposal to amend federal migratory bird hunting regulations.

In December 2023, the Commission authorized a notice of rulemaking to set the bag and possession limits for migratory waterfowl for the 2024-25 hunting seasons to comply with the proposed federal framework. Federal processes require states to provide season selections to USFWS by the end of April each year for inclusion in the final framework, which is anticipated to be published in May 2024. Commission adoption of state regulation changes is scheduled for today's meeting given the federal timing requirements and expectation that the final federal framework will not differ substantially from the proposed regulations due to lack of new biological data or harvest strategies.

The initial statement of reasons (ISOR; Exhibit 1) includes ranges for bag and possession limits and seasons. The proposed regulations also include an option that would allow geese to be taken during the Veterans and Active Military Personnel waterfowl hunting days for the Balance of State Zone. Today the Department will present its final, specific recommendations (Exhibit 5).

Significant changes in the rulemaking include:

- decreasing the duck season length from 103 to 98 days for the Southern San Joaquin Valley Zone, the Southern California Zone, and the Balance of State Zone;
- decreasing the goose season length from 103 to 98 days for the Southern San Joaquin Valley Zone and the Southern California Zone, and from 100 to 98 for the Balance of State Zone; and
- allowing up to five days of falconry-only season for the San Joaquin Valley, Southern California and Balance of State zones.

California Environmental Quality Act

The Department prepared a draft environmental document consistent with the Commission's CEQA certified regulatory program. Commission staff evaluated the draft document and determined that the document reflects the independent judgment of the Commission. Staff submitted the environmental document for public comment (State Clearinghouse Number #2023120465, available at CEQAnet.opr.ca.gov). A final environmental document, updated to reflect public comment, will be included in the Commission's supplemental handouts for this meeting (Exhibit 3).

Significant Public Comments

1. The California Farm Bureau is concerned about potential changes to goose hunting regulations and opposes allowing public land hunting during the late season as it could push geese to private farms and increase crop damage. California Farm Bureau also disagrees with shortening the goose hunting season and advocates for keeping the current duration. (Exhibit 6)
2. A waterfowl hunter states that the Aleutian goose hunting season in the North Coast Management Area is unfair as the season was moved away from the peak period and public lands are closed during the proposed time. The hunter believes the proposed change only benefits private landowners and urges the Commission to return the season dates to the regular waterfowl season for equal opportunity. (Exhibit 7)

Recommendation

Commission staff: Certify the final environmental document, adopt the proposed project, and adopt the proposed waterfowl hunting regulation changes as presented by the Department today.

Department: Adopt the waterfowl hunting regulation changes as presented in the ISOR.

Exhibits

1. ISOR and original proposed regulatory language
2. Email in lieu of a pre-adoption statement of reasons, received March 20, 2024
3. Waterfowl final environmental document (*to be provided separately*)
4. Economic and fiscal impact statement (STD. 399)
5. Department presentation
6. Letter from Chris Reardon, Director of Government Affairs, California Farm Bureau, received February 13, 2024
7. Email from Dustin Kuehn, received March 12, 2024

Motion

Moved by __________ and seconded by __________ that the Commission finds that the environmental document reflects the independent judgment of the Commission, certifies the final environmental document, adopts the proposed project, and adopts the staff recommendations to amend Section 502, regarding migratory waterfowl hunting regulations for the 2024-2025 seasons.

Staff Summary for April 17-18, 2024

21. Mammal Hunting

Today's Item **Information ☐** **Action ☒**

Consider adopting proposed amendments to mammal hunting regulations and taking final action under the California Environmental Quality Act (CEQA)

Summary of Previous/Future Actions

- Wildlife Resources Committee (WRC) vetting — May 17, 2023; WRC
- WRC discussion and recommendation — September 21, 2023; WRC
- Notice hearing — December 13-14, 2023
- Discussion hearing — February 14-15, 2024
- **Today's adoption hearing** — **April 17-18, 2024**

Background

At its December 2023 meeting, the Commission authorized publication of a notice of its intent to amend mammal hunting regulations. The notice was published in the California Regulatory Notice Register on February 2, 2024. The proposed changes affect several species and hunt programs, as well as regulations pertaining to preference points reinstatement:

- Section 362, Nelson bighorn sheep
  - Modify hunt tag quotas
- Section 363, Pronghorn antelope
  - Modify hunt tag quotas
- Sections 364 and 364.1, Elk and Shared Habitat Alliance for Recreational Enhancement (SHARE) elk hunting
  - Modify hunt tag quotas
  - Increase SHARE tag allocations in tandem with the modifications to Section 555
- Section 554, Cooperative deer hunting areas
  - Clarify application process
  - Limit the number of tags per landowner for zones X3a, X5a, and X5b.
- Sections 555 and 555.1, Cooperative elk hunting areas
  - Modify qualifying criteria and tag allocation within "conflict zones" in existing Section 555
  - Define conflict zones, increase hunting opportunity, and address chronically elevated levels of human-elk conflict on private property in a new Section 555.1
- Section 708.14, Big game license tag drawing system
  - Require junior hunters to return all first-choice tags to be eligible for preference points reinstatement

- Require the carcass portion of tags to be included with harvest reports for point reinstatement
- Clarify how tag-holder-return requirements apply within the context of a hunting party.

The proposal also makes several non-substantive edits to regulatory language across the affected sections, such as corrections to spelling and grammar, corrections to addresses, updates to outdated language, and improvements in clarity.

When the Commission authorized notice, several sections where hunt tag quota changes were proposed contained ranges of tag amounts rather than finite quotas. Ranges were necessary because the collection and analysis of species data was not available at the time the Commission issued its notice. The Department completed its data collection and analysis in March of 2024. (Exhibit 24).

Department Recommendations

Based on its analysis of mammal populations, the Department has provided final recommendations on tag quotas for Nelson bighorn sheep (Exhibit 3), pronghorn antelope (Exhibit 8), and elk (Exhibit 12). All tag quotas for each species and associated hunt zones fall within the ranges publicly noticed by the Commission in February of 2024, except for those discussed below.

Necessity of Continuation Notices

At its February 2024 meeting, the Commission directed staff to explore ways to ensure that the Commission has the flexibility at its April 2024 meeting to either omit or include Siskiyou County and/or the Siskiyou Hunt Zone in the new section of regulation. The direction came as a result of concerns raised by the Siskiyou County Board of Supervisors regarding the proposal's original inclusion of the Siskiyou Hunt Zone as a "conflict zone" in Section 555.1 – Conflict Zone Cooperative Elk Hunting Areas. On April 5, 2024, the Commission sent a notice to interested and affected parties that included revised proposed regulatory language, providing an option that omits the Siskiyou Hunt Zone from the list of elk "conflict zones."

The Commission also included revisions to the tag quota ranges for pronghorn antelope in its April notice. The revisions expanded the proposed tag ranges for pronghorn antelope *Zone 3 – Likely Tables* from 15-25 tags to 0-25 tags for General Season Period 1 Buck and from 10-25 tags to 0-25 tags for General Season Period 2 Buck. Expansion of the ranges provided flexibility for the Commission to consider a lower tag quota for that species and zone, since it is below the range in the original notice. While most of the Department's tag quota recommendations throughout this proposal fall within the originally-noticed ranges, survey data for pronghorn antelope revealed drastically lower population numbers in the affected zone than the Department anticipated when recommending the original tag quota ranges.

On April 10, 2024, the Commission sent a subsequent notice that included another revision to Section 363; this revision changed the originally-noticed 15 tag allotment for *Zone 3 – Likely Tables Archery Only Season (Buck)* to a tag quota range of 0-15. The change to a range provides flexibility for the Commission to consider the Department's recommended tag quota since it is less than the quota originally noticed.

California Environmental Quality Act (By Species)

Section 362: Bighorn Sheep. An initial CEQA review of the proposed project was conducted in accordance with CEQA in 2019, and the Commission certified a *Final Environmental Document Regarding Bighorn Sheep Hunting* (SCH No. 2018112036). In the 2019 environmental document, the Commission assessed the then-proposed project's increase of 10 tags, creation of new hunt zones, and reallocation of a fundraising tag. In total, a range of between 0 and 42 bighorn sheep tags was assessed.

As lead agency, the Commission certified the 2019 environmental document and determined that adopting the regulations as proposed would not result in any new significant or substantially more severe environmental effects. The Commission adopted the proposed regulations.

The bighorn sheep tag quota ranges in the 2019 environmental document are the basis for the current proposal. All of the Department's recommended tag quotas fall within the previously analyzed ranges. Therefore, the Department drafted an addendum to the 2019 environmental document which Commission staff has evaluated and determined to be reflective of the independent judgment of the Commission. No new significant or substantially more severe impacts under CEQA than those analyzed and disclosed in the 2019 environmental document will occur due to this proposal. Details of the CEQA analysis and conclusions can be found in the addendum (Exhibit 4).

Section 363: Pronghorn Antelope. An initial CEQA review of the proposed project was conducted in accordance with CEQA in 2004, and the Commission certified a *Final Environmental Document Regarding Pronghorn Antelope Hunting* (SCH No. 2003112078). In the 2004 environmental document, the Commission assessed a pronghorn antelope tag allocation not to exceed 60 in the Mount Dome Hunt Zone; 80 in the Clear Lake Hunt Zone; 150 and 130 for Periods 1 and 2, respectively, in the Likely Tables Hunt Zone; 150 tags each in Periods 1 and 2 in the Lassen Hunt Zone; 150 tags in the Big Valley Hunt Zone; and 25 in the Surprise Valley Hunt Zone.

As lead agency, the Commission certified the 2004 environmental document and determined that adopting the regulations and tag quotas as proposed – within the assessed ranges in each hunt zone – would not result in any new significant or substantially more severe environmental effects. The Commission adopted the proposed regulations.

The pronghorn antelope tag quota ranges described in the 2004 environmental document are the basis for the current proposal. All of the Department's recommended tag quotas fall within the previously analyzed ranges. Therefore, the Department drafted an addendum to the 2004 environmental document which Commission staff has evaluated and determined to be reflective of the independent judgment of the Commission. No new significant or substantially more severe impacts under CEQA than those analyzed and disclosed in the 2004 environmental document will occur due to this proposal. Details of the CEQA analysis and conclusions can be found in the addendum (Exhibit 9).

Sections 364, 364.1, 555 and 555.1: Elk. An initial CEQA review of the proposed project was conducted in accordance with CEQA in 2010, and the Commission certified a *Final Environmental Document Regarding Elk Hunting* (SCH number 2009112083) as part of its review and adoption of elk hunting regulations. In 2019, the Commission again amended elk hunting regulations and certified a final supplemental environmental document (SCH number 2018112037) which assessed an increase in the tag quota range in the Northwestern Elk Zone, concluding that it would not result in any new significant or substantially more severe environmental effects than previously identified by the Commission in 2010.

Most recently, in 2023 the Commission as lead agency adopted regulations: (1) amending elk hunting tag quotas in the Siskiyou and Northwestern hunt zones, adding 10 and 22 tags, respectively; (2) modifying the boundaries of the Bear Valley, Cache Creek, and La Panza hunt zones; and (3) creating the Gabilan, Central Coast, and Tehachapi hunt zones, adding 70 elk tags across these new zones. In adopting the regulations, the Commission determined that they would not result in any new significant or substantially more severe environmental impacts than previously analyzed in the 2010 and 2019 elk hunting environmental documents.

The Department has prepared an addendum to the 2019 elk supplemental environmental document which Commission staff has evaluated and determined to be reflective of the independent judgment of the Commission. Amending the current elk hunting regulations as proposed will not result in any new significant or substantially more severe environmental impacts than those previously analyzed and disclosed in the 2010 and 2019 elk hunting environmental documents. Details of the CEQA analysis and conclusions can be found in the addendum (Exhibit 13).

Significant Public Comments

1. A commenter opposes increases to Roosevelt elk tags in the Northwestern Hunt Zone. (Exhibit 25)
2. The Siskiyou County Fish and Game Commission opposes classifying the Siskiyou Hunt Zone as a “conflict zone” in the new Section 555.1, supports the existing SHARE program, and expresses concerns about the size of SHARE properties. The county advocates for a minimum acreage of 640 acres and allowing adjacent properties to combine acreage for a total size increase. (Exhibit 26)
3. A commenter opposes the entirety of the new proposed Section 555.1 and opposes increased tag allocations for Roosevelt elk on the grounds that elk are facing a number of threats, particularly an outbreak of treponeme-associated hoof disease, and therefore need conservative management to provide a population buffer against loss. (Exhibit 27)
4. The Agua Caliente Band of Cahuilla Indians supports sustainable hunting of bighorn sheep and pronghorn antelope as culturally important animals integral to the tribe’s economic, social, and religious fabric. (Exhibit 28)

Recommendation

Commission staff: Approve the revised projects pursuant to CEQA and adopt the regulations as recommended by the Department.

Department: Adopt the proposed regulations, including option 2 of Section 555.1, and the tag allocations as outlined in the pre-adoption memoranda.

Exhibits

1. Initial statement of reasons (ISOR) for Section 362 – Bighorn sheep hunting
2. Noticed regulatory language (Section 362)
3. Department pre-adoption memo with recommended tag allocations, received April 11, 2024 (Section 362)
4. Addendum to 2019 *Final Environmental Document Regarding Bighorn Sheep Hunting*
5. ISOR for Section 363 – Pronghorn antelope hunting
6. Noticed regulatory language (Section 363)
7. Revised proposed regulatory language (Section 363)
8. Department pre-adoption memo with recommended tag allocations, received April 11, 2024 (Section 363)
9. Addendum to *2004 Final Environmental Document Regarding Pronghorn Antelope Hunting*
10. ISOR for Sections 364 and 364.1 – Elk hunting
11. Noticed regulatory language (Sections 364 and 364.1)
12. Department pre-adoption memo with recommended tag allocations, received April 11, 2024 (Sections 364 and 364.1)
13. Addendum to *2019 Supplemental Environmental Document to the 2010 Final Environmental Document Regarding Elk Hunting*
14. ISOR for Section 554 – Deer cooperative hunting
15. Noticed regulatory language (Section 554)
16. Department pre-adoption memo, received April 11, 2024
17. ISOR for Sections 555 and 555.1 - Elk cooperative hunting
18. Noticed regulatory language (Sections 555 and 555.1)
19. Revised proposed regulatory language (Section 555.1)
20. Pre-adoption statement of reasons (PSOR), received April 11, 2024 (Section 555.1)
21. ISOR for Section 708.14 – Preference points reinstatement
22. Noticed regulatory language (Section 708.14)
23. Department pre-adoption memo, received April 11, 2024 (Section 708.14)
24. Department presentation
25. Email from Phoebe Lenhart, received February 9, 2024
26. Letter from the Siskiyou County Fish and Game Commission, received February 12, 2024
27. Email from Marie Kyle, received April 1, 2024
28. Email from Timothy Wilcox, Tribal Archaeologist, Agua Caliente Band of Cahuilla Indians, received April 3, 2024

Motion

Moved by __________ and seconded by __________ that the Commission, having considered the addenda and associated environmental documents, approves the revised projects pursuant to the California Environmental Quality Act, and adopts the proposed regulations and regulation changes related to mammal hunting as discussed today, including adoption of Option 2 for Section 555.1 to exclude the Siskiyou Hunt Zone.

Staff Summary for April 17-18, 2024

22. Southern California Steelhead

Today's Item **Information** ☐ **Action** ☒

Consider the petition, Department's status review report, and comments received to determine whether listing southern California steelhead as endangered under the California Endangered Species Act (CESA) is warranted.

Summary of Previous/Future Actions

• Received petition	June 14, 2021
• Transmitted petition to Department	June 23, 2021
• Published notice of receipt of petition	July 16, 2021
• Receipt of petition at public meeting; approved Department's 30-day extension request	August 18, 2021
• Receipt of Department's 90-day evaluation report at public meeting	December 15, 2021
• Closed public hearing and administrative record, and continued deliberations to April 2022 meeting	February 16-17, 2022
• Determined petitioned action may be warranted, initiating Department's one-year status review	April 20-21, 2022
• Approved Department's six-month extension request	October 12-13, 2022
• Public notice of having received the Department's one-year status review	February 14-15, 2024
• **Today, potentially determine if listing is warranted**	**April 17-18, 2024**

Background

On June 14, 2021 the Commission received a petition to list southern California steelhead (SCS; *Oncorhynchus mykiss*) as endangered under CESA (Exhibit 1). At its April 2022 meeting, the Commission determined that listing may be warranted, and subsequently provided notice regarding SCS's protected, candidate species status. The notice prompted the Department's status review of the species, as required by California Fish and Game Code Section 2074.6.

The Commission received the Department's status review report on January 18, 2024 (exhibits 2 and 3), and highlighted receipt of the report on its February 14-15, 2024 meeting agenda for public awareness. The status review report represents the Department's final written review of the status of SCS. Based on the information provided, possessed, and received, the Department has concluded that the petitioned action to list SCS as endangered under CESA is warranted, and further recommends implementing the management recommendations and recovery measures described in the status review report.

At today's meeting, the Commission may consider the petition, the Department's written evaluation and status review report, written and oral comments received, and the remainder of the administrative record, to determine if listing SCS as endangered under CESA is warranted. Findings will be adopted at a future meeting.

Significant Public Comments

1. The Endangered Habitats League urges the Commission to classify SCS as endangered under CESA, stating that research shows the fish is critically endangered due to urbanization, agriculture, and water development damaging its habitat. Additionally, the league states that the petition and the Department's report provide strong scientific backing for the listing. (Exhibit 5)
2. A member of the public supports listing SCS under CESA, stating that research shows that the species populations are in danger of extinction. (Exhibit 6)
3. The Cachuma Conservation Release Board requests that the Commission hold the hearing for the listing in southern California (rather than San Jose), as southern California is closer to the natural range of the fish and the agencies that would be most impacted by the listing. (Exhibit 7)
4. The Cachuma Operation and Maintenance Board (COMB) notes concerns about how its data was used in the Department's status review report, stating that data from different surveys was mixed and may lead to inaccurate comparisons of steelhead abundance, and that there are limits to using migrant trapping data. COMB recommends using snorkel survey data to provide a more representative picture of steelhead abundance in the Santa Ynez River basin. COMB questions the report's recommendation and believes COMB's data presents a different conclusion. (Exhibit 8)
5. The Pasadena Casting Club supports listing SCS as endangered, stating that club members have observed its decline due to habitat loss, and that the fish is a barometer of watershed and environmental health. The club states that protecting the fish will benefit water quality, watersheds, recreation, and Californians. (Exhibit 9)
6. A law firm representing the United Water Conservation District (UWCD) argues that the potential CESA listing of SCS as endangered is not supported by sufficient evidence. The firm states that the Department's status review report fails to address key evidence necessary for the Commission's final listing decision, including evidence on resident populations, the interplay between anadromous and resident populations and its effect on species persistence, and the effect of barriers on the long-term persistence of the fish. Additionally, the firm claims that the status review did not follow judicial guidance that examination of this evidence would likely be necessary for any final listing decision. The firm holds that the Commission should either find the listing not warranted or remand the status review to the Department for reconsideration. Attachments sent with the letter include a transcript from previous SCS litigation, a technical memorandum on an SCS lifecycle model, an SCS recovery plan, a South-Central/Southern California Coast Steelhead recovery planning domain five-year review, and a report on the occurrences of steelhead trout in southern California between 1994 and 2018. (Exhibit 10)

7. UWCD submits comments regarding the Department’s status review, as well as previously submitted comments, for the Commission’s review. UWCD states that the status review does not provide an analysis of the status of the species based on the best available science and that the recommendation from the Department to list SCS under CESA is premature. UWCD states that the Commission should find that listing is not warranted at this time and should delay the listing decision until after additional data collection. UWCD also states that the information it has provided demonstrates the need for a more transparent analysis of the data. (Exhibit 11)

8. Rancho Mission Viejo maintains that it follows the Southern Subregion Habitat Conservation Plan (SSHCP) to protect endangered species and their habitats on the southern Orange County ranch, and that it has already addressed a steelhead passage barrier in San Juan Creek by building a bridge and removing an old crossing, as outlined in the steelhead recovery plan. If steelhead return to the area, the ranch hopes ongoing conservation efforts under the SSHCP will be recognized and the need for incidental take permits under CESA can be avoided. (Exhibit 12)

9. A coalition of 26 non-governmental organizations supports listing SCS, stating that the populations are nearing extinction due to habitat loss from urbanization, agriculture, and water development. The coalition further states that a healthy steelhead population benefits California’s future by signaling a resilient ecosystem. Also included are signatures from over 2000 individuals who support listing the fish. (Exhibit 13)

10. The Santa Clarita Valley Water Agency (SCV) disputes the steelhead distribution map in the Department’s status review report. SCV points out that the map shows steelhead presence in the upper Santa Clara River east of Piru Dry Gap, although SCV believes there is no evidence to support this distribution, and requests that the Department correct the map to show no steelhead in that section of the river. If the Department disagrees, SCV asks that supporting data be provided, and an explanation of how steelhead distribution was determined for the area. Additionally, SVC provides a white paper titled *Review of Current and Historical SCS in the Upper Santa Clara River Watershed*. (Exhibit 14)

11. The Association of California Water Agencies (ACWA) expresses concern that the Department’s status review does not consider all available science, particularly the role of resident rainbow trout populations in the overall steelhead population health. ACWA claims that listing SCS under CESA would not provide additional protections beyond those from the federal Endangered Species Act listing, but would create redundancies and potentially hinder water management projects. ACWA requests that the Commission consider resident rainbow trout contributions to steelhead populations in its final decision and exclude coastal watersheds with concrete-lined flood channels from the listing, as they block steelhead passage. Additionally, ACWA provides two technical memoranda, one from Four Peaks Environmental Science & Data Solutions and one from Cramer Fish Sciences. (Exhibit 15)

12. CalTrout forwarded a public support letter with over 4700 signatures collected by EnviroVoters. (Exhibit 16)

13. The Los Angeles County Sanitation District expresses concern for the potential impacts from an SCS listing on wastewater treatment operations, which it states could

result in the need for expensive upgrades to treatment facilities. The district also states that the Department's distribution map is inaccurate and requests that the Commission correct the map to remove SCS designation from the upper Santa Clara River. The district also requests to work with the Department to develop regulations that will protect the fish but allow essential services to continue. (Exhibit 17)

14. The California Building Industry Association opposes listing SCS, stating that there is not enough solid science to justify the listing and that the Department's report relies on uncertain data sources, leading to inaccurate range maps showing steelhead in places where they likely are not present. The association suggests using data from the U.S. Fish and Wildlife Service for better accuracy. Additionally, the association is concerned for the listing's impact on water agencies and homebuilding. (Exhibit 18)

Recommendation

Commission staff: Determine that listing southern California steelhead as endangered is warranted, as recommended by the Department.

Department: List southern California steelhead as endangered under CESA.

Exhibits

1. Petition, received June 14, 2021
2. Department transmittal memo, received January 18, 2024
3. Department status review report, dated February 2024
4. Department presentation
5. Letter from Dan Silver, Executive Director, Endangered Habitats League, received March 18, 2024
6. Letter from Stephen Kanne, received March 20, 2024
7. Letter from Lauren Hanson, Board President, Cachuma Conservation Release Board, received March 21, 2024
8. Letter from Polly Holcombe, Board President, COMB, received March 26, 2024
9. Letter from Edward Wallace, Conservation Chair, Pasadena Casting Club, received March 29, 2024
10. Letter from David Boyer and Christopher Francis, attorneys for United Water Conservation District, Atkinson, Andelson, Loya, Ruud & Romo, received April 3, 2024 (Note: This link goes to an external document due to file size)
11. Letter from Mauricio Guardado, General Manager, UWCD, received April 3, 2024

13. Co-written letter from 26 non-governmental organizations, received April 3, 2024
14. Letter from Stephen Cole, Assistant General Manager, SCV, received April 4, 2024
15. Letter from Stephen Pang, State Relations Advocate, ACWA, received April 4, 2024
16. Email from Russell Marlow, Senior Project Manager, CalTrout, received April 4, 2024
17. Letter from Raymond Tremblay, Department Head, Facilities Planning, Los Angeles Sanitation Districts, received April 4, 2024

18. Letter from Nick Cammarota, Senior Vice President & General Counsel, California Building Industry Association, received April 4, 2024
19. Department memo, *Evaluation of Additional References Received for the Status Review of southern California steelhead* (Oncorhynchus mykiss), received April 11, 2024

Motion

Moved by ___________ and seconded by __________ that the Commission, pursuant to Section 2075.5 of the California Fish and Game Code, finds the information contained in the petition to list southern California steelhead (*Oncorhynchus mykiss*), and the other information in the record before the Commission, **warrants** listing southern California steelhead as an endangered species under the California Endangered Species Act, consistent with the Commission staff and Department recommendations. Findings will be adopted at a future meeting.

OR

Moved by ___________ and seconded by __________ that the Commission, pursuant to Section 2075.5 of the California Fish and Game Code, finds the information contained in the petition to list southern California steelhead (*Oncorhynchus mykiss*), and the other information in the record before the Commission, **does not warrant** listing southern California steelhead as an endangered species under the California Endangered Species Act.

23. Mohave Desert Tortoise

Today's Item **Information ☐** **Action ☒**

Consider the petition, Department's status review report, and comments received to determine whether listing Mohave (also known as Agassiz's) Desert tortoise as endangered under the California Endangered Species Act (CESA) is warranted.

Summary of Previous/Future Actions

• Received petition to change status from threatened to endangered	March 20, 2020
• Transmitted petition to Department	April 13, 2020
• Public receipt of petition	April 15-16, 2020
• Published notice of receipt of petition	May 1, 2020
• Public receipt of Department's 90-day evaluation report	June 24-25, 2020
• Determined petitioned action may be warranted, initiating Department's one-year status review	October 14, 2020
• Approved Department's six-month extension request	October 14, 2021
• Public notice of having received the Department's one-year status review	February 14-15, 2024
• **Today, potentially determine if changing the listing from threatened to endangered is warranted**	**April 17-18, 2024**

Background

On March 20, 2020, the Commission received a petition to change the status of Mohave Desert tortoise (*Gopherus agassizii*) from threatened to endangered under CESA (Exhibit 1). At its October 2020 meeting, the Commission determined that listing may be warranted, and subsequently provided notice of that determination. The notice prompted the Department's status review of the species, as required by California Fish and Game Code Section 2074.6.

The Commission received the Department's status review report on January 9, 2024 (exhibits 2 and 3), and highlighted receipt of the report on the February 14-15, 2024 meeting agenda for public awareness. The status review report represents the Department's final written review of the status of Mohave Desert tortoise. Based on the information provided, possessed, and received, the Department has concluded that the petitioned action to list Mohave Desert tortoise as endangered under CESA is warranted, and further recommends implementing the management recommendations and recovery measures described in the status review report.

At today's meeting, the Commission may consider the petition, the Department's written evaluation and status review report, written and oral comments received, and the remainder of the administrative record, to determine if listing Mohave Desert tortoise as endangered under CESA is warranted. Findings will be adopted at a future meeting.

Significant Public Comments

A co-written letter submitted by Defenders of Wildlife, the Desert Tortoise Council, and the Desert Tortoise Preserve Committee states that the organizations have reviewed the Department's status review and agree with the Department's recommended actions. They urge the Commission to list the tortoise as endangered under CESA and further state that the desert tortoise population is in decline despite past efforts at protection. Lastly, the authors believe that the change in listing status would likely increase funding for conservation efforts and lead to stricter regulations on activities that harm the species. (Exhibit 6)

Recommendation

Commission staff: Determine that listing Mohave Desert tortoise as endangered is warranted, as recommended by the Department.

Department: List Mohave Desert tortoise as endangered under CESA.

Exhibits

1. Petition, received March 20, 2020
2. Department transmittal memo, received January 9, 2024
3. Department status review report, dated February 2024
4. Department presentation
5. Letter from Defenders of Wildlife, the Desert Tortoise Council, and the Desert Tortoise Preserve Committee, received March 29, 2024

Motion

Moved by ___________ and seconded by __________ that the Commission, pursuant to Section 2075.5 of the California Fish and Game Code, finds the information contained in the petition to list Mohave Desert tortoise (*Gopherus agassizii*), and the other information in the record before the Commission, **warrants** listing Mohave Desert tortoise as an endangered species under the California Endangered Species Act, consistent with the Commission staff and Department recommendations. Findings will be adopted at a future meeting.

OR

Moved by ___________ and seconded by __________ that the Commission, pursuant to Section 2075.5 of the California Fish and Game Code, finds the information contained in the petition to list Mohave Desert tortoise (*Gopherus agassizii*), and the other information in the record before the Commission, **does not warrant** listing Mohave Desert tortoise as an endangered species under the California Endangered Species Act.

24. Ballona Wetlands Ecological Reserve

Today's Item **Information ☐** **Action ☒**

Ballona Wetlands Ecological Reserve consistency determination as to whether the visitor uses associated with the parking lots in Area A and the baseball fields in Area C are compatible with the purposes of the reserve.

Summary of Previous/Future Actions

- Adoption hearing for regulations designating ecological reserve and authorizing special uses — August 19, 2005
- **Today make a consistency determination** — April 17-18, 2024

Background

In August 2005, the Commission adopted regulation amendments designating approximately 577 acres along coastal Los Angeles County, which the Department had recently acquired, as Ballona Wetlands Ecological Reserve (Ballona Reserve). The amendments also included special regulations that allowed for specific public uses on Ballona Reserve beyond those allowed by the general regulations for ecological reserves.

Ballona Reserve included some parking lots and Little League baseball fields at the time of acquisition. The special regulations adopted in 2005 included two provisions related to the parking lots and Little League fields:

1. Existing recreational uses may be allowed under license agreement with Playa Vista Little League in that portion of Area C identified in the license agreement unless it is determined by the department that restoration or other uses in this area are more appropriate.
2. Existing parking areas under leases to the County of Los Angeles may be allowed unless it is determined by the Department that restoration or other uses in those areas are more appropriate.

The substance of the two provisions has remained in the Commission's regulations through today and is currently codified in Section 630(h)(3).

In September 2020, Ballona Wetlands Land Trust filed a petition for a writ of mandate and complaint for declaratory relief in Los Angeles County Superior Court. The court issued a writ directing the Commission to make a compatibility determination pursuant to Section 630 as to whether the parking lots in Area A and baseball fields in Area C of Ballona Reserve are compatible with the purpose of the reserve (Exhibit 1).

Since adopting the special regulations for Ballona Reserve, the Commission has never interpreted the two provisions as affirmatively requiring the Department to evaluate the existing uses. Based on the plain language, the provisions allow for the continued use until the Department determines "that restoration or other uses in those areas are more appropriate." However, recently the Department evaluated the special uses related to the parking lots and

Little League fields. The Department "determined that restoration or other uses of the Little League baseball fields or parking lots is not more appropriate at this time" and transmitted a memorandum to the Commission to that effect (Exhibit 2).

Significant Public Comments (N/A)

Recommendation

Commission staff: Based on the analysis in the Department's memorandum, determine that the visitor uses associated with the parking lots in Area A and the baseball fields in Area C are compatible with the purposes of Ballona Wetlands Ecological Reserve.

Exhibits

1. Writ of mandate from the Los Angeles County Superior Court, dated November 7, 2023
2. Department memorandum with attachments, dated April 2, 2024

Motion

Moved by _____________ and seconded by _____________ that Commission determines the visitor uses associated with the parking lots in Area A and the baseball fields in Area C are compatible with the purposes of the Ballona Wetlands Ecological Reserve.

Staff Summary for April 17-18, 2024

26A. Wildlife Resources Committee (WRC)

Today's Item **Information ☐** **Action ☒**

Discuss referred topics and consider revisions to topics and timing. Consider approving draft agenda topics and changing the meeting location for the next committee meeting.

Summary of Previous/Future Actions

- Previous committee meeting — January 16, 2024; WRC
- **Today consider approving agenda topics — April 17-18, 2024**
- Next committee meeting — May 16, 2024; WRC

Background

WRC works under Commission direction to set and accomplish its work plan.

Committee Work Plan

Topics that have been referred by the Commission to WRC are displayed within a work plan for scheduling and tracking. The updated work plan is provided as Exhibit 1 and includes proposed topics for September 2024.

New Topics

Staff has no recommendations for new topics for Commission referral to WRC.

Next Committee Meeting

The next committee meeting is scheduled for May 16, 2024, with webinar and phone options. In addition to standing agenda items (Department updates and future agenda items), four topics are proposed:

1. *Periodic and Annual Rulemakings*: Initial vetting for upland (resident) game birds, mammal hunting, waterfowl hunting, Central Valley sport fishing, and Klamath River Basin sport fishing.
2. *Take of Nongame Mammals*: Discuss concerns regarding take of nongame mammals.
3. *Shotgun Wads:* Continue discussion of plastic pollution caused by shotgun debris from waterfowl hunting.
4. *Waterfowl Hunting in Southampton Bay:* Continue exploration and vetting of potential regulation changes to address waterfowl hunting noise concerns specific to Southampton Bay, consistent with Commission direction at its October 2023 meeting.

The May WRC meeting is currently scheduled to be held in Yreka to accompany a site visit to the Klamath River dam removal sites; that site visit will now be held separately. Staff requests to move the next WRC meeting to the Redding area to simplify travel and to facilitate locating a suitable meeting venue.

Significant Public Comments (N/A)

Staff Summary for April 17-18, 2024

Recommendation

Commission staff: Approve the topics and work plan as proposed and approve the Redding area as the location for the next WRC meeting.

Exhibits

1. WRC work plan, updated April 8, 2024

Motion

Moved by ____________ and seconded by ___________ that the Commission approves the Wildlife Resources Committee topics and work plan as proposed and approves the change of location for the May 16, 2024 meeting to Redding.

26B. Department Wildlife and Fisheries Division, and Department Ecosystem Conservation Division Report

Today's Item **Information ☒** **Action ☐**

The Department will highlight items of note since the last Commission meeting.

Summary of Previous/Future Actions (N/A)

Background

The Department will provide a verbal update on items of interest since the last Commission meeting.

Three news releases of potential interest are provided as exhibits 1-2.

Significant Public Comments (N/A)

Recommendation (N/A)

Exhibits

1. CDFW news: *CDFW Introduces License Application for Mobile Devices*, dated March 20, 2024
2. CDFW news: *CDFW Seeks Artists to Enter Annual California Duck Stamp Art Contest*, dated March 20, 2024

Motion (N/A)

Staff Summary for April 17-18, 2024

27B. Rulemaking Timetable Updates

Today's Item **Information ☐** **Action ☒**

Review and potentially approve changes to the perpetual timetable for anticipated regulatory actions.

Summary of Previous/Future Actions

- Commission approved rulemaking timetable — February 14-15, 2024
- **Today consider approving changes to the rulemaking timetable — April 17-18, 2024**

Background

This is a standing agenda item for staff and the Department to request changes to the Commission's rulemaking timetable (Exhibit 2), confirm changes made by the Commission during this meeting, and highlight minor changes made by staff.

The Department recommends two changes to the rulemaking timetable:

- Schedule a "Possession of Wildlife and Wildlife Rehabilitation" rulemaking, which is currently under "Future Rulemakings: Schedule to be Determined," to repeal Section 679 and add Sections 679.1, 679.2, 679.3, 679.4, 679.5, 679.6, 679.7, 679.8, and 679.9, as well as a manual and associated forms. This rulemaking is necessary to overhaul how the Department administers the wildlife rehabilitation program. The proposed rulemaking schedule is notice in June 2024, discussion in August 2024, and adoption in October 2024.

- Add a "White Sturgeon Harvest and Reporting" rulemaking to amend Sections 1.74, 5.79, 5.80, 27.90, 27.92 and 701, and add Section 701.1. This rulemaking is necessary to revise management of the white sturgeon sport fishery and would provide the Commission with three different management options to consider: (1) catch-and-release only; (2) limited entry harvest tag; and (3) real-time quota. The proposed rulemaking schedule is notice in June 2024, discussion in August 2024, and adoption in October 2024.

Proposed regulation changes for both wildlife rehabilitation and white sturgeon have been discussed at multiple Commission Wildlife Resources Committee meetings.

Staff requests additional adjustments as shown under Agenda Item 27C, *Future Meetings and New Business.* Commission staff suggests adjusting the days upon which items are heard by moving wildlife and inland fisheries items to day one and marine items to day two for the June 2024 meeting. Additionally, staff requests that two recently withdrawn rulemakings be added back to the timetable for adoption: (1) Special Hunts Permits and Drawings and (2) Mitigating Risks for Cervid Importation and Movement. If approved under Agenda Item 27C, the schedule will be adjusted on the draft timetable accordingly.

Significant Public Comments (N/A)

Recommendation

Commission staff: Approve the proposed changes to the rulemaking timetable as identified in this staff summary and Exhibit 2, and any other additional changes identified during this meeting.

Exhibits

1. Department memo, received April 8, 2024
2. *Perpetual Timetable for Regulatory Actions*, dated April 11, 2024

Motion

Moved by _____________ and seconded by _____________ that the Commission approves the proposed changes to the rulemaking timetable as discussed today.

27C. Administrative Items - Future Meetings and New Business

Today's Item **Information ☐** **Action ☒**

This is a standing agenda item to review logistics and approve draft agenda items for the next Commission meetings, consider any changes to approved meeting dates or locations, or introduce new business for a future meeting agenda.

Summary of Previous/Future Actions (N/A)

Background

Upcoming Commission Meetings

The next Commission meetings are scheduled for May 15, 2024 as a teleconference – with an in-person option in Trinidad, Fairfield, Sacramento, Santa Cruz, and San Diego where commissioners will be located – and June 19-20, 2024 in Mammoth Lakes. For all Commission and committee meetings, we continue to provide the ability to participate via webinar and phone, in addition to physical meeting locations. Potential agenda items for both meetings are provided in Exhibit 1 for consideration and potential Commission approval.

For the June meeting only, a commissioner proposes to move marine items to Thursday and wildlife and inland fisheries items to Wednesday. Staff has confirmed the change is feasible for rulemaking purposes and for colleagues at the Department. Most meeting attendees can expect additional travel time to Mammoth Lakes; otherwise, there are no special logistics to consider.

Approved Meeting Dates and Locations

For the May 16, 2024 Wildlife Resources Committee meeting, staff proposes to move the location to the Redding area. The meeting was originally approved for Yreka to accommodate a possible commissioner visit to the Klamath River dams removal site and restoration areas; due to scheduling challenges, that trip will be accommodated separately.

Significant Public Comments (N/A)

Recommendation

Commission staff: Approve agenda items for the May 15, 2024 and June 19-20, 2024 meetings as presented in Exhibit 1 and amended during this meeting; approve moving the May 16, 2024 Wildlife Resources Committee meeting location to the Redding area.

Exhibits

1. Potential agenda items for May 15 and June 19-20, 2024 Commission meetings

Motion

Moved by _____________ and seconded by _____________ that the Commission approves the draft agenda items for the May 15, 2024 and June 19-20, 2024 Commission meetings, as amended during this meeting, and approves moving the May 16, 2024 Wildlife Resources Committee meeting to the Redding area.

Staff Summary for April 17-18, 2024

28. General Public Comment for Items Not on the Agenda

Today's Item **Information ☐** **Action ☒**

Receive public comment regarding topics within the Commission's authority that are not included on the agenda.

Summary of Previous/Future Actions

- **Today's receipt of requests and comment** April 17-18, 2024
- Consider granting, denying, or referring June 19-20, 2024

Background

This item is to provide the public an opportunity to address the Commission on topics not on the agenda. Staff may include written materials and comments received prior to the meeting as exhibits in the meeting binder (if received by the written comment deadline), or as supplemental comments at the meeting (if received by the supplemental comment deadline).

General public comments are categorized into two types: (1) requests for non-regulatory action and (2) informational-only comments. Under the Bagley-Keene Open Meeting Act, the Commission cannot discuss or take action on any matter not included on the agenda, other than to schedule issues raised by the public for consideration at future meetings. Thus, non-regulatory requests generally follow a two-meeting cycle (receipt and direction); the Commission will determine the outcome of the non-regulatory requests received in today's meeting at the next regularly scheduled Commission meeting, following staff evaluation (currently June 19-20, 2024)

Significant Public Comments (N/A)

Recommendation (N/A)

Commission staff: Consider whether to add any future agenda items to address issues that are raised during public comment.

Exhibits

See exhibits for Agenda item 10.

Motion (N/A)

Staff Summary for April 17-18, 2024

Executive Session

Today's Item **Information ☐** **Action ☒**

Executive session will include four standing topics:

(A) Pending litigation to which the Commission is a party

(B) Possible litigation involving the Commission

(C) Staffing

(D) Deliberation and action on license and permit items

Summary of Previous/Future Actions (N/A)

Background

During the public portion of its meeting, the Commission will call a recess and reconvene in a closed session pursuant to the authority of California Government Code Section 11126, subdivisions (a), (c)(3) and (e)(1). The Commission will address four items in closed session:

(A) ***Pending Litigation to Which the Commission is a Party***

See agenda for a complete list of pending civil litigation to which the Commission is a party, at the time the agenda was made public.

(B) ***Possible Litigation Involving the Commission***

(C) ***Staffing***

For details about staffing, see the executive director's report under Agenda Item 2(A) for today's meeting.

(D) ***Deliberation and Action on License and Permit Items***

I. *Consider the proposed decision in Agency Case No. 21ALJ02-FGC, regarding the denial of Attila Molnar's restricted species exhibiting permit renewal application.*

On December 18, 2020, the Department sent Attila Molnar a notice of denial of a renewal application for a restricted species permit. The denial letter stated the Department's decision was based on multiple violations of regulations regarding restricted species.

Molnar timely appealed the denial to the Commission and filed a written statement in support of the appeal. The Department filed a response with the Commission arguing that the denial should be affirmed.

Commission staff referred the appeal to the California Office of Administrative Hearings (OAH). After Molnar submitted a supplemental brief to OAH, OAH submitted a proposed decision (Exhibit 1) to the Commission. The proposed decision finds the Department proved violations occurred that were cause for denial and the denial of the renewal application was the correct result.

Significant Public Comments (N/A)

Recommendation

Commission staff: (D)I. Adopt the proposed decision for Agency Case No. 21ALJ02-FGC.

Exhibits

1. Proposed decision regarding Molnar appeal, dated February 7, 2024

Motion

Moved by _____________ and seconded by _____________ that the Commission adopts the proposed decision for Agency Case No. 21ALJ02-FGC.

State of California
Department of Fish and Wildlife

Original on file
Received March 29, 2024

Memorandum

Date: March 25, 2024

To: Melissa Miller- Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the April 17-18, 2024 Fish and Game Commission Meeting Private Lands Wildlife Habitat Enhancement and Management (PLM) Area Licenses**

California Fish and Game Code Section 3406(c) requires that the activities conducted pursuant to each Private Lands Wildlife Habitat Enhancement and Management Plan (PLM) shall be reviewed annually by the Department of Fish and Wildlife (Department) and by the Fish and Game Commission (Commission) at a public hearing. Licenses for such areas may be granted by the Commission for a period of five (5) years following department review and approval of the management plan (Title 14, California Code of Regulations Section 601(a)).

The Department has reviewed the initial management plan for one new property in one county consisting of approximately 4,988 acres and the 5-year renewals for nine properties in six counties consisting of approximately 112,818 acres. Additionally, the Department has reviewed the annual reports for 52 properties in 14 counties consisting of approximately 550,079 acres.

The Department recommends that the Commission approve the wildlife management plans, applications, and each 2024/25 harvest program under conditions specified in the attached tables. Habitat improvements accomplished under these plans will enhance and maintain wildlife resources on and around the PLM areas. The goals and objectives stated in the management plans are compatible with Department management plans for appropriate species in these areas.

The remaining PLM areas will be submitted to the Commission for approval at the June 19-20, 2024 meeting.

If you have any questions, please contact Ms. Victoria Barr at (916) 203-0567 or by email at Victoria.barr@wildlife.ca.gov.

Proposed Seasons, Harvests, and Habitat Improvements

NORTHERN REGION		
PLM Area	**2024 Proposed Season and Harvest**	**Habitat Improvement Program**
Bell Ranch Deer Zone C4 Tehama 15,000 Acres	Authorized Harvest: 15 forked-horn or better buck deer Issue 15 buck deer tags for the period October 26, 2024 through November 30, 2024	Maintain 16 previously developed springs by checking for broken pipes and repairing as necessary. Maintain 30 water sources by inspecting and making any necessary repairs to the ponds, springs, guzzlers, and water troughs. Install 1 new guzzler near Campbell Creek. Mechanically treat (by crushing with a bulldozer or masticating) at least 15 acres of decadent brush annually to encourage the growth of nutritious deer forage. Restrict off-road vehicle use within the recent brush treatment areas and minimize disturbance to wildlife. Spray invasive plants including star thistle and Italian thistle.
Capistran Ranch Deer Zone B1 Mendocino 14,510 Acres	Authorized Harvest: 20 deer of which no more than 15 may be forked-horn or better buck deer and 5 may be antlerless deer, 2 bull elk, and 2 antlerless elk Issue 10 either-sex deer tags for the period of August 1, 2024 through November 30, 2024 No antlerless deer shall be harvested before September 15, 2024. No more than 10 buck deer may be harvested after October 27, 2024.	Managed livestock grazing (no more than 500 cow/calf pairs on 13,200 acres) for the period of November 15 through June 20 annually will be used to manage invasive plant species and thatch build up. Masticate at least 10 acres of decadent brush annually to create browsing opportunities. Manage invasive plants by focused high-intensity, short-term grazing. Maintain 24 springs by checking the flow and wildlife escape ramps and repairing any damaged parts.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Capistran Ranch Cont.	On or before October 15, 2024, the licensee may request (in writing) up to 10 additional either-sex tags to accomplish the authorized harvest. Issue 2 bull elk tags for the period of August 1, 2024 through December 1, 2024 Issue 2 antlerless elk tags for the period of September 15, 2024 through December 1, 2024	Exclude trespass livestock from USFS and BLM grazing allotments by inspecting and repairing the boundary fence. Replace the nesting material in 4 bluebird nest boxes. Boxes will be relocated if not used the previous season. Maintain 10 wood duck nest boxes annually. Maintain 8 elk crossings annually. Construct 15 brush piles for wildlife cover and oak seedling protection. The 20 foot x 5-foot pile will be created using slash from down trees and brush and will be located near a routinely used water source. Maintain and monitor 2 approximately 1,000-sq. foot food plots spread out over the property and in areas where green summer browse is limited. Each food plot is fenced from cattle and wild pigs. Each will have a motion-sensing camera to record day and night deer activity. The annual report will include a table of total number and composition of deer photographed. Using a tractor, create a 6 foot wide by 300 foot long trail through decadent chaparral to provide access and new palatable forage for wildlife. Maintain 20 mallard hen nest tubes annually. Treat 10 acres of yellow star thistle with appropriate herbicide annually. At least 5 acres of elk and deer forage will be planted and irrigated through the summer months.

California Department of Fish and Wildlife
PLM Area License
5-Year Management Plan Renewals, 2024-2028
Proposed Seasons, Harvests, and Habitat Improvements

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Four Pines Ranch Deer Zone B1 Mendocino 2,001 Acres	Authorized Harvest: 12 forked-horn or better buck deer and 4 antlerless deer Issue 12 buck deer tags and 4 antlerless deer tags for the period of July 16, 2024 through November 30, 2024 No more than 6 buck deer may be harvested after October 27, 2024. No antlerless deer shall be harvested before September 15, 2024.	Maintain at least 7 previously improved springs and 3 existing ponds. Develop 1 additional spring site for wildlife use. Maintain all previously established forage plots with legume mix for wildlife use. Develop 0.25-acre forage plot for enhanced wildlife browse opportunity. Treat at least 3 acres annually of invasive weeds through hand manipulation, herbicides or vegetation management plan burns with CalFire to encourage native vegetation growth. Remove at least 100 feet of unnecessary interior fence to enhance wildlife passage. Create at least a 1 acre opening through dense brush to enhance browse feeding opportunities for wildlife. Remove encroaching conifer seedlings and saplings in at least 3 acres of oak woodlands. Restrict livestock grazing to no more than 50 head of cattle during the winter and spring. In addition manage grazing to only assigned pastures during the specific grazing season. Plant at least 25 willow shoots annually at existing water sources; there will be an expected 75% survival of these shoots after the second year or replanting will be required the next season. Create at least 2 brush piles measuring at least 6 feet high and 15 feet in diameter annually. Older piles (at least 5 years old) will be burned.

California Department of Fish and Wildlife
PLM Area License
5-Year Management Plan Renewals, 2024-2028
Proposed Seasons, Harvests, and Habitat Improvements

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Redwood House Ranch Deer Zone B1 Humboldt 8,419 Acres	Authorized Harvest: 20 either-sex deer of which no more than 10 may be antlerless deer and 1 bull elk Issue 20 either-sex deer tags for the period of August 10, 2024 through November 30, 2024 Issue antlerless deer may be harvested for the period of October 1, 2024 through November 30, 2024 No more than 7 buck deer may be harvested after October 27, 2024. Issue 1 bull elk tag for the period of August 1, 2024 through October 31, 2024	Treat at least 200 acres of oak woodlands by removing encroaching conifers less than or equal to 12 inches DBH from oak woodlands and prairies.
Schneider Ranch Deer Zone B1 Mendocino 5,222 Acres	Authorized Harvest: 6 forked-horn or better buck deer Issue 6 buck deer tags for the period of August 1, 2024 through November 30, 2024 No more than 3 buck deer may be harvested after October 27, 2024.	Burn or mechanically treat at least 7 acres of decadent brush annually. Cultivate with equipment and irrigate the 1-acre Cabin food plot, which provides a year-round deer feeding area annually. Create at least 6 brush piles for wildlife cover. The piles will each be approximately 10 feet in diameter and 6 feet tall and will provide good habitat for both deer and quail. Burn at least 6 brush piles. The remnant charcoal and ashes are nutrient rich and deer roll in them, perhaps for control of external parasites. Inspect 6 previously improved springs and repair any damaged parts, clear any brush that is intruding on the collection

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Schneider Ranch Cont.		galleries, cleaning out accumulated debris and mud, and ensure the box is structurally sound. Exclude all livestock from the ranch.
Smith River PLM Del Norte 25,229 Acres	Authorized Harvest: 4 bull elk and 6 antlerless elk Issue 4 bull elk tags for the period of August 1, 2024 through October 31, 2024 On or before October 15, 2024, the licensee may request (in writing) up to 1 additional bull tag to accomplish the harvest goal. In no case shall the number of tags issued be used to exceed the authorized harvest. The number of tag holders actively hunting shall not exceed the number of elk available to harvest. Issue 6 antlerless elk tags for the period of September 4, 2024 through October 31, 2024	Within the 5-year term, provide and deliver 30 merchantable trees 12 inches-24 inches DBH to project site. Enhance Coho salmon habitat in Rowdy Creek and/or Savoy Creek through the placement of 30-40-foot-long tree segments with root wads attached to be placed instream for large woody debris habitat for salmonids. At least 125 acres of invasive plant species will be treated with herbicide, hand tools, and/or heavy equipment. Treated areas will be revegetated with reseeding and/or planting with native species. Effectiveness monitoring will occur post treatment. 3 wood duck boxes will be installed and annually monitored and maintained.

California Department of Fish and Wildlife

5-Year Management Plan Renewals, 2024-2028
Proposed Seasons, Harvests, and Habitat Improvements

CENTRAL REGION		
PLM Area	**2024 Proposed Season and Harvest**	**Habitat Improvement Program**
Carrizo Ranch San Luis Obispo County 27,056 Acres	Authorized Harvest: 3 bull elk, 2 antlerless elk, 5 forked-horn or better buck deer and 4 antlerless deer Issue 3 bull elk tags for the period of July 15, 2024 through December 1, 2024 Issue 3 antlerless elk tags for the period of September 15, 2024 through December 1, 2024 Issue 5 buck deer tags for the period of July 15, 2024 through December 31, 2024 Issue 3 antlerless deer tags for the period of September 1, 2024 through December 31, 2024	Burn tule grass at Big Spring. Managed and appropriately timed grazing to improve habitat. Leave gates open to ease movement between pastures and neighboring properties (CDFW and Nature Conservancy lands). Manage invasive plants. Install basking structures for turtles at Big Spring.
Gabilan Ranch Deer Zone A Monterey 10,000 Acres	Authorized Harvest: 3 bull elk and 1 antlerless elk Issue 3 bull elk tags for the period of July 1, 2024 through December 31, 2024 Gabilan Ranch is not requesting their antlerless elk tag for the 2024 season.	Maintain perennial water for wildlife and water retention devices and pipes as needed. Burn 200 acres of decadent brush to improve forage for wildlife. Remove cattle in May to provide feed and reduce competition for wildlife. Treat 0.50 acre of purple star thistle to enhance and maintain habitats for wildlife. VMP burns, follow Smoke Management Plan with CDF and Monterey Air Quality Control Board in order to improve burn scheduling flexibility.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Gabilan Ranch Cont.		Continue an erosion control program to reduce sedimentation in the area creeks. Construct 10 brush piles. Maintain wood duck boxes. Grow out gathering field between March and May. Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.
Hearst Ranch San Luis Obispo 5,381 Acres	Authorized Harvest: 6 bull elk and 6 antlerless elk Issue 2 bull elk tags for the period of July 15, 2024 through December 1, 2024 Issue 3 antlerless elk tags for the period of September 15, 2024 through December 1, 2024	Improve stock pond for red-legged frogs. Irrigate approximately 152 acres in the Arroyo de la Cruz drainage and, if necessary, seed with native grassed to produce year-round forage for wildlife. Continue rotational grazing practices to meet the standard for ‘light’ grazing. Exclude livestock with approximately. 2.50 miles of fencing from the 105-acre Arroyo de la Cruz riparian corridor during stream flow. Treat 1 acre for Spanish broom using hand pulling and digging. Application of 3% glyphosate or mechanical cutting as needed. Treat 1 acre of jubata grass with hand pulling and application of 2% glyphosate as needed. Control flower plumes by bagging and removing or burning. Install 4 raptor perches. Monitor/repair/replace escape ramps in wildlife troughs.

Subject: **Agenda Item for the April 17-18, 2024 Fish and Game Commission Meeting Private Lands Wildlife Habitat Enhancement and Management (PLM) Area Licenses**

California Fish and Game Code Section 3406(c) requires that the activities conducted pursuant to each Private Lands Wildlife Habitat Enhancement and Management Plan (PLM) shall be reviewed annually by the Department of Fish and Wildlife (Department) and by the Fish and Game Commission (Commission) at a public hearing. Licenses for such areas may be granted by the Commission for a period of five (5) years following department review and approval of the management plan (Title 14, California Code of Regulations Section 601(a)).

The Department has reviewed the initial management plan for one new property in one county consisting of approximately 4,988 acres and the 5-year renewals for nine properties in six counties consisting of approximately 112,818 acres. Additionally, the Department has reviewed the annual reports for 52 properties in 14 counties consisting of approximately 550,079 acres.

The Department recommends that the Commission approve the wildlife management plans, applications, and each 2024/25 harvest program under conditions specified in the attached tables. Habitat improvements accomplished under these plans will enhance and maintain wildlife resources on and around the PLM areas. The goals and objectives stated in the management plans are compatible with Department management plans for appropriate species in these areas.

The remaining PLM areas will be submitted to the Commission for approval at the June 19-20, 2024 meeting.

If you have any questions, please contact Ms. Victoria Barr at (916) 203-0567 or by email at Victoria.barr@wildlife.ca.gov.

Proposed Seasons, Harvests, and Habitat Improvements

NORTHERN REGION

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
3D Ranch Deer Zone B5 Tehama 2,052 Acres	Authorized Harvest: 8 forked-horn or better buck deer, 7 bear and 75 quail Issue 8 buck deer tags for the period of August 15, 2024 through November 30, 2024 No more than 5 buck deer may be harvested after October 27, 2024. Issue 7 bear tags for the period of August 1, 2024, through December 31, 2024, or when the season closes because the Department has determined that 1,700 bears have been harvested. No cubs or females with cubs will be harvested. Cubs are defined as bears less than one year of age or bears weighing less than 50 pounds. Issue 75 quail seals for the period of September 1, 2024 through February 28, 2025	Mechanically crush 18 acres of decadent brush to improve forage for wildlife. These areas may also be burned dependent upon CalFire, all environmental evaluations have been completed. Cattle grazing has been planned on a rest and utilization rotation that considers forage availability for wildlife. Maintain a minimum of 7 acres of forage plots planted with legumes by replanting as necessary and irrigating. Plots 6 and 7 will be managed to promote turkey mullein through chiseling to remove competition from pasture grasses. Maintain 5 water sources to provide water for wildlife by checking for broken pipes and repairing as necessary. Remove at least 0.50 mile of unnecessary interior fencing to prevent wildlife entanglement. Deepening and sealing all water sources to a depth of at least 5 feet to maintain available water for wildlife during the year.
Ackerman-Southy Daugherty WMA Deer Zone A Mendocino 10,831 Acres	Authorized Harvest: 18 forked-horn or better buck deer Issue 18 buck deer tags for the period of July 15, 2024 through November 30, 2024 No more than 9 buck deer tags may be harvested after September 15, 2024	All habitat projects have been completed for this 5-year management plan.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Ackerman-Southy Daugherty WMA Cont.	On or before October 15, 2024, the licensee may request (in writing) up to 10 additional buck tags to accomplish the authorized harvest. In no case shall the number of tags issued be used to exceed the authorized harvest. The number of tag holders actively hunting shall not exceed the number of deer available to harvest.	
Alexandre Dairy PLM Del Norte 1,728 Acres	Authorized Harvest: 2 bull elk and 4 antlerless elk Issue 2 bull elk tags for the period of August 1, 2024 through December 31, 2024 Issue 4 antlerless elk tags for the period of October 1, 2024 through December 31, 2024	Finalized removal of a fish passage barrier on Tryon Creek. Finalize installation of the 20 water troughs for this 5-year management plan. All water troughs will be maintained and have wildlife escape ramps. 30 Sitka spruce will be planted and protected with elk exclusion fencing to allow proper propagation of the trees. Seasonal grazing of 30 acres of wetlands will be excluded from January 1 through July 15.
Amann Ranch Mendocino 375 Acres	Authorized Harvest: 1 bull elk and 1 antlerless elk Issue 1 bull elk tag for the period of August 1, 2024 through November 30, 2024. Issue 1 antlerless elk tag for the period of September 15, 2024 through November 30, 2024	Irrigate and sub-irrigate at least 225 acres of pasture for use by wildlife. Install 2 new elk friendly fence crossing and repair 2 damaged elk friendly fence crossings. Maintain 100 cattle to reduce competition with elk for forage. Cattle and horses will be removed from the pastures in October and allow for wildlife use. Maintain 16 water troughs and water tanker by ensuring they are holding

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Amann Ranch Cont.		adequate water for wildlife and install escape ramps. Mow, disc and reseed 25 acres in the yellow star-thistle treatment area. Leave unharvested the second cutting of hay on 342 acres. This will retain approximately 500 tons of forage accessible to elk. Preserve the tri-colored blackbird habitat.
Antler Hill Ranch Deer Zone A Mendocino 900 Acres	Authorized Harvest: 5 forked-horn or better buck deer Issue 5 buck deer tags for the period July 7, 2024 through November 30, 2024 No more than 3 buck deer may be taken after September 15, 2024.	Remove at least 2 acres of coyote brush that is encroaching into grasslands. Remove final 200 feet of woven wire fencing in deer travel corridors. Clear at least 1.50 acres of chamise by hand, mechanically or burning. Remove at least 75% of the overstory on 1.50 acres of timberland, to allow the growth of new browse. Remove at least 200 conifer trees up to 16 inches DBH encroaching into grasslands.
Big Lagoon Humboldt 113,933 acres	Authorized Harvest: 5 bull elk and 2 antlerless elk Issue 5 bull elk tags for the period of August 1, 2024 through October 31, 2024 On or before October 1, 2024, the licensee may request (in writing) up to 1 additional bull elk tag to accomplish the authorized harvest.	All habitat projects have been completed for this 5-year management plan.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Big Lagoon Cont.	In no case shall the number of tags issued be used to exceed the authorized harvest. The number of tag holders actively hunting shall not exceed the number of elk available to harvest. Issue 2 antlerless elk tags for the period of September 4, 2024 through November 15, 2024	
Bridges Ranch Deer Zone A Mendocino 1,144 Acres	Authorized Harvest: 10 forked-horn or better buck deer Issue 10 buck deer tags for the period of August 13, 2022 through November 30, 2022 No more than 5 buck deer may be harvested after September 25, 2022.	All burning has been completed for the 5-year management plan. Remove 3 acres of conifer trees 12 inches DBH or less in oak woodland areas. Create at least 5 brush piles measuring at least 15 feet in diameter and 6 feet high. Install 1 wood duck nesting box near the lake. Remove 1 abandoned structure of at least 150 square feet. Remove 30 yards of woven wire fencing.
Carley Ranch Deer Zone B1 Mendocino 1,660 acres	Authorized Harvest: 15 forked-horn or better buck deer Issue 6 buck deer tags for the period of August 1, 2024 through November 30, 2024 No more than 8 buck deer may be harvested after October 27, 2024. On or before October 15, 2024, the licensee may request (in writing) up to 9 additional buck	20 acres of controlled burn in the annual grasslands and chaparral. If this burning cannot be accomplished, brush rake removal of at least 5 acres of montane chaparral will occur. Maintain all previously developed water sources (3 springs, 6 guzzlers, and six associated water tanks) to provide water for wildlife. Maintenance includes repairing broken and deteriorating pipes and other components.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Carley Ranch Cont.	deer tags to accomplish the authorized harvest.	Maintain wildlife-friendly livestock exclusion fencing around developed springs and repairing any damage. Irrigate the 1-acre alfalfa food plot during the dry season. The plot is fenced with wildlife-friendly fencing to exclude livestock. Maintenance of 30 fruit trees have been planted and protected with wire fencing to provide a wildlife food source. Plant at least 3 acres of dryland forage mix for wildlife. Road maintenance and erosion control practices will be completed on roads. No livestock grazing on the ranch as it is used for wildlife habitat only.
Christensen Ranch Deer Zone B1 Mendocino 1,061 Acres	Authorized Harvest: 22 deer of which no more than 15 may be forked-horn or better buck deer and 7 may be antlerless deer Issue 22 either-sex deer tags for the period of August 1, 2024 through November 30, 2024 No antlerless deer shall be harvested before September 15, 2024. No more than 7 buck deer may be harvested after October 27, 2024. On or before October 15, 2024, the licensee may request (in writing) up to 12 additional either-sex tags to accomplish the authorized harvest.	Erosion control on ranch roads to reduce chances of sediment run off into nearby watercourses. Continue to promote bald eagle nesting through the retention of snags and large trees. Annual maintenance on 8 previously developed springs and repair any broken water pipes. Plant *Brassica* seed in the fall by manually seeding and raking in fresh pig rooting areas. The extent of this activity will depend on pig activity but is expected to represent at least 3 sites this year, scattered throughout the ranch. Exclude cattle from the ranch; no cattle leases are proposed under the PLM 5-year management plan.

Proposed Seasons, Harvests, and Habitat Improvements

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Christensen Ranch Cont.	The number of tag holders actively hunting shall not exceed the number of deer available to harvest. In no case shall the number of tags issued be used to exceed the authorized harvest.	Remove conifers up to 12 inches DBH from oak woodlands on 2 acres. Install 2 escape ramps into water troughs. Maintain Star thistle control project using appropriate herbicide treatments on 2 acres. Create 3 slash piles that are at least 6 feet high and 10 feet wide at the base.
Diamond C Outfitters Deer Zone B1 Humboldt 3,200 Acres	Authorized Harvest: 17 forked-horn or better buck deer Issue 17 buck deer tags for the period of July 15, 2024 through November 30, 2024 No more than 7 buck deer may be harvested after October 27, 2024.	Remove or replace (with wildlife friendly fencing) at least 522 yards of wildlife unfriendly fencing. Maintain at least 125 acres of previously treated oak woodlands by removing all conifers. Remove all conifers from at least 10 acres of oak woodlands in new areas. Treat at least 8 acres and 2.25 linear miles of star thistle through hand pulling or herbicide. Create at least 1 brush pile measuring at least 15 feet by 6 feet.
Eden Valley Ranch Deer Zone B1 Mendocino 20,789 Acres	Authorized Harvest: 8 bull elk, 7 antlerless elk, 20 forked-horn or better buck deer, and 5 antlerless deer Issue 8 bull elk tags for the period of July 13, 2024 through December 15, 2024 Issue 7 antlerless elk tags for the period of September 15, 2024 through December 15, 2024	Maintain 23 water sources by repairing any damaged parts. To improve wildlife forage plant, fertilize and irrigate a 100-acre area with oats, legumes, and grasses in pivot #1, pivot #2, and the canon field. Reseed at least 100 acres of pastures used by wildlife. Exclude livestock from 10,000 acres on the east side of Eden Valley to improve wildlife forage. Monitor and maintain the 4 existing rail-

Proposed Seasons, Harvests, and Habitat Improvements

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Eden Valley Ranch Cont.	Issue 20 buck deer tags for the period of July 13, 2024 through November 30, 2024 No more than 7 buck deer may be taken after October 27, 2024. Issue 5 antlerless deer tags for the period of September 15, 2024 through November 30, 2024	type elk crossings and add 5 per year to fences outside the valley. To improve wildlife forage, manage livestock grazing in the 4 pastures on a rest-rotation basis, with cattle primarily spending spring/summer in the upland pastures and fall/winter in the lowland pastures. Remove 0.25 miles of woven wire fencing. Maintain road surfaces and culverts to reduce sedimentation of waterways. Maintain exterior and interior wildlife friendly fences. Treat with herbicide at least 25 acres of yellow starthistle per year. Burn at least 30 acres of yellow star thistle per year. Plant all burned brush piles in M&M mix #2. Create 10 brush piles per year for wildlife at least 20 feet in diameter and 10 feet high. Plant 25 willow shoots near impoundments excluded from livestock to shade and help maintain cooler temperatures. Develop or redevelop and add one water tank if required in at least one pasture per year. Install 6 wood duck boxes. Develop and create at least a 0.25-acre plot planted in M&M seed mix in the Jarbo Pasture.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
		Add escape ramps in water troughs in Paradise Mountain pasture.
Hunter Ranch Deer Zone B1 Humboldt 16,103 Acres	Authorized Harvest: 20 forked-horn or better buck deer and 2 bull elk Issue 20 buck deer tags for the period of July 15, 2024 through November 30, 2024 No more than 7 buck deer may be harvested after October 27, 2024. Issue 2 bull elk tag for the period September 1, 2024 through October 31, 2024	Remove encroaching conifers from at least 60 acres of oak woodland. A total of 414 acres have been identified to provide flexibility to meet this 300-acre requirement: Treatment Group 1 consists of approximately 74 acres. These woodlands are encroached by pre-emergent Douglas-fir. Restoration activities shall include removal of all conifers ≤ 12 inches DBH. Treatment Group 2 consists of approximately 200 acres. These woodlands have emergent Douglas-fir and will be treated under a Timber Harvest Plan (THP) currently in development. These areas are to be treated using a combination of special prescriptions; White and Black Oak Woodland Management and Meadow Restoration silviculture. Restoration activities shall include removal of conifers ≥ 12 inches DBH. Larger Douglas-fir may be retained as wildlife trees as per the THP where they exist. Further treatments for conifers ≤12 inches DBH will be considered in the next PLM 5-year management plan. Treatment Group 3 consists of approximately 140 acres. These woodlands are encroached by pre-emergent and emergent Douglas-fir. Restoration activities shall include removal of all conifers ≤ 10 inches DBH where noncommercial treatments are implemented, and removal of all conifers between 10 feet and 24 feet in diameter

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
		under an Oak Woodland Management Exemption.
Klamath PLM Humboldt 32,594 acres	Authorized Harvest: 2 bull elk and 2 antlerless elk Issue 2 bull elk tags for the period of August 1, 2024 through October 31, 2024 On or before October 1, 2024, the licensee may request (in writing) up to 1 additional bull elk tag to accomplish the authorized harvest. In no case shall the number of tags issued be used to exceed the authorized harvest. The number of tag holders actively hunting shall not exceed the number of elk available to harvest. Issue 2 antlerless elk tags for the period of September 7, 2024 through November 15, 2024	All habitat projects have been completed for this 5-year management plan.
Miller-Eriksen Ranch Deer Zone B1 Mendocino 983 Acres	Authorized Harvest: 16 deer of which no more than 14 may be forked-horn or better buck and 2 may be antlerless deer and 1 bull elk Issue 10 either-sex tag for the period of July 13, 2024 through November 30, 2024	Plant 100 pounds of commercial pasture seed mix in the areas of feral hog rooting to provide food and cover for wildlife. Maintain 0.50 mile of low elk crossing fences. Timber thinning on at least 0.50 acre to create new browse. Build 100 brush piles throughout the property to provide wildlife cover.

Annual Management Plan Renewals, 2024-2025
Proposed Seasons, Harvests, and Habitat Improvements

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Miller-Eriksen Ranch Cont.	No antlerless deer shall be harvested before September 15, 2024. Issue 14 buck deer tags for the period of July 8, 2024 through November 30, 2024 Issue 2 antlerless deer tags tag for the period of September 15, 2024 through November 30, 2024 No more than 7 buck deer may be harvested after October 27, 2024. On or before October 15, 2024, the licensee may request (in writing) up to 7 additional either-sex tags to accomplish the authorized harvest. Issue 1 bull elk tags for the period of July 10, 2024 through November 9, 2024	Maintain the reduced number of livestock, not to exceed 25 cow/calf pairs. Herbicide treatment of at least 1 acre of yellow star thistle. Burn 125 brush piles created in previous years. Maintain livestock exclusion pasture totaling at least 33 acres. Maintain 15 water developments. Burn at least 8 acres of oak woodlands. Burn or thin at least 2 acres of decadent chaparral.
R-R Ranch Mendocino 1,470 Acres	Authorized Harvest: 2 bull and 6 antlerless elk Issue 2 bull elk tags for the period of July 18, 2024 through November 30, 2024 Issue 4 antlerless elk tags for the period of September 5, 2024 through November 30, 2024 On or before October 15, 2024, the licensee may request (in writing) up to 2 additional antlerless elk tags to	Irrigate a 7-acre alfalfa pasture. If the alfalfa production falls below a total cover of 50% in the fall, rip, replant and roll the pasture at a rate of 20 lbs./acre the following March or April with a clover and alfalfa seed mix to provide high quality forage for wildlife. The first cutting of hay will be removed and all subsequent growth will be left for wildlife use. Maintain the existing 100-acre dryland plot with a rye grass/clover mix by harvesting and thatching every summer. Maintain 2 ponds, 3 springs, and 2 water troughs for wildlife use.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
	accomplish the authorized harvest.	Exclude livestock from the ranch to improve forage and cover for wildlife. Create at least 4 wood piles at least 15 feet in diameter and 6 feet high for wildlife. Recycle 50% of existing decadent wood piles by burning. Finalize a control burning plan for the ranch with the goal of burning at least 15 acres per year. Evaluate invasive species on at least 100 acres each year. Initiate treatment on at least 10 acres if invasive species reach 25% cover.
Rainbow Ridge PLM Humboldt Deer Zone B4 21,300 Acres	Authorized Harvest: 15 forked-horn or better buck deer Issue 15 buck deer tags for the period of August 1, 2024 through November 30, 2024 No more than 8 buck deer may be harvested after September 29, 2024.	Finalize treatment of at least 6 acres of conifer removal less than or equal to 12 inches DBH from oak woodlands and prairies in unit E. All other habitat projects have been completed for this 5-year management plan.
R Wild Horse Ranch Deer Zone B5 Tehama 4,000 Acres	Authorized Harvest: 4 forked-horn or better buck deer Issue 4 buck deer tags for the period of November 19, 2024 through November 22, 2024	Mechanically treat at least 10 acres of decadent brush to promote new growth and create wildlife travel corridors. Create a 0.50-acre dugout water catchment basin to provide a water source for wildlife. Build at least 10 brush piles (each 20 feet in diameter) to provide escape cover for wildlife. Burn brush piles created in 2019.

Seven Springs Ranch Deer Zone A Mendocino 2,250 Acres	Authorized Harvest: 9 forked-horn or better buck deer Issue 9 buck deer tags for the period of July 13, 2024, through November 30, 2024. No more than 4 buck deer may be harvested after September 15, 2024.	Exclude livestock grazing from the PLM area to increase habitat quality for wildlife. Remove 0.20 miles of dilapidated woven wire fencing. Plant 0.125 acres of clover and vetch seed on washouts along roads and slides. Cut and mechanically treat, by uprooting, approximately 1 acre of young Douglas fir which are growing on ridges within the oak woodland area. Mechanically treat at least 1.25 acres, with heavy equipment, by removing and crushing decadent brush above the root crown (chaparral areas). Will cut the decadent branch growth off willows that were planted in springs and washouts in prior years.
Shamrock Ranch Deer Zone B1 Mendocino 16,400 Acres	Authorized Harvest: 8 bull elk, 10 antlerless elk, 50 deer of which no more than 30 may be forked-horn or better buck deer, and 20 may be antlerless deer Issue 8 bull elk tags for the period of July 12, 2024 through December 12, 2024 Issue 10 antlerless elk tags for the period of September 15, 2024 through December 12, 2024 Issue 35 either-sex deer tags for the period of July 12, 2024 through November 30, 2024 No antlerless deer shall be harvested before September 15, 2024.	Continued removal and/or treatment of invasive scotch broom in the Anderson pasture near the springs. Fertilize and irrigate 15 acres of hay meadow from mid-July through mid-September to provide forage for wildlife. Rebuild the fencing at the 6-acre Meyer pasture livestock exclosure. Initiate a high intensity/ short duration cattle grazing treatment in the Meyers exclosure to remove accumulated mature, decadent forage. Remove and/or treat 4 acres of invasive scotch broom and restore and protect 2 springs. Create 3 new brush piles in the Meyer Pasture sub-area. 3 mature brush piles will be burned and reseeded.

Shamrock Ranch Cont.	No more than 15 buck deer may be taken after October 27, 2024. On or before October 15, 2024, the licensee may request (in writing) up to 15 additional either-sex deer tags to accomplish the authorized harvest.	Leave approximately 10.5 acres of hay meadow in the North Meadow and 30 feet wide by approximately 1,900 feet long buffer strip along Long Valley Creek in the South Meadow during haying to provide mature forage for elk and cover for the calves. Limit cattle grazing in the hay meadows and surrounding area which encompasses approximately 200 acres to mid-October through mid-December. Remove 660 feet of old woven wire fencing in the Meyers Pasture sub-area to reduce wildlife entanglement. Check and maintain 21 ponds and 8 springs. Repair an existing spring box which feeds an off-channel pond (Sawmill Pond and spring). The pond will be fenced to provide water and habitat for wildlife.
Six Point Ranch Deer Zone A Mendocino 3,960 Acres	Authorized Harvest: 12 forked-horned or better deer, 3 bull elk and 5 antlerless elk Issue 12 buck deer tags for the period of July 15, 2024 through November 30, 2024 No more than 4 buck deer may be harvested after September 27, 2024. Issue 3 bull elk tags for the period of July 20, 2024 through December 1, 2024 Issue 5 antlerless elk tags for the period of September 15, 2024 through November 1, 2024 On or before October 15, 2024, the licensee may request (in writing) up to 1 bull elk tag and 3 additional antlerless elk tags	Maintain 7 miles of roads and water bars where slopes are greater than 15% to reduce sediment entering waterways. Seed along 7 miles roads for wildlife forages and erosion control. Create 15 wildlife brush piles at least 8 feet high and 30 feet in diameter. Place tree stems and brush in the head cuts in at least 5 locations to decrease soil erosion on the upland areas. There will be no cattle grazing on the ranch this year in accordance with the rest period outlined in the management plan. Maintain exclusion fencing around Matthews Ranch Lake and riparian.

Six Point Ranch Cont.	to accomplish the authorized harvest. In no case shall the number of tags issued be used to exceed the authorized harvest. The number of tag holders actively hunting shall not exceed the number of elk available to harvest.	Remove at least 50 feet of fence barriers and replace with elk crossings of wildlife friendly fencing. Maintain all the water developments, name and map them all for better management in the future. Plant 10 acres of forage plots for deer utilization. Establish a 2-acre exclusion plot for deer fawning area. Treat at least 10 acres of yellow star thistle.
Spring Valley Ranch Deer Zone A Mendocino 4,860 Acres	Authorized Harvest: 24 forked-horn or better buck deer, 4 bull elk and 1 antlerless elk tag Issue 24 buck deer tags for the period of August 1, 2024 through November 30, 2024 No more than 8 buck deer may be harvested after September 15, 2024. Issue 4 bull elk tags for the period of August 1, 2024 through November 30, 2024 On or before October 15, 2024, the licensee may request (in writing) up to 1 additional bull elk tag to complete the authorized harvest. In no case shall the number of tags issued be used to exceed the authorized harvest. The number of tag holders actively hunting shall not exceed the number of elk available to harvest.	Remove at least 10 acres of conifer removal in oak woodlands. Maintain 10 previous water development projects. Create at least 10 brush piles at least 6 feet tall and 10 feet in diameter at the base. Remove and manipulate at least 5 acres of brush manipulation by tractor, hand, and/or herbicide to control scotch broom and coyote brush to improve wildlife forage. Mechanical removal of at least 1 acre of blackberries to create clearings for wildlife. Mechanical removal of at least 2 acres of manzanita to create clearings for wildlife. Repair existing elk crossings as necessary and construct 1 new elk crossing. Remove at least 1,000 feet of woven wire cross fencing to reduce wildlife entanglement.

	Issue 1 antlerless elk tag for the period of September 15, 2024 through November 30, 2024	Maintain 2 ponds (1-large 5-acre pond with 1-smaller pond) for use by migratory birds and other wildlife, including large mammals. The pond provides year-round water, as well as roosting, feeding, and nesting habitat. At least 1 mile of road maintenance and erosion control measures to lessen the sedimentation in waterways. Burn at least 5 decadent brush piles.
Stackhouse Ranch Shasta Deer Zone C3 400 Acres	Authorized Harvest: 2 deer of which no more than 1 may be antlerless deer Issue 2 either-sex deer tags for the period of September 1, 2024 through November 30, 2024 No antlerless deer shall be harvested before September 15, 2024.	Conduct at least a 5-acre prescribed burn under the mature oak stands. Allow regrowth of important brush species to 3 feet in the 100 acres of thinned plantations. Plant black oak seedlings. Complete 20 acre thinning and fuels management project. Control invasive blackberries on 15 acres at the pond and restored meadows through spraying with appropriate herbicide. Maintain 6 wood duck nesting boxes. Complete 20 acre thinning and fuels management project.
Stewart Ranch Deer Zone B1 Trinity 11,006 Acres	Authorized Harvest: 36 forked-horn or better buck deer and 5 antlerless deer Issue 36 buck deer tags for the period of July 20, 2024, through November 30, 2024. 10 of those tags shall be provided to apprentice or first-time hunters, and 1 shall be donated to a Hunter Education Instructor.	Rebuild wildlife friendly fencing and rebuild irrigation for all wildlife food plots that burned. Replant 4 irrigated food plots (10 acres total) with clover, chicory, and brassica to provide forage for wildlife at least every 4 years. Replant at least 11 acres of dryland food plots with barley, wheat, oats, plantain, and grains. Maintain 8 water sources (ponds and springs) with cattle exclusion fencing by

Stewart Ranch Cont.	Issue 3 antlerless deer tags for the period of September 15, 2024 through November 30, 2024 No more than 18 buck deer may be harvested after October 23, 2024. On or before October 15, 2024, the licensee may request (in writing) up to 5 additional either-sex deer tags to accomplish the authorized harvest. In no case shall the number of tags issued be used to exceed the authorized harvest. The number of tag holders actively hunting shall not exceed the number of deer available to harvest.	inspecting and repairing any damaged parts. Maintain the 200-yard buffer Golden Eagle nesting site protection area below "TinaMarie's Rock" Maintain all 15 wood duck nesting boxes by repairing and replacing damaged boxes and checking annually for nesting activity. Retreat conifer removal projects that have regrown.
Stover Ranch Humboldt 7,000 Acres	Authorized Harvest: 4 bull elk and 2 antlerless elk Issue 4 bull elk tags for the period September 1, 2024, through November 15, 2024. Issue 2 antlerless elk tags for the period September 4, 2024 through November 15, 2024 One of the antlerless elk tags will be made available for DFW to distribute to an Apprentice Hunter through the SHARE Program. The SHARE program will reimburse the PLM for the tag fee, but the PLM will otherwise provide the hunt free of charge.	Treat at least 33 acres of oak woodland/ prairie margin. Removing all conifer trees less than or equal to 12 inches DBH. Treat at least 50 acres of Grassland core treatment. Removing all conifer trees less than or equal to 18 inches DBH.

Summer Camp Ranch Deer Zone B1 Mendocino 38,502 Acres Summer Camp Ranch Cont.	Authorized Harvest: 80 forked-horn or better buck deer and 1 bull elk Issue 80 buck deer tags for the period of July 13, 2024 through November 30, 2024 No more than 40 buck deer may be taken after October 27, 2024. Issue 1 bull elk tag for the period of July 13, 2024 through November 30, 2024 On or before October 15, 2024, the licensee may request (in writing) up to 20 additional buck deer tags and 1 additional bull elk tag to accomplish the authorized harvest. In no case shall the number of tags issued be used to exceed the authorized harvest. The number of deer or elk tag holders actively hunting shall not exceed the number of deer or elk available to harvest.	Maintain 3 irrigated wildlife forage areas, totaling 12.50 acres. Maintain RE2 riparian exclusion areas totaling 0.50 acre by repairing any damaged fencing and willows will be monitored for survival. Maintain 14 developed springs by checking and repairing any damage. Exclude livestock grazing from July through October. Improved grazing management on the 9-acre Garcey Unit to leave a minimum of 1000 pound per acre RDM. Create a 25-acre shaded fuel break throughout this 5-year period (5 acres each year). The fuel break will be up to 100 feet in width along both sides of approximately 1 mile of existing permanent roadway. Create at least 20 slash piles that are a minimum of 10 feet in diameter. Remove planted conifers in 5 acres of grassland areas to improve forage for wildlife. Cattle will be removed from the PLM from July through October. Maintain approximately 7 miles of riparian fencing on the Eel River and repair any damage. Maintain a minimum of 10 miles of road to prevent sedimentation into the Eel River system. Road maintenance will generally include grading roads, pulling inside ditches where they exist, shaping the road surface to promote proper drainage,

Summer Camp Ranch Cont.		and inspection/repair of drainage facilities such as cross drains and culverts. Burn 100 acres of brush and grasslands in coordination with CalFire Vegetation Management Program to rejuvenate vegetation and control conifers invading oak woodlands. Burns throughout the 5-year period with the CAL FIRE Vegetation Management Program are dependent upon conditions, if burning cannot be conducted during the five-year project, 25 acres of planted ponderosa pine in grassland areas will be treated for conifer removal as an alternative.
Travis Ranch Deer Zone B1 Trinity 11,907 Acres Travis Ranch Cont.	Authorized Harvest: 15 deer of which no more than 5 may be antlerless deer Issue 15 either-sex deer tags for the period of July 15, 2024 through November 30, 2024 Buck deer must be forked-horn or better. No antlerless deer shall be harvested before September 15, 2024. No more than 8 buck deer may be harvested after October 27, 2024.	Remove all dead plant material less than or equal to 10 inches DBH from at least 20 acres of oak woodlands. Create 5 brush piles at least 6 feet tall and 10 feet in diameter at the base.
Wiggins Ranch Humboldt 16,657 Acres	Authorized Harvest: 2 bull elk and 2 antlerless elk Issue 2 bull elk tags for the period of August 1, 2024 through October 31, 2024 Issue 2 antlerless elk tags for the period of September 4,	Remove encroaching conifers less than or equal to 12 inches DBH from at least 50 acres of oak woodland and adjacent grasslands. Within the treatment area at least 20 conifers greater than 12 inches DBH will be girdled.

	2024 through November 15, 2024 On or before October 1, 2024, the licensee may request (in writing) up to 1 additional bull elk tag to complete the authorized harvest. One of the antlerless elk tags will be made available for DFW to distribute to an Apprentice Hunter through the SHARE Program. The SHARE program will reimburse the PLM for the tag fee, but the PLM will otherwise provide the hunt free of charge.	
Wilkinson Hunting Club Deer Zone B1 Humboldt/ Trinity 5,376 acres	Authorized Harvest: 14 forked-horn or better buck deer Issue 14 buck tags for the period of August 19, 2024, through November 30, 2024. No more than 7 buck deer may be harvested after October 27, 2024.	Remove 10 acres of conifer trees 12 inches DBH or less in oak woodland areas. Remove at least 2,200 feet of abandoned fencing. Create at least 2 brush piles measuring at least 15 feet in diameter and 6 feet high. Create a 1 acre planted food plot enclosed by 3-foot electric fencing to keep wild pigs and cattle out but allow deer passage. Develop or rehabilitate 2 springs.

Proposed Seasons, Harvests, and Habitat Improvements

BAY DELTA REGION

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Corral Hollow Ranch Deer Zone A San Joaquin County 2,772 Acres	Authorized Harvest: 1 bull elk Issue 1 bull elk tag for the periods of July 15, 2024 through September 15, 2024 and November 15, 2024 through December 15, 2024.	Provide 480 acres of grasslands for exclusive use by elk. Continue to implement a rotational cattle grazing regime to provide adequate forage for elk. Leave downed and standing dead trees, including those that are a result of the SCU Lightning Complex and Corral Fires. Fence off a 30-acre section to establish elk forage plots. Five-acre plots are to be disked and planted each year for the next 5 years, resulting in 25 acres of planted forage. Seed mixes should contain a mixture of native grasses and forbs. Build and install 5 peeler-core elk crossings over the next 5 years. Two of these crossings will be located on the forage plot boundary fence and should be completed during the first year of this plan.
Coon Creek Ranch Deer Zone A Santa Clara County 1,650 Acres	Authorized Harvest: 8 forked-horn or better buck deer Issue 8 buck deer tags to take for the periods of July 11, 2024 through November 30, 2024.	Brush approximately 10 new acres of chaparral. Pile brush and burn. Maintain springs and pond. Limit cattle grazing to 80 acres of ranch.

CENTRAL REGION		
PLM Area	**2024 Proposed Season and Harvest**	**Habitat Improvement Program**
Alexander Ranch Deer Zone A Monterey 786 Acres	Authorized Harvest: 1 bull elk, 2 antlerless elk and 1 forked-horn or better buck deer Issue 1 bull elk tag for the period of July 2, 2024, through December 31, 2024 Issue 2 antlerless elk tags for the period of September 15, 2024, through December 31, 2024 Issue 1 buck deer tag for the period of July 2, 2024, through November 30, 2024.	Maintain existing springs, troughs and reservoirs to provide water for wildlife. Conduct 2 elk counts per year (count deer when possible, too). Create 5 brush piles for use by wildlife. Mechanically crush or manipulate 5 acres of decadent brush to improve forage for wildlife. Limit cattle stocking rate to 75 animals to enhance and provide habitat and feed for wildlife.
Avenales Ranch San Luis Obispo County 11,300 Acres	Authorized Harvest: 4 bull elk and 3 antlerless elk Issue 3 bull elk tags for the period of July 15, 2024, through December 1, 2024. Issue 3 antlerless elk tags for the period of September 15, 2024, through December 1, 2024.	Repair, maintain, and upgrade wildlife projects which were built in 2019. Install a 5,000-gallon water tank, rain catch cover, fencing, and Wildlife friendly water trough for wildlife usage on the lower Power line road. Install an extra 5000-gallon water tank for extra water storage. Install 1 wildlife friendly water trough. Work with local college students on research on the mountain king snake. This would consist of allowing them to access the ranch, helping with access to remote back county and recording any sighting we come across. |

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Bardin Ranch Deer Zone A Monterey 8,000 Acres	Authorized Harvest: 2 bull elk tags (*every other year*), and 1 antlerless elk tag (*annually*) Issue 2 bull elk tag for the period of October 1, 2024, through December 31, 2024. Issue 4 antlerless elk tags for the period of October 1, 2024, through December 31, 2024.	Plant forage in the Gabilan elk and two hay fields. Mechanically clear and pile brush to improve grazing and enhance bird nesting habitat. Maintain all water supplies, springs, water troughs, and dams and remove brush in springs. Continue livestock grazing rotation and construct elk crossings. Implement improvements to storage reservoirs. Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.
Camp 5 Outfitters – Roth Ranch Deer Zone A Monterey/San Luis Obispo 5,800 Acres	Authorized Harvest: 2 bull elk, 1 antlerless elk, 6 forked-horn or better buck deer, and 3 either-sex deer Issue 2 bull elk tags for the period of July 2, 2024, through December 31, 2024. Issue 1 antlerless elk tag for the period of September 15, 2024, through December 31, 2024. Issue 6 buck deer tags for the period of July 2, 2024, through November 30, 2024. Issue 3 either- sex deer tags for the period of September 1, 2024 through November 30, 2024 for antlerless deer.	Maintain perennial water for wildlife and water retention devices and pipes as needed. Plant 100 acres of grain for wildlife. Plant 20 acres safflower for wildlife Build a 20 foot x 20 foot brush pile. Continue to keep cattle grazing at 20% of carrying capacity. Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Carnaza Ranch San Luis Obispo County 8,475 acres	Authorized Harvest: 3 bull elk and 3 antlerless elk Issue 3 bull elk tags for the period of July 15, 2024, through December 31, 2024. Issue 3 antlerless elk tags for the period of September 15, 2024, through December 31, 2024.	Plant 100 acres of barley for wildlife. Plant 10 trees. Keep water troughs full year-round.
Chimney Rock Ranch San Luis Obispo County 6,500 Acres	Authorized Harvest: 3 bull elk and 10 forked-horn or better buck deer Issue 3 bull elk tags for the period of July 15, 2024, through November 30, 2024. Issue 16 buck deer tags for the period beginning July 15, 2024, through November 30, 2024. At the request of the licensee on or before October 25th, the licensee may request an addition of 4 deer tags to accomplish the authorized harvest.	Construct 10+ brush piles for wildlife cover. Will burn old, collapsed piles, weather/burn days permitting. Defer cattle from Lake Pasture from early spring thru mid-fall. Continue to monitor/repair and/or improve all water sources. Spray yellow star thistle, medusa head, thistles, etc. in Lake Pasture and on San Marcos Dam.
Clark & White Ranch San Luis Obispo County 5,660 Acres	Authorized Harvest: 3 bull elk and 2 antlerless elk Issue 3 bull elk tags for the period of July 15, 2024, through December 15, 2024. Issue 2 antlerless elk tags for the period of September 15, 2024, through December 15, 2024.	Plant 1,000 acres of barley for use by elk and other wildlife. Repair 1 dam to increase standing water and enhance riparian/marsh habitats.

D- Rafter L Ranch San Luis Obispo County 3,156 Acres	Authorized Harvest: 2 bull elk, 1 antlerless elk Issue 2 bull elk tags for the period of July 15, 2024, through December 31, 2024. Issue 1 antlerless elk tag for the period of September 15, 2024, through December 31, 2024.	Maintain existing brush piles by adding new brush to the tops/edges of the brush piles. Create brush pile #11 near Pond 2 for bird and small animal cover. Maintain duck boxes at Ponds 1-8. Maintain goose/turtle platforms at Ponds 2 and 3. Maintain pond turtle basking structures at Ponds 4 and 10. Maintain oak trees for mast production by preserving existing oak trees and woodlands, and preventing brush encroachment through livestock grazing. Leave downed woody material for wildlife use. Maintain operational status of two existing water projects. Plant 5 valley oak trees from acorns collected on site.
DeFrancesco/ Eaton Ranch Deer Zone: A Merced 4,149 Acres	Authorized Harvest: 10 forked-horn or better buck deer, 3 bull elk, and 3 cow elk Issue 10 buck deer tags for the period of July 13, 2024, through November 30, 2024. Issue 3 bull elk tags for the period of July 13, 2024, through November 30, 2024. Issue 3 antlerless elk tags for the period of September 14, 2024, through November 30, 2024.	Plant and maintain 5 acres of winter forage in area where juniper removal took place. Eliminate cattle grazing on APNs 087-070-011 and 087-070-013 between June 1, 2024 and December 31, 2024. Maintain water supply troughs at Main spring, Deer Camp, Laurel spring, Squirrel Spring, & Hay Barn.

Hartnell Ranch Deer Zone A Monterey 4,600 Acres	Authorized Harvest: 1 bull elk, 2 antlerless elk and 2 forked-horn or better buck deer Issue 1 bull elk tag for the period of July 2, 2024, through December 31, 2024. Issue 2 antlerless elk tags for the period of September 15, 2024, to December 31, 2024. Issue 2 forked horn or better buck deer tags for the period of July 2, 2024, to November 30, 2024.	Maintain existing springs, troughs and reservoirs to provide water for wildlife. Conduct 3 elk counts per year (count deer, when possible, too). Create 8 brush piles for use by wildlife. Mechanically crush or manipulate 10 acres of decadent brush to improve forage for wildlife. Limit Cattle stocking rate to 250 animals to maintain reserve habitats for wildlife.
Indian Valley Cattle Company (IVCC) – Lombardo Ranch Deer Zone A Monterey 12,500 Acres	Authorized Harvest: 3 bull elk, 2 antlerless elk and 4 forked-horn or better bucks Issue 3 bull elk tags for the period of July 15, 2024, through December 31, 2024. Issue 2 antlerless elk tag for the period of September 15, 2024, through December 31, 2024. Issue 4 buck deer tags for the period of July 2, 2024, through November 30, 2024.	Burn or brush crush 3-5 acres of chaparral. Create 4-6 brush piles for use by wildlife. Maintain cattle stocking rate of approximately 300 animals to provide feed and reduce competition with wildlife. Plant 350 acres of barley. Rotationally graze all pastures and rest others to increase wildlife access. No grazing in the Big Sandy Creek. Rotate cattle grazing of volunteer barley to facilitate wildlife use. Rehabilitate 25-50 acres of abandoned farmland to improve habitat value.
Lewis Ranch Deer Zone A San Benito 512 Acres	Authorized Harvest: Issue 1 bull elk tag (*every other year*), and 1 antlerless elk tag (*annually*) Issue 1 bull elk tag for the period of July 15, 2024, through December 31, 2024.	Maintain perennial water for wildlife and repair collection devices and troughs as needed. Clean and repair 4 existing owl boxes. Check 4 bat boxes. Create 12 brush piles for use by wildlife.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
Lewis Ranch Cont.	Issue 1 antlerless elk tag for the period of September 15, 2024, to December 31, 2024.	Disc/plant/fertilize 8 fields with barley. No grazing of livestock on 512 acres.
Lone Ranch Deer Zone A San Benito 12,500 Acres	Authorized Harvest: 3 bull elk, 2 antlerless elk and 4 forked-horn or better buck deer Issue 3 bull elk tags for the period of August 1, 2024, through December 31, 2024. Issue 2 antlerless elk tag for the period of September 15, 2024, to December 31, 2024. Issue 4 forked horned or better buck deer tags for the period of July 2, 2024, through November 30, 2024.	Maintain perennial water for wildlife and repair collection devices and troughs as needed. Repair and improve Red Mountain Pond Spring to provide clean drinking water for wildlife. Rest Lower McCoy Pasture (1,500 acres), Cabin Pasture (300 acres), Loco Flat Pasture (200 acres) and Johnson Pasture (1,200 acres). Install 3 elk crossings in McCoy. Treat noxious weeds, such as yellow-star thistle, with herbicide in Driveway and Devil’s Canyon.
Morisoli Ranch Deer Zone A Monterey and San Benito Counties 14,700 Acres	Authorized Harvest: 4 bull elk and 4 antlerless elk Issue 4 bull elk tags for the period of July 1, 2024, through December 31, 2024. Issue 4 antlerless elk tags for the period of September 15, 2024, through December 31, 2024.	Maintain perennial water for wildlife and water retention devices and pipes as needed – develop one new water source for wildlife. Mechanically clear 5 acres of old growth brush to stimulate new forage growth for use by wildlife. Upgrade/improve old elk crossings and install one additional crossing. Construct and install 1 owl next box. Construct additional water storage tank, lines and troughs. Plant a minimum of 10 acres of dryland forage mix to provide wildlife forage.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
		Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.
Peachtree Ranch Deer Zone A Monterey 32,104 Acres	Authorized Harvest: 7 bull elk and 4 antlerless elk Issue 7 bull elk tags for the period of July 2, 2024, through December 31, 2024. Issue 4 antlerless elk tag for the period of September 15, 2024, through December 31, 2024. **This represents an increase in tag allocation (2 additional bull elk tag and 1 additional antlerless tag)*	Maintain perennial water for wildlife and water retention devices and pipes as needed. Build 1 elk crossing. Conduct 10-12 elk counts. Report the vegetation height by pasture after the steers have shipped. Install 15 escape ramps in water troughs. Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.
Pine Mountain Ranch Deer Zone A San Benito County 1,621 Acres	Authorized Harvest: 4 forked-horn or better buck deer Issue 4 buck deer tags for the period of July 2, 2024, through November 20, 2024.	Maintain perennial water for wildlife and water retention devices and pipes as needed – develop 1 new water source for wildlife. Continue to mechanically clear or brush crush decadent to stimulate new forage growth for use by wildlife. Plant a minimum of additional dryland forage mix to provide wildlife forage. Repair and maintain fencing as needed – continue to remove interior fencing to encourage wildlife to traverse the property.

PLM Area	2024 Proposed Season and Harvest	Habitat Improvement Program
		Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.
Rancho La Cuesta Deer Zone A San Benito 4,000 Acres	Authorized Harvest: 2 bull elk, 1 antlerless elk, and 4 forked-horn or better buck deer Issue 2 bull elk tags for the period of July 15, 2024, through December 31, 2024. Issue 1 antlerless elk tag for the period of September 15, 2024, through December 31, 2024. Issue 2 buck deer tags for the period of July 15, 2024, through November 30, 2024 *Rancho La Cuesta is not requesting their full allocation of deer tags.*	Clean and maintain water points on the ranch to provide water for wildlife. Provide water for the upper ranch. Continue to repair pond damage that occurred in 2023. Plant 5 acres of grass and legumes to provide high quality food for elk and deer. Maintain 2,350-acre cattle free refuge on the upper portion of the ranch for exclusive use by wildlife. Burn or mechanically manipulate 5 acres of decadent chaparral to stimulate growth of quality browse for wildlife. Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.
Rooster Comb Ranch Deer Zone: A Stanislaus 4,862 Acres	Authorized Harvest: 6 forked-horn or better buck deer and 2 bull elk Issue 6 buck deer tags for the period of August 10, 2024, through November 24, 2024. Issue 2 bull elk tags for the period of September 6, 2024, through December 31, 2024.	Plant 20 acres with rye/vetch/sudan mix in Area A. Clear 5 acres of decadent chapparal and use cuttings to make quail habitat. Maintain and/or repair all water sources. Maintain and/or repair all elk crossings.

Temblor Ranch 30,000 Acres Kern/San Luis Obispo Counties	Authorized Harvest: 9 bull elk and 10 antlerless elk Issue 9 bull elk tags for the period of July 15, 2024, through December 31, 2024. Issue 10 antlerless elk tags for the period of September 15, 2024, through December 31, 2024.	Plant 100 acres of barley. Plant 5 shade trees and 5 fruit trees. Install 1 water trough.
Trinchero Ranch Deer Zone A San Benito 4,452 Acres	Authorized Harvest: 2 bull elk and 1 antlerless elk Issue 2 bull elk tags for the period of July 15, 2024, through December 31, 2024. *Trinchero Ranch is not requesting their full allocation of tags.*	Maintain perennial water for wildlife and water retention devices and pipes as needed. Control invasive tamarisk along San Benito River adjacent to house pasture. Plant dryland range mix in brush cleared areas. Construct 4-6 brush piles for wildlife use. Limit cattle grazing on approximately 4000 acres in Black Mountain and Red Mountain pastures from December through May. Contribute to CDFW chronic wasting disease surveillance by providing samples from harvested elk.

STAFF SUMMARY FOR OCTOBER 11-12, 2023
(For Background Purposes Only)

9. WHITE STURGEON EMERGENCY REGULATION

Today's Item **Information ☐** **Action ☒**

Discuss and consider adopting emergency regulations concerning recreational take of white sturgeon to support recovery of sturgeon populations and to track fishing pressure and success.

Summary of Previous/Future Actions

- Wildlife Resources Committee (WRC) discussion and recommendation — September 19, 2023; WRC
- **Today's adoption hearing — October 11-12, 2023**

Background

White sturgeon is an anadromous fish species that resides primarily in the San Francisco Bay-Delta and migrates as adults into the major rivers of the Central Valley to spawn. White sturgeon are long lived, potentially in excess of 100 years, with most individuals reaching maturity by approximately 14 to 15 years. Mature white sturgeon spawn every 2 to 5 years. Successful recruitment to the adult population is uncommon, occurring approximately every s6to 7 years, and is highly correlated with above normal water years as measured by high mean daily Sacramento–San Joaquin River Delta outflow. The abundance of legal-sized white sturgeon in California has declined considerably since the 1980s, when abundance was estimated to be approximately 175,000 fish. In 2015, the Department estimated abundance in California at about 48,000 fish, and the Department's 2023 estimate was about 33,000 fish.

At present, recreational anglers can keep one white sturgeon per day, with a combined total of three per year, between 40 and 60 inches (fork length). The season is open year-round, with some limited regional and/or seasonal closures. Fishing pressure for white sturgeon, as measured by the number of fish harvested by anglers, has remained relatively stable; however, the number of fish caught and released has declined precipitously, indicating that fewer fish overall are being caught. The exploitation rate (i.e., the age-specific proportion of the population or biomass that is removed each year) of white sturgeon is estimated to be very high, ranging from 8 to 29.6% between 2007 and 2015. It has been suggested that the highest exploitation rate that a white sturgeon population can sustain is approximately 5 to 10%.

During July and August 2022, the San Francisco Bay region experienced a major harmful algal bloom (HAB) of *Heterosigma akashiwo* that resulted in significant mortality of fishes, including sturgeon. The resulting mortality has exacerbated what the Department believes to be an already unsustainable level of fishery exploitation of white sturgeon into a crisis situation.

Synopsis of Events

The Commission was first informed about the existence of an emergency through WRC. At the January 2023 WRC meeting at the request of the chair, the Department responded to an op-ed written by various sturgeon researchers in the academic field, calling on the Department to close the recreational white sturgeon fishery. The Department's response included a brief discussion of white sturgeon population declines, and the status of white sturgeon data being processed from various sources, including ongoing evaluation of impacts caused to the species by the summer of 2022 HAB, the possibility of future regulatory actions, data collection and modelling, and future stakeholder input. At the January meeting, the Department indicated that, based on the information available at the time, emergency action was not warranted, but that data was still being analyzed.

During the May 2023 WRC meeting, the Department outlined its previous and future plans for stakeholder engagement on the subject of potential white sturgeon regulation changes, stating its intent to develop a proposed regular rulemaking for Commission consideration that would change white sturgeon regulations for the 2025 calendar year, and that the Department was continuing to analyze data to determine the status of white sturgeon and appropriate management measures, including options for changes to sport fishing.

At the September 2023 WRC meeting, the Department presented new evidence on the white sturgeon population, the effects of the HAB, current and historical rates of sturgeon exploitation, and other information, all of which led the Department to conclude that an emergency situation exists. To protect the surviving population of white sturgeon and maintain a recreational fishery into the future, the Department stated that immediate steps are necessary to (1) stop angler-associated harvest of adult white sturgeon and (2) minimize harassment and handling on the spawning grounds so that adults can successfully spawn, and new individuals can recruit to the population.

Given this new information, WRC decided to recommend to the full Commission that it consider an emergency regulation at its next scheduled meeting, in October 2023. As a result of that WRC decision, Commission staff requested the Commission president add an agenda item to the October meeting to allow the Commission to consider emergency action.

Proposed Emergency Regulations

This proposed regulatory action amends sections 5.79, 5.80, 27.90 and 29.72, which describe report card and tagging requirements, seasons, and associated bag limits for white sturgeon recreational fishing in inland waters.

- Section 5.79: Removes language regarding white sturgeon harvest tags, as no harvest would be allowed under the proposed emergency regulations. Adds a requirement for anglers to report the length of any fish caught, to provide the Department with additional data for future management options. Adds language to instruct anglers to report additional sturgeon caught and released to provide data on fishing pressure and success.
- Section 5.80: Specifies white sturgeon fishing seasons from the west Carquinez Bridge east to the Highway 50 bridge on the Sacramento River, and above the Highway 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River; changes the fishing to catch-and-release only; and changes the daily bag limit to 0.
- Section 27.90: Specifies white sturgeon fishing seasons for the Carquinez Bridge area, which falls under the jurisdiction of marine fisheries; changes the fishing to catch-and-release only; and changes the daily bag limit to 0.

- Section 27.92: Updates language to a bag limit of 0 and specifies that white sturgeon is catch-and-release only in ocean waters.

Further details on the proposed changes are available in the emergency statement and proposed regulatory language (exhibits 4 and 5).

Significant Public Comments

1. An owner of a bait shop writes in opposition to the proposed emergency regulations, stating that the closure is not necessary and will have a dire effect on small businesses and the fishing industry (Exhibit 6).
2. A member of the public expresses concern that the urgency for the rulemaking is exaggerated. They state that the information provided is only from the last 4 years and that historical information from the past 80 years should also be considered. Lastly, they indicate that they are unaware of any successful catch-and-release fisheries on the West Coast, and are skeptical of the survey results that inquired if people would continue to fish without the option of harvest (Exhibit 7).

Recommendation

Commission staff: Adopt the emergency regulations amending sections 5.79, 5.80, 27.90, and 27.92 related to white sturgeon catch and release as recommended by the Department.

Committee: The Wildlife Resources Committee recommends the Commission adopt an emergency regulation regarding recreational take of white sturgeon.

Department: Adopt the emergency regulations as presented in the emergency statement in Exhibit 4 to pause all harvest of white sturgeon within the recreational fishery until new regulations can be developed that will limit exploitation to sustainable rates based on monitoring data.

Exhibits

1. Department presentation
2. Supplementary material from the Department, received October 4, 2023
3. Department memo, received September 22, 2023
4. Draft emergency statement and informative digest
5. Draft proposed regulatory language
6. Email from Leonard Butcher, received September 18, 2023
7. Email from Jacob Linard, received September 25, 2023

Motion

The Commission determines, pursuant to Section 399 of the California Fish and Game Code, that adopting these regulations is necessary for the immediate conservation, preservation, and protection of birds, mammals, fish, amphibians, or reptiles, including, but not limited to, their nests or eggs.

The Commission further determines, pursuant to Section 11346.1 of the California Government Code, that an emergency situation exists and finds the proposed regulations are necessary to address the emergency.

Moved by ___________ and seconded by ___________ that the Commission adopts the emergency regulations amending sections 5.79, 5.80, 27.90 and 27.92 related to white sturgeon catch and release fishing regulations.

Director

Subject: Submittal of Emergency Statement for Readoption of Sections 5.79, 5.80, 27.90 and 27.92, Title 14, California Code of Regulations, Re: White Sturgeon

Please find attached the Findings of Emergency and Statement of Proposed Emergency Regulatory Action to Readopt amendments to sections 5.79, 5.80, 27.90 and 27.92, of Title 14, California Code of Regulations. At its October 11, 2023 meeting, the Fish and Game Commission (Commission) approved an emergency rulemaking amending sections 5.79, 5.80, 27.90, and 29.72, Title 14, CCR, which describe report card and tagging requirements, and seasons and bag limits for White Sturgeon sport fishing in inland waters. The current emergency rule will expire after six months, on May 15, 2024, unless it is readopted for an additional 90 days at the April 18, 2024 Commission meeting. The continuation of the emergency action reducing the bag limit, reducing the size limit, instituting a per-day vessel limit, and closing fishing in migrating and spawning habitat is necessary to protect the White Sturgeon population until a permanent regulation can be implemented.

During July and August 2022, the San Francisco Bay region experienced a major Harmful Algal Bloom (HAB) that resulted in significant mortality of sturgeon. The Department recorded over 850 sturgeon carcasses, the majority legal-sized or larger. Based on carcass studies and fish kills of other species of sturgeon, it is thought that only a small percentage of the fish killed floated long enough to be detected. The absolute magnitude of this impact on the White Sturgeon population is unknown but is thought to be significant.

To protect the surviving population and maintain a recreational fishery into the future, immediate steps are necessary to reduce angler associated harvest of adult White Sturgeon and to minimize harassment and handling on the spawning grounds. Continuing the emergency action directed at reducing exploitation rate and protecting reproduction of the species is necessary until long term regulations are enacted that will adequately protect the remaining White Sturgeon population.

We request submission of this emergency action to the Office of Administrate Law after consideration at the April meeting. If you have any questions or need additional information, please contact Jay Rowan, Chief, Fisheries Branch at fisheries@wildlife.ca.gov. The Department point of contact for this emergency regulation should identify Statewide Sturgeon Coordinator, John Kelly. He can be reached at sturgeon@wildlife.ca.gov.

Finding of Emergency and
Statement of Proposed Emergency Regulatory Action

Readoption of Emergency Action to Amend Sections 5.79, 5.80, 27.90, and 27.92
Title 14, California Code of Regulations
Re: White Sturgeon

Date of Statement: February 15, 2024

Throughout this document, Department or CDFW refer to the California Department of Fish and Wildlife and Commission refers to the California Fish and Game Commission. Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

I. Emergency Regulations in Effect to Date

At its October 11, 2023 meeting, the Commission approved an emergency rulemaking amending sections 5.79, 5.80, 27.90, and 27.92, Title 14, CCR, which describe report card and tagging requirements, and seasons and bag limits for White Sturgeon sport fishing in inland and ocean waters.

Background

White Sturgeon Sport Fishing

White Sturgeon (*Acipenser transmontanus*) are an anadromous species of fish that reside primarily in the San Francisco Bay Delta (SF Bay) and migrate as adults into the major rivers of the Central Valley to spawn. Most spawning occurs in the Sacramento River approximately between Verona and Colusa (Schaffter 1997), with a lesser amount of spawning on the lower San Joaquin River (Jackson et al. 2015). Some additional spawning may occur in tributaries such as the Feather, Bear, and Yuba rivers. White Sturgeon are long lived, potentially in excess of 100 years, with most reaching maturity by approximately 19 years, spawning every two to four years once mature (Chapman et al. 1996; Hildebrand et al. 2016). Successful recruitment to the adult population is uncommon, occurring approximately every six to seven years, highly correlated with above normal water years as measured by high mean daily Delta outflow (CDFW 2023; Fish 2010). The abundance of legal-sized White Sturgeon has declined considerably since the 1980s, when abundance was estimated to be approximately 175,000 fish (CDFW 2023; Danos et al. 2019). In 2015, the Department estimated abundance at about 48,000 fish (Danos et al. 2019), and the most recent estimate was about 33,000 fish (CDFW 2023).

Fishing pressure for White Sturgeon has remained stable at roughly 40,000 to 45,000 anglers per year since 2013 when fees were first charged for the Sturgeon Fishing Report Card (Card). Based on Card returns, the number of fish harvested by anglers has remained relatively stable. However, the number of fish caught and released has declined precipitously, indicating that fewer fish overall are being caught. According to Card data, in 2021, anglers kept 46% of landed fish (Hause et al. 2021). The majority of anglers that harvest fish keep only one a year (75%), with only about 5% of anglers that harvest (1% of Cardholders) keeping the full three-fish limit. Exploitation rate of White Sturgeon is estimated to be very high, ranging from 8 to 29.6% between 2007 and 2015 (Blackburn et al. 2019) and averaging 8.1% in the years since that time (CDFW 2023). It is suggested that the highest exploitation rate that a sturgeon population can sustain is approximately 5 to 10% (Beamesderfer and Farr 1997), and that does not account for other anthropogenic sources of mortality such as habitat loss, altered hydrology, or contaminants. For comparison, Washington and Oregon use 3.8% as a target for management in areas that permit harvest.

Section 5.79, White Sturgeon Report Card and Tagging Requirements for Inland Waters

The emergency regulations amended White Sturgeon report card and tagging requirements for inland waters in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (b): Edit text to reflect that report cards will come with only one tag rather than three. Add subsections (7) and (8) to clarify when anglers can continue to fish catch and release after harvesting a fish. Anglers will not be permitted to fish catch and release the same day they harvest a fish in order to prevent 1) take over the daily possession limit and 2) “high grading” (holding a fish in captivity while continuing to fish in the hopes of catching a larger individual).
- Subsection (c)(1): Add a requirement for anglers to report length of caught fish. This is necessary to provide more data availability on the nature of size to inform future management options related to age.
- Subsection (c)(2): Remove the current language that tells anglers if all lines on the card are filled, any additional sturgeon caught and released do not need to be recorded, and replace with language guiding anglers to report additional sturgeon caught and released on the back of the card. This is necessary in order to track fishing pressure and success. It is valuable to track all fish caught by anglers and this should not be restricted simply by the size of the printed card. This type of data allows the Department to form a better understanding of the fishery as we plan long-term regulations for the fishery.

Section 5.80, White Sturgeon

The proposed regulations will amend the White Sturgeon open season and daily and annual bag limit in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (a); from the west Carquinez Bridge east to the Hwy 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River the fishing season will

remain open all year. Above the Hwy 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River, including all tributaries of both rivers, fishing will be allowed from June 1 through December 31 and all fishing for sturgeon will be unlawful from January 1 to May 31. This is necessary to maintain recreational fishing, which has economic and cultural benefits, while preventing additional mortality of the impacted White Sturgeon population and minimizing harassment and handling of migrating and spawning individuals. White Sturgeon are known to handle catch and release fishing with minimal adverse impacts except during migration and spawning season when additional stress of catch can cause fish to abort spawning activities.

- Subsection (b), now (b) and (c); Divide this subsection so there are individual sections for daily and annual limits. This will allow unambiguous clarification of when catch and release angling is permitted. Change the annual bag limit of "three fish per year statewide" to "one fish per calendar year statewide". This is necessary to reduce harvest of White Sturgeon in inland waters to ensure protection of the population impacted by the HAB-induced fish kill and provide protection during migration and spawning.
- Add subsection (d); add vessel daily limit of two fish per day per vessel, regardless of how many sturgeon report card holders are on board. This will help reduce the daily amount of harvest associated with multi-angler vessels, both private and professional, and should contribute to less overall harvest of the adult population.
- Subsection (c), now (e): change the minimum legal size from 40 to 42 in. fork length and the maximum size from 60 to 48 in. fork length. Reducing the slot limit to target a lower size range of adults is expected to reduce overall harvest and provide more protection of the larger, most reproductively valuable fish in the population.
- Subsections (e) through (l) will need to be re-lettered to account for the splitting of subsection (b) and the addition of subsection (d) daily vessel maximum harvest.

Section 27.90, White Sturgeon

These regulations refer to areas west of the Carquinez Bridge, which fall under the jurisdiction of marine fisheries. The emergency regulations will amend the White Sturgeon open season and daily and annual bag limit in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (a): west of the Carquinez Bridge, angling will be allowed all year, except as described in Section 27.95. This note has been added to explicitly draw attention the existing seasonal closure in San Francisco Bay.
- Subsection (b), now (b) and (c); Divide this subsection so there are individual sections for daily and annual limits. This will allow unambiguous clarification of when catch and release angling is permitted. Change the annual bag limit of "three fish per year statewide" to "one fish per calendar year statewide". This is necessary to reduce harvest of White Sturgeon in marine waters to ensure protection of the population impacted by the HAB-induced fish kill and provide protection during migration and spawning.
- Add subsection (d); add vessel daily limit of two fish per day per vessel, regardless of how many sturgeon report card holders are on board. This will help reduce the daily amount of

harvest associated with multi-angler vessels, both private and professional, and should contribute to less overall harvest of the adult population.

- Subsection (c), now (e): change the minimum legal size from 40 to 42 in. fork length and the maximum size from 60 to 48 in. fork length. Reducing the slot limit to target a lower size range of adults is expected to reduce overall harvest and provide more protection of the larger, most reproductively valuable fish in the population.
- Subsections (c) through (h) will need to be re-lettered to account for the splitting of subsection (b) and the addition of subsection (d) daily vessel maximum harvest.

Subsection 27.92, White Sturgeon Report Card and Tagging Requirements for Ocean Waters

The proposed regulations will amend White Sturgeon report card and tagging requirements for ocean waters in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (b): Edit text to reflect that report cards will come with only one tag rather than three. Add subsections (7) and (8) to clarify when anglers can continue to fish catch and release after harvesting a fish. Anglers will not be permitted to fish catch and release the same day they harvest a fish in order to prevent 1) take over the daily possession limit and 2) “high grading” (holding a fish in captivity while continuing to fish in the hopes of catching a larger individual).
- Subsection (c)(1), now subsection (b)(1); add a requirement for anglers to report length of caught fish to provide more data availability to inform future management options. Subsection (c)(2), now subsection (b)(2); remove the current language that tells anglers if all lines on the card are filled any additional sturgeon caught and released do not need to be recorded and replace with language guiding anglers to report additional sturgeon caught and released on the back of the card. This is necessary in order to track fishing pressure and success. It is valuable to track all fish caught by anglers and this should not be restricted simply by the size of the printed card. This type of data allows the Department to form a better understanding of the fishery as we plan long-term regulations for the fishery.

II. Request for Approval of Readoption of Emergency Regulations

At the October 11, 2023 FGC meeting, the Commission voted in support of an emergency action that limited harvest via reductions in the bag and legal slot limits, and instituted per-day vessel limits and seasonal and geographic closures of migrating and spawning habitat. This was intended to protect the existing population in the short term while allowing time for the Department to develop new long-term management measures for the future population.

The current emergency rule will expire after six months, on May 15, 2024, unless it is readopted for an additional 90 days at the April 18, 2024 meeting of the Fish and Game Commission (Commission). The continuation of the emergency action reducing the bag limit, reducing the size limit, instituting a per-day vessel limit, and closing fishing in migrating and spawning habitat is necessary to protect the White Sturgeon population until a permanent regulation can be implemented.

It is anticipated that a standard rulemaking to permanently adopt these White Sturgeon fishery changes will be received by the Commission at its June 14-15, 2024 meeting at which time the Commission may authorize publication of a notice of its intent to adopt the regulations. It is expected that the permanent regulations would become effective in January 2025.

III. Statement of Facts Constituting the Need for Readoption of Regulatory Action

Until the start of the emergency action on November 16, 2023, recreational anglers were permitted to keep one White Sturgeon per day, and a combined total of three per year, between 40 and 60 in. fork length, meaning the measurement of the fish from the front of its head to the fork in its tail. The season was open year-round, with some limited regional and/or seasonal closures. The emergency action accomplished the following:

a) reduced the annual bag limit for White Sturgeon from three to one fish,
b) reduced the legal-sized slot limit from 40-60" total length (TL) to 42-48" TL,
c) placed a limit of two fish per day per boat, and
d) closed White Sturgeon fishing in the migrating and spawning reaches of the Sacramento and San Joaquin rivers from January 1 through May 31.

It is likely to have resulted in the desired effect of reducing exploitation rate and protecting spawning fishes; however, the actual effect of the emergency action will not be quantifiable until summer 2025 due to how data are collected in this fishery. The Department monitors harvest using the Sturgeon Fishing Report Card (card) which must be returned after the end of the calendar year. Card data are analyzed and trends are reported in the summer of the year following the card year (e.g. 2023 data will be reported in summer 2024) after sufficient time is given for cards to be returned to the Department, entered in the database, QA/QC by staff, and then analyzed. The emergency regulations went into effect on November 16, 2023, so only 1.5 months of data under the emergency action will be available for analysis later in 2024. It is possible that trends associated with the emergency action will become apparent in those data, but the Department will not be able to accurately assess the effects of this action until the summer of 2025 when 2024 data are available. The continued emergency action directed at reducing exploitation rate and protecting reproduction of the species is necessary until long term regulations are enacted that will adequately protect the remaining White Sturgeon population.

IV. Existence of an Emergency and Need for Immediate Action

The Commission considered the following factors in determining that an emergency does exist at this time:

The magnitude of potential harm:

During July and August 2022, the SF Bay region experienced a major HAB of *Heterosigma akashiwo* that resulted in significant mortality of fishes, including both White and Green sturgeon. The unprecedented fish kill resulting from the 2022 HAB killed at least 850 sturgeon, primarily

White Sturgeon (CDFW 2023). Of these carcasses, 86% were legal-sized or greater, representing mature, spawning broodstock (CDFW 2023). This estimate represents the minimum mortality experienced, which may have been an order of magnitude greater based on data from other sturgeon populations. This added mortality from the HAB was equivalent to 62% of the mortality due to harvest in 2022. Further, *H. akashiwo* bloomed again in the summer of 2023, resulting in a less intense HAB that resulted in the loss of at least 15 White and one Green sturgeon, suggesting that recuring HABs should be anticipated in the future. The abundance of legal-sized White Sturgeon has already declined considerably in the past forty years, and these HAB fish kills exacerbated the situation considerably. Abundance was estimated to be approximately 175,000 legal-sized fish in the 1980s (Danos et al. 2019). The Department's most recent population estimate of White Sturgeon was around 33,000 fish. Without knowledge of the true size of the population reduction resulting from the HAB fish kills, these mortality events could be impacting a considerable portion of the population.

The existence of a crisis situation:

The fish kill resulting from the HAB exacerbated what the Department believed to be an already unsustainable level of fishery exploitation of White Sturgeon into a crisis situation. In order to protect the surviving population of White Sturgeon and maintain a recreational fishery into the future, immediate steps were necessary to reduce angler associated harvest of adult White Sturgeon and to minimize harassment and handling on the spawning grounds so that these adults can spawn successfully, and new individuals can recruit to the population. The Department recommended that all harvest of White Sturgeon within the recreational fishery be paused until new regulations could be developed to limit exploitation to sustainable rates based on monitoring, which was opposed by the recreational sturgeon fishing industry. Based on carcass studies and fish kills of other species of sturgeon, it is thought that only a small percentage of the fish killed floated long enough to be detected (Fox et al. 2020). A second, less intense HAB of the same organism resulted in additional mortality, indicatingthat HABs are likely to recur in the future. The absolute magnitude of this impact on the White Sturgeon population is unknown, but is thought to be quite significant. Based on fishery data, the White Sturgeon population was already overexploited under current regulations, and updated regulations were needed and were being considered. The mortality from the HAB fish kills elevated an unsustainable situation into a crisis.

The immediacy of the need:

Immediate steps are necessary to reduce harvest of White Sturgeon, and allow the remaining population to persist after the die-offs. Take of White Sturgeon peaks in the fall and winter, so individuals are at risk if action is not taken quickly. Harassment and handling must be eliminated on White Sturgeon spawning grounds to ensure new individuals are recruiting to the population and maintain a recreational fishery in the future. These steps will protect the population while long term fishery changes are implemented, reducing fishery mortality and protecting spawning. Furthermore, In July and August 2023, a new HAB of the same species formed in the Northern San Francisco Bay. As of mid-August, 15 White Sturgeon carcasses and one Green Sturgeon carcass have been reported. It is imperative that we act to mitigate anthropogenic sturgeon mortality during this or future HAB events. These steps will protect the population while long term fishery changes are implemented, reducing fishery mortality and protecting spawning.

Whether the anticipation of harm has a basis firmer than simple speculation:

The Department has monitored the White Sturgeon population since the 1950s, focusing primarily on abundance of legal-sized fish that are targeted in the fishery. Records indicate that the population has declined substantially from ~175,000 legal sized in the 1980s to ~33,000 in the most recent estimate. The historic SF Bay fish kill in 2022 is also known to have killed a large number of mature, spawning-age sturgeon though the absolute magnitude of that impact is unknown. Harvest of the adult population is known to be high, routinely exceeding exploitation rates recommended in the scientific literature and used by other natural resource agencies of management. Recruitment in the population is known to be poor, infrequent, and closely associated with above normal water years, making it difficult for the species to recover from overharvest. Under current environmental and management conditions, the White Sturgeon population cannot handle the current rate of exploitation and is not sustainable. Long term permanent regulation changes are needed to limit harvest to sustainable levels. Until new regulations are in place, the reduction of harvest of White Sturgeon will minimize fishery related impacts to the population and minimize the magnitude of potential harm, while still offering recreational fishing opportunities to anglers.

V. Readoption Criteria

Same as or Substantially Equivalent

Pursuant to Government Code subdivision 11346.1(h), a readoption may be approved only if the text is “the same as or substantially equivalent to an emergency regulation previously adopted by that agency.” The language proposed for this rulemaking is the same as the language of the original emergency regulation.

Substantial Progress

Government Code subdivision 11346.1(h) specifies “Readoption shall be permitted only if the agency has made substantial progress and proceeded with diligence to comply with subdivision (e)” [sections 11346.2 through 11347.3, inclusive].

A regular rulemaking (certificate of compliance) is currently underway and will be presented to the Commission for public notice at its April 17-18, 2024 meeting.

Proposed Action by the Commission

The Commission proposes the readoption of the emergency amendments to sections 5.79, 5.80, 27.90, and 27.92 that are the same as previously effective.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State

None. No costs or savings to state agencies or costs/savings in federal funding to the state are anticipated. The Department's existing level of monitoring and enforcement activities is expected to be unchanged by this emergency action. However, the Department anticipates a reduction in White Sturgeon Report Cards sales revenue estimated to be (-$13,596) over the 90 day emergency readoption period in fiscal year 2023-2024.

(b) Nondiscretionary Costs/Savings to Local Agencies

None.

(c) Programs Mandated on Local Agencies or School Districts

None.

(d) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code

None.

(e) Effect on Housing Costs

None.

IV. Technical, Theoretical, and/or Empirical Studies, Reports, or Documents Relied Upon:

The Department relied on the following documents in proposing this emergency rulemaking action:

VI. Authority and Reference

Section 5.79

Authority cited: Sections 200, 205, 265 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 265, Fish and Game Code.

Section 5.80

Authority cited: Sections 200, 205, 265, 275 and 399, Fish and Game Code.
Reference: Sections 110, 200 and 205, Fish and Game Code.

Section 27.90

Authority cited: Sections 200, 202, 205, 220 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 206, Fish and Game Code.

Section 27.92

Authority cited: Sections 200, 205, 265 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 265, Fish and Game Code.

VII. Fish and Game Code Section 399 Finding

In accordance with subdivision (a) of section 399 of the Fish and Game code, the Commission finds that adopting this regulation is necessary for the immediate conservation, preservation, or protection of adult White Sturgeon during the State of Emergency proclaimed to exist in California and directs state officials to take immediate action to prepare for and mitigate the effects of HAB-induced White Sturgeon mortality.

Informative Digest/Policy Statement Overview

White Sturgeon (*Acipenser transmontaus*) are a species of fish native to California which live primarily in the San Francisco Bay Delta and migrate to the rivers of the Central Valley to spawn. White Sturgeon live potentially more than 100 years. Most reach sexual maturity by approximately 19 years of age and spawn every 2-4 years once mature. It is rare for larval sturgeon to survive to adulthood; successful broods occur every 6-7 years and are associated with above-average water flow in the Delta. The population of White Sturgeon has declined considerably in the last forty years. In the 1980s, the abundance of adult White Sturgeon was estimated to be 175,000 fish. The Department's most recent estimate is about 33,000 fish.

Until the emergency action, recreational anglers could keep one White Sturgeon 40-60 inches long per day and a total of three per year. The season was year-round, with some limited exceptions. As of November 16, 2023, the Department of Fish and Wildlife (Department) recommended an emergency action that a) reduced the annual bag limit for White Sturgeon from three to one fish, b) reduced the legal-sized slot limit from 40-60" total length (TL) to 42-48" TL, c) placed a limit of two fish per day per boat, and d) closed White Sturgeon fishing in the migrating and spawning reaches of the Sacramento and San Joaquin rivers from January 1 through May 31. Since the Department established its Sturgeon Fishing Report Card (Card) in 2013, about 40-45,000 recreational anglers have purchased cards every year. Based on data gathered from Cards, the number of fish kept by anglers has remained steady, but the number of fish caught and released has declined significantly, which indicates that fewer fish overall are being caught. The exploitation rate of White Sturgeon is estimated to be very high in California, between 8 and 30% between 2007-2015 and averaging 8.1% since that time. The sustainable exploitation rate of White Sturgeon is likely less than 4%. The Department believes that the current exploitation rate of sturgeon is unsustainable, and has been investigating ways to better manage the population.

The unsustainable exploitation rate of White Sturgeon was exacerbated to a crisis in 2022, when the San Francisco Bay experienced a major Harmful Algal Bloom (HAB) that resulted in significant mortality of many fishes, including White Sturgeon. The Department recorded over 850 sturgeon carcasses, the majority legal-sized or larger. Based on carcass studies and fish kills of other species of sturgeon, it is thought that only a small percentage of the fish killed floated long enough to be detected. The absolute magnitude of this impact on the White Sturgeon population is unknown, but is thought to be quite significant. A less intense HAB in 2023 killed at least 15 White Sturgeon and 1 Green Sturgeon.

Immediate steps are necessary to reduce harvest of White Sturgeon to protect the surviving population after the unprecedented fish kill until revised long-term regulations can be developed. Harassment and handling of fish must be eliminated on their migrating and spawning grounds to allow current adults to spawn successfully, ensuring a recreational fishery into the future.

Benefits of the Regulation:

These harvest restrictions will protect the remaining population while new long-term regulations are developed during proposed re-adoption actions, providing opportunity for surviving fish to spawn unmolested.

Consistency and Compatibility with Existing Regulations

Article IV, Section 20 of the State Constitution specifies that the Legislature may delegate to Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to regulate sport fishing in waters of the state (Fish and Game Code sections 200, 205, and 315). The Commission has reviewed its own regulations and finds that the proposed regulations are consistent with other recreational fishing regulations in Title 14, CCR, and therefore finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the California Code of Regulations and finds no other state agency regulations pertaining to temporarily prohibiting harvest of White Sturgeon due to population decline.

Proposed Emergency Regulatory Language

Sections 5.79, Title 14, CCR, is amended to read as follows:

§ 5.79. White Sturgeon Report Card and Tagging Requirements for Inland Waters (FG 683, See Section 701).

(a) Sturgeon Fishing Report Card Required. All anglers must have a valid Sturgeon Fishing Report Card in their possession while fishing for or taking W~~w~~hite S~~s~~turgeon. Cardholders must complete and return the card pursuant to regulations in this Section and in Section 1.74.

(b) Tagging and Recording Requirements for Retained Fish. A Sturgeon Fishing Report Card includes a detachable ~~tags~~tag that shall be used to tag any W~~w~~hite S~~s~~turgeon that is taken and retained in the sport fishery. Any W~~w~~hite S~~s~~turgeon possessed by any person shall be tagged.

(1) Upon taking and retaining a W~~w~~hite S~~s~~turgeon, the cardholder shall immediately record the following information:

(A) The fishing location, time of catch and length of the fish shall be recorded legibly and permanently in the appropriate spaces on the tag. The cardholder shall immediately and completely punch out the date of catch (month and day) on the sturgeon tag.~~ Tags shall be used in sequential order.~~

(B) The month, day, fishing location and length of the fish shall be recorded in the appropriate space~~s~~ on the Sturgeon Fishing Report Card~~ which corresponds to the number on the tag~~.

(2) Immediately after recording the information above, the cardholder shall remove and completely detach the tag from the card and affix it to the W~~w~~hite S~~s~~turgeon. Cardholders shall not wait until completion of fishing activity to tag any W~~w~~hite S~~s~~turgeon in possession.

(3) The tag shall be securely fastened to the fish. To affix the tag, a “zip tie”, string, line or other suitable material shall be passed through the tag at the location specified on the sturgeon tag and attached to the fish.

(4) ~~Tags~~The tag shall not be removed from the report card until immediately prior to affixing to a W~~w~~hite S~~s~~turgeon. Any tag~~s~~ detached from the report card and not affixed to a W~~w~~hite S~~s~~turgeon shall be considered used and therefore invalid. No person shall possess any used or otherwise invalid sturgeon tags.

(5) Records of Prior Activity. The tag ~~All tags~~ must be accounted for at all times by entry of a record on the Sturgeon Fishing Report Card~~ corresponding to all tags that are not in the cardholder’s possession~~. Any tag that was lost or destroyed shall be recorded as such on the corresponding line on the Sturgeon Fishing Report Card.

(6) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(7) After retaining and tagging a White Sturgeon, a cardholder shall not continue to fish catch and release for White Sturgeon on the same day.

(8) Cardholders that have retained and tagged a White Sturgeon are permitted to catch and release White Sturgeon starting on the day after the tag was used.

(c) Reporting Requirements for Released Fish.

(1) Whenever the cardholder catches and releases a sturgeon, the cardholder shall immediately record the month, day, location code, length, and species of sturgeon.

(2) If all lines in the “sturgeon released” field of the report card are filled, any additional sturgeon caught and released ~~need not be recorded on the card~~may be recorded on the back of the card.

(3) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(d) Sturgeon tags must be left affixed to the fish in place, including while stored at a residence or non-transient location, until the fish is processed for immediate consumption.

(e) The annual fee for the Sturgeon Fishing Report Card is specified in Section 701(c).

NOTE: Authority cited: Sections 200, 205~~ and 265~~, 265 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 265, Fish and Game Code.

Proposed Emergency Regulatory Language

Section 5.80, Title 14, CCR, is amended to read as follows:

§ 5.80. White Sturgeon.

(a) Open season: ~~All year, except for closures listed under special regulations.~~ (1)

All year: from the west Carquinez Bridge east to the Hwy 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River.

(2) From June 1 through December 31: above the Hwy 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River, including all tributaries of both rivers. From January 1 through May 31: it is unlawful to take White Sturgeon.

(b) ~~Daily and annual bag limit: One fish per day. Three fish per year statewide.~~

(b) Daily limit: One fish per day. After harvesting a White Sturgeon, anglers shall not continue to catch and release White Sturgeon on the same day. Anglers that have retained and tagged a fish are permitted to fish catch and release for White Sturgeon starting on the day after the tag was used.

(c) Annual bag limit: One fish per calendar year statewide.

(d) Daily vessel maximum harvest: All persons aboard a vessel may be cited for violation of a daily vessel maximum harvest limit. No more than two White Sturgeon may be harvested per day on a vessel, regardless of the number of anglers on board. Anglers must have in their possession a report card with a valid tag in order to retain a White Sturgeon. When the daily vessel maximum harvest is reached, only anglers that have not tagged a White Sturgeon that day may continue to fish catch and release for White Sturgeon.

(~~c~~e) Size limit: No fish less than ~~40~~42 inches fork length or greater than ~~60~~48 inches fork length may be taken or possessed.

(~~d~~f) Methods of take: Only one single point, single shank, barbless hook may be used on a line when taking sturgeon. The sturgeon must voluntarily take the bait or lure inside its mouth. No sturgeon may be taken by trolling, snagging or by the use of firearms. Sturgeon may not be gaffed, nor shall any person use any type of firearm or snare to take any sturgeon. For the purposes of this section, a snare is a flexible loop made from any material that can be tightened like a noose around any part of the fish.

(~~e~~g) Removal from water. Any sturgeon greater than 68 inches fork length may not be removed from the water and shall be released immediately.

(~~f~~h) Report card required: Any person fishing for or taking sturgeon shall have in their possession a nontransferable Sturgeon Fishing Report Card issued by the department and shall adhere to all reporting and tagging requirements for sturgeon defined in Sections 1.74 and 5.79, Title 14, CCR.

(~~g~~i) Special North Coast District Sturgeon Closure (Humboldt, Del Norte, Trinity and Siskiyou cos.). It is unlawful to take any sturgeon in the North Coast District at any time.

(~~h~~j) For regulations on take and possession of sturgeon in ocean waters as defined in Section 27.00, see Sections 27.90, 27.91, and 27.95.

(~~i~~k) Special Sierra and Valley District Sturgeon Closure from January 1 to December 31 (Shasta, Tehama, Butte and Glenn cos.).

(1) Sacramento River from Keswick Dam to the Highway 162 Bridge.

(A) It is unlawful to take any sturgeon.

(B) It is unlawful to use wire leaders.

(C) It is unlawful to use lamprey or any type of shrimp as bait.

(~~j~~l) Special Yolo Bypass Flood Control System Sturgeon Closure. It is unlawful to take any sturgeon in the Yolo Bypass, Toe Drain Canal, and Tule Canal upstream of Lisbon Weir at any time.

NOTE: Authority cited: Sections 200, 205, 265~~ and 275~~, 275 and 399, Fish and Game Code.
Reference: Sections 110, 200 and 205, Fish and Game Code.

Proposed Emergency Regulatory Language

Section 27.90,Title 14, CCR, is amended to read as follows:

§ 27.90. White Sturgeon.

(a) Open season: All year except as described in Section 27.95 of these regulations.
~~(b) Daily and annual bag limit: One fish per day. Three fish per year statewide.~~
(b) Daily limit: One fish per day. After harvesting a White Sturgeon, anglers shall not continue to catch and release White Sturgeon on the same day. Anglers that have retained and tagged a fish are permitted to fish catch and release for White Sturgeon starting on the day after the tag was used.
(c) Annual bag limit: One fish per calendar year statewide.
(d) Daily vessel maximum harvest: All persons aboard a vessel may be cited for violation of a daily vessel maximum harvest limit. No more than two White Sturgeon may be harvested per day on a vessel, regardless of the number of anglers on board. Anglers must have in their possession a report card with a valid tag in order to retain a White Sturgeon. When the daily vessel maximum harvest is reached, only anglers that have not tagged a White Sturgeon that day may continue to fish catch and release for White Sturgeon.

(~~c~~e) Size limit: No fish less than ~~40~~42 inches fork length or greater than ~~60~~48 inches fork length may be taken or possessed.
(~~d~~f) Methods of take: Only one single point, single shank, barbless hook may be used on a line when taking sturgeon. The sturgeon must voluntarily take the bait or lure in its mouth. No sturgeon may be taken by trolling, snagging or by the use of firearms. Sturgeon may not be gaffed, nor shall any person use any type of firearm or snare to take any sturgeon. For the purposes of this section, a snare is a flexible loop made from any material that can be tightened like a noose around any part of the fish.
(~~e~~g) Removal from water. Any sturgeon greater than 68 inches fork length may not be removed from the water and shall be released immediately.
(~~f~~h) Report card required: Any person fishing for or taking sturgeon shall have in their possession a nontransferable Sturgeon Fishing Report Card issued by the department and shall adhere to all reporting and tagging requirements for sturgeon defined in Sections 1.74 and 27.92, Title 14, CCR.
(~~g~~i) For regulations on take and possession of sturgeon in inland waters as defined in Section 1.53, see Section 5.80 and Section 5.81.
(~~h~~j) Boat limits, as defined in Subsection 27.60(c) and Section 195, are not authorized for sturgeon fishing and shall not apply to the take, possession or retention of W~~w~~hite S~~s~~turgeon.

NOTE: Authority cited: Sections 200, ~~202,~~ 205 ~~and 220~~, 265, 275, and 399, Fish and GameCode.
Reference: Sections 110, 200, and 205, ~~and 206,~~ Fish and Game Code.

Proposed Emergency Regulatory Language

Section 27.92, Title 14, CCR, is amended to read as follows:

§ 27.92. White Sturgeon Report Card and Tagging Requirements for OceanWaters (FG 683, See Section 701).

(a) Sturgeon Fishing Report Card Required. All anglers must have a valid Sturgeon Fishing Report Card in their possession while fishing for or taking W~~w~~hite S~~s~~turgeon. Cardholders must complete and return the card pursuant to regulations in this Section and in Section 1.74.

(b) Tagging and Recording Requirements for Retained Fish. A Sturgeon Fishing Report Card includes a detachable tag~~s~~ that shall be used to tag any W~~w~~hite S~~s~~turgeon thatis taken and retained in the sport fishery. Any W~~w~~hite S~~s~~turgeon possessed by any person shall be tagged.

(1) Upon taking and retaining a W~~w~~hite S~~s~~turgeon, the cardholder shall immediately record the following information:

(A) The fishing location, time of catch and length of the fish shall be recorded legibly and permanently in the appropriate spaces on the tag. The cardholder shall immediately and completely punch out the date of catch (month and day) on the sturgeon tag.~~ Tags shall be used in sequential order.~~

(B) The month, day, fishing location and length of the fish shall be recorded in the appropriate space~~s~~ on the Sturgeon Fishing Report Card~~ which corresponds to the number on the tag~~.

(2) Immediately after recording the information above, the cardholder shall remove and completely detach the tag from the card and affix it to the W~~w~~hite S~~s~~turgeon. Cardholders shall not wait until completion of fishing activity to tag any W~~w~~hite S~~s~~turgeon in possession.

(3) The tag shall be securely fastened to the fish. To affix the tag, a “zip tie”, string, line or other suitable material shall be passed through the tag at the location specified on the sturgeon tag and attached to the fish.

(4) The ~~Tags~~tag shall not be removed from the report card until immediately prior to affixing to a W~~w~~hite S~~s~~turgeon. Any tag~~s~~ detached from the report card and not affixed to a W~~w~~hite S~~s~~turgeon shall be considered used and therefore invalid. Noperson shall possess any used or otherwise invalid sturgeon tags.

(5) Records of Prior Activity. The tag~~ All tags~~ must be accounted for at all times by entry of a record on the Sturgeon Fishing Report Card ~~corresponding to all tags that are not in the cardholder’s possession~~. Any tag that was lost or destroyed shall be recorded as such on the corresponding line on the Sturgeon Fishing Report Card.

(6) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(7) After retaining and tagging a White Sturgeon, cardholders shall not continue to catch and release White Sturgeon on the same day.

(8) Cardholders that have retained and tagged a White Sturgeon are permitted to fish catch and release for White Sturgeon starting on the day after the tag was used.

(c) Reporting Requirements for Released Fish.

(1) Whenever the cardholder catches and releases a sturgeon, the cardholder shall immediately record the month, day, location code, length, and species of sturgeon.

(2) If all lines in the "sturgeon released" field of the report card are filled, any additional sturgeon caught and released ~~need not be recorded on the card~~may be recorded on the back of the card.

(3) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(d) Sturgeon tags must be left affixed to the fish in place, including while stored at a residence or non-transient location, until the fish is processed for immediate consumption.

(e) The annual fee for the Sturgeon Fishing Report Card is specified in Section 701, Title 14, CCR.

NOTE: Authority cited: Sections 200, 205~~ and 265~~, 265 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 265, Fish and Game Code.

STATE OF CALIFORNIA — DEPARTMENT OF FINANCE

ECONOMIC AND FISCAL IMPACT STATEMENT
(REGULATIONS AND ORDERS)

STD. 399 (Rev. 10/2019)

ECONOMIC IMPACT STATEMENT

DEPARTMENT NAME	CONTACT PERSON	EMAIL ADDRESS	TELEPHONE NUMBER
Fish and Game Commission	David Thesell	fgc@fgc.ca.gov	916 902-9291

DESCRIPTIVE TITLE FROM NOTICE REGISTER OR FORM 400	NOTICE FILE NUMBER
Readopt Emergency Action: Amend Section 5.79, 5.80, 27.90, and 27.92, Title 14, CCR, Re: White Sturgeon	Z

A. ESTIMATED PRIVATE SECTOR COST IMPACTS *Include calculations and assumptions in the rulemaking record.*

1. Check the appropriate box(es) below to indicate whether this regulation:

- ☐ a. Impacts business and/or employees
- ☐ b. Impacts small businesses
- ☐ c. Impacts jobs or occupations
- ☐ d. Impacts California competitiveness
- ☐ e. Imposes reporting requirements
- ☐ f. Imposes prescriptive instead of performance
- ☐ g. Impacts individuals
- ☒ h. None of the above (Explain below):

Emergency action: no economic assessment only fiscal impact assessment

If any box in Items 1 a through g is checked, complete this Economic Impact Statement.
If box in Item 1.h. is checked, complete the Fiscal Impact Statement as appropriate.

2. The Fish and Game Commission (Agency/Department) estimates that the economic impact of this regulation (which includes the fiscal impact) is:

- ☒ Below $10 million
- ☐ Between $10 and $25 million
- ☐ Between $25 and $50 million
- ☐ Over $50 million *[If the economic impact is over $50 million, agencies are required to submit a Standardized Regulatory Impact Assessment as specified in Government Code Section 11346.3(c)]*

3. Enter the total number of businesses impacted: ____________

Describe the types of businesses (Include nonprofits): ____________

Enter the number or percentage of total businesses impacted that are small businesses: ____________

4. Enter the number of businesses that will be created: ____________ eliminated: ____________

Explain: ____________

5. Indicate the geographic extent of impacts: ☐ Statewide

☐ Local or regional (List areas): ____________

6. Enter the number of jobs created: ____________ and eliminated: ____________

Describe the types of jobs or occupations impacted: ____________

7. Will the regulation affect the ability of California businesses to compete with other states by making it more costly to produce goods or services here? ☐ YES ☐ NO

If YES, explain briefly: ____________

ECONOMIC IMPACT STATEMENT (CONTINUED)

B. ESTIMATED COSTS *Include calculations and assumptions in the rulemaking record.*

1. What are the total statewide dollar costs that businesses and individuals may incur to comply with this regulation over its lifetime? $ ____________

   a. Initial costs for a small business: $ ____________ Annual ongoing costs: $ ____________ Years: ________

   b. Initial costs for a typical business: $ ____________ Annual ongoing costs: $ ____________ Years: ________

   c. Initial costs for an individual: $ ____________ Annual ongoing costs: $ ____________ Years: ________

   d. Describe other economic costs that may occur: ____________

2. If multiple industries are impacted, enter the share of total costs for each industry: ____________

3. If the regulation imposes reporting requirements, enter the annual costs a typical business may incur to comply with these requirements. *Include the dollar costs to do programming, record keeping, reporting, and other paperwork, whether or not the paperwork must be submitted.* $ ____________

4. Will this regulation directly impact housing costs? ☐ YES ☐ NO

   If YES, enter the annual dollar cost per housing unit: $ ____________

   Number of units: ____________

5. Are there comparable Federal regulations? ☐ YES ☐ NO

   Explain the need for State regulation given the existence or absence of Federal regulations: ____________

   Enter any additional costs to businesses and/or individuals that may be due to State - Federal differences: $ ____________

C. ESTIMATED BENEFITS *Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. Briefly summarize the benefits of the regulation, which may include among others, the health and welfare of California residents, worker safety and the State's environment: ____________

2. Are the benefits the result of: ☐ specific statutory requirements, or ☐ goals developed by the agency based on broad statutory authority?

   Explain: ____________

3. What are the total statewide benefits from this regulation over its lifetime? $ ____________

4. Briefly describe any expansion of businesses currently doing business within the State of California that would result from this regulation: ____________

D. ALTERNATIVES TO THE REGULATION *Include calculations and assumptions in the rulemaking record. Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. List alternatives considered and describe them below. If no alternatives were considered, explain why not: ____________

ECONOMIC IMPACT STATEMENT (CONTINUED)

2. Summarize the total statewide costs and benefits from this regulation and each alternative considered:

   Regulation: Benefit: $ ______ Cost: $ ______

   Alternative 1: Benefit: $ ______ Cost: $ ______

   Alternative 2: Benefit: $ ______ Cost: $ ______

3. Briefly discuss any quantification issues that are relevant to a comparison of estimated costs and benefits for this regulation or alternatives: ______

4. Rulemaking law requires agencies to consider performance standards as an alternative, if a regulation mandates the use of specific technologies or equipment, or prescribes specific actions or procedures. Were performance standards considered to lower compliance costs? ☐ YES ☐ NO

   Explain: ______

E. MAJOR REGULATIONS *Include calculations and assumptions in the rulemaking record.*

California Environmental Protection Agency (Cal/EPA) boards, offices and departments are required to submit the following (per Health and Safety Code section 57005). Otherwise, skip to E4.

1. Will the estimated costs of this regulation to California business enterprises **exceed $10 million**? ☐ YES ☐ NO

If YES, complete E2. and E3
If NO, skip to E4

2. Briefly describe each alternative, or combination of alternatives, for which a cost-effectiveness analysis was performed:

   Alternative 1: ______

   Alternative 2: ______

   (Attach additional pages for other alternatives)

3. For the regulation, and each alternative just described, enter the estimated total cost and overall cost-effectiveness ratio:

   Regulation: Total Cost $ ______ Cost-effectiveness ratio: $ ______

   Alternative 1: Total Cost $ ______ Cost-effectiveness ratio: $ ______

   Alternative 2: Total Cost $ ______ Cost-effectiveness ratio: $ ______

4. Will the regulation subject to OAL review have an estimated economic impact to business enterprises and individuals located in or doing business in California exceeding $50 million in any 12-month period between the date the major regulation is estimated to be filed with the Secretary of State through12 months after the major regulation is estimated to be fully implemented?

   ☐ YES ☐ NO

   If YES, agencies are required to submit a Standardized Regulatory Impact Assessment (SRIA) as specified in Government Code Section 11346.3(c) and to include the SRIA in the Initial Statement of Reasons.

5. Briefly describe the following:

   The increase or decrease of investment in the State: ______

   The incentive for innovation in products, materials or processes: ______

   The benefits of the regulations, including, but not limited to, benefits to the health, safety, and welfare of California residents, worker safety, and the state's environment and quality of life, among any other benefits identified by the agency: ______

FISCAL IMPACT STATEMENT

A. FISCAL EFFECT ON LOCAL GOVERNMENT *Indicate appropriate boxes 1 through 6 and attach calculations and assumptions of fiscal impact for the current year and two subsequent Fiscal Years.*

☐ 1. Additional expenditures in the current State Fiscal Year which are reimbursable by the State. (Approximate)
(Pursuant to Section 6 of Article XIII B of the California Constitution and Sections 17500 et seq. of the Government Code).

$ ______________

☐ a. Funding provided in ______________

Budget Act of ______________ or Chapter ______________ , Statutes of ______________

☐ b. Funding will be requested in the Governor's Budget Act of ______________

Fiscal Year: ______________

☐ 2. Additional expenditures in the current State Fiscal Year which are NOT reimbursable by the State. (Approximate)
(Pursuant to Section 6 of Article XIII B of the California Constitution and Sections 17500 et seq. of the Government Code).

$ ______________

Check reason(s) this regulation is not reimbursable and provide the appropriate information:

☐ a. Implements the Federal mandate contained in ______________

☐ b. Implements the court mandate set forth by the ______________ Court.

Case of: ______________ vs. ______________

☐ c. Implements a mandate of the people of this State expressed in their approval of Proposition No. ______________

Date of Election: ______________

☐ d. Issued only in response to a specific request from affected local entity(s).

Local entity(s) affected: ______________

☐ e. Will be fully financed from the fees, revenue, etc. from: ______________

Authorized by Section: ______________ of the ______________ Code;

☐ f. Provides for savings to each affected unit of local government which will, at a minimum, offset any additional costs to each;

☐ g. Creates, eliminates, or changes the penalty for a new crime or infraction contained in ______________

☐ 3. Annual Savings. (approximate)

$ ______________

☐ 4. No additional costs or savings. This regulation makes only technical, non-substantive or clarifying changes to current law regulations.

☒ 5. No fiscal impact exists. This regulation does not affect any local entity or program.

☐ 6. Other. Explain ______________

FISCAL IMPACT STATEMENT (CONTINUED)

B. FISCAL EFFECT ON STATE GOVERNMENT *Indicate appropriate boxes 1 through 4 and attach calculations and assumptions of fiscal impact for the current year and two subsequent Fiscal Years.*

☐ 1. Additional expenditures in the current State Fiscal Year. (Approximate)

$ ______________________

It is anticipated that State agencies will:

☐ a. Absorb these additional costs within their existing budgets and resources.

☐ b. Increase the currently authorized budget level for the ______________ Fiscal Year

☐ 2. Savings in the current State Fiscal Year. (Approximate)

$ ______________________

☐ 3. No fiscal impact exists. This regulation does not affect any State agency or program.

☒ 4. Other. Explain White Sturgeon Report Card sales are anticipated to drop resulting in a $13,596 decline in CDFW revenue for the remainder of fiscal year 2023-24.

C. FISCAL EFFECT ON FEDERAL FUNDING OF STATE PROGRAMS *Indicate appropriate boxes 1 through 4 and attach calculations and assumptions of fiscal impact for the current year and two subsequent Fiscal Years.*

☐ 1. Additional expenditures in the current State Fiscal Year. (Approximate)

$ ______________________

☐ 2. Savings in the current State Fiscal Year. (Approximate)

$ ______________________

☒ 3. No fiscal impact exists. This regulation does not affect any federally funded State agency or program.

☐ 4. Other. Explain ______________________

FISCAL OFFICER SIGNATURE	DATE

The signature attests that the agency has completed the STD. 399 according to the instructions in SAM sections 6601-6616, and understands the impacts of the proposed rulemaking. State boards, offices, or departments not under an Agency Secretary must have the form signed by the highest ranking official in the organization.

AGENCY SECRETARY	DATE

Finance approval and signature is required when SAM sections 6601-6616 require completion of Fiscal Impact Statement in the STD. 399.

DEPARTMENT OF FINANCE PROGRAM BUDGET MANAGER	DATE

STD399 ADDENDUM

Emergency Action to Amend Sections 5.79, 5.80, 27.90, and 27.92
Title 14, California Code of Regulations
Re: White Sturgeon

Readopt I

Economic Impact Statement

Under the 90-day extension of this emergency regulation, take will still be permitted to anglers that purchase a Sturgeon Report Card, but harvest will be limited by 1) reduction of the legal slot limit, 2) reduction of the annual bag limit, 3) adding a vessel limit of two fish per day, and 4) protecting critical migrating and spawning behavior via a seasonal and geographic closure of river habitat. Catch and release angling will be permitted after anglers reach their annual harvest limit to preserve recreational angling opportunities.

This emergency action is necessary to maintain current and future recreational fishing's economic and cultural benefits, while preventing additional mortality of the impacted White Sturgeon population and minimizing harassment of spawning individuals.

A. ESTIMATED PRIVATE SECTOR COST IMPACTS

1. Answer: h. None of the above. (Explain below):

Emergency regulations do not require an economic impact statement; only fiscal impacts must be evaluated (California Government Code Section 11346.1).

Fiscal Impact Statement details are provided below.

Fiscal Impact Statement

A. FISCAL EFFECT ON LOCAL GOVERNMENT

Answer: 5. No fiscal impact.

The proposed amendment to Section 5.79, Title 14, CCR will not have the potential for a fiscal effect on local governments.

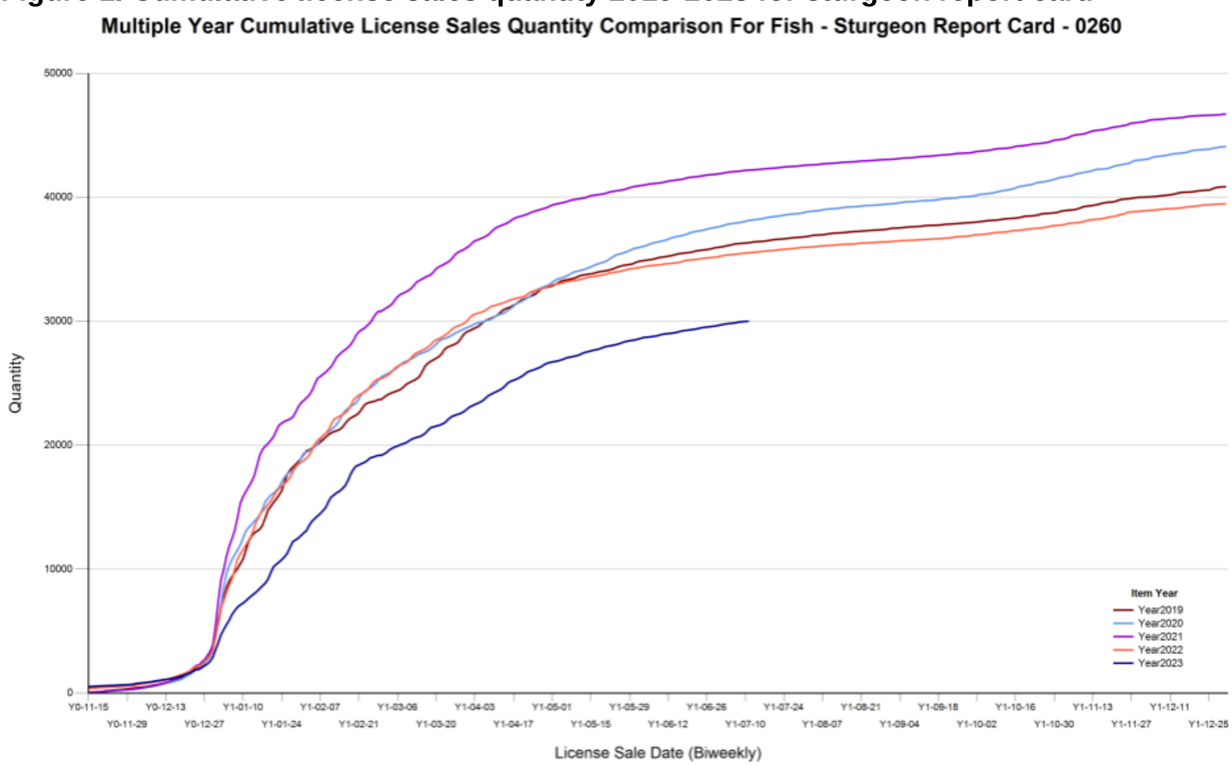
B. FISCAL EFFECT ON STATE GOVERNMENT

Answer: 4. Other.

The Fish and Game Commission (Commission) anticipates that the readoption of the proposed emergency action for another 90 days will not introduce new costs or savings for state agencies. The Department of Fish and Wildlife's (Department) existing level of monitoring and enforcement activities is expected to be unchanged. However, the Department anticipates that the continued reduced take limits may result in a continued drop in White Sturgeon Report Cards sales revenue estimated to be (-$13,596) over the 90-day emergency readoption period during that later part of fiscal year 2023-2024.

Sales of Sturgeon report cards since a fee has been charged are plotted in Figure 1, showing purchases throughout the year. Most cards are sold in the first months of the year, with a small bump in sales in the later months of the year. Sales in years 2020 and 2021 may have been elevated due to the Covid-19 pandemic surge in outdoor recreation. For this fiscal year, as of July 2023, Sturgeon card sales have reached about 30,000, which is about 17% less than the amount sold in 2022, and 19% less than 2019, which are more historically-typical years with no pandemic affects. While difficult to discern with certainty, the lower 2023 numbers to date may be a result of the new 365-day sportfish license and the recent closure of the salmon fishery. Many other states with 365-day licenses experienced absolute declines in license sales and for some sport fishers, no s~~S~~almon opportunity induces them to forego all fishing trips for any other fish. Thus, acknowledging the probable influence of those factors, 2023-24 fiscal year total sales were already projected to be about ~~32,929~~33,491 or 18 percent less than the 40,851 average sold during a typical year.

Figure 1. Cumulative license sales quantity 2019-2023 for sturgeon report card



A Department survey of White Sturgeon fishery participants reveals that while over 67 percent report the main reason to fish for White Sturgeon is recreation and 70 percent state that their goal is only or mostly catch and release; approximately 27 percent state their goal is to fish for food and 43 percent answer that they would not participate in a catch and release only fishery. These sentiments have been recognized in the proposed emergency action in efforts to balance resource protection with recreational fishery opportunity.

Recent spatial and temporal take patterns suggest that the emergency action's proposed January to May upper spanning ground closure is the one component that may induce a small decline in report card sales during the 180-day emergency period.

The evidence that six percent of the seasonal catch has occurred in the area of the proposed January to May spanning ground closure, may induce those individual fishers to not purchase a Sturgeon Report Card, if that is the only time and area that they fish. Many may pursue Sturgeon in other areas at different times as well as the spawning grounds. But for some, that may be the only area and time for Sturgeon fishing, so it is reasonable to project a six percent drop in card sales revenue in 2024. This amounts to an estimated 1,025 fewer cards sold in 2023 and 1,320 fewer in 2024.

Table 1. White Sturgeon Report Card Price 2023 and 2024

2023 Base Fee	ALDS 3% Surcharge	2023 DFG Revenue per Card	2024 Base Fee	2024 DFG Revenue per Card
$9.50	$0.29	$9.79	$10.00	$10.30

The 2023 Department revenue per card is $9.79 and $10.30 in 2024. The projected revenue losses to the Department for reduced White Sturgeon report card sales are $10,037 for the calendar year 2023, and $13,596 for 2024. The fiscal year 2023-2024 losses are projected to total $23,633.

C. FISCAL EFFECT ON FEDERAL FUNDING OF STATE PROGRAMS

Answer: 3. No fiscal impact.

The proposed emergency action will not have the potential for a fiscal effect on the federal funding of state programs.

State of California
Department of Fish and Wildlife

Signed original on file,
received March 26, 2024

Memorandum

Date: March 25, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: Request for 6-Month Extension, Greater Sage-Grouse Status Review Report

The Department of Fish and Wildlife (Department) requests a 6-month extension of time pursuant to Fish and Game Code section 2074.6 to produce and make publicly available the final peer reviewed greater sage-grouse (*Centrocercus urophasianus*) status review report. The Department anticipates receiving substantial comments and/or scientific information from tribes, stakeholders, and other interested parties regarding the petition to list greater sage-grouse as threatened or endangered under the California Endangered Species Act (CESA). The Department has determined that an extension is necessary to complete independent peer review of the status review report and to provide a minimum of 30 days for public review prior to the public hearing specified in Fish and Game Code section 2075.5. The requested extension would change the due date of the Department's status review report to December 28, 2024, which is 18 months from the date the Fish and Game Commission published the Notice of Findings (Cal. Reg. Notice Register 2023, No. 26-Z, p. 852).

If you have any questions or need additional information, please contact Scott Gardner, Wildlife Branch Chief at wildlifemgt@wildlife.ca.gov or (916) 801-6257.

Dear Secretary Crowfoot, President Murray and Director Bonham:

On behalf of the County of Lassen, I offer Lassen County's comments in response to the "notice and request for information: Greater Sage-Grouse is a candidate for listing under the California Endangered Species Act."

The issue of the Greater Sage Grouse and its habitat is a significant issue for economic, recreational and business interest in Lassen County for decades and continues to be a primary concern of the Lassen County Board of Supervisors; I write to urge your leadership in supporting and expediting locally important conservation efforts that will be further delayed or terminated by a listing under the CESA by the California Fish and Game Commission. Conservation efforts are planned for the next few years. For these reasons, I ask that you strongly recommend against a proposed listing of the Greater Sage Grouse until such conservation efforts can be implemented and such efforts be monitored and adjusted for success.

The primary pathway supporting sage grouse conservation in Lassen County is via the Buffalo-Skedaddle Sage-Grouse Working Group[1], of which CDFW is a member.

The Buffalo-Skedaddle Sage-grouse Working Group, is comprised of federal, state, and local agencies, industry organizations, and other stakeholders and has been actively engaged in collaborative conservation efforts for over two decades. The group is solution-oriented and focused on completing on-the-ground work at a meaningful scale.

Notable conservation accomplishments from recent years are listed below:

Juniper removal: In the Buffalo-Skedaddle Population Management Unit (PMU), juniper encroachment threatens priority sage-grouse habitat. Collaborative efforts have successfully treated juniper at a landscape scale, covering over 15,000 acres of public, state, and private land since 2021.

Spring enhancement and protections: Fencing installations around fragile spring ecosystems within the Buffalo-Skedaddle PMU enhance water availability, cover, and forage diversity for sage-grouse. Over 30 spring systems have been protected through new or maintained fence enclosures in recent years.

Riparian restoration: Restoration techniques such as Beaver Dam Analog and Zeedyk rock structures have been implemented to rehabilitate degraded spring and stream systems. Over 300 low-tech stream restoration structures have been constructed at 10 locations, fostering healthy riparian habitats essential for sage-grouse survival.

Invasive annual grass control and restoration seeding: Efforts to control annual grasses through aerial herbicide sprays and subsequent re-seeding have enhanced habitat structure and diversity, benefiting sage-grouse populations. Since 2021, over 20,000 acres have been treated with herbicide and 15,000 acres have been seeded.

Sagebrush plantings: Native sagebrush seedling plantings have been conducted to further improve sage-grouse habitat. Over 26,000 sagebrush seedlings have been planted since 2021.

Continued conservation efforts are planned for the next few years, including extensive juniper removal (30,000+ acres), riparian restoration projects (~15 locations), new spring fencing initiatives (~5 locations), and the planting of thousands of sagebrush seedlings. More information on conservation efforts can be found in the Conservation Strategy for Greater Sage-grouse in the Buffalo-Skedaddle Population Management, updated in 2021.

The limiting factors are limited human capacity, logistical challenges to conduct projects at meaningful scale and the deflection of workforce and time required to overcome the existing regulatory framework. The current institutional bottlenecks reducing the pace and scale of conservation work include slow and onerous permitting from state and federal agencies to do stream restoration projects, limited capacity to conduct archaeological clearances necessary to conduct large scale vegetation management and habitat restoration projects.

Most recently, CDFW's bureaucratic processes which are restricting the well-documented necessity to conduct raven population control measures, is working against sage grouse nesting success. The current raven population is well above that threshold that significantly reduces sage grouse nest success therefore restricting sage

[1] https://ucanr.edu/sites/buff-sked-rangeland-project//

[3] https://ucanr.edu/sites/buff-sked-rangeland-project/files/381538.pdf

grouse population recovery (O'Neill, et al 2023[2]). In conjunction with the implementation of the Buffalo-Skedaddle Sage Grouse Conservation Strategy[3], raven control, similar to what is done in support of the desert tortoise, is needed.

The consequences of state CESA listing are difficult to quantify, but there is no evidence that such a listing will provide any additional capacity to implement work on the ground. To the contrary, experience has consistently demonstrated that once such state-level actions are taken, energy is redirected into arguments about the regulatory program itself rather than completing conservation projects that would benefit sage grouse and other wildlife. Furthermore, CESA listings work against the collaborative efforts such as Buffalo-Skedaddle as many partners will be reluctant to participate in conservation processes with CESA listed species.

A CESA listing will not improve regulatory efficiency to cut "green tape" to expedite beneficial environmental conservation and restoration efforts such as the Buffalo-Skeddle strategy. CDFW does not have the staffing and funding capacity itself, nor the credibility with local partners or federal agencies to overcome the loss of the multi-partner collaborative conservation work that currently exists. The pace, scale, and quality of on-the-ground conservation work in Lassen County will be significantly reduced or cease to exist in California in the event of a CESA listing by the California Fish and Game Commission.

Loss of planned conservation investments in Lassen County from CESA restrictions could result in the loss of jobs, revenue and tax base for Californians. According to the U.S. Census, 19 percent of our residents live in poverty, and per capita income is approximately $21,214 in the unincorporated communities and $14,002 in the City of Susanville. The countywide labor force has declined approximately 35 percent over the past decade and that situation has not been helped by the State's recent closure of the California Correctional Center; an estimated net loss of 600 State jobs and $160 million in local payroll. The February 2024 preliminary unemployment rate is 7.8% in Lassen County, which is 3.6% higher than the U.S. Unemployment Rate and 2.2% higher than the California Unemployment Rate.

Thank you for your time and attention to this matter.

Sincerely,

Richard Egan, County Administrative Officer

Re: The Greater Sage-Grouse being a candidate for listing under California Endangered Species Act (CESA)

Dear Commissioners:

The Inyo County Board of Supervisors supports the California Department of Fish and Wildlife (CDFW) in its management of the greater sage-grouse. As verified by the information in the most recent ten-year (2014-2024) CDFW study results (study attached), there has been a substantial 39% increase in the Bi-State Greater Sage-Grouse population levels. The information demonstrates the effectiveness of the Department's activities to ensure the continued success of the greater sage-grouse in the Eastern Sierra. The Commission believes that the Department's successes should be used to improve, enhance, and protect all species of sage-grouse throughout the state.

The study results show that the greater sage-grouse populations are recovering thus the need to list the species as endangered is not needed. CDFW has done an exceptional job in the past ten years of managing the local populations. The study confirms that recovery is in progress. Any effort to list the species as endangered may detrimentally affect the success of the current management activities and adversely impact ongoing improvements. The listing of this species as endangered is not warranted.

The Commission commends CDFW and supports its continued management of the greater sage-grouse. The success of the Department's program will ensure a strong future for the greater sage-grouse in California.

Sincerely,

Chairperson Matt Kingsley,
Inyo County Board of Supervisors

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

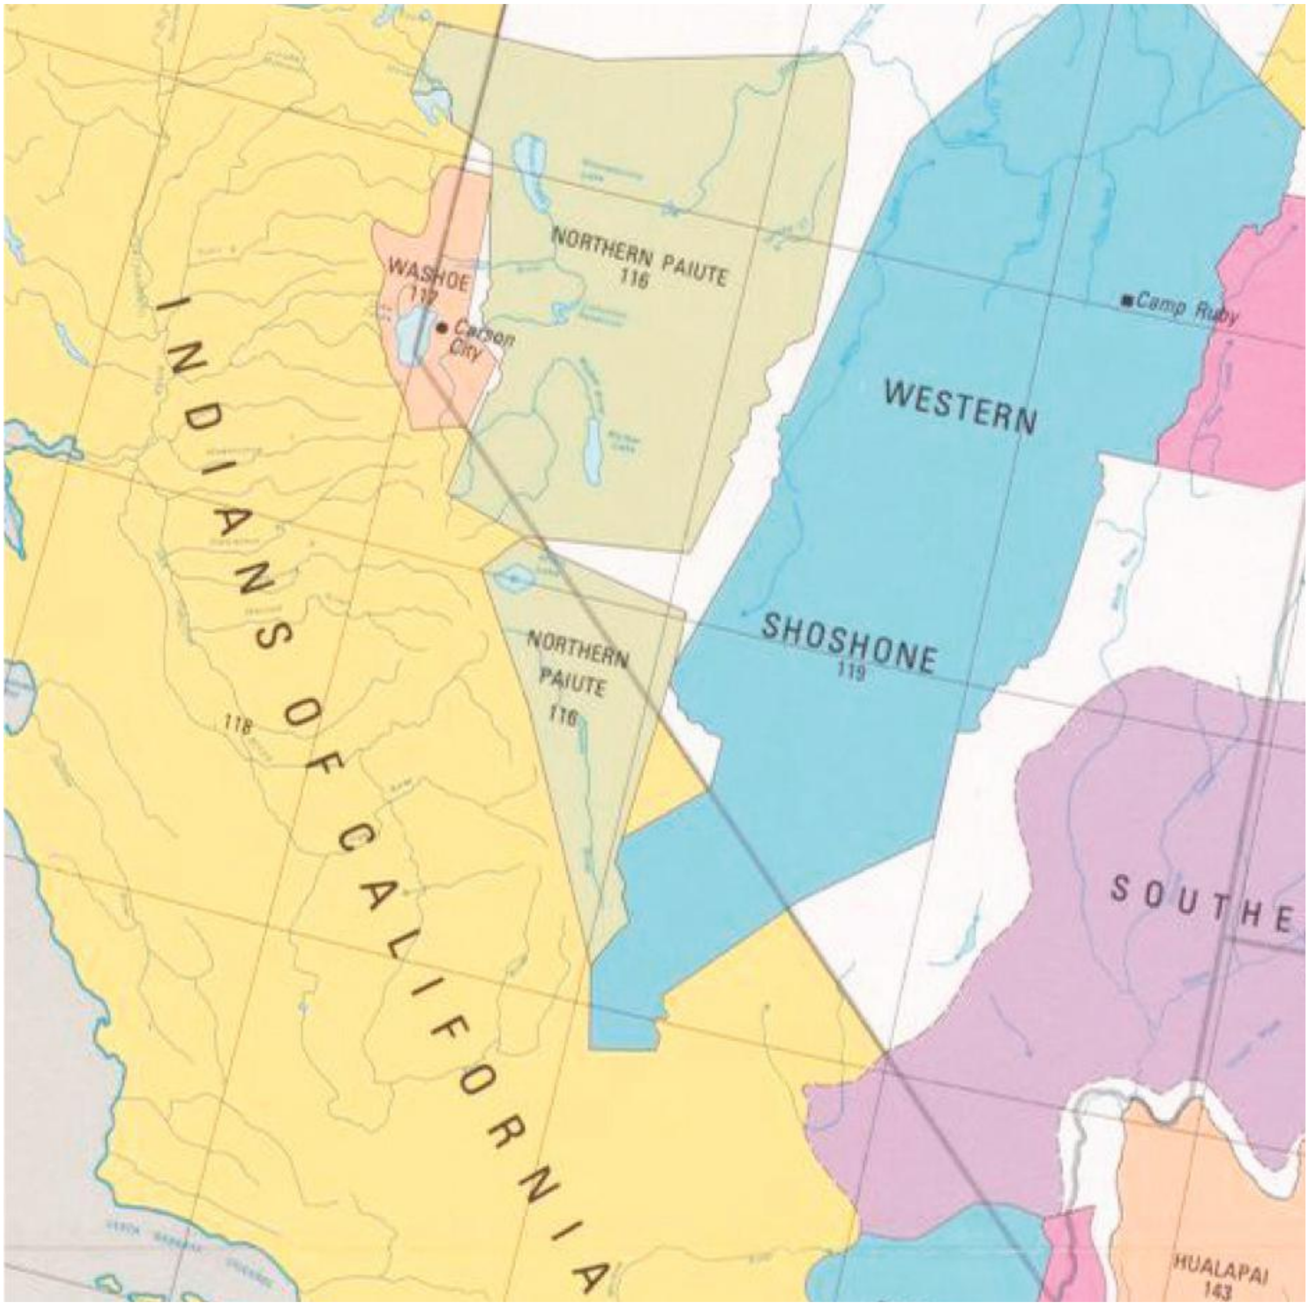

Figure 1: Ancestral lands of the Bi-State area (map source: Indian Claims Commission)

ANCESTRAL LANDS ACKNOWLEDGEMENT

The Bi-State area is located in the heart of the Northern Paiute (Numu) territory and extends to include the lands of the Washoe (Wa She Shu) in the north, and Western Shoshone (Newe) in the south. We honor the Indigenous caretakers who have stewarded these lands, waters, and animals since time immemorial and pay respect to the elders who lived before, the people of today, and the generations to come.

CONSERVATION HISTORY

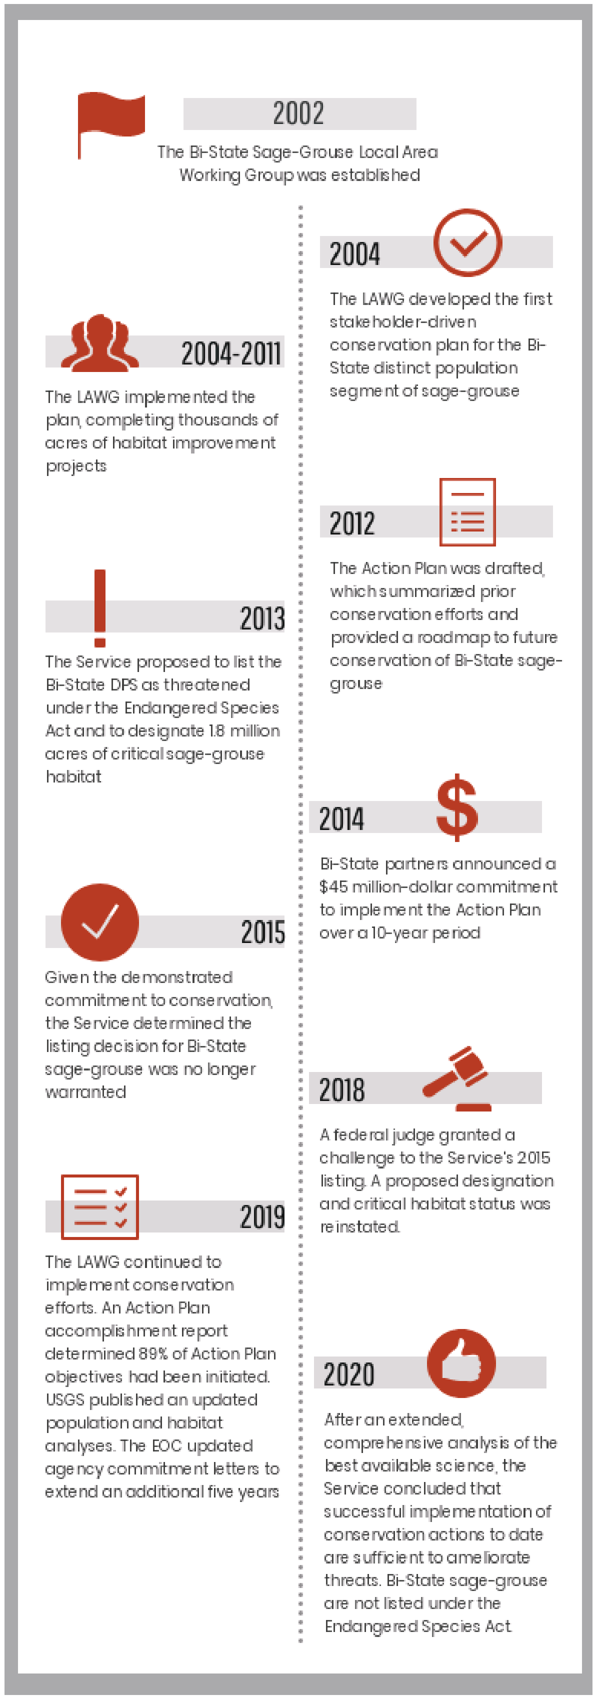

Figure 2: Timeline of Bi-State conservation efforts and USFWS listing decisions

Bi-State sage-grouse, habitat, and people

EXECUTIVE SUMMARY

The Bi-State Sage-Grouse Conservation Action Plan was written in 2012 to provide a roadmap to conservation for the Bi-State greater sage-grouse distinct population segment (Bi-State DPS). The Bi-State area, located along the California and Nevada state border, is divided into six Population Management Units (PMUs) (Figure 4). In each PMU, threats were identified and ranked, and unique conservation strategies were created to address threats (Table 3). The Action Plan called out priority actions deemed necessary to protect sage-grouse populations and their habitats. Projects in the Action Plan sought to:

- implement a coordinated interagency approach,
- incorporate science-based adaptive management,
- increase regulatory mechanisms,
- minimize and eliminate risk,
- improve and restore habitat,
- monitor sage-grouse populations,
- and maintain stakeholder involvement.

At every step it was assumed that projects would be altered or added as priorities change based on new information, and new priorities occur that were unknown when the Action Plan was written.

Action Plan strategies and objectives are implemented through the Bi-State Local Area Working Group (Bi-State LAWG), a collaborative conservation network of federal, state, and local government agencies, Native American tribal members and representatives, nonprofits organizations, and private landowners.

The Bi-State LAWG receives guidance from a team of agency scientists and biologists that make up the Technical Advisory Committee (TAC), as well as support from agency directors and leadership that make up the Executive Oversight Committee (EOC). Each year projects outlined in the Action Plan are implemented utilizing a science-based adaptive management and collaborative conservation approach. In 2014, agency partners announced a $45 million dollar commitment to implement the Action Plan over a 10-year period.

The purpose of this report is to provide a 10-year summary of Bi-State Action Plan implementation which includes population monitoring, vegetation monitoring, and the implementation of a wide variety of habitat improvement projects. Understanding Action Plan implementation and the effectiveness of conservation actions will help Bi-State partners to prioritize future conservation actions for Bi-State sage-grouse.

ACCOMPLISHMENTS

Much has been accomplished since the implementation of the Action Plan in 2012 (Figure 3). Bi-State partnerships remain strong and active and the Action Plan, while flexible, remains the guiding framework for Bi-State conservation efforts. Additionally, partners are well on their way to meeting the $45 million dollar funding commitment established in 2014. To date, approximately 84% of that funding has been allocated with a total of $37.6 million dollars spent on sage-grouse conservation efforts over the last eight years.

The objectives, strategies, and actions outlined in the Action Plan include population monitoring, habitat monitoring, and the implementation of a wide variety of conservation actions to maintain healthy sage-grouse populations and habitat in the Bi-State conservation planning area. Population monitoring includes sage-grouse capture, intensive monitoring of survival, nest success, and brood success, and annual lek monitoring. The collection of these data provides information on habitat selection and utilization as well as factors influencing sage-grouse population trends. Vegetation monitoring efforts aim to evaluate habitat quality and the effectiveness of completed conservation actions including post-fire restoration and conifer treatment. Finally, Action Plan directed conservation projects are carried out to address the following threats to Bi-State sage-grouse and their habitats:

- Wildfire
- Urbanization
- Conifer expansion
- Invasive species
- Infrastructure
- Loss of sagebrush/ meadows
- Small populations
- Human disturbance
- Wild horse grazing
- Permitted livestock grazing
- Predation

Since 2012, 945 sage-grouse have been captured and fitted with very high frequency (VHF) or Global Positioning System (GPS) transmitters across all Bi-State Population Management Units (PMUs) (Table 2, Figure 6). Population monitoring has occurred through annual lek counts and through the tracking of marked birds to better understand survival, reproduction, and recruitment. Vegetation monitoring has been completed at 816 sites to measure vegetation response to habitat improvement projects including changes in sagebrush cover, perennial grass cover, species richness and presence of non-native and invasive species. A total of 141 of the 159 actions identified in the Action Plan have been implemented. These projects have improved habitat conditions for sage-grouse on more than 143,000 acres of land in the Bi-State.

Over the last ten years, the Action Plan has provided a clear framework to guide this collaborative conservation effort. It has helped the Bi-State LAWG increase their understanding of sage-grouse population trends, gain a better understanding of factors influencing populations, and learn how and where to implement conservation actions to provide the greatest benefit to sage-grouse and their habitats. Recent USGS research suggests the implementation of the Action Plan has bolstered Bi-State sage-grouse populations by 3.9% annually and 31.1% since 2012 (Bi-State TAC, 2022). Bi-State partners are currently evaluating the most recent science and working to update the Action Plan so that it may continue to act as a guiding document for sage-grouse related conservation efforts in the Bi-State.

Bi-State sage-grouse on lek

INTRODUCTION

The Bi-State Local Area Working Group (Bi-State LAWG) was formed in 2002 to establish a landscape-level approach to conservation and management of the Bi-State greater sage-grouse distinct population segment (Bi-State DPS). This diverse group of stakeholders includes, federal, state, and local government agencies, Tribal members and representatives, non-profit organizations, and private landowners.

This group has been striving to implement a collaborative approach to sage-grouse conservation and management for twenty years and has been lauded nationally as a model of collaborative conservation success. Together they developed the first Bi-State sage-grouse conservation plan in 2004. In 2012, the Bi-State LAWG organized a planning and strategy approach to build and improve upon the multi-pronged effort to affect the conservation of the Bi-State DPS. While an important milestone, it was not the beginning of the Bi-State LAWG's effort but a continuation of efforts that began a decade before.

Encouraged by a potential listing of the species under the Endangered Species Act, the Bi-State LAWG set out to evaluate threats to Bi-State sage-grouse and identify tangible on-the-ground actions to alleviate these concerns. This effort culminated in the 2012 Bi-State Conservation Action Plan (Action Plan), which provided a 10-year adaptable scope of work, grounded in the best available science, and supported by funding commitments provided by local, state, and federal agency partners. The Action Plan summarized relevant threats and prior conservation efforts and outlined a comprehensive set of strategies, objectives, and actions designed to achieve conservation of sustainable populations and habitats for the Bi-State DPS (Bi-State TAC, 2012).

Each year projects outlined in the Action Plan are implemented utilizing a science-based adaptive management and collaborative conservation approach. Understanding Action Plan implementation and the effectiveness of conservation actions will help Bi-State partners to update the Action Plan and prioritize future conservation actions for Bi-State sage-grouse. The purpose of this report is to provide a 10-year summary of Bi-State Action Plan implementation which includes population monitoring, vegetation monitoring, and the implementation of a wide variety of habitat improvement and conservation projects.

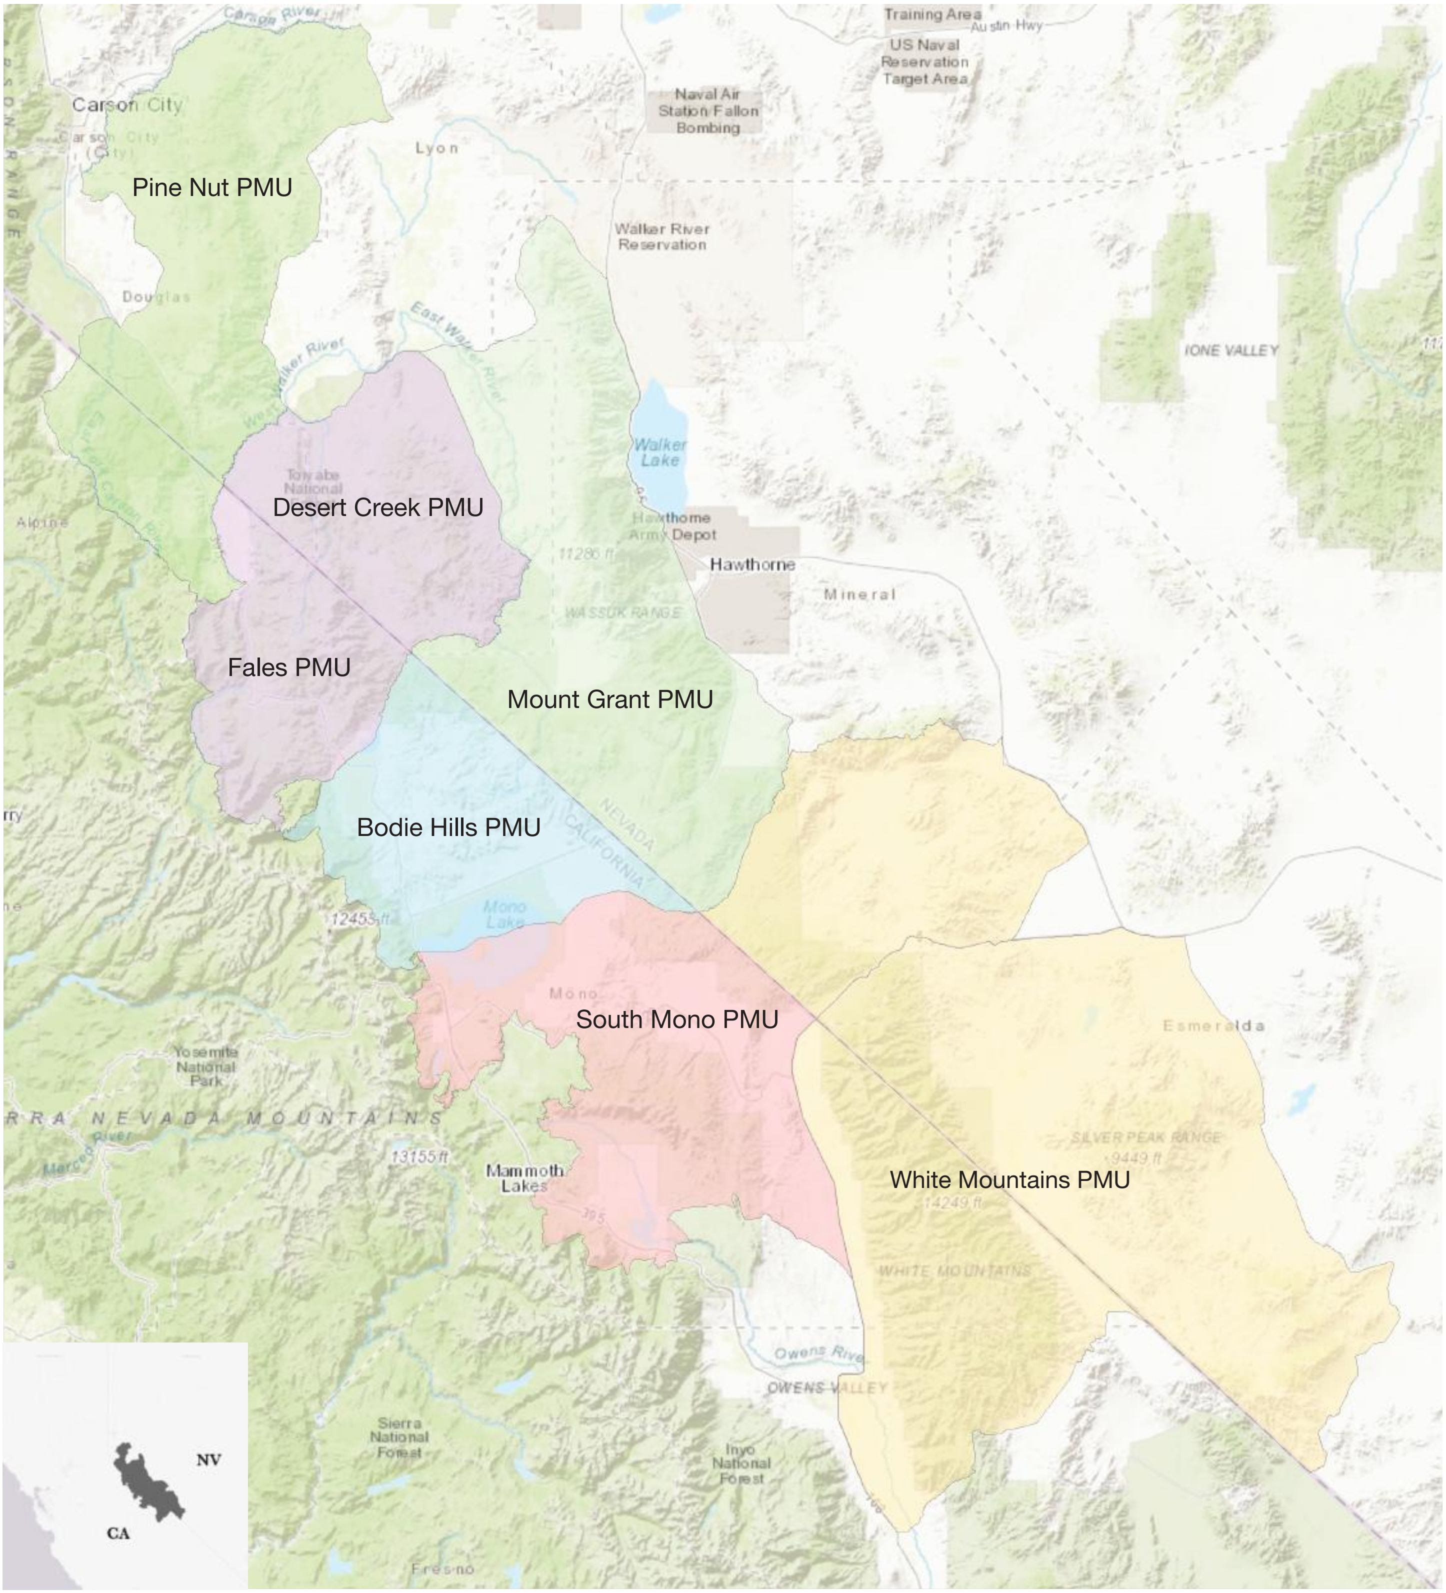

Figure 4: Bi-State Population Management Units

POPULATION MONITORING

There are six Population Management Units (PMUs) within the Bi-State, including the Bodie Hills, Desert Creek/Fales, Mount Grant, Pine Nut, South Mono and White Mountains (Figure 4). Research and monitoring projects detailed in the Action Plan include telemetry, habitat and vital rate data collection, and the coordination of annual lek counts to better understand population demographics and improve predictive models and adaptive management capabilities.

Monitoring efforts were in place in 2012 when the Action Plan was written but a cooperative plan to intensively monitor sage-grouse populations was initiated during the fall of 2015. This monitoring plan allows partners to identify long-term population trends, understand key habitat characteristics, and ultimately allows for a before and after study design to quantify sage-grouse response to management actions (Table 1).

Since 2012, 945 sage-grouse have been captured in the spring and fall seasons and fitted with Very High Frequency (VHF) collars or Global Positioning Satellite (GPS) transmitters (Table 2, Figure 6). Sage-grouse movement and survival is tracked in consecutive years. Intensive monitoring is conducted during nesting and brood-rearing periods to track reproduction and recruitment (Mathews et al., 2018). These vital rates provide data for the Integrated Population Model (IPM) which can characterize population growth rate and isolate factors affecting that rate for individual sub-populations and the Bi-State DPS.

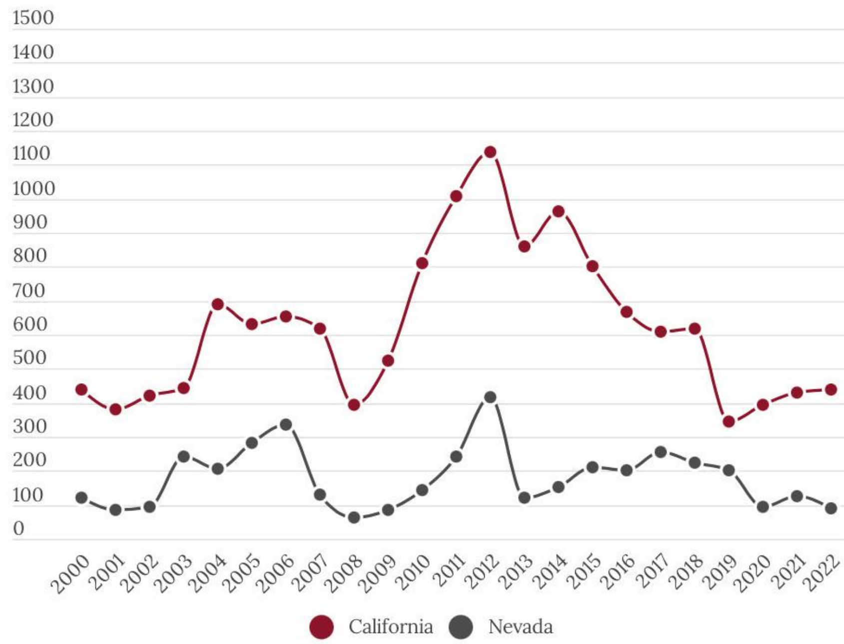

Figure 7: Bi-State sage-grouse lek attendance trends

LEK MONITORING

Each spring, between the months of March and May, Bi-State partners collaborate to monitor known leks to count sage-grouse when they congregate and visibly display on lekking grounds. These counts generate annual population estimates which help Bi-State partners understand population trends over time. These population trends are cyclical and count results fluctuate year to year. To determine long-term trends, annual lek count data is incorporated into an Integrated Population Model which accounts for low counts or leks not counted and generates modeled population estimates.

Within the Bi-State area, there are a total of 101 documented lek locations between California and Nevada, of which 49 are considered currently active (Figure 8) . The active lek status is defined by two or more males present for at least two of five recorded years (Connelly et al., 2003). The total number of documented leks may be somewhat misleading due to the presence of “satellite leks” within many of the PMUs. Satellite leks are small leks that often occur near larger active leks during years of relatively high abundance. The “active” definition is sometimes difficult to apply to satellite leks that are utilized sporadically and do not persist each year. State agencies including NDOW and CDFW are currently working on delineating satellite leks as autonomous or connected, thereby removing some uncertainty surrounding lek counts as an index of population change.

CALIFORNIA LEK SURVEYS

California sage-grouse lek counts are conducted by CDFW, USFS, USGS, LADWP, BLM, Mono County, and others. The primary method used to obtain lek count data in California involves saturation counts which is the simultaneous survey of all leks within a breeding complex on a minimum of three separate days spaced throughout the survey period. The peak male count is represented by the survey having the highest cumulative number of grouse counted on all leks within a breeding complex on any one day.

NEVADA LEK SURVEYS

Lek counts in the Nevada portion of the Bi-State are conducted by NDOW, USFS, BLM, USGS personnel, and volunteers using on-the-ground survey and aerial survey methods. Because many leks in Nevada are remote in nature and difficult to access, saturation counts are not attempted. Lek counts are attempted at all known active leks multiple times during the lekking season, and the highest recorded number of males is documented as the annual count. Remote leks are often surveyed aerially by helicopter.

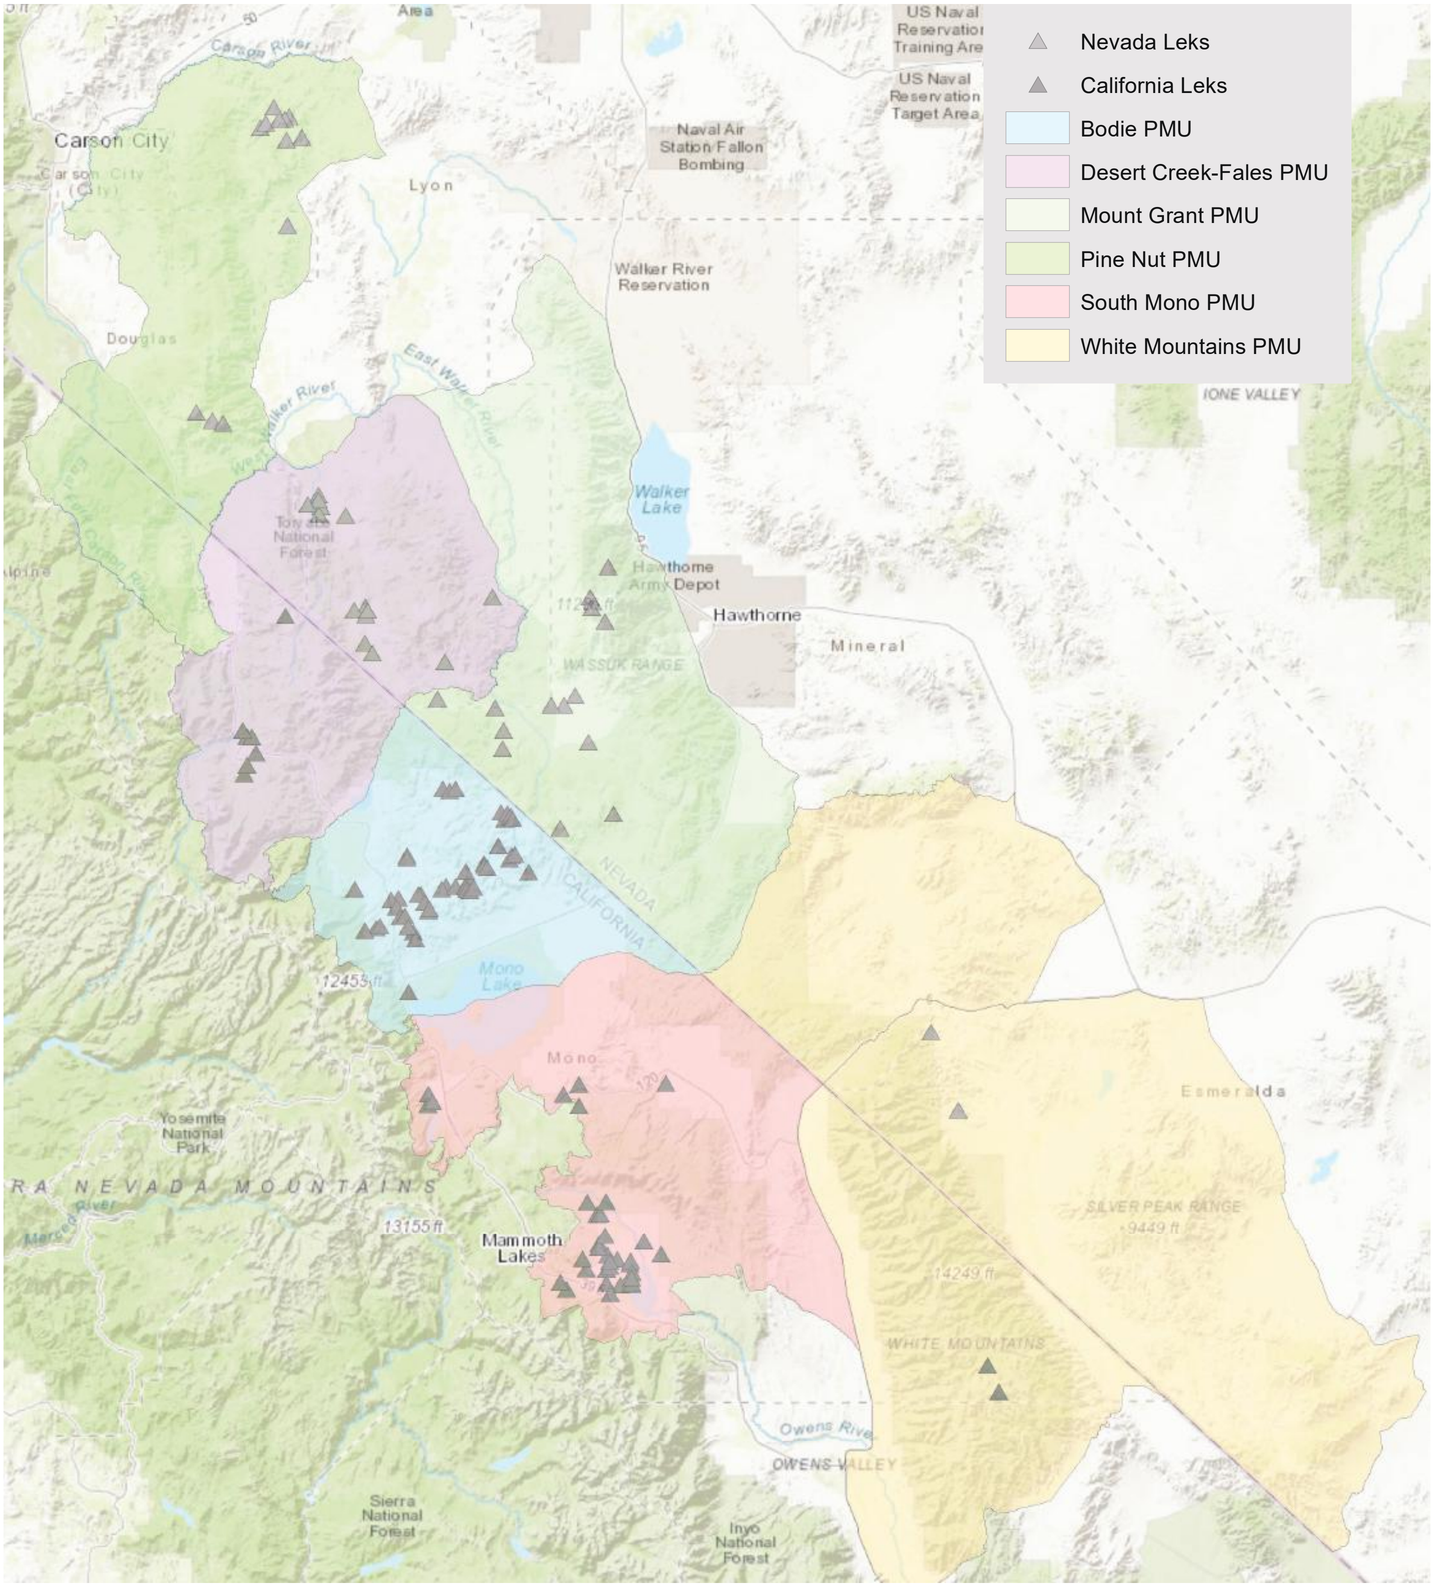

Figure 8: Known Bi-State lek locations

POPULATION MANAGEMENT UNIT SUMMARY

Sage-grouse population trends are cyclical and typically mirror climatic conditions. During periods of adequate moisture, sage-grouse populations often do well, while periods of drought bring population declines (Blomberg, 2012). The five-year period between 2012 and 2016 saw extreme drought conditions, with record-high temperatures and record-low snow pack and precipitation (Gleick, 2017). Since 2012, there have only been two years that California reached or surpassed long-term average precipitation levels and sage-grouse population trends have reflected this. (Figure 9). The following PMU sections summarize scientific research modeled by USGS' IPM. The population demographic descriptions that follow are for the reporting period between 2012 and 2021. They are heavily influenced by recent climactic conditions and do not accurately represent long-term population trends in the Bi-State.

PINE NUT

The Pine Nut PMU is in the northernmost region of the Bi-State. This area contains 574,373 acres of BLM, USFS, Tribal, private, and state or county managed lands (Bi-State Action Plan, 2012). This population of sage-grouse is relatively isolated from the rest of the Bi-State and with population estimates of 48 birds it is the smallest in the Bi-State area (Coates, 2022). Monitoring efforts took place from 2012 through 2015. Over that time 109 birds were captured, marked, and monitored for survival, nest, and brood success. Monitoring efforts were planned to initiate again in 2020 but halted due to concerns around capturing birds within such a small population.

The greatest threats to sage-grouse populations and their habitats in the Pine Nut PMU are wildfire, conifer encroachment, invasive species, recreational use impacts, infrastructure, and energy development (Table 3). Examples of completed conservation actions to address identified threats include:

- 11,704 acres of post-wildfire restoration
- 20,837 acres of conifer expansion treatment
- 838 acres of invasive species monitoring and removal
- 651 acres of meadow restoration and improvement
- 14.8 miles of fence removal and fence marking
- 3 wild horse gathers to maintain AML
- 4 projects to improve livestock grazing management
- 7 education and outreach events

Since 2012, sage-grouse populations in the Pine Nut PMU have been in decline. The likelihood that this population will become extirpated within the next ten years is 67.7% (Coates, 2019). Drought, wildfire, and wild horse impacts have all played a role in limiting habitat and reproductive success. Telemetry data between 2013 and 2015 indicates that some birds have moved from the Pine Nuts to the Bodie Hills PMU (Coates et al., 2016). Considering the Pine Nut subpopulation only makes up approximately 1% of the entire Bi-State population, changes in the overall total of birds in this area will not have great effects on the Bi-State as a whole, however, loss of population distribution is concerning (Coates, 2019).

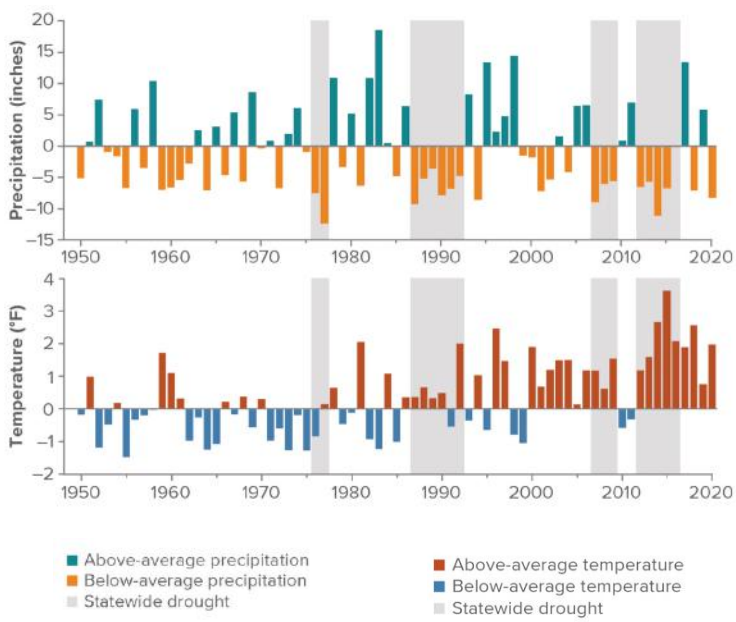

Figure 9: California drought and temperature data (Source: Western Regional Climate Center California Climate Tracker)

DESERT CREEK-FALES

The Desert Creek subpopulation is on the Nevada side of the Bi-State and is bordered to the west by the Fales subpopulation in California. These subpopulations are managed as one PMU. The Desert Creek-Fales PMU contains 567,992 acres of USFS, private, BLM, state or country, and Department of Defense managed lands (Bi-State Action Plan, 2012). IPM population estimates for Desert Creek total 237 birds while Fales is estimated at 88 (Coates, 2022). Monitoring in Desert Creek occurred in 2012 and between 2015 through 2018. During that time 79 birds were captured, marked, and monitored for survival, nest success, and brood success.

The greatest threats to sage-grouse populations and their habitats in the Desert Creek-Fales PMU are urbanization, conifer encroachment, wildfire, and infrastructure (Table 3). Examples of completed conservation actions to address identified threats include:

- 6,578 acres protected through conservation easements
- 21,016 acres of conifer expansion treatment
- 26 miles of fence marking
- 218 acres of sagebrush and meadow restoration
- 453 acres of invasive species removal
- 6 projects to improve livestock grazing management
- 1 education and outreach event

Since 2012, sage-grouse populations in the Desert Creek-Fales PMU have been in a slight decline. The most recent IPM estimates suggest that decline to be 4.5% annually (Coates, 2019). The ten-year extirpation estimates were 23.4% for Desert Creek and 38.4% for Fales (Coates, 2019). Sage-grouse in Desert Creek are located in lower elevation, drier habitats. Impacts from drought have likely caused these declines. However, recent lek counts suggest that sage-grouse numbers have been improving in the Fales PMU.

BODIE HILLS

The Bodie Hills PMU is west of the Mount Grant PMU on the California side of the Bi-State. It contains 349,630 acres of BLM, USFS, private, state, county, and Tribal lands (Bi-State Action Plan, 2012). This subpopulation is the largest in the Bi-State. Recent IPM estimates suggest there are 819 birds in the Bodie Hills PMU, which represents 36.6 percent of all sage-grouse within the Bi-State DPS (Coates, 2022). The Bodie Hills are higher in elevation compared to the rest of the Bi-State and habitat and bird populations tend to fare better during periods of drought as a result. Because the Bodie Hills subpopulation accounts for the bulk of population abundance, Bodie Hills PMU trends substantially influence overall trends across the Bi-State DPS (Coates, 2022). Capture and monitoring in the Bodie Hills occurred between 2012 and 2021. During that time 253 birds were collared and monitored for survival, nest success, and brood success.

Bodie Hills PMU in spring

The greatest threats to sage-grouse populations and their habitats in the Bodie Hills PMU are wildfire and conifer encroachment (Table 3). Examples of completed conservation actions to address identified threats include:

- 825 acres of post-wildfire restoration
- 7,713 acres of conifer expansion treatment
- 1,690 acres of sagebrush and meadow restoration
- 32 miles of fence removal, modification, and marking
- 11,624 acres protected through conservation easements
- 170 acres of invasive species removal
- Annual monitoring of the Montgomery Pass wild horse herd
- 32 projects to improve livestock grazing management
- 3 education and outreach events

In 2012, sage-grouse populations were at an all-time high in the Bodie Hills PMU. Since then, coincident with a long period of drought, populations have declined slightly but population estimates in the Bodie Hills PMU still remain four times higher than they were two decades ago (Coates, 2019). The IPM estimates the likelihood of ten-year extirpation to be low at 2.4% (Coates, 2019). The Bodie Hills PMU is higher in elevation relative to other Bi-State PMUs and can withstand the effects of drought longer than other lower elevation sites (Coates, 2019). Bodie Hills also contains a relatively large amount of late brood-rearing habitat in the Bi-State, which has led to higher recruitment rates for this reporting period (Coates, 2019).

Sage-grouse in Long Valley meadow

MOUNT GRANT

The Mount Grant PMU is east of the Bodie Hills on the Nevada side of the Bi-State. This area contains 699,079 acres of USFS, BLM, Department of Defense, private, and Tribal managed lands (Bi-State Action Plan 2012). IPM estimates suggest there are 230 sage-grouse in the Mount Grant PMU (Coates, 2022). Capture and monitoring in Mount Grant occurred between 2012 and 2018, and in 2021. During that time 145 birds were captured and monitored for survival, nest, and brood success.

The greatest threats to sage-grouse populations and their habitats in the Mount Grant PMU are wildfire, conifer encroachment, infrastructure, mineral exploration and development, and energy development (Table 3). Examples of completed conservation actions to address identified threats include:

- 1,562 acres of post-wildfire restoration
- 8,862 acres of conifer expansion treatment
- 60 acres of sagebrush and meadow restoration
- 47 sites monitored to assess meadow conditions
- 26 miles of fence marking
- 2,607 acres of invasive species monitoring and removal
- 1 wild horse gather to maintain AML
- 2 projects to improve permitted livestock grazing management
- 3 projects to limit recreational use impacts
- 2 education and outreach events

Between 2012 and 2018, sage-grouse populations in the Mount Grant PMU remained very close to stable. Since 2019 there have been sharper declines in male lek attendance, which is likely a result of long-term drought in the higher elevations of the Mount Grant PMU. USGS has documented movement of birds from Mount Grant to the Bodie Hills PMU. The IPM estimates the likelihood of ten-year extirpation to be moderate at 24.6% (Coates, 2019). More intensive monitoring of this population will begin in 2022, which may provide more understanding of the demographic rates associated with population declines.

SOUTH MONO

The South Mono PMU contains 579,483 acres of BLM, USFS, private, county, and Tribal managed lands (Bi-State Action Plan, 2012). This subpopulation is the second largest in the Bi-State and includes the Parker Meadows, Sagehen, and Long Valley subpopulations. Recent IPM estimates suggest there are 769 birds in the South Mono PMU, the majority of which utilize the Long Valley area (Coates, 2022). As of spring 2021, the Long Valley subpopulation represents 31 percent of all sage-grouse within the Bi-State DPS. Because of its large size, population changes at Long Valley have large impacts on the overall Bi-State DPS trends (Coates, 2022). Capture and monitoring in the Sagehen subpopulation occurred in 2014 and 2015. Capture and monitoring in the Parker Meadows subpopulation occurred in 2012 and between 2017-2021. Capture and monitoring in the Long Valley subpopulation occurred from 2015 to 2021. During that time a total of 250 birds were collared and monitored for survival, nest success, and brood success.

The greatest threats to sage-grouse populations and their habitats in the South Mono PMU are wildfire, infrastructure, recreation and human disturbance, and urbanization (Table 3). Examples of completed conservation actions to address identified threats include:

- 2,926 acres of post-wildfire restoration
- Progress has been made to close the Benton Crossing landfill by 2023
- 1,246 acres of seasonal road closures to limit recreational use impacts during lekking season
- 52.8 miles of permanent road closures in critical sage-grouse habitat
- 2,305 acres protected through conservation easements
- 5.7 miles of fence removal, modification, and marking
- 6,275 acres of conifer expansion treatment
- Implementation of LADWP's Adaptive Management Plan for watering in Long Valley
- Raven monitoring and egg oiling efforts to reduce predation impacts
- 5 acres of invasive weed treatment
- 4 projects to improve permitted livestock grazing management
- 16 education and outreach events

The South Mono population has experienced slight declines over the reporting period likely associated with drought, predation, and high levels of recreational activity in the Long Valley area.

White Mountain PMU

Sage-grouse and pronghorn

The 10-year extirpation probability remained low at 3.8 %. Birds in the Long Valley portion of the South Mono PMU rely heavily on wet meadows and irrigated pastures near Crowley Lake during nesting and brood rearing periods. During long periods of drought, birds may venture further out in those irrigated pastures with little overhead protection from avian predators (Coates, 2022). Although the effect of outdoor recreation pressure on sage-grouse has not been quantified, recreational use has increased significantly over the reporting period and may be affecting habitat selection patterns (Coates, 2022). Birds in the Sagehen area have sharply declined, it is presumed that they have joined the core population in the Long Valley area during the drought period. Birds in the Parker Meadows area have experienced a large increase after experimental translocation efforts were implemented between 2017 and 2021 (see translocation section).

WHITE MOUNTAINS

The White Mountains PMU is the highest elevation sage-grouse habitat in the Bi-State area and contains 1,753,875 acres of BLM, USFS, and privately managed lands (Bi-State Action Plan, 2012). Recent IPM estimates suggest there are 40 birds in this population (Coates, 2022). However, the White Mountains are remote and difficult to access in the spring, sage-grouse in the PMU have not been extensively monitored, and historic lek count data is lacking. Therefore, the IPM should be interpreted with caution as bird numbers could be much higher than the model suggests (Coates, 2022). Capture and monitoring efforts took place in 2013, 2015 and from 2017 to 2021. During that period 196 birds were collared and monitored for survival, nest success, and brood success.

The greatest threats to sage-grouse populations and their habitats in the White Mountains PMU are conifer expansion and wild horses (Table 3). Examples of completed conservation actions to address identified threats include:

- TAC members evaluated 5 conifer treatment sites
- Monitoring of White Mountain and Silver Peak wild horse herds
- Coordinated management of Crooked Creek grazing allotment
- 1.7 miles of fence marking
- 4 education and outreach events

Sage-grouse in the White Mountains were relatively understudied, largely because these sage-grouse reside at high elevations that are often inaccessible until mid-summer. The subpopulation represents the most southwestern, and potentially highest elevation occupancy of greater sage-grouse across the species range, representing a unique and potentially extreme study site. Thus, less is known about this population compared to other Bi-State populations (Coates, 2022). Capture and monitoring efforts will continue in an effort to increase understanding of demographic rates and population trends in the White Mountains PMU.

Parker Meadow brood translocation

PARKER MEADOW TRANSLOCATION

One management action specifically listed in the Action Plan was the addition of birds, through translocation, from other PMUs to critically small and isolated sub-populations of sage-grouse. Translocations are designed to: 1) bolster population size to reduce the eminent likelihood of local extinction that would negatively impact the overall stability and persistence of the DPS; and 2) infuse genetic variation to 'rescue' this population from the harmful effects of low genetic diversity within the subpopulation.

Ongoing research conducted by the USGS highlighted the potential for population declines within the Parker Meadow subpopulation in the South Mono PMU to critically low levels. It was determined that intervening management efforts were necessary to maintain and increase the Parker Meadow subpopulation.

After three years of planning, the first of a multi-year translocation effort began in March 2017. That year, 28 sage-grouse (20 females, 8 males) were captured at Bodie Hills and translocated to Parker Meadows. All captured birds were fitted with VHF or GPS (male only) transmitters. As part of an experimental design, a subset of females was artificially inseminated prior to release to help increase the probability of nest initiation that spring. Additionally, three post-hatch broods, females with newly hatched chicks, were translocated. These were the first greater sage-grouse brood translocations attempted range-wide. The expectation is that these reproductive conditions would help "anchor" the female to the release area, and their surviving chicks would add new recruits to the population at Parker Meadows.

Data from 2017 efforts suggested that brood translocations are more successful because they bypass the effects of low nest initiation and success associated with the translocation of pre-nesting females. In 2018, 20 more sage-grouse (13 females, 7 males) were translocated from Bodie Hills to Parker Meadows, five of which were pre-nesting hens and eight were females with broods. In 2019, a total of 20 birds (10 females with broods, 5 pre-nesting females, 5 males) were translocated from the Bodie Hills PMU. Fifteen were outfitted with VHF transmitters and 5 with GPS transmitters to track movement and monitor survival. No translocations took place in 2020 due to the covid-19 pandemic. In 2021, five hens with their broods were translocated to Parker Meadows.

Given what has been learned during the initial years of translocation efforts, measures have been identified to minimize morality and dispersal rates. Design changes to transport boxes and increasing the emphasis on brood translocations promise to reduce the number of individuals required to be handled and improve success of the translocation overall (Figure 10). Moving forward USGS will be using a new protocol that involves mixed brood translocations, where one hen is translocated with her brood and part of another hen's brood. The purpose of this method is to limit the number of adults removed from the source population, decreasing negative demographic impacts to that population. The translocation effort in Parker Meadows will continue in the coming years. Changes to protocols and methods will continue to utilize a science based, adaptive approach to allow this effort to be as successful as possible.

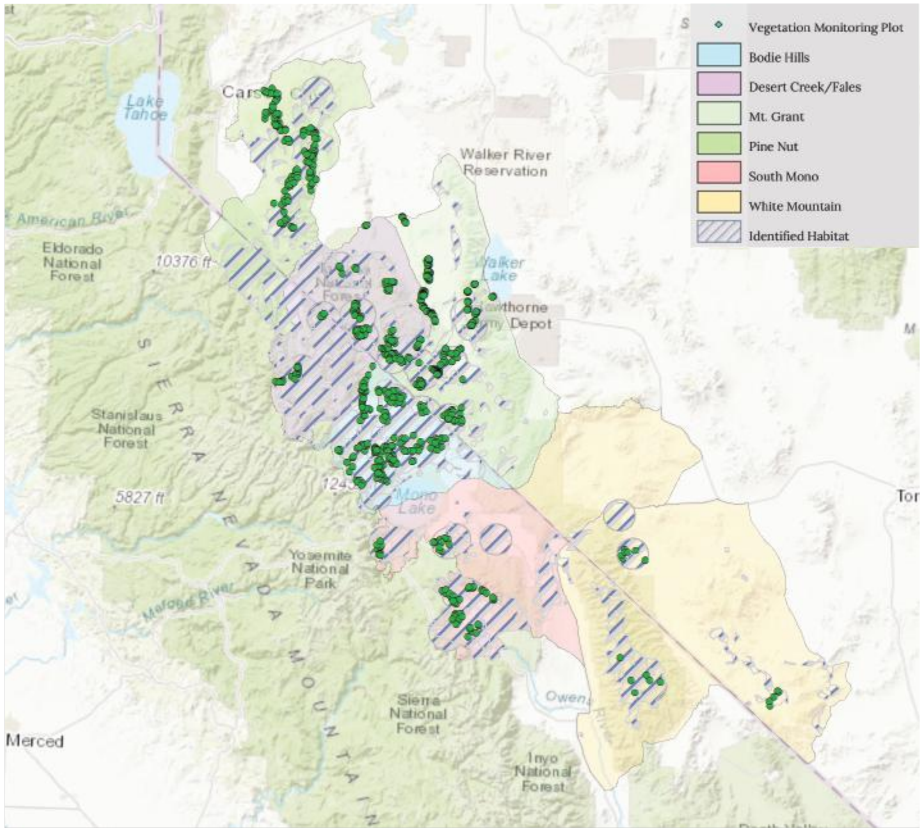

Figure 11: Vegetation monitoring plot locations

VEGETATION MONITORING

The Nevada Partners for Conservation and Development (NPCD), housed within the Nevada Department of Wildlife (NDOW), has been collecting vegetation data across numerous sites across all Bi-State PMUs since 2011.

In areas identified for conifer removal and at sites that have experienced episodes of wildfire, the NPCD establishes monitoring plots both within and outside of treatment and wildfire boundaries. Sampling is conducted prior to treatment to establish baseline conditions and sites are revisited post treatment to determine treatment and fire restoration effectiveness. Plots outside of treatment and wildfire boundaries serve as controls against which the restoration projects' effectiveness can be compared. The methods NPCD employs are consistent with the BLM's Assessment, Inventory and Monitoring protocols (AIM; Taylor et al. 2014) and are designed to be easily replicated, requiring little or no expensive equipment.

Since the Action Plan was implemented, 816 vegetation plots have been monitored across the Bi-State. Monitoring measures vegetation response to treatment including changes in sagebrush cover, perennial grass cover, species richness and presence of non-native and invasive species (Figure 12). Vegetation response to treatment is often slow; however, preliminary results from selected sites suggest that species richness, sagebrush, perennial grass, and forb cover are elevated in treatment plots compared to control sites. These results suggest that conifer treatment and post wildfire restoration efforts are improving habitat conditions for sage-grouse.

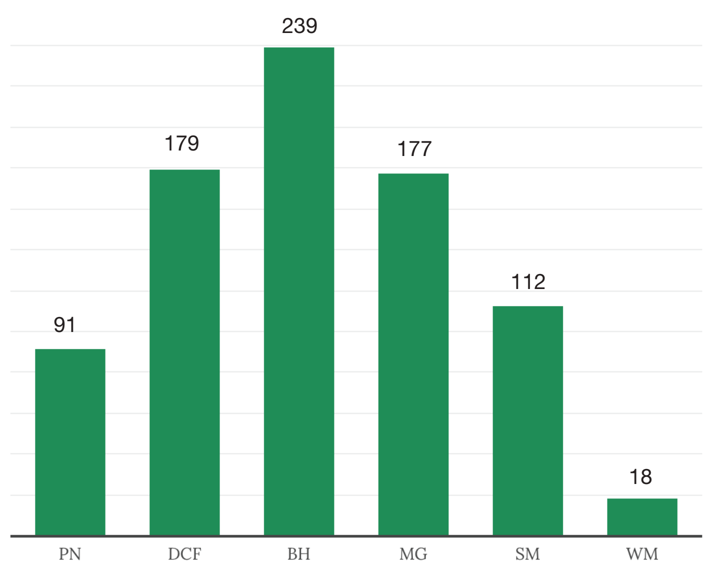

Figure 12: Completed vegetation monitoring plots

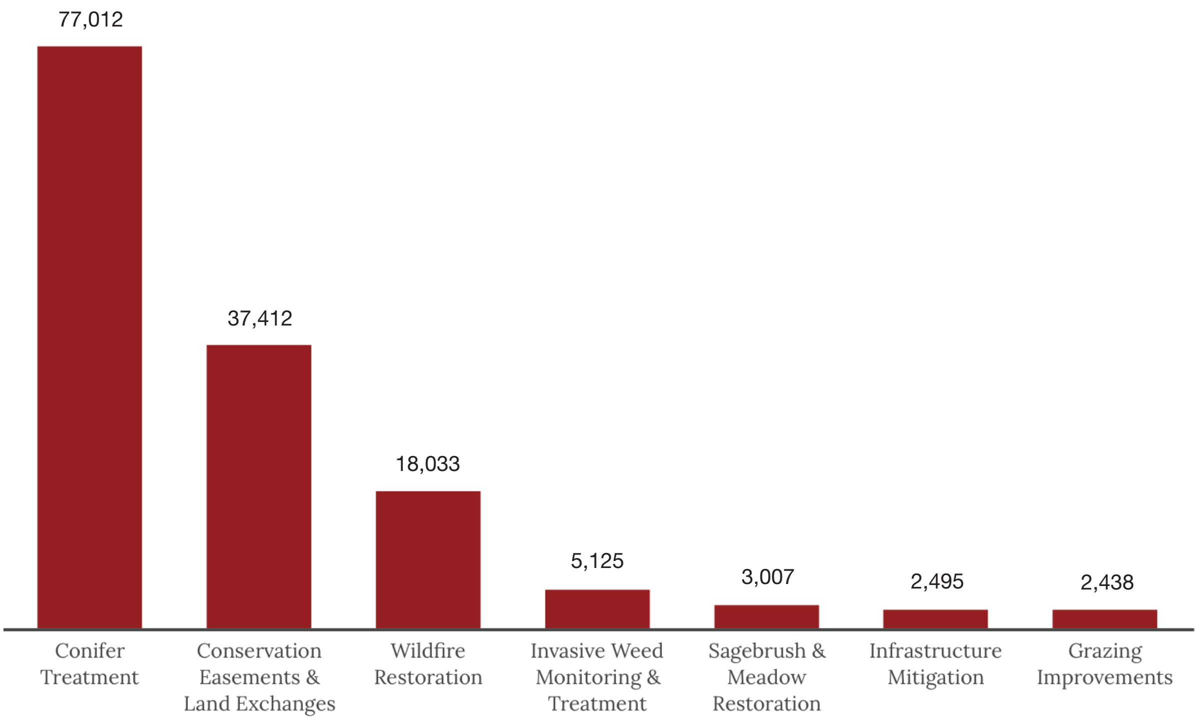

Figure 13: Acres of work completed to address identified threats to Bi-State sage-grouse

CONSERVATION ACTION IMPLEMENTATION

The Action Plan intended to provide a foundation and vision for a coordinated and cooperative management approach for conservation of the Bi-State sage-grouse, to ensure healthy population levels, and to maintain and improve sage-grouse habitat.

Individual objectives, strategies, and actions outlined in the Plan provide a strategic framework designed to achieve these overall conservation goals. Conservation actions are outlined using a hierarchal approach that identifies each action relative to the broader conservation objectives and strategies identified in the Plan (Bi-State Action Plan, 2012). The highest priority threats were identified and prioritized for each individual PMU.

In the last ten years, on-the-ground conservation efforts have been initiated to improve habitat conditions on more than 143,000 acres in the Bi-State (Figure 13). The following pages identify threats to Bi-State sage-grouse and their habitats and detail actions taken to address those threats. Work completed represents the highest priority actions in the Bi-State informed by research, a conservation planning tool developed by USGS, input from the Bi-State Local Area Working Group, and common-sense realities of implementing projects.

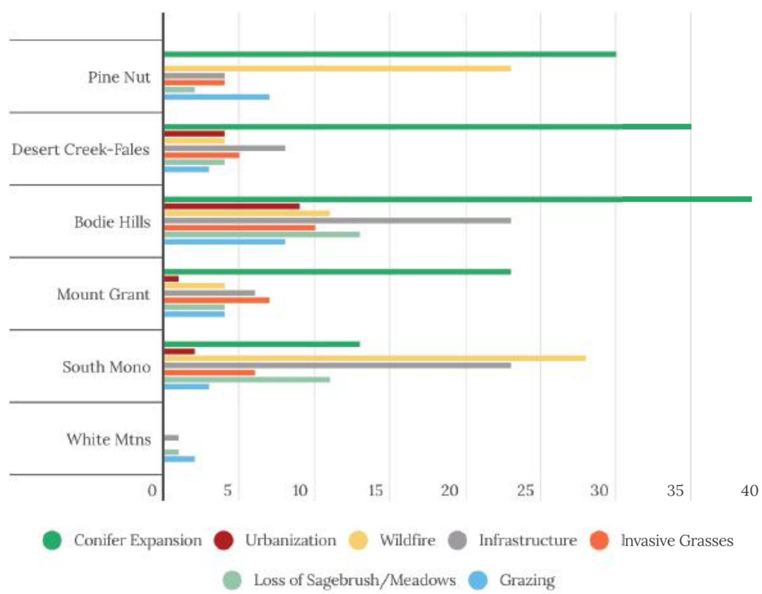

Figure 14: Number of completed projects by PMU

Post fire conifer removal

Wind fencing to improve soil stabilization

WILDFIRE

Large, intense wildfires are an increasing issue across the West and the Bi-State is not immune to this threat. Addressing wildfire is identified as a high priority in the Pine Nut, Desert Creek-Fales, Mt. Grant, Bodie and South Mono PMUs.

Changing climate, periods of drought, encroaching conifer, and the proliferation of non-native weeds, such as cheatgrass, alter sagebrush ecosystems and increase the likelihood of ignition and fuel load available for wildfire that can quickly devastate large expanses of important sage-grouse habitat.

A disturbed ecosystem post-fire is more susceptible to further invasion of non-native plant species and conversion of sagebrush to annual grass monocultures, which in turn increases potential for fire. This cycle alters fire regimes, causing more frequent and intense fires that perpetuate loss of habitat and threats to sage-grouse. Actions employed to address the threat of wildfire include, strategic fire suppression, fuel breaks, conifer removal, fuel reduction and post-fire rehabilitation. The removal of encroaching conifer reduces fuel availability for wildfires in sagebrush ecosystems and can act as a fuel break to halt or slow the progress of a spreading wildfire. Fuel reduction entails thinning thick stands of conifer, mosaic mowing and prescribed burns to limit the spread and decrease the intensity of wildfires while promoting native plant species production. Post-fire rehabilitation helps avoid ecosystem type conversion and promotes the return of suitable sage-grouse habitat though erosion control and seeding of native shrubs and grasses.

ACCOMPLISHMENTS

- To address the threat of wildfire, Bi-State LAWG partners communicate across jurisdictional boundaries to implement coordinated fire-management strategies that minimize the loss of suitable sage-grouse habitat.
- A concerted effort is made to ensure that fire personnel are informed and respond to wildfire with consistency across management boundaries. This requires the ability to: 1) identify locations that provide current or potential habitat for sage-grouse and 2) prioritize fire suppression and management actions in these areas to minimize sage-grouse habitat loss.
- Interagency fire management and suppression agreements were established between the BLM and USFS. Existing fire management plans were updated to include conservation measures identified by the National Sage-Grouse Technical Team to reduce long-term loss of sagebrush.
- Since 2012, a total of 18,034 acres of work, including conifer removal, fuel breaks, fuels reduction and post-fire rehabilitation has occurred in the Pine Nut, Desert Creek-Fales, Mount Grant, Bodie and South Mono PMUs.
- Resource advisor kits are updated annually to provide the most recent information on sage-grouse populations and all fire personnel receive training on fire protocols specific to sage-grouse habitat.
- Wildfire prevention activities include patrols to locate fire starts, document campfires and educate the public on fire regulations.
- LADWP prohibits camping on their lands and has adopted a no campfire policy to reduce the potential for human caused fire.

Bi-State conservation easement

URBANIZATION

Biomes in the arid west have uneven distributions of food and cover, thus fragmentation can be particularly acute for the wildlife that depend on these environments. Many sagebrush obligate species have evolved to require very large areas of intact habitat to meet their seasonal and annual resource needs. Therefore, disturbance of a relatively small number of fragmented sagebrush acres can have a disproportionate impact on the species that need that habitat to survive (Crist, 2015).

Maintaining high quality, intact habitat conditions into the future and addressing the risks associated with urbanization is a high priority in the Desert Creek-Fales, Pine Nut, and South Mono PMUs.

Conservation easements are implemented to limit urban development that may fragment habitat. These are voluntary legal agreements between a landowner and a qualified organization, like a land trust, which places some conservation restrictions on the use of a property to protect its natural values. These agreements provide benefits to both landowners and wildlife. They protect large quantities of suitable habitat from further development and allow landowners to pursue available funding to implement conservation projects on their land.

In addition to conservation easements on private lands, land purchases or exchanges have occurred that resulted in public, state, or federal ownership of occupied sage-grouse habitat. These acquisitions ensure that land remains intact for generations and managed in a way that will maintain quality habitat and provide conservation value to Bi-State sage-grouse.

ACCOMPLISHMENTS

- The Action Plan identifies 12 actions to address the threat of urbanization in the Desert-Creek Fales, Bodie Hills, and White Mountain PMUs, seven of which are complete. In total, 37,412 acres have been entered into conservation easement agreements or have been acquired through land purchase or exchange since 2012. These completed projects insure that connected, high-quality habitat is available for sage-grouse and other wildlife species well into the future.

- Partners have implemented new policies, plans and programs to promote land conservation and to reduce development and human disturbance impacts.

- In 2014 the NRCS designated the Bi-State region as "Grasslands of Special Environmental Significance." This designation raised the amount of funds NRCS contributes to the acquisition of easements from 50 percent to 75 percent.

- In 2017, the Eastern Sierra Land Trust secured $8 million dollars in funding through the USDA's Regional Conservation Partnership Program (RCPP) which allowed ranchers and landowners to apply for conservation funding for projects on their lands that benefit both working lands and wildlife.

- Mono County implemented new policies in their County Plan to reduce the impact of development in sage-grouse habitat.

Actions not completed include the following:

- MER2-2: Secure a conservation easement or agreement with the Desert Creek Ranch to maintain essential brood rearing habitat in proximity to lek # 2 in the Desert Creek-Fales PMU.

- MER2-5: Secure a conservation easement or agreement with the Mormon Ranch to maintain essential brood rearing habitat in proximity to the Bridgeport Canyon/ Little Mormon lek complex in the Bodie Hills PMU.

- MER2-6: Secure a conservation easement or agreement for the Aurora Meadow complex to maintain brood rearing habitat in proximity to the Aurora lek in the Mount Grant PMU.

- MER2-8: Secure conservation easements or agreements with willing landowners in the Burcham Flat, Wheeler Flat and Fales Hot Springs vicinities to prevent further development impacts in proximity to leks in the Fales breeding complex in the Desert Creek Fales PMU.

- MER2-12: Secure conservation easements or agreements with willing landowners to maintain key nesting or wintering habitats along the east side of the White Mountains in the White Mountains PMU.

CONIFER ENCROACHMENT

The loss and fragmentation of high-quality, intact sage-grouse habitat to encroaching conifer is a high priority threat in the Pine Nut, Desert Creek-Fales, Mt. Grant, Bodie and White Mountain PMUs. Pinyon pine, juniper, and Jeffery pine are native species in the Bi-State but expansion beyond historical limits due to fire suppression, historic overgrazing by domestic livestock and favorable climate conditions has become problematic (Brockway et al. 2002). Across the Bi-State area, it is estimated that approximately 40 percent of the historically available sagebrush habitat has experienced woodland expansion over the past 150 years (USGS, 2012). Conifer encroachment into sagebrush systems is problematic as it may increase fire severity and size, deplete soil water and nutrients, reduce native understory, provide perches for avian predators, and alter sage-grouse habitat selection. All of which can affect behavioral decisions, distribution, and population dynamics of sage-grouse.

Previous studies have shown that sage-grouse experience population-level impacts at low levels of encroachment and that leks are less likely to be active near small, dispersed trees (Baruch-Murdo et al. 2013). In 2017, the USGS published a study, conducted in the Bi-State, that demonstrated changes in sage-grouse habitat selection and negative effects to vital rates directly associated with encroaching conifer (Coates et al. 2017). To address the threat of conifer encroachment, the USGS and TAC developed a spatially explicit Conservation Planning Tool (CPT). The CPT is a model that ranks the relative benefit of individual conifer removal projects. Bi-State partners can utilize this tool to select and prioritize conifer removal projects that will provide the most conservation value to sage-grouse and maximize benefit from dollars spent. Addressing conifer encroachment and infill provides a myriad of benefits to sage-grouse that include increasing habitat connectivity, maintaining native understory, eliminating perches for predators, conserving soil water and nutrients, and increasing ecosystem resilience to fire and resistance to cheatgrass invasion.

Conifer projects within the Bi-State are ranked using the CPT and the TAC's expertise regarding areas of occupied sage-grouse habitat being impacted by conifer encroachment. Conifer removal projects aim to improve habitat, increase connectivity, and reduce risk to sage-grouse. Phase I conifer cover is targeted to provide the most benefit at the lowest cost. Post-treatment maintenance is often required in the years following initial treatment to ensure that small seedlings and saplings were not missed in the original treatment.

Parker Meadows pre conifer treatment

Parker Meadows post conifer treatment

ACCOMPLISHMENTS

- The Action Plan contains 20 actions that call for the evaluation and implementation of conifer removal projects as a method to restore and maintain intact sagebrush habitat for sage-grouse. Of those 19 have been initiated and are in various states of completion.

- In total, 64,697 acres of conifer treatment and 12,315 acres of conifer treatment maintenance have been completed.

Actions not completed include the following:

MER4-2: Evaluate pinyon-juniper encroachment and potential connectivity issues in the Masonic Gulch, Red Wash, and Chinese Camp vicinities in the Mount Grant PMU.

Native seed collection

Cheatgrass

Aerial seeding with native seed source post fire

INVASIVE AND NOXIOUS SPECIES

Non-native plants are not overly abundant in the Bi-State area, except for cheatgrass, which occurs in all PMUs throughout the range. It is most prevalent in the Pine Nut PMU, where it is identified as a high priority threat and in the Mt. Grant PMU where it is listed as a moderate threat. The infiltration of cheatgrass into sagebrush systems can increase fire potential size and severity, out-compete native understory species after fires, and perpetuate a devastating disturbance cycle.

To counter the threat of habitat loss, Bi-State land management agencies and their partners have implemented numerous conservation actions and strategies. These include strategic fire suppression to avoid ecosystem-type conversion, utilization of native plant species to rehabilitate burned areas, and mechanical and chemical weed treatments.

ACCOMPLISHMENTS

- Since 2012, monitoring to detect invasive annual grasses has occurred on 3,325 acres across multiple PMUs in the Bi-State.
- Post fire restoration and conifer treatment sites are assessed prior to treatment to select appropriate methods to minimize site disturbance that could result in the establishment of non-native plant species.
- Chemical and mechanical treatment of non-native plant species have occurred on 1,786 acres in the Pine Nut, Desert Creek-Fales, Bodie Hills, and South Mono PMUs.
- Native seeds are collected for future Bi-State restoration and rehabilitation projects.

Bi-State meadow habitat

LOSS OF SAGEBRUSH AND MEADOWS

Healthy sagebrush and meadow conditions are necessary components of sage-grouse habitat, crucial to supporting sage-grouse throughout their life cycle. Land managers make every effort to implement best management practices to avoid the degradation of intact sage-grouse habitat through adopted regulatory mechanisms. When sagebrush and meadow conditions are compromised, improvements are made through restoring native hydrology, installing check dams to stabilize stream head-cuts, fencing areas to allow recovery from livestock grazing, prescribed fire, and irrigation.

ACCOMPLISHMENTS

- Through the completion of 40 projects within all Bi-State PMUs, 3,008 acres of meadow and sagebrush were restored or enhanced through irrigation, meadow improvement, and vegetation restoration.
- Meadow habitat improvement efforts on public and private lands in upper Aurora Canyon in the Bodie Hills PMU have been implemented.
- The Bishop BLM installed check dams to stabilize stream area headcuts in 2010, since then additional check dams have been installed in subsequent years and maintenance of these structures occurs annually.
- Hydrological function was returned to Wheeler Creek through restoration efforts to increase plant cover and diversity on adjacent brood meadows.
- The Eastern Sierra Land Trust cleaned up two dump sites and cleared out irrigation ditches in sage-grouse habitat located on privately owned property.
- In 2018 and 2019, the Nevada State Parks conducted proper functioning condition surveys to evaluate and assess stream health within the Walker River State Recreation Area. The objective of these projects is to gather information on creeks and their associated meadows to develop restoration projects designed to reconnect fragmented habitat and restore summer brooding habitat in the Mt. Grant PMU.
- Assessment, inventory, and monitoring (AIM) vegetation plots are completed throughout the Bi-State annually to evaluate ecosystem health.
- Through the Seeds of Success program native seeds were collected at multiple sites to provide a local seed source for restoration projects.
- Between 2015 and 2021, partners met seven times to complete assessments for future wet meadow and stream restoration sites in multiple PMUs.
- LADWP developed an adaptive management plan for irrigating meadows in the Long Valley area of the South Mono PMU to maintain important sage-grouse habitat.

Actions not completed include the following:

HIR1-5-PN: Manage high elevation wet meadows in the southern portion of the Pine Nut PMU. Maintain existing fences and mark with diverters.

HIR2-1-PN: Restore previously burned sagebrush habitat within a three mile radius of Mill Canyon Lek.

HIR2-2-PN: Maintain meadows in Mount Seigal and Bald Mountain areas in proper functioning condition or improve through livestock management.

HIR2-3-PN: Improve sagebrush habitat quality west of Big Meadow.

HIR2-3-MG: Evaluate meadow habitat conditions in the Aurora and Gregory Flat vicinities.

Converting Bodie Hills fence to let down

INFRASTRUCTURE & HUMAN DISTURBANCE

Infrastructure is identified as a high priority threat in the Pine Nut, Desert Creek- Fales and Mount Grant PMUs. The threat of human disturbance is high in the Pine Nut and South Mono PMUs and moderate in the Desert Creek-Fales PMU.

Infrastructure features impacting sage-grouse in the Bi-State region include linear features such as roads, power lines and fences and location specific features like landfills, communication towers and windmills. Impacts from linear features include fragmentation of habitat (Braun 1998), direct mortality through collisions and increased available perches for predators (Connelly et al. 2000). Roads not only fragment habitat but also increase potential for human access and disturbance. Site specific infrastructure, such as landfills, attract and increase predator populations. Recent studies found that transmission lines in central Nevada affected multiple demographic rates of sage-grouse and influenced raven abundance and habitat selection, which had cascading effects to associated sage-grouse populations (Gibson, 2018).

To address threats posed by infrastructure, fences in occupied sage-grouse habitat are evaluated for strike hazards and are either removed, modified, or marked as necessary. Permanent and seasonal road closures serve to reduce disturbance and potential fragmentation. Location specific infrastructure threats are evaluated, and steps are taken to remove structures that increase risk to sage-grouse.

Threats associated with human disturbance include illegal hunting and recreational use impacts to sage-grouse habitat. These threats have been addressed through increased law enforcement, public education and the adoption of land management policies that restrict access to key habitat through road closures, regulation of new road development, and seasonally enforced regulations.

ACCOMPLISHMENTS

The Action Plan identifies 12 actions to decrease infrastructure threats to Bi-State sage-grouse. Since 2012, 11 of these 12 actions have been addressed and include, fence evaluation, the removal of the site-specific hazards, and the following actions:

- Fourteen miles of fence have been removed in the Bodie Hills, Pine Nut, and South Mono PMUs. An additional 7.5 miles of fencing was converted to “let down”. Many miles of fence across the Bi-State were marked with flight diverters.

- LADWP imposes seasonal closures of their land near Crowley Lake during the peak lekking period to reduce the potential for human disturbance. 2,420 acres of land near leks and nesting habitat benefit from seasonal road closures annually.

- Four windmills in Adobe Valley located within the South Mono PMU were removed and converted to solar in 2014. Over six miles of the Fletcher power line located in the Bodie Hills PMU was decommissioned and removed. This project was completed in 2014. Progress toward the closure and relocation of the Mono County landfill has been made through planning and funding acquisition. Closure is on track to be completed in 2024.

- With the new designation of the Walker River State Recreation Area in the Mt. Grant PMU, law enforcement patrols to deter poaching and manage recreational use have increased.

- Partners worked together to develop public lek viewing guidelines and produced outreach material to disseminate information to the public.

- The BLM adopted a land use amendment that regulates the development of new roads or OHV trails in Bi-State sage-grouse habitat. Recreation monitoring and management activities have increased in the South Mono and Bodie Hills PMUs.

Actions not completed include the following:

MER3-7: Minimize impacts from traffic near the Aurora Borealis mine in the Mount Grant PMU.

Converting Bodie Hills fence to let down

GRAZING PERMITTED LIVESTOCK

The grazing of permitted livestock is listed as a low priority threat in all PMUs across the Bi-State. To address the threat of habitat degradation caused by grazing and to implement beneficial livestock management strategies, the NRCS and ESLT provided $8 million in funding for habitat improvement and enhancement projects on private lands through the Regional Conservation Partnership Program. Land management agencies monitor active grazing allotments on their land for compliance with permit terms and conditions within all Bi-State PMUs.

ACCOMPLISHMENTS

- USGS completed livestock surveys in conjunction with sage-grouse monitoring efforts.
- Grazing management tactics to improve sage-grouse habitat were employed across 1,127 acres in the Bodie Hills PMU.
- Fences were erected around the area burned during the Hot Creek Fire in the South Mono PMU to limit grazing impacts to recovering resources.
- Seven range improvement inspections were completed in the Pine Nut and Mount Grant PMUs.
- A 15-year USDA Conservation Reserve Program lease in the Bodie PMU was signed this year protecting 1,054 acres of land.

GRAZING WILD HORSES

Grazing of wild horses and burros are listed as a low or moderate threat in the Pine Nut, Bodie Hills and Mt. Grant PMUs. Each year the USGS documents the presence of wild horses and burros through the completion of raptor, raven, horse, and livestock surveys. Land management agencies make efforts to monitor Bi-State wild horse and burro populations to establish and maintain Appropriate Management Levels (AML) to protect their health as well as that of the habitat they and other species rely upon.

ACCOMPLISHMENTS

- The U.S. Forest Service and BLM completed aerial surveys of the Montgomery Pass Wild Horse Territory to generate a minimum count and assess the herds size compared to the established AML in the Desert Creek Fales PMU.
- USFS staff completed wild horse surveys in the Powell Mountain herd in the Mt. Grant PMU.
- Bishop BLM completed wild horse surveys in the South Mono and Bodie Hills PMUs.
- Horses were gathered in the Wassuk range to maintain AML in the Mt. Grant PMU.
- Carson City BLM District Office organized and implemented a wild horse gather in the Pine Nut Mountain PMU to meet AML, a total of 404 horses were gathered. Animals gathered were made available for adoption at Palomino Valley Wild Horse and Burro Center in Reno through the Wild Horse and Burro Adoption Program. Those that were not adopted are cared for in off-range pastures, where they retain their “wild” status and protection under 1971 Wild Free-Roaming Horses and Burros Act.
- USFS and BLM employees attended the Wild Horse and Burro National Overview meeting, held in Reno, Nevada, to discuss new science and facts, public involvement, ongoing and future planning regarding the management of wild horses and burros.
- The Inyo National Forest filled a rangeland specialist position whose duties include the management of wild horse and burro territories on National Forest lands.

Bi-State partners

COLLABORATIVE CONSERVATION

Additional actions to improve sage-grouse conservation efforts are completed each year to implement a coordinated interagency approach, incorporate a science-based adaptive management plan, improve regulatory mechanisms, and maintain stakeholder involvement.

INTERAGENCY APPROACH

The Action Plan identifies three actions designed to implement a coordinated interagency approach to sage-grouse conservation, all of which have been initiated. These actions include:

- Development of a "Sage-Grouse Service Team" approach to support the conservation and management of sage-grouse populations in the Bi-State. This requires that partners work collaboratively and provide multi-jurisdictional funding to facilitate the conservation of Bi-State sage-grouse and its habitats.
- Each year, Bi-State partners work together to leverage expertise and develop conservation strategies to develop a proposed program of work based on priority, staff availability and funding. Agencies work across jurisdictional boundaries to monitor population demographics, complete vegetation monitoring plots, and carry out Action Plan projects.
- In 2014, Bi-State partners announced a $45 million-dollar commitment to implement the 2012 Action Plan over a 10-year period (Table 5). Under the direction of the Executive Oversight Committee, each partnering agency drafted a commitment letter to the Service, stating their acknowledgment of responsibility and dedication to implement a coordinated interagency approach to conservation.
- Since 2014, approximately 84% of that funding has been allocated with a total of $37.6 million agency dollars spent on sage-grouse conservation efforts over the last eight years (Figure 15).

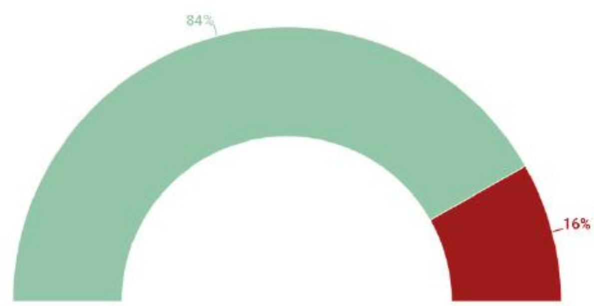

Figure 15: Allocated funding for sage-grouse conservation 2014-2021

Agency	Funding Commitment	Conservation Role
NDOW	$3.6M	Vegetation monitoring, population monitoring
CDFW	$1M	Translocation, population monitoring, predator monitoring, habitat acquisition
USFS	$13.9M	NEPA planning for projects, planting and irrigation plans, grazing management, meadow restoration, population monitoring
NRCS	$12M	Land owner outreach on easement and habitat restoration opportunities, conservation easements, matching funds for partners, utilize program funding to implement projects
BLM	$6.5M	NEPA planning for projects, conifer removal, meadow enhancement, infrastructure evaluation, wild horse assessment, population monitoring
USGS	$2.5M	Develop and apply modeling and science to inform adaptive management, CPT, IPM, population monitoring
Mono County	$5.9M	Coordinate on easement development and provide matching funds, relocate landfill, landowner education and outreach, general plan update
USFWS	$1M	Science and capacity support, landowner engagement and outreach, implementation of private lands restoration opportunities

Table 5: Partner funding commitment and conservation role

SCIENCE-BASED ADAPTIVE MANAGEMENT

Bi-State partners utilize a science-based adaptive management approach to generate a strategic process for guiding sage-grouse management. This approach integrates the best available science to inform local and landscape-level management and conservation decisions for Bi-State sage-grouse.

Science-based adaptive management guides management decisions based on data-driven models, implementation of actions, outcome evaluation and modification of management practices based on this iterative learning process (Bi-State Action Plan, 2012). This management strategy provides insight into what management actions should be conducted and which areas should be targeted, while reducing the chances of carrying out actions in areas where the effects are inconsequential and not meaningful. The Action Plan identifies seven actions necessary to manage sage-grouse populations and implement projects through adaptive, science-based methods. These actions include:

- Establishment of inter-agency agreements and funding mechanisms to support a USGS Science Adviser. The primary duty of the Science Adviser was the development of the Conservation Planning Tool (CPT) to prioritize conservation projects (Bi-State Action Plan, 2012). Funding for this position was initially acquired in 2012 and has been secured annually.

- The six remaining actions detail necessary information to be acquired and incorporated into the CPT to increase its function and management value. These actions include defining habitat, ranking risks, integrating population performance, and identifying factors that influence population vital rates. Each of these actions is carried out annually to improve the predictive power of the CPT and inform management decisions to maximize benefit to Bi-State sage-grouse populations.

- The USGS has also furthered science based adaptive management initiatives through additional research and the development of analytical tools beyond those originally identified in the Action Plan. Those accomplishments include furthering research on sage-grouse response to conifer density and conifer treatment, appropriate normalized difference vegetation index (NDVI) levels for irrigated meadows in sage-grouse habitat, and by developing a targeted annual warning system that helps to identify when sage-grouse subpopulations are experiencing declines that should trigger management actions.

IMPROVED REGULATORY MECHANISMS

The Action Plan outlines 13 actions for improved regulatory mechanisms, 12 of which have been completed. These actions provide consistent land management direction across jurisdictional boundaries to conserve Bi-State sage-grouse and their habitats into the future. Considering the majority of sage-grouse habitat in the Bi-State is on federally managed public lands, effective conservation of Bi-State DPS and its habitats requires strong land use management plans.

Plans are implemented by land management agencies in close coordination with state and federal wildlife agencies to ensure there is seamless regulatory direction for all sage-grouse related issues across management boundaries. These amendments aim to minimize or eliminate threats affecting the status of sage-grouse and to improve habitat conditions. Ongoing plan maintenance occurs to incorporate the most recent information ensuring that public lands containing Bi-State sage-grouse and sage-grouse habitat are adequately protected.

Bi-State land management agencies agreed to adopt plan amendments to incorporate best management practices, standardize operating procedures, implement conservation measures, and mitigate threats to increase regulatory effectiveness and provide direction specific to conservation of the Bi-State DPS. These plan amendments require that agencies consider sage-grouse populations and habitat in land use planning and activity plan analysis to limit potential impacts on sage-grouse or their habitat.

Since the Action Plan was implemented:

- The Humboldt-Toiyabe National Forest has signed an amendment to their Land Use Plan.

- The Carson District and Tonopah Field Offices of the NV BLM have signed ammendments to their Land Use Plans.

- The Inyo National Forest updated their Land Management Plan.

- Mono County has updated their General Plan to better manage Bi-State habitat and protect sage-grouse populations.

Actions not completed include the following:

IRM2-2: Coordinate with local and county governments in Nevada to incorporate sage-grouse conservation guidance.

MAINTAINING STAKEHOLDER INVOLVEMENT

Relationships built on trust and cooperation among stakeholders are essential to the goal of long-term conservation of sage-grouse and its habitats. Participants involved in this conservation effort include federal, state, and local governments; Native American tribes; non-profit organizations; ranchers and landowners; among others. The Action Plan identifies six priorities for maintaining stakeholder involvement, all of which are implemented annually. Actions include conducting Local Area Working Group meetings developing outreach materials to facilitate the sharing and distribution of information, and maintaining a Bi-State website that provides accessible information to partners and the public.

Together, partners conduct Action Plan maintenance, carry out identified actions and track implementation progress to ensure the Action Plan is effectively guiding conservation and management efforts.

Since 2012, considerable progress has been made toward maintaining stakeholder involvement. Accomplishments include:

- Formation of the Bi-State Tribal Natural Resource Committee (BTNRC),20 BTNRC meetings, and two Traditional Ecological Knowledge Summits.
- Thirteen Local Area Working Group meetings.
- Creation of the Bi-State Sage-Grouse website.
- Production of LAWG newsletters to provide sage-grouse related updates and notifications to partners and public.
- 183 education and outreach accomplishments.

Bi-State partners

Bi-State sage-grouse, habitat, and conservation efforts

EFFECTIVENESS MONITORING

The 2012 Action Plan was designed to provide a “road-map” to conservation. It contains 159 actions intended to be implemented over a ten-year span. The implementation of multiple projects is often required to achieve the intended goal of a single action. These projects represent the highest priority actions deemed necessary to conserve Bi-State sage-grouse populations and their habitats. Projects are prioritized through a science-based adaptive management process that utilizes on-the-ground evaluation to inform management decisions and prioritize conservation actions. This process incorporates the best available science and key lessons learned from prior efforts to: 1) identify the most critical issues; 2) develop projects that address those issues and 3) assess and adjust project implementation as necessary to improve the probability of benefiting sage-grouse.

Population monitoring provides the basis of understanding for what types of projects should be implemented and where they should be placed. Utilizing monitoring data, the USGS developed a resource selection function that identified key sage-grouse habitat in the Bi-State. The highest priority projects are in this identified habitat to provide the most ecological benefit to sage-grouse. Published research regarding habitat selection, population models, genetics and conservation strategies all contribute to effective adaptive management. In 2014, the USGS incorporated completed research into the development of a Conservation Planning Tool (CPT), which measures ecological benefits to sage-grouse for a given management action using resource selection functions and estimates of abundance and space use (Ricca et al., 2017). The CPT informs and prioritizes habitat improvement project design and is especially valuable for prioritizing conifer treatment and wildfire restoration projects. Boundaries of these projects are initially drawn as a best guess based on bird use, aerial imagery, and knowledge of the habitat. The CPT then ranks these projects based on benefit to grouse and cost effectiveness. Each year additional research and monitoring data is incorporated into the CPT, and it becomes more valuable as a result.

In 2015 and again in 2017, the TAC used the CPT results as the basis for re-prioritizing Bi-State conifer projects. This planning tool has proven to be incredibly valuable when combined with other information, such as on-the-ground knowledge of an area, logistics of planning and implementing projects and professional expertise. Combined, these tools provide the basis for prioritization of conservation projects.

Another important scientific tool used to help direct conservation efforts and understand their impacts is USGS' Integrated Population Model (IPM). The IPM helps partners understand the demographic rates that are driving population trends and aids in the development of targeted actions to improve those rates and overall population trends.

Efforts to implement conservation projects across the Bi-State have increased annually since 2012. Currently, 141 of 159 identified actions in the Action Plan have been initiated, meaning they are in progress, ongoing or occur annually, or have been evaluated as part of the planning process. These actions represent 89% of all identified actions in the Action Plan.

The completion of these projects illustrates the effectiveness of long-held and time-tested partnerships between stakeholders. Together, they established and implemented a framework that fostered ongoing problem solving and proactive engagement. This collaborative process effectively integrates multiple perspectives and interests and has proven to be more successful in providing durable solutions to complex issues and challenges.

Over the last ten years, the Action Plan has provided a clear framework to guide this collaborative conservation effort. The Bi-State LAWG increased their understanding of sage-grouse population trends, gained a better understanding of factors influencing populations, and learned how and where to implement conservation actions to provide the greatest benefit to sage-grouse and their habitats. Recent USGS research suggests the implementation of the Action Plan has bolstered Bi-State sage-grouse populations by 3.9% annually and 31.1% since 2012 (Bi-State TAC, 2022).

Moving forward with maintained momentum, Bi-State stakeholders will continue to conduct collaborative conservation efforts at the landscape scale to benefit sage-grouse populations and the sagebrush ecosystem in the Bi-State. The group is currently working to expand the partnership to include the diversity of stakeholders necessary to find solutions to these large-scale and often complex ecological challenges. Together the group will evaluate the most recent science and work to update the Action Plan so that it may continue to act as a guiding document for future sage-grouse related conservation efforts in the Bi-State.

Bi-State sage-grouse lekking in spring

Action Type	Actions Identified	Actions Initiated	Total Projects
Coordinated Interagency Approach	3	3	46
Science Based Adaptive Management	7	7	16
Increased Regulatory Mechanisms	13	12	24
Wildfire	9	9	154
Urbanization	12	7	24
Infrastructure & Human Disturbance	12	11	85
Conifer Encroachment	13	13	85
Disease and Predation	4	4	12
Wild Horses	5	5	13
Small Populations	6	6	8
Habitat Restoration & Improvement	41	35	216
Research and Monitoring	28	27	94
Maintaining Stakeholder Involement	6	6	125
Total	159	145	902

Table 6: Compelted Action Plan associated projects

Action ID	PMU	Action Description
HIR1-5-PN	Pine Nut	Manage high elevation wet meadows in the southern portion of the Pine Nut PMU. Maintain existing fences and mark with diverters
HIR2-1-PN	Pine Nut	Restore previously burned sagebrush habitat within a three mile radius of Mill Canyon Lek
HIR2-2-PN	Pine Nut	Maintain meadows in Mount Seigal and Bald Mountain areas in proper functioning condition or improve through livestock management
HIR2-3-PN	Pine Nut	Improve sagebrush habitat quality west of Big Meadow
MER2-2	Desert Creek/Fales	Secure a conservation easement with Desert Creek Ranch
MER2-8	Desert Creek/Fales	Secure conservation easements with willing landowners in the Burcham Flat, Wheeler Flat and Fales Hot Springs vicinities
HIR2-4-DCF	Desert Creek/Fales	Determine the feasibility for improving perennial grass and forb cover in proximity to Desert Creek Lek #2 in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects based on the results
HIR2-6-DCF	Desert Creek/Fales	Evaluate nesting habitat and brood meadow condition on Burcham/Wheeler Flats in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects based on the results
HIR2-7-DCF	Desert Creek/Fales	Improve meadow habitat on private lands in Huntoon Valley, Swauger Creek, and north Bridgeport Valley
RAM3-6	Desert Creek/Fales	Continue and supplement ongoing telemetry effort in Fales PMU
MER2-6	Mount Grant	Secure conservation easement or agreement for Aurora Meadows complex
HIR2-3-MG	Mount Grant	Evaluate meadow habitat conditions in the Aurora and Gregory Flat vacinities
MER3-7	Mount Grant	Minimize impacts from traffic near the Aurora Borealis mine
MER4-2	Mount Grant	Evaluate pinyon-juniper encroachment and potential connectivity issues in the Masonic Gulch, Red Wash, and Chinese Camp vicinities of the Mount Grant PMU. Design and implement site-specific tree removal projects based on the results
HIR1-7-B	Bodie Hills	Complete the Lime Kiln windmill removal and solar pump replacement project in the southern portion of the Bodie PMU
MER2-5	Bodie Hills	Secure conservation easement or agreement with Mormon Ranch
MER2-12	White Mountain	Secure conservation easements or agreements along the eastside of the White Mountains
IRM2-2	Multiple PMUs	Coordinate with local and county governments in Nevada to incorporate sage-grouse conservation guidance

APPENDIX A: ACTION PLAN IMPLEMENTATION

Strategy	Identified Actions	Completed Projects
Coordinated Interagency Approach: Implement a coordinated interagency approach towards conservation and management of greater sage-grouse populations and habitats within the Bi-State Plan area.		
	CIA1-1: Implement a "Sage-Grouse Service Team" approach to support sage-grouse conservation and management in the Bi-State area. Provide cross-jurisdictional staff support to facilitate the coordinated interagency effort to conserve the Bi-State DPS and its habitat.	
		Executive Oversight Committee meetings
		Development of the Bi-State coordinator position
		Updated Bi-State MOU
	CIA1-2: Provide multi-jurisdictional funding to support sage-grouse conservation and management in the Bi-State area. Establish a process to identify and support cross-jurisdictional funding opportunities to facilitate the coordinated interagency effort to conserve the Bi-State DPS and its habitat.	
		2014 Partner funding commitment letters
		2019 update of funding commitment letters
		Interagency funding agreements to support on-the-ground projects, USGS science and research, lek monitoring, vegetation monitoring, Bi-State coordinator position, translocation efforts, and the Traditional Ecological Knowledge Summit
	CIA1-3: Annually engage the Bi-State Local Area Working Group (LAWG) via the Technical Advisory Committee (TAC) to develop a proposed program of work for the upcoming calendar year based on available staff and funding. The proposed annual program of work should be completed by January 31 each calendar year.	
		Technical Advisory Committee meetings
		Annual accomplishment reporting
Science Based Adaptive Management: Implement scientifically and economically sound management strategies to conserve greater sage-grouse populations and habitats within the Bi-State Plan area.		
	SAM1-1: Establish interagency agreements and funding mechanisms needed to provide funding and logistical support to secure the services of a USGS Science Advisor.	
		Annual funding provided to USGS
	SAM2-1: Acquire high resolution (5 meter or less), multi-spectral (7 band minimum), imagery for the entire Bi-State area and begin the image classification and field verification process required to model sage-grouse habitat selection and suitability based on resource availability and use.	
		Bi-State Sage-Grouse resource selection function and map developed
		Critical habitat map created
		Pinyon-juniper layer acquired to model habitat
		Life-stage habitat selection maps generated
	SAM2-2: Continually incorporate new sage-grouse telemetry, habitat, and vital rate data into the CPT to improve predictive modeling and adaptive management capabilities.	
		Telemetry data has been incorporated into the CPT

	SAM2-3: Incorporate the CPT into habitat improvement project design and population augmentation and reintroduction evaluation processes to provide managers with an interactive, spatially-explicit tool to choose the most appropriate areas for management action, as well as to evaluate and quantify project effectiveness following implementation.	
		CPT was created and published in Ecological Applications
		CPT used to rank conifer treatment projects in 2015 and 2017
		Meetings held regarding updated and automated CPT
	SAM2-4: Incorporate hypothesized risk factors into the CPT to model and quantify the relative importance of each risk factor by life-history stage for each PMU.	
		In progress
	SAM2-5: Incorporate sage-grouse vital rates into the CPT to identify which environmental factors are likely exerting the greatest influence on sage-grouse persistence to determine the probability of population performance for each PMU.	
		Integrated Population Models completed and updated
		Incorporating the IPM into CPT in progress
	SAM2-6: Incorporate the vital rate adjusted CPT into habitat improvement project design and population augmentation and reintroduction evaluation processes to further improve managers abilities to choose the most appropriate areas for management action, as well as to evaluate and quantify project effectiveness following implementation.	
		Life-stage habitat selection maps generated
		Incorporating the IPM into CPT in progress
Improved Regulatory Mechanisms: Improve regulatory effectiveness and consistency for discretionary agency actions that may affect the Bi-State DPS and its habitats.		
	IRM1-1: Develop and issue interim BLM/USFS guidance designed to increase the regulatory effectiveness and consistency for Federal land management actions that may affect the Bi-State DPS and its habitat until land use plans are updated to include additional guidance specific to sage-grouse conservation in the Bi-State area. Land use plan updates are identified by relative priority in this section.	
		2012 Inyo NF supervisors letter
		2012 BLM NV Instructional Memorandum
	IRM1-2: Coordinate and informally confer with state wildlife agencies and the FWS when evaluating Federal land management actions that may affect the Bi-State DPS and its habitat or when developing and implementing policies or land use plan objectives designed to avoid or minimize impacts to the Bi-State DPS and its habitat.	
		Inter-Agency Coordination for Land Management Actions
		USFWS Coordination and Conferencing
	IRM1-3: Implement BLM Manual 6840 to increase conservation efforts for the Bi-State DPS and its habitat.	
		All projects for BLM follow guidance in Manual Policies

	IRM1-4: Implement National Forest Manual 2670 to increase conservation efforts for the Bi-State DPS and its habitat.	
		BSSG designation as USFS Sensitive Species for Region 4
		Implementation of National Forest Plan Policies
		Implement BSSG in policy and in LMP as “At Risk Species”
		Inyo Land Use Plan Implementation
	IRM1-5: Revise the Carson City District Consolidated RMP (Sierra Front and Stillwater Field Offices) to incorporate additional land use plan guidance specific to greater sage-grouse conservation.	
		Land Use Planning Amendment for the Bi-State DPS in the Carson City District RMP
	IRM1-6: Revise or amend the Toiyabe National Forest LRMP (Bridgeport and Carson Ranger Districts) according to the Region 4 schedule.	
		The “Greater Sage-grouse Bi-state Distinct Population Segment Forest Plan Amendment Record of Decision” was signed in May 2016, revising the Forest Plan with new conservation measures for the Bi-state sage-grouse.
	IRM1-7: Revise the Tonopah RMP (Tonopah Field Office) to incorporate additional land use plan guidance specific to greater sage-grouse conservation	
		Land Use Planning Amendment for the Bi-State DPS in the Tonopah RMP
	IRM1-8: Revise the Inyo National Forest LRMP (Mono Lake, Mammoth, White Mountain and Mount Whitney Ranger Districts) according to the Region 5 schedule.	
		Inyo NF Land Use Plan revised and updated
	IRM1-9: Implement actions in support of the Bishop RMP.	
		Implementation of Bishop BLM Supplemental Rules to Land Use Plan
	IRM1-10: Revise or amend the Bishop RMP according to the California BLM schedule.	
		Current plan deemed adequate
	IRM1-11: Annually conduct plan maintenance on applicable RMPs (Carson City, Tonopah, and Bishop) to incorporate the most recent information specific to sage-grouse populations and habitats on public lands administered by the BLM to insure the Bi-State DPS and its habitats are adequately protected	
		Annual and ongoing incorporation of relevant science into Annual Plans
	IRM2-1: Coordinate with Mono County to develop and incorporate sage-grouse conservation guidance into applicable plans and programs.	
		Mono County General Plan update
		Mono County review projects for consistency with grouse policies
	IRM2-2: Coordinate with county and local governments in Nevada to develop and incorporate sage-grouse conservation guidance into applicable plans and programs.	
		Efforts have been made to reach out to county and local government but successful engagement is still lacking

Minimize and Eliminate Wildfire Risk: Implement a coordinated interstate/interagency approach towards management of wildfire incidents and suppression activities designed to minimize the risk of catastrophic wildfire and the associated loss of sage-grouse habitat in the Bi-State area.		
	MER1-1: Develop and implement an interagency fire management and suppression agreement specific to the management of wildland fire incidents within and immediately adjacent to known occupied and potential sage-grouse habitats in the Bi-State area prior to the 2012 fire season.	
		Inter-agency fire agreement was signed for the Inyo National Forest and the Bishop BLM
		Inter-agency fire agreement was signed between Carson BLM and H-T National Forest
	MER1-2: Update existing Fire Management Plans (FMPs) to incorporate fire and fuels management conservation measures identified by the National Sage-Grouse Technical Team prior to the 2012 fire season.	
		Fire management plans were updated to incorporate suppression direction to minimize loss of suitable sage-grouse habitat.
	MER1-3: Annually update dispatch systems and protocols to include line officer and resource advisor notifications and requirements for all wildland fire incidents within and immediately adjacent to known occupied and potential sage-grouse habitats in the Bi-State area.	
		Annual Bishop BLM dispatch updates for fire protocols in sage-grouse habitat
		Annual Carson BLM dispatch updates for fire protocols in sage-grouse habitat
		Annual Inyo NF dispatch updates for fire protocols in sage-grouse habitat
	MER1-4: Annually update resource advisor kits to include to the most recent information specific to sage-grouse populations and habitats within the Bi-State area to insure the DPS and its habitat are adequately protected.	
		Resource Advisor Kit Updates- BLM Bishop/ Inyo NF
		Resource Advisor Kit Updates- Humboldt-Toiyabe NF
		Resource Advisor Kit Updates- BLM Carson
	MER1-5: Develop and provide sagebrush and sage-grouse habitat sensitivity training during required annual fireline refreshers for federal fire personnel in the Bi-State area. Focus training on sagebrush habitat identification, basic sagebrush habitat ecology, and initial attack strategies and tactics designed to minimize long-term impacts to sagebrush ecosystems.	
		Bishop BLM annual fire refresher for sage-grouse SOPs
		Inyo NF annual fire refresher for sage-grouse SOPs
	MER1-6: Establish an interagency cadre of sagebrush/sage-grouse habitat resource advisors (READs) to support fire suppression, burned area emergency rehabilitation (BAER), and fuels management projects in the Bi-State area. Include NDOW, CDFG, FWS, NRCS, and NDF representation on this team.	
		Resource Advisor Development and Cadre

	MER1-7: Prioritize fire suppression actions, fire rehabilitation efforts, and fuels treatments to minimize sagebrush habitat loss or type conversions in and immediately adjacent to known occupied and potential sage-grouse habitats in the Bi-State area.	
		Alpine County forest restoration project
		Burbank fire rehabilitation seeding
		Ray May fire rehabilitation seeding
		TRE fire rehabilitation seeding
		Como fire rehabilitation seeding
		Preacher fire rehabilitation seeding
		Doe Ridge fire rehabilitation, restoration, and planting
		Indian fire rehabilitation, seeding, planting, and erosion control
		Mono fire restoration seeding
		Spring Peak fire rehabilitation and conifer removal
		Spring Peak fire rehabilitation, seeding, sagebrush planting, and conifer removal
		Walker fire Sage-Grouse SOPs implemented
		Bodie fire invasive plant removal
		Indian fire seeding
		Green Creek fire rehabilitation
		Pine Nut Land Health Project (sunrise unit)
		Fuel breaks on private land
		Bodie State Park fuels reduction
		Green Creek fire restoration
		Owens River fire restoration
		Slinkard post fire restoration, planting, seeding, invasive species removal, and mowing
		Buckskin Valley post-fire rehabilitation
		Pipeline conifer thinning
		Sunrise Pass firewood stewardship contract
		Illinois Unit, Thinning/Pile Burning
		Seeding of dozer lines on Hot Creek fire
		Hot Creek fire restoration, grazing enclosure, seeding, and planting
		West Antelope fuel break maintenance
		East Antelope fuel break maintenance
		Mono City and Conway Ranch Estates fuel break maintenance
		Tufa fire suppression
		Lyon Fire sagebrush seedling planting
		Mountain View Fire ESR plan and treatment
		Slink Fire soil stabilization, seeding, and planting
		Topaz Marine Corps housing fuel break
	MER1-8: Increase wildfire prevention activities and programs in and adjacent to known occupied and potential sage-grouse habitats in the Bi-State area.	
		LADWP policy restricting campfires and stoves
		Fire prevention patrols
		Bodie State Park Fire Plan
		Targeted wildfire prevention

		Fire related public education events
	MER1-9: Develop and implement a native species seed bank program for the Bi-State DPS. Establish a seed storage facility and conduct seed collections to insure the availability of locally adapted seed for fire rehabilitation efforts in important sage-grouse habitats. Coordinate with the Nevada Division of Forestry (NDF) and other interested agencies to collect and store locally adapted seed for use in fire rehabilitation efforts.	
		Seeds of Success program
		Post fire native seeding contracts
		Seed storage facility for native plants
		Bishop native plant nursery
		Native seed collection
Minimizing and Eliminating Urbanization Risk: Secure conservation easements or agreements with willing landowners to maintain private lands and associated sage-grouse habitats values and minimize the risk of future development impacts to important sage-grouse habitats in the Bi-State area.		
	MER2-1: Provide technical assistance to willing landowners to develop Conservation Agreements or Candidate Conservation Agreements with Assurances.	
		Private Lands Conservation Plan
		CDFW and Mono County workshop to share information and develop project conditions/mitigations for sage grouse
		Designation of Walker River State Recreation Area
		Funding aquisition for Black Lake Preserve easement
		Annual conservation easement planning
		Mono County conservation easement assistance
	MER2-2: Secure a conservation easement or agreement with the Desert Creek Ranch to maintain essential brood rearing habitat in proximity to Desert Creek Lek #2 in the Desert Creek-Fales PMU.	
		Incomplete
	MER2-3: Secure a conservation easement or agreement with the Sceirine Ranch to maintain current land use practices and associated sage-grouse brood rearing/late summer habitat values in the Bodie, Mount Grant and Desert Creek-Fales PMUs.	
		Easements secured in the Bodie Hills and Desert Creek-Fales PMUs
	MER2-4: Secure a conservation easement or agreement with the Sweetwater Ranch to maintain essential brood rearing habitat in proximity to the Wiley Ditch/Sweetwater Summit lek complex in the Desert Creek-Fales PMU.	
		Easements secured near Sweetwater Summit
	MER2-5: Secure a conservation easement or agreement for the Mormon Ranch to maintain essential brood rearing habitat in proximity to the Bridgeport Canyon/Little Mormon lek complex in the Bodie PMU.	
		Incomplete
	MER2-6: Secure a conservation easement or agreement for the Aurora Meadows complex to maintain brood rearing habitat in proximity to the Aurora lek in the Mount Grant PMU.	
		Incomplete

	MER2-7: Secure a conservation easement or agreement for Sinnamon Meadows to maintain brood rearing/late summer habitat values in the western portion of the Bodie PMU.	
		Easement secured
	MER2-8: Secure conservation easements or agreements with willing landowners in the Burcham Flat, Wheeler Flat and Fales Hot Springs vicinities to prevent further development impacts in proximity to leks in the Fales breeding complex in the Desert Creek-Fales PMU.	
		Incomplete
	MER2-9: Secure conservation easements or agreements with willing landowners for important brood meadow habitat in the Green Creek area.	
		Green Creek land donation
		CDFW aquired lands
		Conservation easement secured
	MER2-10: Secure conservation easements or agreements with willing landowners to maintain key brood rearing/late summer habitats in Bodie Hills portion of the Bodie PMU.	
		Easements secured
	MER2-11: Secure conservation easements or agreements with willing landowners in Huntoon Valley, Swauger Creek and northern Bridgeport Valley to maintain brood rearing/late summer habitat values in the southwest portion of the Desert Creek-Fales PMU.	
		Easement secured in Huntoon Valley
	MER2-12: Secure conservation easements or agreements with willing landowners to maintain key nesting or wintering habitats along the eastside of the White Mountains in the White Mountains PMU.	
		Incomplete
Minimize and Eliminate Infrastructure and Human Disturbance Risk: Implement site-specific conservation measures designed to minimize or eliminate risks associated with existing infrastructure and human disturbance in the Bi-State area.		
	MER3-1: Install flight diverters on the existing non-let down fence adjacent to Long Valley Lek 2 to deter documented fence strikes.	
		Fence near lek 2 converted to lek down
		Flight diverters installed in surrounding area
	MER3-2: Identify and provide an alternate location for the Mono County landfill and work towards removing the existing landfill out of the Long Valley portion of the South Mono PMU.	
		Mono County continued planning and funding acquisition for the closure of the Benton Crossing landfill. The project is projected to be completed by 2023
	MER3-3: Design and implement public lek viewing guidelines and other management strategies to reduce human disturbance in the vicinity of Desert Creek Lek #2 in the Desert Creek-Fales PMU.	
		Developed lek viewing guidelines consistent with widely accepted policies to ensure minimization of potential human impacts. Produced brochure for public education and outreach

	MER3-4: Evaluate existing fences in the Bodie PMU for fence strike hazards. Remove extraneous fences or mark existing fences with flight diverters to deter fence strikes in areas where fence strike hazards are documented. Focus initial efforts in the vicinity of Bodie State Historic Park, 7-Troughs, and Lower Summers Meadow.	
		Race Track fence removal and fence marking
		Lower Summers meadow fence marking
		Bodie Creek Electric Fence Removal
		Sinnamon Meadows fence removal and fence marking
		Bodie Bowl fence removal
		Conway Ranch fence removal and fence marking
		Private lands fence marking in Bodie
		Bodie State Park Volunteer Day - fence and corral Removal
		Bodie Hills fence marking near Beideman lek
		Big Flat fence marking
		Bodie Hill fence maintenance
		Potato Peak exclosure fence converted to let down
		Converted Fence to Let Down in the Bodie Hills
		BLM annual maintenance of all let down fencing in Bodie Hills PMU
	MER3-5: Work with private landowners in the Long Valley portion of the South Mono PMU to evaluate existing fences for fence strike hazards. Provide assistance to modify or mark existing fences with flight diverters to deter fence strikes in areas where fence strike hazards are documented.	
		Cashbaugh fence marking
	MER3-6: Remove or relocate the existing fence near Wiley Ditch Lek #3 in the Desert Creek-Fales PMU if flight diverters are ineffective at preventing fence strikes.	
		Flight diverters installed in surrounding area
	MER3-7: Develop and implement stipulations to minimize disturbance impacts associated with increased traffic from the Aurora-Borealis mine in the Mount Grant PMU.	
		Incomplete
	MER3-8: Increase warden presence during the sage-grouse breeding season in the lower elevations of the Mount Grant PMU to deter poaching.	
		Walker River State Recreation law enforcement and park patrols
	MER3-9: Avoid the construction of new roads and other infrastructure within known occupied and potential sage-grouse habitat in the Mount Siegel and Bald Mountain vicinities in the Pine Nut PMU unless these features are designed to improve habitat conditions.	
		BLM Resource Management Plans contain actions and best management practices to address new road construction. Future planned Travel Management will take into consideration limiting any new roads/OHV trails in this area as well
	MER3-10: Design and implement public lek viewing guidelines to address potential human disturbance impacts if demand increases in the Long Valley portion of the South Mono PMU.	

		Developed lek viewing guidelines consistent with widely accepted policies to ensure minimization of potential human impacts. Produced brochure for public education and outreach
	MER3-11: Install "grouse crossing" signs at strategic locations along the Owens River Road in the Long Valley portion of the South Mono PMU where birds are known to roost and road kills have been documented.	
		CDFW, BLM and Mono County met to discuss "grouse crossing sign". Action deemed not necessary in Long Valley. Signs were installed in Parker Meadow area
	MER3-12: Provide educational opportunities to landowners about the importance of sage-grouse habitat and the need to reduce predation caused by pets in areas where sage-grouse occur.	
		NRCS, federal land management agencies, and ESLT all interact with private landowners to stress the importance of sage-grouse habitat
Minimize and Eliminate Conifer Encroachment Risk: Map and quantify the spatial juxtaposition and level of pinyon-juniper encroachment that has occurred in relation to known occupied and potential sage-grouse habitat in the Bi-State area. Develop and implement site specific treatments designed to maintain, improve, or restore key seasonal ranges and habitat connectivity within and among breeding populations based on restoration potential.		
	MER4-1: Evaluate pinyon-juniper encroachment and potential connectivity issues between upper elevation sagebrush habitats in the Bodie PMU and adjacent low elevation habitats including the Bridgeport Valley and East Walker River in the Bodie and Desert Creek-Fales PMUs and the East Walker River, Ninemile Flat, Aurora, and Alkali Valley portions of the Mount Grant PMU. Design and implement site-specific tree removal projects based on the results.	
		East Walker Landscape Habitat Improvement Project NEPA

		Bodie Hills Upland Vegetation Restoration Conifer Removal DNA 2016
	MER4-2: Evaluate pinyon-juniper encroachment and potential connectivity issues in the Masonic Gulch, Red Wash, and Chinese Camp vicinities of the Mount Grant PMU. Design and implement site-specific tree removal projects based on the results.	
		Incomplete
	MER4-3: Evaluate pinyon-juniper encroachment and potential connectivity issues in the Huntoon Valley, Swauger Creek and Mount Jackson vicinities of the Desert Creek-Fales PMU. Design and implement site-specific tree removal projects based on the results.	
		The TAC evaluated these areas in 2015 (CPT reranking reports) and determined they were a lower priority than other work in the northern half of the Bi-State. After high priority work is completed the TAC will reevaluate using the CPT and local knowledge
	MER4-4: Evaluate pinyon-juniper encroachment and potential connectivity issues in the Aurora and Gregory Flats vicinities of the Mount Grant PMU. Design and implement site-specific tree removal projects based on the results.	
		The TAC evaluated these areas in 2015 (CPT reranking reports) and determined they were a lower priority than other work in the northern half of the Bi-State. After high priority work is completed the TAC will reevaluate using the CPT and local knowledge
	MER4-5: Evaluate pinyon-juniper encroachment and potential connectivity issues in the lower Rough Creek and Del Monte Canyon vicinities of the Mount Grant PMU. Design and implement site-specific tree removal projects based on the results.	
		Rough Creek Sage-Grouse Habitat Improvement Project NEPA
		Rough Creek Unit 5
		Rough Creek Unit 1
		Rough Creek Unit 2
		Rough Creek Unit 3
		Rough Creek Unit 6
		Rough Creek Unit 7
		Rough Creek Unit 8
	MER4-6: Evaluate pinyon-juniper encroachment and potential connectivity issues in the Spring Peak, Mount Hicks, and Powell Mountain vicinities of the Mount Grant PMU. Design and implement site-specific tree removal projects based on the results.	
		Field evalutation determined that there were only about 10 trees to cut in a drainage. Other trees were in true conifer areas.
	MER4-7: Evaluate pinyon-juniper encroachment and potential connectivity issues in the Baldwin Canyon and Lapon Canyon vicinities of the Mount Grant PMU. Design and implement site-specific tree removal projects based on the results.	
		Hawthorne Army Depot meeting
		Baldwin Canyon PJ NEPA
		Baldwin Canyon Habitat Improvement

	MER4-8: Evaluate pinyon-juniper encroachment and potential connectivity issues between upper elevation sagebrush habitats in the Bodie PMU and adjacent low elevation habitats in the Mono Basin portion of the Bodie PMU. Design and implement site-specific tree removal projects based on the results.	
		Bodie Hills Upland Vegetation Restoration Conifer Removal 2015
		Bodie Hills Upland Vegetaion Restoration Conifer Removal 2016
		Sinnamon Cut Sagebrush Restoration through Conifer Removal
		Bodie Hills Pinyon-Juniper Removal NEPA 2021
		Bridgeport Canyon Conifer Pile Burning
	Action MER4-9: Evaluate pinyon-juniper encroachment and potential connectivity issues along the northern flank of the Sweetwater Mountains between Burcham Flat and Jackass Flat in the Desert Creek-Fales PMU. Design and implement site-specific tree removal projects based on the results.	
		Sweetwater P-J Re-treatment
		Jackass Flat Pinyon-Juniper Removal NEPA
	MER4-10: Evaluate pinyon-juniper encroachment and potential connectivity issues along the eastside of the White Mountains and Palmetto Mountains in the White Mountains PMU. Design and implement site-specific tree removal projects based on the results.	
		TAC evaluated these areas in 2015 and determined they were lower priority than other work in the southern half of the Bi-State. Additional data from telemetry studies will help define these areas
		TAC evaluated these areas in 2017 and determined they were lower priority than other work in the southern half of the Bi-State. Additional data from telemetry studies will help define these areas
	MER4-11: Evaluate pinyon-juniper encroachment and potential connectivity issues along the eastside in the Truman Meadows portion of the White Mountains PMU. Design and implement site-specific tree removal projects based on the results.	
		TAC evaluated these areas in 2015 and determined they were lower priority than other work in the PMU
		TAC evaluated these areas in 2017 and determined they were lower priority than other work in the PMU
	MER4-12: Evaluate pinyon-juniper encroachment and potential connectivity issues between Long Valley and Adobe Valley in the South Mono PMU. Design and implement site-specific tree removal projects based on the results.	
		Arcularius Jeffrey Pine Removal
		Long Valley Habitat Enhancement NEPA
		INF Parker Jeffrey Pine Removal NEPA
		Long Valley - Jeffery Pine Removal
		South Mono Conifer Treatment Site Visits
		Pre-NEPA Planning: Hilton and Clover Patch Conifer Treatment
	MER4-13: Evaluate pinyon-juniper encroachment and potential connectivity issues in the Waterson draw area and at the base of south slope of Glass Mountains in the South Mono PMU. Design and implement site-specific tree removal projects based on the results.	

		Long Valley Unit 4 Habitat Enhancement
Minimize and Eliminate Disease and Predation Risk: Monitor, and quantify where possible, the extent of disease and predation risks to greater sage-grouse populations in the Bi-State area. Take appropriate management action where causal effects can be identified and effectively mitigated.		
	MER5-1: Evaluate raptor and raven use of the DC Intertie transmission line in the Mount Grant PMU. Install perch deterrents if the data indicate facilitated predation is adversely affecting sage-grouse population performance.	
		Raptor raven surveys were completed in Mount Grant in association with telemetry efforts in 2016, 2017, 2018, and 2021
	MER5-2: Evaluate raptor and raven use of the double wood transmission line that crosses brood meadows along the upper Owens River east of Lek 9x at Inaja Ranch. Install perch deterrents if the data indicate facilitated predation is adversely affecting sage-grouse population performance.	
		A field trip occurred to evaluate this transmission line. No mitigation was implemented
		Raptor raven surveys were completed in Long Valley in association with telemetry efforts between 2014 and 2021
		USGS implemented raven egg oiling effort to reduce predation
	MER5-3: Evaluate raptor and raven use of the westside transmission lines in the Bodie PMU. Install perch deterrents if the data indicate facilitated predation is adversely affecting sage-grouse population performance.	
		Raptor raven surveys were completed annually in the Bodie Hills in association with telemetry efforts
	MER5-4: Develop and implement a West Nile virus surveillance and detection program. Implement mosquito abatement measures and/or Best Management Practices (BMPs) designed to minimize or prevent the potential for a West Nile virus outbreak if the data indicate that West Nile virus is prevalent in the Bi-State area.	
		Investigation of Inyo guzzlers resulted in their design that prohibit larval development due to the enclosed systems, lack of light, routine maintenance at off-site drinker. County Abatement Program confirmed that such guzzlers do not pose a risk to west Nile virus
Minimize and Eliminate Wild Horse Grazing Risks: Maintain wild horse populations at the appropriate management levels (AMLs) and within designated herd management areas (HMAs) or wild horse territories (WHTs) to minimize the risk of excessive use levels and range expansion		
	MER6-1: Implement captures or contraceptive methods to maintain the Powell Mountain Wild Horse Herd at or below AML and within the designated WHT.	
		Annual monitoring of the Powell Mountain herd for horses outside boundary
	MER6-2: Implement captures or contraceptive methods to maintain the Pine Nut Wild Horse Herd at or below AML and within the designated HMA.	
		Pine Nut Mountains Herd Management Area Plan EA
		Pine Nut wild horse gather
		Pine Nut wild horse sterilization efforts

	MER6-3: Evaluate the status of the White Mountain and Silver Peak Wild Horse and Burro herds. Establish AML and implement captures or contraceptive methods if needed to maintain the herds at or below AML and within the designated WHT.	
		Wild Horse monitoring in White Mountain and Silver Peak herds in White Mountains PMU
	MER6-4: Implement captures or contraceptive methods to maintain the Wassuk Wild Horse Herd at or below AML and within the designated HMA.	
		Wassuks Mountain wild horse gather
	MER6-5: Evaluate the status of the Montgomery Pass Wild Horse Herd. Establish AML and implement captures or contraceptive methods if needed to maintain the herd at or below AML and within the designated WHT.	
		2014 Montgomery Pass wild horse herd survey
		2015 Montgomery Pass wild horse population estimate completed
		Annual wild horse monitoring in Sagehen
		2020 aerial survey of the Montgomery Herd Wild Horse Territory
		2020 Montgomery Pass wild horse ground survey
Minimize and Eliminate Small Population Size Risks: Identify potential sage-grouse population augmentation and re-introduction sites and develop translocation guidelines to support potential augmentation and reintroduction efforts in the Bi-State area.		
	MER7-1: Develop a contingency plan for emergency augmentation of small breeding populations at Parker Meadows and Gaspipe Spring in the South Mono PMU if the need arises.	
		Parker Meadow translocation efforts 2017, 2018, 2019, and 2021
	MER7-2: Develop a contingency plan for emergency augmentation of small breeding populations in the Pine Nut Range in the Pine Nut PMU if the need arises.	
		TAC met to discuss translocations 2015. It was determined that only the Parker population was in need of a translocation until the IPM or other data suggested that there was an clear reason to begin translocation elsewhere. Leks in the pine nuts are monitored yearly to track the status of the population
	MER7-3: Evaluate the need for augmentation of the Fales population in the Desert Creek- Fales PMU.	
		Discussions within the TAC have occurred , but translocations have not been implemented at this time?
	MER7-4: Evaluate the Powel Mountain area in the Mount Grant PMU as a potential sage-grouse habitat restoration and reintroduction area.	
		BSSG TAC met to discuss translocations 2015. It was determined that only the Parker population was in need of a translocation until the IPM or other data suggested that there was an clear reason to begin translocation elsewhere
	MER7-5: Evaluate the McBride Flat/Sagehen Spring area in the Truman Meadows portion of the White Mountains PMU as a potential sage-grouse habitat restoration and reintroduction area.	

		BSSG TAC met to discuss translocations 2015. It was determined that only the Parker population was in need of a translocation until the IPM or other data suggested that there was an clearn reason to begin translocation elsewhere. Telemetry work in the White Mountain PMU will help determine if this is necessary
	MER7-6: Evaluate Coyote Flat as a potential sage-grouse habitat restoration and reintroduction area.	
		BSSG TAC met to discuss translocations 2015. It was determined that only the Parker population was in need of a translocation until the IPM or other data suggested that there was an clear reason to begin translocation elsewhere. Telemetry work in the White Mountain PMU will help determine if this is necessary
Habitat Improvement and Restoration: Implement habitat improvement and restoration projects designed to ensure the long-term viability of greater sage-grouse populations within the Bi-State Plan area. Continue to implement on-going habitat improvement and restoration projects on public and private lands in the Bi-State area. Design and implement additional site-specific sage-grouse habitat improvement and restoration projects on public and private lands in the Bi-State area in cooperation with the Bi-State Local Area Work Group.		
	HIR1-1-PN: Continue to implement pinyon and juniper removal projects in appropriate areas adjacent to occupied sage-grouse habitat in Upper Mill Canyon in the Pine Nut PMU.	
		Mill Canyon conifer treatment Lyon Unit
		Mill Canyon conifer treatment unit 1
		Mill Canyon conifer treatment unit 2
		Mill Canyon conifer treatment Big Lake unit
		Mill Canyon conifer treatment maintenance
		Mt Siegel conifer treatment
	HIR1-2-PN: Continue to implement pinyon and juniper removal in the Buckskin Valley Vegetation Treatment project area in the Pine Nut PMU.	
		EQIP contract to treat a portion of the BLM land in Buckskin Valley project area (3 sites: 411, 147, 747)
		2012 Buckskin Valley Vegetation Management Project
		2013 Buckskin Valley Vegetation Management Project
		Private Lands EQIP/WHIP program: PJ Removal in Buckskin Valley area
		2013 EQIP contract to treat a portion of the BLM land in Buckskin Valley project area
		2014 EQIP contract to treat a portion of the BLM land in Buckskin Valley project area
		2015 EQIP contract to treat Crest Unit of Pine Nut Land Health Project
		Buckskin Valley conifer treatment
		2013 private lands conifer treatment
		Crest 2 conifer treatment
		Lyons Fire conifer removal
		Crest 3 conifer treatment
		Buckskin Valley conifer treatment maintenance
		Pine Nut Mountain Powerline Project

		2020 Buckskin Valley conifer treatment
		2021 Buckskin conifer treatment
	HIR1-3-PN: Maintain the existing fence around the Big Meadow complex in the Pine Nut PMU and mark with flight diverters to deter fence strikes.	
		Big Meadow fence marking
		Big Meadow fence maintenance
	HIR1-4-PN: Continue to manage livestock to maintain proper functioning condition of the Big Meadow complex in the Pine Nut PMU.	
		Churchill Canyon grazing permit written with flexibility to change grazing if probems arise
	HIR1-5-PN: Manage high elevation wet meadows in the southern portion of the Pine Nut PMU for proper functioning condition and forb abundance and diversity. Maintain existing fences and mark with flight diverters to deter fence strikes.	
		Incomplete
	HIR2-1-PN: Restore previously burned sagebrush habitat within a three-mile radius of the Mill Canyon lek in the Pine Nut PMU.	
		Incomplete
	HIR2-2-PN: Maintain meadows in the Mount Siegel/ Bald Mountain area in proper functioning condition or improve through livestock management or fencing in the Pine Nut PMU.	
		Incomplete
	HIR2-3-PN: Evaluate options to improve sagebrush habitat quality west of the Big Meadow complex in the Pine Nut PMU. Design and implement site specific habitat improvement projects based on the results.	
		Incomplete
	HIR2-4-PN: Control noxious weeds within and surrounding the Big Meadow complex in the Pine Nut PMU.	
		Ongoing weed treatments completed by Carson City BLM
	HIR1-1-DCF: Continue pinyon and juniper removal across Sweetwater Flat and in adjacent pinyon and juniper encroached sagebrush habitats in the Desert Creek-Fales PMU.	
		2013 Sweetwater Summit conifer treatment maintenance
		2016 Sweetwater Summit conifer treatment
		2017 Sweetwater Summit conifer treatment maintenance
	HIR1-2-DCF: Implement the Long Doctor pinyon-juniper removal project in the Desert Creek-Fales PMU.	
		Long Doctor pinyon removal-Sweetwater Summit area 2012
		Long Doctor pinyon removal - Sweetwater Summit Area 2013
		Long Doctor pinyon removal - Sweetwater Summit Area 2014
		Long Doctor pinyon removal maintenance 2015
	HIR1-3-DCF: Continue to work with the permittees on Wheeler Flat to develop and implement grazing management strategies that reduce the impacts of early season grazing on key brood meadows in the Desert Creek-Fales PMU.	

		Wheeler Flat fence marking
		Wheeler Flat trough installation
	HIR1-4-DCF: Continue to develop and implement an interagency restoration plan for Wheeler Creek to restore hydrologic function and increase forb cover and diversity on adjacent brood meadows in the Desert Creek-Fales PMU.	
		Wheeler Creek restoration NEPA
		Wheeler Creek meadow restoration
	HIR2-1-DCF: Design and implement site specific projects to improve meadow habitat conditions on Wheeler Flat in the Desert Creek-Fales PMU.	
		Wheeler Flat enclosure fence construction, marking, and maintenance
	HIR2-2-DCF: Investigate opportunities to implement habitat improvement projects on the Sweetwater Ranch in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects where feasible.	Private Lands-EQIP/WHIP conifer treatment
		Sweetwater Flat fence marking
	HIR2-3-DCF: Evaluate options to reduce cheatgrass densities southeast of Desert Creek Lek #2 in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects based on the results.	
		2013 Smith Valley Conservation District weed treatments
	HIR2-4-DCF: Determine the feasibility for improving perennial grass and forb cover in proximity to Desert Creek Lek #2 in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects based on the results.	
		Incomplete
	HIR2-5-DCF: Determine the feasibility for improving perennial grass and forb cover across Sweetwater Flat to improve pre-laying and nesting habitat conditions in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects based on the results.	
		Private Lands-EQIP/WHIP program irrigation project
		Private Lands-EQIP/WHIP program rabbit brush removal project
	HIR2-6-DCF: Evaluate nesting habitat and brood meadow condition on Burcham/Wheeler Flats in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects based on the results.	
		Incomplete
	HIR2-7-DCF: Investigate opportunities for meadow habitat improvement on private lands in the Huntoon Valley, Swauger Creek and north Bridgeport Valley vicinities in the Desert Creek-Fales PMU. Design and implement site specific habitat improvement projects where feasible.	
		Incomplete
	HIR1-1-MG: Continue pinyon and juniper removal in the China Camp area and adjacent public and private lands in the Mount Grant PMU.	
		China Camp pinyon removal 2012
		China Camp pinyon removal 2013
		China Camp pile burning 2016

		Flying M conifer treatment
		China Camp (Long Meadow) conifer treatment
		Private lands conifer treatment
	HIR2-1-MG: Develop and implement a management strategy to restore brood habitat on the Rosachi Ranch in the Mount Grant PMU.	
		2012 Meadow restoration Rosaschi Ranch
		2014 Rosaschi Ranch brood rearing habitat improvement
		Rosachi Ranch annual irrigation
		2013 Meadow Restoration Rosaschi Ranch
		Rosaschi Ranch upland field restoration (east field)
		Rosaschi Ranch upland field restoration (west field)
	HIR2-2-MG: Work with Flying M Ranch to maintain and improve brood habitat conditions in the Rough Creek and lower Bodie Creek vicinities of the Mount Grant PMU. Design and implement site specific habitat improvement projects where feasible.	
		Flying M Ranch project demonstration sites (seeding and fuel break)
		FM Ranch sage-grouse habitat enhancement
		Meadow and stream proper functioning condition surveys completed
		UAV surveys in Walker River State Recreation Area
		9 Mile Ranch fence marking
		Installed HOBOs on Bodie and Rough Creeks
		Streamflow monitoring
	HIR2-3-MG: Evaluate meadow habitat conditions in the Aurora and Gregory Flats vicinities of the Mount Grant PMU. Design and implement meadow habitat restoration projects based on the results.	
		Incomplete
	HIR2-4-MG: Work with the Hawthorne Army Depot to maintain and improve brood habitat quality at Lapon Meadows in the Mount Grant PMU. Design and implement site specific habitat improvement projects where feasible.	
		2013 Hawthorne Army Depot meeting
	HIR2-5-MG: Investigate options to control noxious weeds and cheatgrass within and around the Ninemile Ranch Unit in the Mount Grant PMU. Design and implement site specific habitat restoration projects based on the results.	
		2012 Smith Valley Conservation District weed monitoring and treatment
		2013 Smith Valley Conservation District weed monitoring and treatment
		2015 Smith Valley Conservation District weed monitoring and treatment
		2016 Smith Valley Conservation District weed monitoring and treatment
		2017 Smith Valley Conservation District weed monitoring and treatment
		2019 Nine Mile weed monitoring and treatment
		2020 Nine Mile weed monitoring and treatment
	HIR1-1-B: Complete ongoing pinyon and juniper removal projects in the Lower Summers (Lek 10), Green Creek, Stringer Meadows (Lek 9A), and Upper Aurora Canyon vicinities in the Bodie PMU.	

		Lek 9a conifer treatment maintenance
		Lower Summers conifer treatment
		Lower Summers conifer treatment East Unit
		Lower Summers conifer treatment Meadow Unit
		Lower Summers conifer treatment maintenance
		2012 Upper Aurora conifer treatment maintenance
		2013 Upper Aurora conifer treatment maintenance
		2014 Upper Aurora conifer treatment maintenance
		Stringer Meadow Unit conifer treatment
		Green Creek conifer treatment
		Green Creek conifer treatment
		2012 Green Creek conifer treatment maintenance
		2014 Green Creek conifer treatment maintenance
		2018 Green Creek conifer treatment maintenance
		2017 Greeen Creek pile burn
	HIR1-2-B: Maintain existing meadow habitat protective enclosures in the Bodie Hills portion of the Bodie PMU. Incorporate targeted short-duration grazing to improve brood meadow forb production where appropriate.	
		Murphy Meadow #1 fence conversion and yearly exclosure maintenance
		Upper Bodie Creek riparian pasture
		Aspen B1072 exclosure
		Artesian Spring exclosure
		Murphy Meadows exclosure #2
		Aspen P1094 exclosure
		7 Troughs Riparian Pasture
		Fourway Meadow exclosure
		N. Potato Peak Meadow exclosure
		Aspen P1094A exclosure
		Aspen B1075 exclosure
		Aspen B1076 exclosure
		Upper Geiger meadow exclosure
		Geiger Meadow #1 exclosure maintenance
		Geiger Meadow #2 exclosure maintenance
		Kirkwood Meadow restoration
	HIR1-3-B: Continue meadow habitat improvement efforts on public and private lands in Upper Aurora Canyon in the Bodie PMU.	
		Private Lands-EQIP/WHIP program rabbitbrush control
		Upper Aurora Canyon meadow improvement
		Aurora meadow owing
		Aurora Canyon electric fence
		Aurora Canyon headcut stabilization
		Aurora Canyon exclosure maintenance
	HIR1-4-B: Complete the planned removal of the Bodie to Fletcher transmission line that traverses portions of both the Bodie and Mount Grant PMUs.	
		Bodie sub to Fletcher sub power line removal

	HIR1-5-B: Continue to manage permitted livestock grazing to maintain current nesting habitat quality in the Bodie Hills breeding complex in the Bodie PMU.	
		Bodie Mountain Allotment
		Dog Creek Allotment
		Green Creek Allotment
		Mono Sand Flat Allotment
		Mormon Ranch Allotment
		Potato Peak Allotment
		Rancheria Gulch Allotment
		Aurora Canyon Allotment
		15 Year CRP Lease
	HIR1-6-B: Complete the ongoing NEPA analysis to support implementation of sage-grouse habitat improvement projects in the Bodie PMU consistent with the findings of the Bodie Hills Conservation Action Plan (Provencher et al. 2009).	
		Bodie Hills Upland Vegetation Restoration Programmatic NEPA
	HIR1-7-B: Complete the Lime Kiln windmill removal and solar pump replacement project in the southern portion of the Bodie PMU.	
		Incomplete
	HIR2-1-B: Evaluate stringer meadows, spring complexes, and irrigated meadows in the Bodie PMU as potential brood habitat improvement sites. Design and implement site specific habitat improvement projects based on the results.	
		Warm Springs meadow improvement
		Private Lands - EQIP/WHIP program project-watering facility to redistribute livestock
		Field tour with Sherm Swanson to assess riparian areas
		Drafted EA and NEPA for Bodie Hills meadow restoration
	HIR2-2-B: Evaluate mid-elevation sagebrush habitats in the Bodie Hills breeding complex for potential early brood habitat improvement sites in the Bodie PMU. Design and implement site specific habitat improvement projects based on the results.	
		Noxious weed survey and treatment
	HIR1-1-SM: Continue to implement and enforce seasonal road closures designed to reduce human disturbance on public lands in the vicinity of Lek 1, Lek 5, and Lek 8 in the Long Valley portion of the South Mono PMU.	
		Lek 8 nesting habitat seasonal closure
		Lek 1 nesting habitat seasonal closure
		Lek 5 nesting habitat seasonal closure
		Long Valley seasonal road closure
	HIR1-2-SM: Continue to monitor for illegal vehicle use and camping within the Long Valley portion of the South Mono PMU. Increase law enforcement presence and enforcement activities were required to minimize or eliminate recreation impacts.	
		Shepherd's Tub vegetation restoration
		Habitat protection through boulder placement
		Inyo NF Long Valley recreation monitoring
		Long Valley restoration project

		Bishop BLM Long Valley recreation monitoring
	HIR1-3-SM: Implement the proposed tree encroachment removal project near Sagehen Summit in the South Mono PMU.	
		2014 Sagehen Summit conifer treatment
		Sagehen II Sage-Grouse Habitat Enhancement Project NEPA
		2018 Sagehen II conifer treatment
	HIR1-4-SM: Continue to monitor implementation of new grazing permit terms and conditions in the Long Valley portion of the South Mono PMU. Identify priorities for more intensive management attention, especially in upland sagebrush types.	
		Annual livestock grazing monitoring
	HIR1-5-SM: Complete the windmill removal and solar pump replacement projects in the Adobe Valley portion of the South Mono PMU.	
		Four Adobe Valley windmills removed and conversion to solar
	HIR1-6-SM: Maintain the Indian Spring protective fence in the Mono Basin portion of the South Mono PMU.	
		Fence removed after fire. Now riparian area is monitored and maintained.
	HIR2-1-SM: In drought years, work with the LADWP to prioritize irrigation for important brood meadows (e.g., Laurel meadows) in the Long Valley portion of the South Mono PMU.	
		CDFW works with LADWP to advise on best irrigation practices
		LADWP, CDFW, USFWS, Audubon met to discuss water allocation strategies in Long Valley that provide adequate habitat for bird and fish species while maintaining LADWP's mission to provide water to paying customers
		LADWP submitted a commitment letter to the USFWS stating willingnes to manage their land with best management practices for sage-grouse in mind
		LADWP developed and implemented and Adaptive Management Plan for watering in Long Valley
Research and Monitoring: Implement a coordinated interagency research and monitoring program to support the conservation and management of greater sage-grouse populations and habitats within the Bi-State Plan area.		
	RAM1-1: Coordinate annual lek monitoring efforts across state and federal jurisdictional boundaries.	
		Annual lek counts are carried out by a diversity of partners across the Bi-State
	RAM1-2: Increase the level of interagency support and effort for annual lek counts in the Pine Nut, Desert Creek-Fales, Mount Grant, and White Mountains PMUs. Implement "saturation counts" where logistically feasible.	
		Beginning in 2012 NDOW, Bishop BLM, Carson BLM, USGS, CDFW determine staff needs and coordinate lek surveys in Pine Nut, Desert Creek-Fales, Mt. Grant, and White Mountain PMUs
	RAM1-3: Maintain the current level of interagency support and effort required to conduct annual "saturation counts" in the Bodie and South Mono PMUs.	

		Annual coordinated saturation counts. BIFO/CDFW leads the coordination of these counts. LADWP, NRCS, USFS and volunteers are involved
	RAM1-4: Conduct a systematic aerial inventory of potential breeding habitats in the Bi-State area to identify new or previously undocumented leks.	
		Aerial lek inventory occurred in 2012
	RAM1-5: Focus aerial lek monitoring efforts on remote or otherwise inaccessible locations. Augment aerial surveys with ground counts when and where logistically feasible.	
		Aerial helicopter surveys are conducted most years in hard to access areas in the the Pine Nut, Desert Creek and Mount Grant PMUs
	RAM1-6: Increase the level of volunteer training and support for annual lek monitoring efforts in the Bi-State area.	
		Mono County Lek tour and training
		Annual Bi-State volunteer lek survey training
	RAM1-7: Incorporate lek habitat inventory and assessment protocols identified in the interagency Sage-Grouse Habitat Assessment Framework (Stiver et al. 2010) into lek inventory and monitoring efforts in the Bi-State area.	
		Sage-grouse HAF conducted on leks within Mount Grant PMU in FY19 included Baldwin Canyon, Nine Mile Flat, Nine Mile 2, and Mudspring leks. 4 more in Pine Nut PMU
	RAM1-8: Develop and implement a standardized lek location database for documented (active and historic) leks in the Bi-State area.	
		Development of the California Lek database
		Development of the integrated lek database (CA and NV)
	RAM2-1: Identify and map existing sagebrush habitats and important sage-grouse habitats within each PMU. Develop a draft interim habitat map for the Bi-State area by April 30, 2012. Complete a final interim habitat map for the Bi-State area by September 30, 2012.	
		Published map of BSSG habitat
	RAM2-2: Incorporate standardized vegetation and environmental characteristics data sampling into existing agency vegetation inventory and monitoring protocols to support the development and implementation of the Conservation Planning Tool (CPT).	
		Standardized vegetation sampling protocols for treatment efficacy
		Standardized vegetation sampling protocols for nest and brood sites
	RAM2-3: Incorporate multi-scale sage-grouse habitat inventory and assessment protocols identified in the interagency Sage-Grouse Habitat Assessment Framework (Stiver et al. 2010) into habitat inventory and monitoring efforts in the BiState area.	
		Annual vegetation monitoring and treatment efficiency monitoring
	RAM3-1: Continue and expand the on-going telemetry effort in the Pine Nut PMU. Incorporate additional capture locations into the study design based on lek inventory results.	

		Capture and monitoring efforts in the Pine Nut PMU (2012-2015)
	RAM3-2: Implement a new telemetry effort in the Mount Grant PMU to supplement and expand on previous efforts focused in the Bodie PMU. Focus initial capture efforts in the China Camp, Baldwin Canyon, Aurora and Lapon Meadows lek areas, as well as brood rearing habitat on Ninemile Ranch and Scierine Ranch. Incorporate additional capture locations into the study design based on lek inventory results.	
		Capture and monitoring efforts in the Mount Grant PMU (2012-2018 and 2021)
	RAM3-3: Implement a new telemetry effort in the Desert Creek portion of the Desert Creek-Fales PMU to supplement and expand on previous efforts. Focus initial capture efforts in the Desert Creek, Sweetwater and Wiley Ditch lek areas, as well as brood-rearing habitats on the Desert Creek Ranch, Sweetwater Ranch and Scierine Ranch. Incorporate additional capture locations into the study design based on lek inventory results.	
		Capture and monitoring efforts in the Desert Creek-Fales PMU (2012, 2015-2018)
	RAM3-4: Implement a new telemetry effort in the White Mountains PMU to supplement and expand on previous efforts. Incorporate the use of GPS technology to improve data collection capabilities in the White Mountains. Incorporate additional capture locations into the study design based on lek inventory results.	
		Capture and monitoring efforts in the White Mountain PMU (2013, 2016-2021)
	RAM3-5: Continue and supplement the on-going radio telemetry effort in the South Mono PMU. Focus new capture efforts in the Sagehen Summit, Sagehen Meadows, Gaspipe Spring and McLaughlin Spring areas. Incorporate additional capture locations into the study design based on lek inventory results.	
		Capture and monitoring efforts in the South Mono PMU (2014-2021)
	RAM3-6: Continue and supplement the on-going telemetry effort in the Fales Portion of the Desert Creek-Fales PMU. Focus additional capture efforts in the upper elevations of the Sweetwater Range and in the Huntoon Valley. Incorporate additional capture locations into the study design based on lek inventory results.	
		Incomplete
	RAM3-7: Continue and supplement the on-going radio telemetry effort in the Bodie PMU. Focus additional capture efforts in previously un-sampled lek areas and habitat restoration project areas. Incorporate additional capture locations into the study design based on lek inventory results.	
		Capture and monitoring efforts in the Bodie Hills PMU (2012-2021)
	RAM3-8: Collect vegetation and environmental characteristics data at telemetry relocation points and random points following standardized protocols to support the development and implementation of the Conservation Planning Tool (CPT).	
		Vegetation characteristics collected at telemetry locations

	RAM3-9: Incorporate the use of GPS technology into the study design for ongoing and planned telemetry efforts to collect data on intra-day and potential long-range and inter-PMU movements.	
		USGS deploys GPS collars to monitor sage-grouse movement
	RAM3-10: Collect feces in addition to environmental and vegetation characteristics data at winter relocations for diet quality analysis using gas chromatography	
		UC Davis diet and behaviorial study was completed
	RAM4-1A: Collect a blood sample from each captured bird and submit these samples to the University of Denver for genetic analyses.	
		Blood samples are collected
	RAM4-1B: Collect feathers from each captured bird and submit these samples to the University of Idaho and/or the US Forest Service Rocky Mountain Research Station (RMRS) genetics lab in Missoula, Montana for genetic analyses.	
		Feathers are collected
	RAM4-1C: Collect morphological measurements from each captured bird to calculate body condition index (BCI) by obtaining mass, flat wing, tarsus, and culmen measurements.	
		Morphological measurements are collected
	RAM4-2: Collect feathers from each monitored lek and submit these samples to the University of Idaho and/or the US Forest Service RMRS genetics lab in Missoula, Montana for genetic analyses.	
		Feathers are collected and genetic analyses are complete
	RAM5-1A: Develop and implement a standardized spatial database (ArcMap geodatabase) to collect and store all greater sage-grouse conservation related project work occurring in the Bi-State area. Coordinate geodatabase development with signatories to the Bi-State MOU and the Bi-State LAWG to ensure end user compatibility. Populate the geodatabase with conservation actions completed to date by September 30, 2012. Establish procedures for effective and efficient geodatabase maintenance and distribution.	
		Geodatabase to track BSSG projects was developed
	RAM5-1B: Develop and implement a standardized tabular database (Microsoft Access database) to collect and store all greater sage-grouse related conservation work occurring in the Bi-State area. Coordinate database development with signatories to the Bi-State MOU and the Bi-State LAWG to ensure end user compatibility. Populate the database with conservation actions completed to date by September 30, 2012. Establish procedures for effective and efficient database maintenance and distribution.	
		Tabular database was developed
	RAM5-2: Investigate options to develop and implement an Interagency BiState Sage-Grouse Conservation sharepoint site to facilitate collaborative projects and data sharing. If determined to be feasible, establish the sharepoint site and provide access to signatories of the Bi-State MOU.	
		Google Drive created

Maintaining Stakeholder Involvement: Develop active, well informed, local planning groups committed to the development and implementation of sage-grouse conservation actions within the Bi-State Plan area.		
	MSI1: Continue to support the stakeholder based Bi-State Local Area Working Group (LAWG) process to identify, develop, and implement PMU specific conservation actions for greater sage-grouse populations and habitats in the Bi-State area.	
		The Sage-Grouse Conservation Plan for Bi-State Area is updated through meetings held by the Technical Advisory Committe
	MSI1-2: Conduct PMU planning meetings on an as needed basis to address PMU specific issues and to identify, develop, and prioritize PMU specific conservation actions.	
		Minden NRCS SGI SWAT Workshop
		Long Valley Tribal Forum
		Adobe Field Tour
		Parker Meadow Field Tour
		Presentation on the BSSG to the LA Audubon in Bishop
		Aurora Canyon Road Hydrology Restoration Field Trip
		Pine Nut Project Field Tour with Assistant Secretary of Interior
		Pine Nut Project, Field tour with NCCS regional director
		Pine Nut Land Health Annual Meeting
		LAWG Field Tour of 9 Mile Ranch
		Nevada PMU Meeting
		Parker Meadow Disturbance Meeting
	MSI1-3: Conduct Bi-State LAWG planning meetings on a semi-annual basis to review the status of greater sage-grouse populations and habitats in the Bi-State area and to identify, prioritize, and coordinate implementation of annual conservation actions. Continue University of Nevada Cooperative Extension facilitation of the BiState LAWG meeting.	
		Annual Bi-State LAWG meetings held
	MSI2-1: Conduct workshops to provide information about programs available to assist ranchers and other private landowners that may be interested in the implementation of sage-grouse conservation projects and to explore opportunities for cooperative conservation of sage-grouse in the Bi-State area.	
		Bi-State landowner open house
		RCPP Grant meeting
		Deep Springs resource management team meeting
		Mono County meetings
	MSI2-2: Develop and publish a Bi-State LAWG sage-grouse conservation newsletter.	
		Mailchimp e-newsletter was created
	MSI2-3: Develop and implement a publically accessible Bi-State LAWG Sage-Grouse Conservation webpage to facilitate the sharing and distribution of information specific to greater sage-grouse conservation efforts in the Bi-State area.	
		Website was created and is mainainted to provide BSSG related information

State of California
Department of Fish and Wildlife

Signed Original on File
Received March 26, 2024

M e m o r a n d u m

Date: March 25, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: Submission of Initial Statement of Reasons for the April 17-18, 2024, Fish and Game Commission Meeting to Amend Sections 2.30, 5.00, 7.50, 8.00, and 703 Title 14, California Code of Regulations, Re: Inland Sport Fishing Regulations Update

The Department of Fish and Wildlife (Department) requests the Fish and Game Commission (Commission) authorize publication of notice of its intent to amend sections 2.30, 5.00, 7.50, 8.00, and 703 for the upcoming sport fishing regulatory cycle. The proposed regulatory changes are needed to effectively manage California's sport fisheries and correct errors and inaccuracies in the existing regulations to reduce public confusion and improve regulatory enforcement. Authorization of this request will allow for possible adoption at the August 2024 Commission meeting.

The Department is submitting the attached Initial Statement of Reasons (ISOR) with proposals to reduce the daily bag limit for trout in Parker Lake and Willow Creek, reduce the minimum size limit for black bass in Lake Castaic, allow take of American Shad by spearfishing in the Valley District, simplify and streamline access to low-flow fishing information, amend the fishing boundary for Deep Creek, and update the Department's mailing address.

If you have any questions regarding this item, please contact Jay Rowan, Fisheries Branch Chief or Karen Mitchell, Senior Environmental Scientist, at Fisheries@wildlife.ca.gov.

Initial Statement of Reasons for Regulatory Action

Amend Sections 2.30, 5.00, 7.50, 8.00, and 703
Title 14, California Code of Regulations
Re: Inland Sport Fishing Regulations Update

I. Date of Initial Statement of Reasons: January 24, 2024

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing

Date: April 18, 2024 Location: San Jose, CA

(b) Discussion Hearing

Date: June 20, 2024 Location: Mammoth Lakes, CA

(c) Adoption Hearing

Date: August 15, 2024 Location: Fortuna, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

This California Department of Fish and Wildlife (Department) proposal combines Department and public requests for changes to Title 14, sections 2.30, 5.00, 7.50, 8.00 and 703, for the 2024 sport fishing regulatory cycle. This proposal will reduce the daily bag limit for trout in Parker Lake and Willow Creek, reduce the minimum size limit for black bass in Lake Castaic, allow take of American Shad by spearfishing in the Valley District, simplify and streamline access to low-flow fishing information, amend the fishing boundary for Deep Creek, and update the Department's mailing address. These proposed regulatory changes are needed to effectively manage California's sport fisheries, and correct errors and inaccuracies in the existing regulations to reduce public confusion and improve regulatory enforcement.

(b) Proposed Regulations

The Department is proposing changes to the following regulations in Title 14, CCR:

- ***Section 2.30, Spearfishing***
  - The proposal would amend the freshwater sport fishing regulations to include American Shad as a species that may be taken by spearfishing in the Valley District, and clarification of the spearfishing boundaries (Section 2.30 Spearfishing, subsection (b)).
  - Currently several species of fish can be taken by speargun in the Valley District between May and September. Those species include Striped Bass, carp, goldfish,

Sacramento (Western Sucker), Sacramento Blackfish, Hardhead, Sacramento Pikeminnow, and lamprey. The regulations do not include American Shad as a species that can be taken by spearfishing. The Department would like to add spearfishing as a method of take for American Shad. The Department does not believe that adding this method of take will impact the American Shad population, or any other fish species. Additionally, this regulation change will increase angling opportunities for the angling community.

- The Department would also like to more clearly define spearfishing boundaries written in the regulations so that the need to look up Fish and Game Code Section 1505 is reduced. Additionally, the department would like to add language for anglers to check their local city and/or county ordinances for speargun (firearm) restrictions.

- ***Section 5.00, Black Bass, Subsection (b)(7), Castaic Lake (Los Angeles Co.)***
  - The proposal is to reduce the 15-inch total length minimum size limit at Castaic Lake to the statewide standard of 12-inch total length minimum size limit. The daily bag limit of five fish will remain unchanged.
  - The current regulation for black bass at Castaic Lake is inadequate and was enacted to protect a “trophy” black bass fishery that no longer exists. Castaic Lake has limiting factors that are not conducive to maintaining a large population of “trophy” black bass. Habitat for juvenile bass and sunfish is limited as shorelines are generally steep in both arms and contain few small coves. Aquatic vegetation, which is important for recruitment of black bass, is lacking due to water level fluctuations. There is also a large population of striped bass which are additional competitors of forage resources. Department electrofishing data from 2013-2022 show the black bass fishery has declined in condition and has stunted between 10-15 inches. The average Relative Weight (body condition) was 78 in 2022, where 100 is considered adequate health. Harvest is needed to reduce the population, warranting the regulation change. In addition to the black bass fisheries data, the Department has been contacted multiple times by local angling groups calling for the regulation change. Castaic Lake is the only water in the area with a special regulation, aligning it with the statewide black bass regulation would create regulation simplification and expand angler opportunity for resource utilization.
- ***Section 7.50, Subsection (b)(42), Deep Creek (San Bernardino Co.)***
  - This proposal would amend the fishing boundary for Deep Creek for clarity purposes. The current boundary reads “from headwaters at Little Green Valley to confluence of Willow Creek.” The proposed new boundary is “from below Green Valley Lake Dam to the confluence of Willow Creek. This change is necessary to ensure law enforcement officers are clear on which area the regulations apply. Current regulations mention Little Green Valley, which does not exist.
- ***Section 7.50, Parker Lake (Mono County)***
  - This proposal would amend the trout regulations for Parker Lake to year-round angling, two fish bag limit, 14-inch minimum size limit, and an artificial lures only gear restriction from the General Statewide Regulations for trout (i.e., Section 5.85) of all year, 5 fish

bag limit with 10 in possession. This will require adding Parker Lake to Section 7.50, Special Fishing Regulations for Trout.

- Parker Lake has been a designated Heritage Wild Trout water since 2011. Historically, Parker Lake was a fast action Brook Trout fishery that produced trophy size Brown Trout. Recent survey efforts by the Department in 2021 have shown a consistent decline in both species population numbers since surveys conducted in 2003 and 2011. The large decline in Brook Trout numbers in the lake indicates Parker Lake is no longer a fast action Brook Trout fishery, suggesting there is overharvest. Brown Trout have also decreased in size since 2003 and 2011 and are trending towards no longer reaching trophy sizes. Parker Lake has become more popular in recent years due to increasing interest and advertisement of the lake on various social media platforms, which most likely caused the increase in angling pressure. Since this water is not stocked, the current fishing methods and 5 fish bag limit with an additional 10 Brook Trout over 10 inches is most likely resulting in overfishing and a decline in both species.

- ***Section 7.50, Willow Creek (Alpine County)***
    - This public proposal seeks to amend the fishing regulations on Willow Creek upstream from the confluence with the West Fork Carson River to the main tributary of Willow Creek to protect the declining populations of trout in the creek. This proposal would reduce the daily bag limit for trout from five fish per day to catch and release fishing only, with a gear restriction of artificial lures and barbless hooks only. This change would require adding Willow Creek to Section 7.50, Special Fishing Regulations for Trout.
    - The Department has little data on the status of trout populations in Willow Creek, but given the small size of the watershed, and multiple exceptional droughts of the past decade, the Department supports actions to ensure this fishery continues to be viable. This aligns with the Department's mission to conserve and provide fishing opportunities for future generations.

- ***Section 8.00, Low Flow Fishing Restrictions***

Low-flow restrictions provide protection to listed and targeted game fish when stream flows are low. Low-flow restrictions affect fishing seasons for ten coastal counties: Del Norte, Humboldt, Mendocino, Sonoma, Marin, Napa, San Mateo, Santa Cruz, Santa Clara, and Monterey. Currently, the Department reports low-flow information via three different phone lines reflected in this section. Each phone line is associated with specific waters and each line is supported by one of the three Department regions (Northern Region 1, Bay Delta Region 3, and Central Region 4).

- The low-flow phone lines are problematic, and a continued source of concern for the Department. The phone line messages for all three low-flow phone lines are inefficient as it requires the public to navigate a phone line and potentially listen to information that is not relevant to their needs. Additionally, if the public is not engaged, they may miss the pertinent information requiring them to listen to the message again. Constituents have expressed concerns with the phone line and have requested a web-based message on public forums and with Department staff.

- In the event of inclement weather and/or power outages, the phone lines have been down and unable to communicate low-flow updates. The Department's Telecom Representative has identified multiple options to improve the phone lines, however these options will be expensive and time and labor intensive.
- With the proposed amendments to Section 8.00, the Department seeks to simplify and streamline access to low-flow information by transitioning the three low-flow phone lines to a Department webpage. A single source of information will be more efficient for the state and its constituents. An online system will be much more efficient for CDFW to operate. The proposed regulation changes show the phone number in existing regulation struck out and the Department website's regulations page (www.wildlife.ca.gov/regulations) added for Low-Flow Restrictions and information. This regulation will not impact where or when low-flow closures occur.

- ***Other Changes***

  The Department is proposing additional changes to correct errors in the regulations, including:

  1. Section 703(a)(3): The mailing address for the Department's Fisheries Branch in this section needs to be changed from 830 S Street, Sacramento, CA 95811 to 1010 Riverside Pkwy, West Sacramento, 95605.
  2. Section 7.50: Non-substantive renumbering of subsections (b)(106) through (b)(169) to account for the addition of Parker Lake and Willow Creek.

(c) Necessity of the Proposed Regulation Changes

The proposed changes are necessary to align California's inland sport fishery regulations with the Department's current fisheries management goals and objectives. Specifically, the changes are necessary to: (1) protect declining populations of trout in Parker Lake and Willow Creek; (2) increase fishing opportunity for black bass in Castaic Lake; (3) increase fishing opportunity for spearfishers in the Valley District; (4) make access to low-flow fishing information more efficient; and (5) make needed corrections to existing regulations to reduce public confusion and improve regulatory enforcement.

(d) Goals and Benefits of the Regulation

As stated in Fish and Game Code Section 1700, Conservation of Aquatic Resources, it is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant water fisheries based in California in harmony with international law, respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the state. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence, and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based sport fish seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations sport fish to ensure their continued existence.

The benefits of the proposed regulations are consistent with the sustainable management of California's sport fisheries, general health and welfare of California residents, and promotion of businesses that rely on sport fishing throughout California.

(e) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: Sections 200, 205, 255, 265, 270, 275, 315, and 399 Fish and Game Code.
Reference: Sections 200, 205, 255, 265, 270, and 275 Fish and Game Code.

(f) Specific Technology or Equipment Required by Regulatory Change

None.

(g) Identification of Reports or Documents Supporting Regulation Change

None.

(h) Public Discussions of Proposed Regulations Prior to Notice Publication

The Department presented the proposed amendments to the sport fishing regulations at the Commission's Wildlife Resources Committee meetings on September 19, 2023 and January 16, 2024.

On December 12, 2023, the Department released an online survey associated with the proposed low-flow regulation change to gauge the public's use of the current phone lines, preference to recorded phone line messages vs a web-based platform, and ability to access online low-flow information. The survey was completed on February 22, 2024 and results indicated overall support for a web-based provision of low flow information.

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

No alternatives were identified by or brought to the attention of Commission staff that would have the same desired regulatory effect.

(b) No Change Alternative

The no change alternative would leave the current regulations in place.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed changes provide clarification of existing regulations that are necessary for the continued preservation of the resource, while providing inland sport fishing opportunities and thus, the prevention of adverse economic impacts.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission does not anticipate adverse impacts on the creation or elimination of jobs within the state. The Commission does not anticipate adverse impacts on the creation of new business, the elimination of existing businesses or the expansion of businesses in California. The proposed changes are to provide clarification of existing regulations that are not anticipated to change the level of fishing activity and thus the demand for goods and services related to sportfishing that could impact the demand for labor, nor induce the creation of new businesses, the elimination, nor the expansion of businesses in California.

The Commission anticipates benefits to the environment by the sustainable management of fishery resources throughout the state. The Commission does not anticipate any benefits to the health and welfare of California residents or to worker safety.

(c) Cost Impacts on a Representative Private Person or Business

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None. No changes to costs or savings to state agencies or in federal funding are anticipated by the proposed clarification of existing regulations. The Department program implementation and enforcement are projected to remain the same with a stable volume of fishing activity.

(e) Nondiscretionary Costs/Savings to Local Agencies: None.

(f) Programs Mandated on Local Agencies or School Districts: None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None.

(h) Effect on Housing Costs: None.

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

The Commission does not anticipate adverse impacts on the creation or elimination of jobs within the state because the proposed amendments are not anticipated to impact the level of fishing activity and thus the demand for goods and services related to sportfishing that could impact the demand for labor.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The Commission does not anticipate that any of the proposed amendments would induce impacts on the creation of new business or the elimination of existing businesses, because the economic impacts of the proposed clarifications of existing regulations are unlikely to be stimulate or lessen the demand for goods or services related to sport fishing, travel, or tourism to the affected areas.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The Commission does not anticipate that any of the proposed clarification of existing regulations would induce impacts on the expansion of businesses currently doing business within the state. The proposed regulations are not anticipated to increase demand for services or products from the existing businesses that serve individuals who engage in inland sport fishing. The number of fishing trips and angler economic contributions are expected to remain within the range of historical averages.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

The Commission does not anticipate direct benefits to the health and welfare of California residents besides the furtherance of opportunities for sport fishing which is healthy outdoor recreation and form of relaxation for many. Sport fishing also provides opportunities for multi-generational family activities and promotes respect for California's environment by younger generations, the future stewards of California's natural resources.

(e) Benefits of the Regulation to Worker Safety

The Commission does not anticipate any benefits to worker safety from the proposed regulations because inland sport fishing does not impact working conditions.

(f) Benefits of the Regulation to the State's Environment

Under the proposed regulations, the Commission anticipates benefits to the environment in the sustainable management of inland fishery resources. It is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence, and the maintenance of a sufficient resource to support a reasonable sport use.

(g) Other Benefits of the Regulation

Other benefits of the regulation include consistency with federal fishery management goals, and support for businesses that rely on inland sport fishing.

Informative Digest/Policy Statement Overview

This California Department of Fish and Wildlife (Department) proposal combines Department and public requests for changes to California Code of Regulations (CCR) Title 14, sections 2.30, 5.00, 7.50, 703, and 8.00, for the 2024 sport fishing regulatory cycle. This proposal will reduce the daily bag limit for trout in Parker Lake and Willow Creek, reduce the minimum size limit for black bass in Lake Castaic, allow take of American Shad by spearfishing in the Valley District, simplify and streamline access to low-flow fishing information, amend the fishing boundary for Deep Creek, and update the Department's mailing address. These proposed regulatory changes are needed to effectively manage California's sport fisheries, and correct errors and inaccuracies in the existing regulations to reduce public confusion and improve regulatory enforcement.

The Department is proposing changes to the following regulations in Title 14, CCR:

- ***Section 2.30, Spearfishing***
  - The proposal would amend the freshwater sport fishing regulations to include American Shad as a species that may be taken by spearfishing in the Valley District, and clarification of the spearfishing boundaries (Section 2.30 Spearfishing, subsections (b) and (c)).
- ***Section 5.00, Black Bass, Subsection (b)(7), Castaic Lake (Los Angeles Co.)***
  - The proposal is to reduce the 15-inch total length minimum size limit at Castaic Lake to the statewide standard of 12-inch total length minimum size limit. The daily bag limit of five fish will remain unchanged.
- ***Section 7.50, Subsection (b(42), Deep Creek (San Bernardino Co.)***
  - This proposal would amend the fishing boundary for Deep Creek for clarity purposes. The current boundary reads "from headwaters at Little Green Valley to confluence of Willow Creek." The proposed new boundary is "from below Green Valley Lake Dam to the confluence of Willow Creek." This change is necessary to ensure law enforcement officers are clear on which area the regulations apply. Current regulations mention Little Green Valley which does not exist.
- ***Section 7.50, Parker Lake (Mono Co.)***
  - This proposal would amend the trout regulations for Parker Lake to year-round angling, two fish bag limit, 14-inch minimum size limit, and an artificial lures only gear restriction from the General Statewide Regulations for trout (i.e., Section 5.85) of all year, 5 fish bag limit with 10 in possession. This will require adding Parker Lake to Section 7.50, Special Fishing Regulations for Trout.
- ***Section 7.50, Willow Creek (Alpine Co.)***
  - This public proposal seeks to amend the fishing regulations on Willow Creek upstream from the confluence with the West Fork Carson River to the main tributary of Willow Creek to protect the declining populations of trout in the creek. This proposal would reduce the daily bag limit for trout from five fish per day to catch and release fishing

only, with a gear restriction of artificial lures and barbless hooks only. This will require adding Willow Creek to Section 7.50, Special Fishing Regulations for Trout.

- ***Section 8.00, Low Flow Fishing Restrictions.***
  - This proposal seeks to simplify and streamline access to low-flow information by transitioning the three different phone lines in current regulations to a single-source CDFW webpage.

- ***Other Changes***

  The Department is proposing additional changes to correct errors in the regulations, including:

  1. Section 703(a)(3): The mailing address for the Department's Fisheries Branch in this section needs to be changed from 830 S Street, Sacramento, CA 95811 to 1010 Riverside Pkwy, West Sacramento, 95605.
  2. Section 7.50: Renumber subsections (b)(106) through (b)(169) to account for the addition of Parker Lake and Willow Creek.

Benefits of the Proposed Regulations

As stated in Fish and Game Code Section 1700, Conservation of Aquatic Resources, it is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant water fisheries based in California in harmony with international law, respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the state. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence, and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based sport fish seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations sport fish to ensure their continued existence.

The benefits of the proposed regulations are consistent with the sustainable management of California's sport fisheries, general health and welfare of California residents, and promotion of businesses that rely on sport fishing throughout California.

Consistency and Compatibility with Existing Regulations

Article IV, Section 20 of the State Constitution specifies that the Legislature may delegate to the Fish and Game Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to regulate recreational fishing in waters of the state (Fish and Game Code sections 200, 205, 315, and 316.5). The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the California Code of Regulations and finds no other state agency regulations pertaining to trout sport fishing seasons, bag, and possession limits.

Proposed Regulatory Language

Subsection (b) of Section 2.30, Title 14, CCR, is amended to read:

§ 2.30. Spearfishing.

Spearfishing is permitted only in:

(a) The Colorado River District for carp, tilapia, goldfish and mullet, all year.

(b) The Valley District and Black Butte Lake (Tehama County) for <u>American Shad,</u> carp, tilapia, goldfish, striped bass, Sacramento (Western) Sucker, Sacramento blackfish, hardhead, Sacramento pikeminnow and lamprey, from May 1 through September 15, except that no spearfishing is permitted in:

(1) Shasta County (see Section 2.12).

(2) Tehama County except Black Butte Lake.

(3) Butte Creek (Butte Co.).

(4) Feather River below Oroville Dam (Butte Co.).

~~(5) Designated salmon spawning areas (See Fish and Game Code Section 1505).~~

<u>(5) Yuba River upstream of Simpson Lane Bridge (Yuba Co.).</u>

<u>(6) American River upstream of Howe Ave. Bridge (Sacramento Co.).</u>

<u>(7) Mokelumne River upstream of Elliot Road Bridge (San Joaquin Co.).</u>

<u>(8) San Joaquin River upstream of State Route 99 Bridge (Madera and Fresno Co.).</u>

<u>(9) Stanislaus River upstream of S. Santa Fe Road (J7) Bridge (Stanislaus Co.).</u>

<u>(10) Tuolumne River upstream of the Geer Road (J14) Bridge (Stanislaus Co.).</u>

<u>(11) Merced River upstream of N. Santa Fe Drive (J7) Bridge (Merced Co.).</u>

<u>(12) All designated salmon spawning areas (See Fish and Game Code Section 1505).</u>

<u>(13) Refer to all county, city, and/or local regulations and ordinances to confirm if use and/or possession of projectile weapons is prohibited.</u>

(c) The Kern River from the Kern-Tulare county line upstream to the Johnsondale Bridge for carp, goldfish, Sacramento (Western) Sucker, hardhead and Sacramento pikeminnow, from May 1 through September 15.

(d) See bullfrogs (Section 5.05).

Note: Authority cited: Sections 200, 205, 255 and 265, Fish and Game Code.
Reference: Sections 200, 205, 255 and 265, Fish and Game Code.

Proposed Regulatory Language

Subsection (b)(7) of Section 5.00, Title 14, CCR, is amended to read:

§ 5.00. Black Bass.

. . . No changes to subsections (a) and (b)(1) through (b)(6), just shown for background information. . .

It is unlawful to take or possess black bass except as provided in this section:

(Note: Some waters are closed to all fishing under Sections 7.40 and 7.50.)

(a) General Statewide Restrictions:

(1) Lakes/Reservoirs and the Sacramento-San Joaquin Delta: The following waters, except for those listed in subsection (b), are open to fishing all year, with a 12-inch total length minimum size limit and a five-fish daily bag limit: All lakes and reservoirs in the State, and the Sacramento-San Joaquin River Delta (see Section 1.71 for definition of the Delta).

(2) Rivers/Streams and Private Ponds: Rivers, streams, canals, and lakes or ponds entirely on private lands that are not listed in subsection (b) are open all year with no size limit and a five-fish daily bag limit.

(b) Special Regulations: Counties and individual waters listed below are those having regulations different from the General Statewide Restrictions in subsection (a).

DISTRICTS AND COUNTIES WITH SPECIAL REGULATIONS

Area or Body of Water	**Open Season**	**Size (total length)**	**Bag Limit**
(1) Colorado River District: All waters (Bag and size limits conform with Arizona regulations.).	All year.	13-inch minimum.	6
(2) Inyo Co.: All streams east of Highway 395 from the southern Inyo Co. line north to the junction of Highway 6 and east of Highway 6 to the Mono Co. line, except those streams listed by name in Section 7.50(b), Special Fishing Regulations.	All year.	12-inch minimum.	5
The remaining streams of Inyo Co., except those waters listed in Section 7.50(b), Special Fishing Regulations	Last Sat. in Apr. through Nov. 15. Closed to bass fishing from Nov. 16 through the Fri. preceding	12-inch minimum.	5

	the last Sat. in Apr.		
All Lakes, Big Pine Canal, Fish Spring Canal, and Millpond in Inyo Co.	All year.	12-inch minimum.	5
(3) Mono Co.: All streams except for Fish Slough (see subsection (b)(10)) and those waters listed by name in Section 7.50(b), Special Fishing Regulations	Last Sat. in Apr. through Nov. 15. Closed to bass fishing from Nov. 16 through the Fri. preceding the last Sat. in Apr.	No size limit.	5
(4) Plumas Co.: All waters.	All year.	No size limit.	5

INDIVIDUAL BODIES OF WATER WITH SPECIAL REGULATIONS

Area or Body of Water	**Open Season**	**Size (total length)**	**Bag Limit**
(5) Barrett Lake (San Diego Co.) (Also see Section 2.08.)	All year.	Catch and Release only.	0
(6) Casitas Lake (Ventura Co.)	All year.	12-inch minimum. No more than one over 22 inches.	5
(7) Castaic Lake (Los Angeles Co.).	All year.	~~15~~12-inch minimum.	5
(8) Cuyamaca Lake (San Diego Co.).	All year.	No size limit for Largemouth Bass. Catch and Release only for Smallmouth Bass.	5
(9) Fish Slough (Mono Co.), except the fenced portions of Fish Slough within the BLM Spring, which are closed to all fishing all year. See Section 7.50(b)(49), Special	All year.	No size limit.	5

Area or Body of Water	Open Season	Size (total length)	Bag Limit
Fishing Regulations.			
(10) Hodges Lake (San Diego Co.).	All year.	15-inch minimum.	5
(11) Lett's Lake (Colusa Co.).	All year.	No size limit.	5
(12) Plaskett Meadows lakes, upper and lower (Glenn Co.).	All year.	No size limit.	5
(13) Shaver Lake (Fresno Co.).	All year.	No size limit.	5
(14) Upper Otay Lake (San Diego Co.). (Also see Section 2.08.)	All year	Catch and Release only.	0

Note: Authority cited: Sections 200, 205, 265, 270 and 275, Fish and Game Code. Reference: Sections 200 and 205, Fish and Game Code.

Proposed Regulatory Language

Subsection (b) of Section 7.50, Title 14, CCR, is amended to read:

§ 7.50. Alphabetical List of Trout Waters with Special Fishing Regulations

[…No changes to subsection (a)…]

(b)

[…No changes to subsections (b)(1) through (b)(41)…]

§ 7.50. Alphabetical List of Trout Waters with Special Fishing Regulations.

(b)

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(42) Deep Creek (San Bernardino Co.) from ~~headwaters at Little Green Valley to confluence of Willow Creek.~~ below Green Valley Lake Dam to the confluence of Willow Creek.	All year. Only artificial lures may be used.	2 trout

[…No changes to subsections (b)(43) through (b)(104)…]

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(105) Parker Creek (Mono Co.) from Parker Lake to the confluence with Rush Creek.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(106) Parker Lake (Mono Co.)	All year. Only artificial lures may be used. 14-inch minimum size limit.	2 trout
(~~106~~107) Pine Creek (Goose Lake Tributary) and tributaries (Modoc Co.).	Sat. preceding Memorial Day through the last day in Feb.	5 trout
(~~107~~108) Pine Valley Creek (San Diego Co.) upstream of Barrett Lake and all its tributaries.	All year. Only artificial lures may be used.	2 trout
(~~108~~109) Piru Creek (Los Angeles and Ventura Cos.).		

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(A) Piru Creek and tributaries upstream of Pyramid Lake.	All year. Only artificial lures may be used.	2 trout
(B) From Pyramid Dam downstream to the bridge approximately 300 yards below Pyramid Lake.	Closed to all fishing all year.	
(C) From the bridge approximately 300 yards below Pyramid Lake downstream to the falls about 1/2 mile above the old Highway 99 bridge.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~109~~110) Pit River (Shasta and Modoc Cos.).		
(A) Pit River, South Fork (Modoc Co.) and tributaries upstream of the Highway 395 bridge in Likely.	Sat. preceding Memorial through the last day in Feb.	5 trout
(B) Pit River, North Fork (Modoc Co.) and tributaries from the confluence with the South Fork in Alturas upstream to and including Franklin Creek.	Sat. preceding Memorial Day through the last day in Feb. Only artificial lures may be used.	2 trout
(C) From Pit No. 3 (Britton Dam) downstream to the outlet of the Pit No. 3 Powerhouse.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(D) Pit River, from Pit No. 3 Powerhouse downstream to Shasta Lake.	All year.	2 trout. 4 trout in possession.
(~~110~~111) Pole Creek and tributaries (Placer Co.).	Closed to all fishing all year.	
(~~111~~112) Portuguese Creek, West Fork (Madera Co.) from headwaters downstream to confluence with the East Fork Portuguese Creek.	Sat. preceding Memorial Day through the last day in Feb. Only artificial lures with barbless hooks may be used.	0 trout

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(~~112~~113) Prosser Creek from the Prosser Reservoir dam downstream to the confluence with the Truckee River (Nevada Co.).	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~113~~114) Purisima Creek (San Mateo Co.).	Sat. preceding Memorial Day through Sep. 30. Only artificial lures with barbless hooks may be used.	0 trout
(~~114~~115) Putah Creek (Solano and Yolo Cos.) from Solano Lake to Monticello Dam.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~115~~116) Redwood Creek and tributaries (Alameda Co.).	Closed to all fishing all year.	
(~~116~~117) Redwood Creek (Humboldt Co.) and tributaries above the mouth of Bond Creek.	Closed to all fishing all year.	
(~~117~~118) Robinson Creek (Mono Co.).		
(A) From the U.S. Forest Service boundary downstream to Upper Twin Lake.	Sat. preceding Memorial Day through Sep. 30.	5 trout
(B) Between Upper and Lower Twin Lakes.	Sat. preceding Memorial Day through Sep. 30.	5 trout
(~~118~~119) Rock Creek Diversion Channel (Mono Co.) from its source below Tom's Place to its confluence with Crooked Creek.	Closed to all fishing all year.	
(~~119~~120) Rock Creek Lake (Inyo Co.).	Last Sat. in Apr. through Nov. 15.	5 trout
(~~120~~121) Rock Creek in the Hat Creek Drainage (Shasta Co.) from Rock Creek spring (origin) downstream to Baum Lake.	Closed to all fishing all year.	

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(~~121~~122) Rock Creek (Shasta Co.) from its confluence with Pit River to Rock Creek Falls (about one mile upstream).	Closed to all fishing all year.	
(~~122~~123) Roosevelt Lake (Mono Co.).	All year. Only artificial lures may be used.	2 trout
(12~~3~~124) Rush Creek (Mono Co.).		
(A) Rush Creek from Grant Lake Dam downstream to Mono Lake.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(B) Rush Creek (Mono.Co.) between Silver Lake and Grant Lake.	Sat. preceding Memorial Day through Sep. 30.	5 trout
(~~124~~125) Sabrina Lake (Lake Sabrina, Inyo Co.).	Last Sat. in Apr. through Nov. 15.	5 trout
(~~125~~126) Sacramento River and tributaries above Keswick Dam (Shasta and Siskiyou Cos.).		
(A) Sacramento River and tributaries from Box Canyon Dam downstream to the Scarlett Way bridge in Dunsmuir.	All Year. Only artificial lures with barbless hooks may be used.	0 trout
(B) Sacramento River and tributaries from Scarlett Way bridge downstream to the county bridge at Sweetbriar.	Sat. preceding Memorial Day through Sep. 30. Oct. 1 through the Fri. preceding Memorial Day. Only artificial lures may be used.	5 trout 2 trout
(C) Sacramento River and tributaries from the county bridge at Sweetbriar downstream to Shasta Lake.	All year. Only artificial lures may be used.	2 trout
(~~126~~127) Sagehen Creek (Nevada Co.).		

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(A) From the stream gauging station (located about 1/8 mile below Sagehen Creek Station Headquarters) upstream to about 1/8 mile above the station headquarters at a point where the stream splits into two sections.	Closed to all fishing all year.	
(B) From the Highway 89 bridge upstream to the gauging station at the east boundary of the Sagehen Creek Station.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~127~~128) Salmon Creek and tributaries above Highway 1 (Monterey Co.).	Sat. preceding Memorial Day through Sep. 30. Only artificial lures with barbless hooks may be used.	0 trout
(~~128~~129) San Gabriel River, West Fork and tributaries (Los Angeles Co.).		
(A) Upstream of Cogswell Dam (including Cogswell reservoir and its tributaries).	All year. Only artificial lures may be used.	2 trout
(B) From Cogswell Dam downstream to the second bridge upstream from the Highway 39 bridge.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~129~~130) San Luis Rey River West Fork (San Diego Co.).	All year. Only artificial lures may be used.	2 trout
(~~130~~131) Santa Ana River and tributaries upstream above Seven Oaks Dam (San Bernardino Co.). This does not include Bear Creek. See subsection (b)(8), Bear Creek (San Bernardino Co.) for additional info.	All year.	5 trout

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(~~131~~132) Santa Ynez River and tributaries upstream of Gibraltar Dam (Santa Barbara Co.).	All year.	2 trout. 4 trout in possession.
(~~132~~133) Sausal Creek and tributaries (Alameda Co.).	Closed to all fishing all year.	
(~~133~~134) Sespe Creek and tributaries above Alder Creek confluence (Ventura Co.).	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~134~~135) Silver Creek (Mono Co.), tributary to West Walker River, and tributaries upstream from Silver Falls.	Closed to all fishing all year.	
(~~135~~136) Silver Creek and all other tributaries to Sworinger Lake (Modoc and Lassen Cos.).	Sat. preceding Memorial Day through the last day in Feb. Only artificial lures may be used.	2 trout
(~~136~~137) Silver King Creek and tributaries (Alpine Co.) upstream of the confluence with Snodgrass Creek.	Closed to all fishing all year.	
(~~137~~138) Silver Lake (Mono. Co.).	Last Sat. in Apr. through Nov. 15.	5 trout
(~~138~~139) Slinkard Creek and tributaries (Mono Co.) upstream from a department of Fish and Wildlife rock gabbion barrier (38.606976°N, 119.567687°W). The barrier is located approximately 5–6 miles upstream from the Hwy 89 and Hwy 395 junction.	All year. Only artificial flies with barbless hooks may be used.	0 trout
(~~139~~140) Solano Lake (Solano Co.).	All year. Only artificial lures and barbless hooks may be used.	0 trout

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(~~140~~141) Sonoma Creek and tributaries (Sonoma Co.) above the Sonoma Creek seasonal waterfall in Sugarloaf Ridge State Park (located 0.2 miles upstream of the west end of the Canyon Trail).	Sat. preceding Memorial Day through Sep. 30. Only artificial lures with barbless hooks may be used.	0 trout
(~~141~~142) Sonoma Lake (Sonoma Co.).	All year.	2 trout. 4 trout in possession.
(~~142~~143) Sonoma Lake tributaries (Sonoma Co.).	Sat. preceding Memorial Day through Sep. 30. Only artificial lures may be use.	2 trout
(~~143~~144) Soulajoule Lake tributaries (Marin Co.).	Sat. preceding Memorial Day through Sep. 30.	2 trout. 4 trout in possession.
(~~144~~145) South Lake (Inyo Co.).	Last Sat. in Apr. through Nov. 15.	5 trout
(~~145~~146) Squaw Valley Creek and tributaries (Shasta Co.).	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~146~~147) Stanislaus River, Middle Fork (Tuolumne Co.).		
(A) From Beardsley Dam downstream to the U. S. Forest Service footbridge at Spring Gap (including the Beardsley Afterbay).	All year. Only artificial lures may be used.	2 trout
(B) From the U.S. Forest Service footbridge at Spring Gap to New Melones Reservoir.	All year.	2 trout. 4 trout in possession.
(~~147~~148) Stevens Creek and all tributaries upstream of Stevens Creek Reservoir (Santa Clara Co.).	All year. Only artificial lures with barbless hooks may be used.	0 trout

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(~~148~~149) Stony Creek, and tributaries (including the North, South, and Middle forks) from the headwaters downstream to the diversion dam west of Stonyford in the center of Section 35, T18N, R7W (Colusa, Glenn and Lake Cos.).	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~149~~150) Susan River (Lassen Co.)	Sat. preceding Memorial Day through the last day in Feb.	5 trout
(~~150~~151) Sweetwater River and tributaries upstream of Sweetwater Reservoir (San Diego Co.).	All year. Only artificial lures may be used.	2 trout.
(~~151~~152) Tahoe Lake and tributaries (Placer and El Dorado Cos.).		
(A) Tahoe Lake tributaries upstream to the first lake.	Sat. preceding Memorial Day through Sep. 30. Only artificial lures with barbless hooks may be used.	0 trout
(B) Tahoe Lake within 300 feet of the mouth of its tributaries.	Sat. preceding Memorial Day through Sep. 30. Only artificial lures with barbless hooks may be used.	0 trout
(~~152~~153) Trinity River, above Trinity Lake (Trinity Co.) from the confluence with Tangle Blue Creek (Hwy. 3), downstream (south) to the mouth of Trinity Lake, approximately 13.8 miles.	Sat. preceding Memorial Day through Sep. 30. Oct. 1 through the Fri. preceding Memorial Day. Only artificial lures with barbless hooks may be used.	5 trout
(~~153~~154) Truckee River (Nevada, Placer, and Sierra Cos.).		
(A) Truckee River for 1,000 feet below the Lake Tahoe outlet dam.	Closed to all fishing all year.	

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(B) Truckee River from the confluence of Trout Creek downstream to the mouth of Prosser Creek.	All year. Only artificial flies with barbless hooks may be used.	0 trout
(C) Truckee River from the mouth of Prosser Creek downstream to the Nevada State Line.	Last Saturday in Apr. through Nov. 15. Only artificial lures may be used. Nov. 16 through the Friday preceding the last Saturday in Apr. Only artificial lures with barbless hooks may be used.	2 trout 0 trout
(~~154~~155) Tule River and tributaries (Tulare Co.).		
Tule River, North Fork (Tulare Co.), only in the North Fork Tule River and all its forks and tributaries above the confluence with Pine Creek (about 50 yards upstream from the Blue Ridge road bridge, about 12 1/4 miles north of Springville).	All year. Only artificial lures may be used.	2 trout
(~~155~~156) Tuolumne River (Stanislaus and Tuolumne Cos.) from O'Shaughnessy Dam (Hetch Hetchy Reservoir downstream to Clavey River Falls.	All year. Only artificial lures may be used.	2 trout
(~~156~~157) Twelvemile Creek (Modoc Co.).	Sat. preceding Memorial Day through the last day in Feb. Only artificial lures with barbless hooks may be used.	0 trout
(~~157~~158) Twin Lakes (Mammoth, Mono Co.).	Last Sat. in Apr. through Nov. 15.	5 trout
(~~158~~159) Twin Lakes, Upper and Lower (Bridgeport, Mono Co.).	Last Sat. in Apr. through Nov. 15.	5 trout

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(~~159~~160) Upper Otay Lake (San Diego Co.).	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~160~~161) Upper Truckee River and tributaries upstream from confluence with Showers Creek (Alpine and El Dorado Cos.).	Sat. preceding Memorial Day through Sep. 30. Only artificial lures with barbless hooks may be used.	0 trout
(~~161~~162) Virginia Lakes, Upper and Lower (Mono Co.).	Last Sat. in Apr. through Nov. 15.	5 trout
(~~162~~163) Walker Creek (Mono Co.) from the private property line (fence) to the confluence Rush Creek.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~163~~164) Walker River, East Fork (Mono Co.) from Bridgeport Dam to Nevada State Line.	Last Sat. in Apr. through Nov. 15. Only artificial lures may be used. Minimum size limit: 18 inches total length. NOTE: BOW AND ARROW FISHING FOR CARP ONLY IS PERMITTED.	2 trout
(~~164~~165) Whiskey Creek (Mono Co.) downstream from Crowley Lake Drive (old Highway 395).	Sat. preceding Memorial Day through Sep. 30.	5 trout
(166) Willow Creek (Alpine Co.) upstream from the confluence with the West Fork Carson River to the main tributary of Willow Creek.	All year. Only artificial lures with barbless hooks may be used.	0 trout
(~~165~~167) Wolf Creek and tributaries (tributary to West Walker River) (Mono Co.).	All year. Only artificial flies with barbless hooks may be used.	0 trout

Body of Water	*Open Season and Special Restrictions*	*Daily Bag and Possession Limit*
(~~166~~168) Wolf Creek Lake (at the headwaters of Wolf Creek, tributary to the West Walker River) (Mono Co.).	Closed to all fishing all year.	
(~~167~~169) Yellow Creek (Plumas Co.) from Big Springs downstream to the marker at the lower end of Humbug Meadow.	Sat. preceding Memorial Day through the last day in Feb. Only artificial lures with barbless hooks may be used.	0 trout
(~~168~~170) Yuba River, Middle Fork (Nevada and Sierra Cos.) from Jackson Meadows Dam downstream to Milton Lake.	See Milton Lake (b)(97).	
(~~169~~171) Yuba River, North Fork (Sierra and Yuba Cos.) from the western boundary of Sierra City to the confluence with Ladies Canyon Creek.	All year. Only artificial lures may be used.	2 trout

NOTE: Authority cited: Sections 200, 205, 265, 270, 315 and 399, Fish and Game Code. Reference: Sections 200, 205, 265 and 270, Fish and Game Code.

Proposed Regulatory Language

Section 8.00, Title 14, CCR, is amended to read:

§ 8.00. Low-Flow Restrictions.

(a) Eel River, Mad River, Mattole River, Redwood Creek, Smith River and Van Duzen River. Stream closures: Special Low Flow Conditions.

(1) From September 1 through April 30:

(A) Any of the stream reaches listed in subsections (a)(2) through (8) below shall be closed to all angling on Tuesday and Wednesday when the department determines that the flow on the previous Monday at any of the designated gauging stations is less than the minimum flows set forth in subsections (a)(2) through (8).

(B) Any of the stream reaches listed in subsections (a)(2) through (8) below shall be closed to all angling on Thursday and Friday when the department determines that the flow on the previous Wednesday at any of the designated gauging stations is less than the minimum flows set forth in subsections (a)(2) through (8).

(C) Any of the stream reaches listed in subsections (a)(2) through (8) below shall be closed to all angling from Saturday through Monday when the department determines that the flow on the previous Friday at any of the designated gauging stations is less than the minimum flows set forth in subsections (a)(2) through (8).Note: Authority cited: Sections 200, 205, 265 and 270, Fish and Game Code. Reference: Sections 200, 205 and 265, Fish and Game Code.

(D) Notwithstanding subsections (a)(1)(A) through (C), the department may close or keep a stream reach closed to fishing when the minimum flow is exceeded on the scheduled flow determination day if the department is reasonably assured that the stream flow is likely to decrease below the minimum flow as specified in subsections (a)(2) through (8) before or on the next flow-determination date.

(E) The department may reopen a stream at any time during a closed period if the minimum flow as specified in subsections (a)(2) through (8) is exceeded and the department is reasonably assured that it will remain above the minimum flow until the next scheduled Monday, Wednesday, or Friday flow determination. The department shall make information available to the public by a ~~telephone recorded message~~webpage updated, as necessary, no later than 1:00 p.m. each Monday, Wednesday, and Friday as to whether any stream will be open or closed to fishing. It shall be the responsibility of the angler to use the ~~telephone number~~webpage designated in the sport fishing regulations booklet to obtain information on the status of any stream.

(2) Eel River

(A) From the mouth to Fulmor Road, at its paved junction with the south bank of Eel River. Closed to angling, except:

1. Legal fishing methods other than angling are permitted.

2. From the mouth to Cock Robin Island Bridge, angling from shore for non-salmonids is permitted.

Minimum Flow: 350 cfs at the gauging station near Scotia.

(B) The main stem Eel River from the paved junction of Fulmor Road with the Eel River to the South Fork Eel River. Minimum Flow: 350 cfs at the gauging station near Scotia.

(3) The South Fork of the Eel River downstream from Rattlesnake Creek and the Middle Fork Eel River downstream from the Bar Creek. Minimum Flow: 340 cfs at the gauging station at Miranda.

(4) Van Duzen River: The main stem Van Duzen River from its junction with the Eel River to the end of Golden Gate Drive near Bridgeville (approximately 4,000 feet upstream from the Little Golden Gate Bridge).

Minimum Flow: 150 cfs at the gauging station near Grizzly Creek Redwoods State Park.

(5) Mad River: The main stem Mad River from the Hammond Trail Railroad Trestle to Cowan Creek.

Minimum Flow: 200 cfs at the gauging station at the Highway 299 bridge.

(6) Mattole River: The main stem of the Mattole River from the mouth to Honeydew Creek.

Minimum Flow: 320 cfs at the gauging station at Petrolia.

(7) Redwood Creek: The main stem of Redwood Creek from the mouth to its confluence with Bond Creek.

Minimum Flow: 300 cfs at the gauging station near the Highway 101 bridge.

(8) Smith River: The main stem Smith River from the mouth of Rowdy Creek to the mouth of Patrick Creek (tributary of the Middle Fork Smith River); the South Fork Smith River from the mouth upstream approximately 1000 feet to the County Road (George Tyron-) bridge and Craigs Creek to its confluence with Jones Creek; and the North Fork Smith River from the mouth to its confluence with Stony Creek.

Minimum Flow: 600 cfs at the Jedediah Smith Redwoods State Park gauging station.

~~THE NUMBER TO CALL FOR INFORMATION IS (707) 822–3164.~~Check the Department's regulations page at www.wildlife.ca.gov/regulations for Low-Flow Restrictions and Information.

(b) Mendocino, Sonoma, and Marin County coastal streams: Stream Closures: Special Low Flow Conditions.

(1) From September 1 through April 30:

(A) Any of the stream reaches listed in subsections (b)(2) through (5) below shall be closed to all angling on Tuesday and Wednesday when the department determines that the flow on the previous Monday at the applicable designated gauging stations is less than the minimum flows set forth in subsections (b)(2) through (5).

(B) Any of the stream reaches listed in subsections (b)(2) through (5) below shall be closed to all angling on Thursday and Friday when the department determines that the flow on the previous Wednesday at the applicable designated gauging stations is less than the minimum flows set forth in subsections (b)(2) through (5).

(C) Any of the stream reaches listed in subsections (b)(2) through (5) below shall be closed to all angling from Saturday through Monday when the department determines that the flow on the previous Friday at the applicable designated gauging stations is less than the minimum flows set forth in subsections (b)(2) through (5).

(D) Notwithstanding subsections (b)(1)(A) through (C), the department may close or keep a stream reach closed to fishing when the minimum flow is exceeded on the scheduled flow determination day if the department is reasonably assured that the stream flow is likely to decrease below the minimum flow as specified in subsections (b)(2) through (5) before or on the next flow-determination date.

(E) The department may reopen a stream at any time during a closed period if the minimum flow as specified in subsections (b)(2) through (5) is exceeded and the department is reasonably assured that it will remain above the minimum flow until the next scheduled Monday, Wednesday, or Friday flow determination.

(F) The department shall make information available to the public by a ~~telephone recorded message~~webpage updated, as necessary, no later than 1:00 p.m. each Monday, Wednesday, and Friday as to whether any stream will be open or closed to fishing. It shall be the responsibility of the angler to use the ~~telephone number~~webpage designated in the sport fishing regulations booklet to obtain information on the status of any stream.

~~THE NUMBER TO CALL FOR INFORMATION IS (707) 822–3164 for Mendocino County and (707) 944–5533 for Sonoma, Marin, and Napa Counties.~~Check the Department's regulations page at www.wildlife.ca.gov/regulations for Low-Flow Restrictions and information.

(2) All rivers, creeks, and streams that flow directly into the Pacific Ocean (and its bays) in Mendocino County, except for the Russian and Gualala rivers. This excludes sections and reaches above fish migration barriers, dams, and natural features that prevent upstream anadromous migration.

Minimum Flow: 200 cfs at the USGS gauging station on the main stem Navarro River near Navarro, CA.

(3) All rivers, creeks, and streams that flow directly into the Pacific Ocean (and its bays) in Sonoma and Marin Counties, except for the Russian River. This excludes sections and reaches above fish migration barriers.

Minimum Flow: 150 cfs at the gauging station on the South Fork Gualala River near Sea Ranch (Sonoma County).

(4) Russian River main stem below the confluence of the East Branch Russian River (Mendocino and Sonoma Counties), Laguna de Santa Rosa, and Santa Rosa Creek.

Minimum Flow: 300 cfs at the gauging station located on the main stem Russian River near Guerneville (Sonoma County).

(5) The Napa River (Napa County) between Trancas Avenue in Napa and Oakville Cross Bridge near Yountville.

Minimum Flow: 15 cfs at the gauging station at the Oak Knoll Bridge on the main stem Napa River.

(c) South Central Coast Streams — Special Low Flow Closures: During December 1 through March 7, the following streams (subsections (c)(1) through (5)) will be closed to fishing when the department determines that stream flows are inadequate to provide fish passage for migrating steelhead trout and salmon. Closed streams will be reopened when the department determines flows are adequate for fish passage.

(1) Pescadero Creek and all anadromous reaches of San Mateo Co. coastal streams normally open for fishing, from Elliot Creek through Milagro Creek, shall be closed to all fishing when the department determines that the Pescadero Creek flows are impeding fish passage. (U. S. G. S. gauging station is on Pescadero Creek.)

(2) Aptos and Soquel Creeks (Santa Cruz Co.) shall be closed to all fishing when the department determines that the Soquel Creek flows are impeding fish passage. (U. S. G. S. gauging station on Soquel Creek.)

(3) The Pajaro River and Uvas, Llagas, and Corralitos Creeks (Santa Cruz, Monterey, & Santa Clara Cos.) shall be closed to all fishing when the department determines that the Pajaro River flows are impeding fish passage. (U. S. G. S. gauging station on the lower Pajaro River.)

(4) The main stem of the Salinas River (Monterey Co.), below its confluence with the Arroyo Seco River, shall be closed to all fishing when the department determines that the flows are impeding fish passage (U. S. G. S. Spreckels gauging station on the Salinas River.)

(5) The Arroyo Seco River (Monterey Co.) shall be closed to all fishing when the department determines that the flows are impeding fish passage. (Flows to be evaluated at U. S. G. S. Spreckels gauging station on the Salinas River and the U. S. G. S. gauging station near Geenfield on the Arroyo Seco River.)

(6) The San Lorenzo River and all its tributaries, as well as all anadromous reaches of coastal streams normally open for fishing in Santa Cruz Co. from the San Lorenzo River north through Waddell Creek, shall be closed to all fishing when the department determines that the flow at the U.S.G.S. gauging station (#11160500) in the San Lorenzo River at Big Trees is less than 40 cfs.

(7) The Carmel River main stem, and the adjacent waters of San Jose, Gibson, Malpaso, and Soberanes Creeks that are west of Highway 1 (Monterey Co.), shall be closed to all fishing when the department determines that the flow at the U. S. G. S. gauging station near Carmel is less than 80 cfs.

(8) The Big Sur River main stem west of the Highway 1 bridge, all of Limekiln Creek and its tributaries, and the anadromous portions of all other Big Sur Coast streams west of Highway 1 in Monterey Co., from Granite Creek south to Salmon Creek, shall be closed to all fishing when the department determines that the flow at the U. S. G. S. gauging station on the Big Sur River is less than 40 cfs.

(9) The stream flow gauges referred to above in subsections (c)(6) through (8) will be checked on Tuesday and Friday of each week. The decision as to whether these rivers will be open or closed to fishing will take place only on Tuesday and Friday of each week. In the event that river flow differs later in the week, the fishing status for each specific river will not change until the day following the next scheduled reading.

(10) It shall be the responsibility of the angler to use the ~~telephone number~~ webpage designated in the sport fishing regulations booklet to obtain information on the status of any of the rivers or creeks listed above in subsections (c)(1) through (8).

~~THE NUMBER TO CALL FOR INFORMATION IS (831) 649–2886.~~Check the Department's regulations page at www.wildlife.ca.gov/regulations for Low-Flow Restrictions and information.

NOTE: Authority cited: Sections 200, 205, 265 and 270, Fish and Game Code. Reference: Sections 200, 205 and 265, Fish and Game Code.

Proposed Regulatory Language

Subsection (a) of Section 703, Title 14, CCR is amended to read:

§ 703. Miscellaneous Applications, Tags, Seals, Licenses, Permits, and Fees.

(a) Applications, Forms and Fees for January 1 through December 31 (Calendar Year).

… No changes to subsections (1) through (2)…

(3) Determination that a Transgenic Aquatic Animal is not Detrimental

(A) The applicant shall apply in the form of a letter, on letterhead if an entity, for a department determination that a transgenic aquatic animal is not detrimental in accordance with Section 1.92 and shall include all of the following:

1. The name, mailing address, telephone number(s), and e-mail address of the person seeking to import, possess, distribute, and sell the transgenic aquatic animal or of the principal contact person if an entity seeks to import, possess, distribute, and sell the transgenic aquatic animal.

2. A detailed analysis based on credible science containing:

a. The common and scientific names of the species for which an exemption is sought.

b. A description of the life history of the species.

c. A description of the method(s) by which the genome of the species has been deliberately altered, modified, or engineered.

d. The known or anticipated effects of the genetic alteration, modification or engineering of the species.

e. An analysis of the potential risk to native fish, wildlife, or plants posed by the presence of the transgenic aquatic animal within California.

f. A description of the applicant's proposed importation, possession, distribution, and sale of the transgenic aquatic animal within California.

3. Certification in the following language: I certify that the information submitted in this application is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject the application to rejection, or the department determination to revocation, and to civil and criminal penalties under the laws of the State of California.

a. The original signature of the person, or principal contact person if an entity, seeking the determination.

4. The applicant shall submit a separate application and nonrefundable fee of $4,790 per species of transgenic aquatic animal.

5. The applicant shall submit one paper copy, and an electronic copy (via email or other device as directed by department staff) containing all application materials, and the application fee, to the Fisheries Branch Chief at ~~830 S Street, Sacramento, CA 95811~~1010 Riverside Pkwy, West Sacramento, CA, 95605.

(B) Contents of the Department Determination

1. The department shall issue a determination in writing, based on the information provided by the applicant, and any other relevant credible scientific information in the possession of the department or submitted to the department.

2. The determination shall state whether:

a. The presence of the transgenic aquatic animal within California is detrimental and subject to regulation under Section 671 and subsection 671.1(a)(8); or,

b. The presence of the transgenic aquatic animal within California is not detrimental and poses no reasonably foreseeable risk to native fish, wildlife, or plants and is not subject to regulation under Section 671 and subsection 671.1(a)(8).

c. In making its determination, the department may impose reasonable conditions to ensure the proposed importation, possession, distribution, and sale of the transgenic aquatic animal within California is not detrimental to native fish, wildlife, or plants.

d. The department may revoke or change its determination at any time upon newly-obtained information or circumstances involving said animal's detrimental impacts.

3. If the department identifies deficiencies in the application, requiring additional time or further review, the department shall reject the application and provide written notification of the identified deficiencies in the application to the applicant. No additional fee is required if the application, with required information, is resubmitted within one year of receipt of the original application.

(C) Effect of Department Determination

1. Once it receives a determination from the department that the transgenic aquatic animal poses no reasonably foreseeable risk to native fish, wildlife, or plants, the applicant or its authorized agent may import, possess, distribute, and sell the animal within the state provided that both the applicant and its authorized agent possess and provide within three business days, upon request by the department, a copy of the department's determination.

2. Any wholesaler or retailer purchasing a transgenic aquatic animal from the applicant or its authorized agent may import, possess, distribute, and sell the animal provided that the wholesaler or retailer possesses and provides within three business days, upon request by the department, both a copy of the department's

determination and written documentation to demonstrate that the animal that the wholesaler or retailer purchased originated from the applicant or its authorized agent.

3. Individuals purchasing a transgenic aquatic animal that originated from the applicant, its authorized agent, or wholesalers or retailers as authorized by this section may possess the animal, without a copy of the department's determination or any other documentation, provided that the animal is maintained in a closed system and not placed in the waters of the state.

NOTE: Authority cited: Sections 713, 1002, 1002.5, 1050, 1055, 2118, 2120, 2122, 2150, 2150.2, 2157 and 5060, Fish and Game Code.

Reference: Sections 395, 396, 398, 713, 1002, 1002.5, 1050, 2116, 2116.5, 2117, 2118, 2120, 2125, 2150, 2150.2, 2150.4, 2151, 2157, 2190, 2193, 2271, 3005.5, 3007, 3503, 3503.5, 3511, 3513, 3950, 5060, 5061, 10500, 12000 and 12002, Fish and Game Code; and Title 50, Code of Federal Regulations, Parts 21.29 and 21.30.

ECONOMIC AND FISCAL IMPACT STATEMENT (REGULATIONS AND ORDERS)

STD. 399 (Rev. 10/2019)

DRAFT DOCUMENT

ECONOMIC IMPACT STATEMENT

DEPARTMENT NAME	CONTACT PERSON	EMAIL ADDRESS	TELEPHONE NUMBER
Fish and Gam Commission	David Thesell	fgc@fgc.ca.gov	916 902-9291
DESCRIPTIVE TITLE FROM NOTICE REGISTER OR FORM 400			NOTICE FILE NUMBER
Amend Sections 2.30, 5.00, 7.50, 703, and 8.00 Title.14, CCR, Re: Inland Sport Fishing Regulations Update			Z

A. ESTIMATED PRIVATE SECTOR COST IMPACTS *Include calculations and assumptions in the rulemaking record.*

1. Check the appropriate box(es) below to indicate whether this regulation:

- ☐ a. Impacts business and/or employees
- ☐ b. Impacts small businesses
- ☐ c. Impacts jobs or occupations
- ☐ d. Impacts California competitiveness
- ☐ e. Imposes reporting requirements
- ☐ f. Imposes prescriptive instead of performance
- ☐ g. Impacts individuals
- ☒ h. None of the above (Explain below):

No new private sector costs are necessarily incurred.

If any box in Items 1 a through g is checked, complete this Economic Impact Statement.
If box in Item 1.h. is checked, complete the Fiscal Impact Statement as appropriate.

2. The ______________________ estimates that the economic impact of this regulation (which includes the fiscal impact) is:
(Agency/Department)

- ☐ Below $10 million
- ☐ Between $10 and $25 million
- ☐ Between $25 and $50 million
- ☐ Over $50 million *[If the economic impact is over $50 million, agencies are required to submit a Standardized Regulatory Impact Assessment as specified in Government Code Section 11346.3(c)]*

3. Enter the total number of businesses impacted: ______________

Describe the types of businesses (Include nonprofits): ______________

Enter the number or percentage of total businesses impacted that are small businesses: ______________

4. Enter the number of businesses that will be created: ______________ eliminated: ______________

Explain: ______________

5. Indicate the geographic extent of impacts: ☐ Statewide

☐ Local or regional (List areas): ______________

6. Enter the number of jobs created: ______________ and eliminated: ______________

Describe the types of jobs or occupations impacted: ______________

7. Will the regulation affect the ability of California businesses to compete with other states by making it more costly to produce goods or services here? ☐ YES ☐ NO

If YES, explain briefly: ______________

DRAFT DOCUMENT

ECONOMIC IMPACT STATEMENT (CONTINUED)

B. ESTIMATED COSTS *Include calculations and assumptions in the rulemaking record.*

1. What are the total statewide dollar costs that businesses and individuals may incur to comply with this regulation over its lifetime? $ ____________

   a. Initial costs for a small business: $ ____________ Annual ongoing costs: $ ____________ Years: ________

   b. Initial costs for a typical business: $ ____________ Annual ongoing costs: $ ____________ Years: ________

   c. Initial costs for an individual: $ ____________ Annual ongoing costs: $ ____________ Years: ________

   d. Describe other economic costs that may occur: ____________

2. If multiple industries are impacted, enter the share of total costs for each industry: ____________

3. If the regulation imposes reporting requirements, enter the annual costs a typical business may incur to comply with these requirements. *Include the dollar costs to do programming, record keeping, reporting, and other paperwork, whether or not the paperwork must be submitted.* $ ____________

4. Will this regulation directly impact housing costs? ☐ YES ☐ NO

   If YES, enter the annual dollar cost per housing unit: $ ____________

   Number of units: ____________

5. Are there comparable Federal regulations? ☐ YES ☐ NO

   Explain the need for State regulation given the existence or absence of Federal regulations: ____________

   Enter any additional costs to businesses and/or individuals that may be due to State - Federal differences: $ ____________

C. ESTIMATED BENEFITS *Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. Briefly summarize the benefits of the regulation, which may include among others, the health and welfare of California residents, worker safety and the State's environment: ____________

2. Are the benefits the result of: ☐ specific statutory requirements, or ☐ goals developed by the agency based on broad statutory authority?

   Explain: ____________

3. What are the total statewide benefits from this regulation over its lifetime? $ ____________

4. Briefly describe any expansion of businesses currently doing business within the State of California that would result from this regulation: ____________

D. ALTERNATIVES TO THE REGULATION *Include calculations and assumptions in the rulemaking record. Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. List alternatives considered and describe them below. If no alternatives were considered, explain why not: ____________

ECONOMIC IMPACT STATEMENT (CONTINUED)

2. Summarize the total statewide costs and benefits from this regulation and each alternative considered:

Regulation: Benefit: $ ______ Cost: $ ______

Alternative 1: Benefit: $ ______ Cost: $ ______

Alternative 2: Benefit: $ ______ Cost: $ ______

3. Briefly discuss any quantification issues that are relevant to a comparison of estimated costs and benefits for this regulation or alternatives: ______

4. Rulemaking law requires agencies to consider performance standards as an alternative, if a regulation mandates the use of specific technologies or equipment, or prescribes specific actions or procedures. Were performance standards considered to lower compliance costs? ☐ YES ☐ NO

Explain: ______

E. MAJOR REGULATIONS *Include calculations and assumptions in the rulemaking record.*

California Environmental Protection Agency (Cal/EPA) boards, offices and departments are required to submit the following (per Health and Safety Code section 57005). Otherwise, skip to E4.

1. Will the estimated costs of this regulation to California business enterprises **exceed $10 million**? ☐ YES ☐ NO

If YES, complete E2. and E3
If NO, skip to E4

2. Briefly describe each alternative, or combination of alternatives, for which a cost-effectiveness analysis was performed:

Alternative 1: ______

Alternative 2: ______

(Attach additional pages for other alternatives)

3. For the regulation, and each alternative just described, enter the estimated total cost and overall cost-effectiveness ratio:

Regulation: Total Cost $ ______ Cost-effectiveness ratio: $ ______

Alternative 1: Total Cost $ ______ Cost-effectiveness ratio: $ ______

Alternative 2: Total Cost $ ______ Cost-effectiveness ratio: $ ______

4. Will the regulation subject to OAL review have an estimated economic impact to business enterprises and individuals located in or doing business in California exceeding $50 million in any 12-month period between the date the major regulation is estimated to be filed with the Secretary of State through12 months after the major regulation is estimated to be fully implemented?

☐ YES ☒ NO

If YES, agencies are required to submit a Standardized Regulatory Impact Assessment (SRIA) as specified in Government Code Section 11346.3(c) and to include the SRIA in the Initial Statement of Reasons.

5. Briefly describe the following:

The increase or decrease of investment in the State: ______

The incentive for innovation in products, materials or processes: ______

The benefits of the regulations, including, but not limited to, benefits to the health, safety, and welfare of California residents, worker safety, and the state's environment and quality of life, among any other benefits identified by the agency: ______

DRAFT DOCUMENT

FISCAL IMPACT STATEMENT

A. FISCAL EFFECT ON LOCAL GOVERNMENT *Indicate appropriate boxes 1 through 6 and attach calculations and assumptions of fiscal impact for the current year and two subsequent Fiscal Years.*

☐ 1. Additional expenditures in the current State Fiscal Year which are reimbursable by the State. (Approximate)
(Pursuant to Section 6 of Article XIII B of the California Constitution and Sections 17500 et seq. of the Government Code).

$ ______________

☐ a. Funding provided in ______________

Budget Act of ______________ or Chapter ______________ , Statutes of ______________

☐ b. Funding will be requested in the Governor's Budget Act of ______________

Fiscal Year: ______________

☐ 2. Additional expenditures in the current State Fiscal Year which are NOT reimbursable by the State. (Approximate)
(Pursuant to Section 6 of Article XIII B of the California Constitution and Sections 17500 et seq. of the Government Code).

$ ______________

Check reason(s) this regulation is not reimbursable and provide the appropriate information:

☐ a. Implements the Federal mandate contained in ______________

☐ b. Implements the court mandate set forth by the ______________ Court.

Case of: ______________ vs. ______________

☐ c. Implements a mandate of the people of this State expressed in their approval of Proposition No. ______________

Date of Election: ______________

☐ d. Issued only in response to a specific request from affected local entity(s).

Local entity(s) affected: ______________

☐ e. Will be fully financed from the fees, revenue, etc. from: ______________

Authorized by Section: ______________ of the ______________ Code;

☐ f. Provides for savings to each affected unit of local government which will, at a minimum, offset any additional costs to each;

☐ g. Creates, eliminates, or changes the penalty for a new crime or infraction contained in ______________

☐ 3. Annual Savings. (approximate)

$ ______________

☐ 4. No additional costs or savings. This regulation makes only technical, non-substantive or clarifying changes to current law regulations.

☒ 5. No fiscal impact exists. This regulation does not affect any local entity or program.

☐ 6. Other. Explain ______________

FISCAL OFFICER SIGNATURE	DATE

The signature attests that the agency has completed the STD. 399 according to the instructions in SAM sections 6601-6616, and understands the impacts of the proposed rulemaking. State boards, offices, or departments not under an Agency Secretary must have the form signed by the highest ranking official in the organization.

AGENCY SECRETARY	DATE

Finance approval and signature is required when SAM sections 6601-6616 require completion of Fiscal Impact Statement in the STD. 399.

DEPARTMENT OF FINANCE PROGRAM BUDGET MANAGER	DATE

ADDENDUM TO FORM STD. 399

Amend Sections 2.30, 5.00, 7.50, 8.00, and 703
Title 14, California Code of Regulations
Re: Inland Sport Fishing Regulations Update

This California Department of Fish and Wildlife (Department) proposal combines Department and public requests for changes to Title 14, sections 2.30, 5.00, 7.50, 8.00, and 703 for the 2024 sport fishing regulatory cycle. This proposal will reduce the daily bag limit for trout in Parker Lake and Willow Creek, reduce the minimum size limit for black bass in Lake Castaic, allow take of American Shad by spearfishing in the Valley District, simplify and streamline access to low-flow fishing information, amend the fishing boundary for Deep Creek, and update the Department's mailing address in Section 703. These proposed changes are needed to effectively manage California's sport fisheries, increase fishing opportunities, improve access to fishing information, reduce public confusion and improve regulatory enforcement.

Economic Impact Statement

A. Estimated Private Sector Costs Impacts

Answer 1: h. None of the above (Explain below):

The Commission is not aware of any private sector cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

Fiscal Impact Statement

A. Fiscal Effect on Local Government

Answer 5. No fiscal impact exists. This regulation does not affect any local entity or program. No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution.

B. Fiscal Effect on State Government

Answer 3. No fiscal impact exists. This regulation does not affect any State agency or program. The Department program implementation and enforcement are projected to remain the same with a stable volume of fishing activity.

B. Fiscal Effect on Federal Funding of State Programs

Answer 3. No fiscal impact exists. This regulation does not affect any federally funded State agency or program.

INLAND SPORT FISHING REGULATIONS

Updates for 2025

PRESENTATION TO THE FISH AND GAME COMMISSION

April 18, 2024 | Karen Mitchell

Fisheries Branch

Overview – Proposed Regulation Changes

1. Castaic Lake (Los Angeles County): Reduce Black Bass size limit from 15 inches to statewide standard of 12 inches
2. Parker Lake (Mono County): Change 5 fish bag limit to 2 fish bag limit, 14-inch minimum size limit, artificial lures
3. Deep Creek (San Bernardino County): Amend fishing boundary description for clarity
4. Spearfishing (Valley District): Include American Shad as a species that may be taken by spearfishing
5. Low-flow Fishing Restrictions: Information platform change from phone lines to web based (multiple counties)
6. Willow Creek (Alpine County): Petition for Regulation Change

Castaic Lake – Los Angeles County

- Reduce the 15-inch total length minimum size limit to the statewide standard of 12-inches
  - "Trophy" black bass fishery no longer exists
    - inadequate habitat and food competition
    - the black bass fishery has declined in condition and has stunted between 10-15 inches
  - Harvest is needed to reduce the population
  - Local angling groups have called for the regulation change
  - Reverting to the statewide regulation would create regulation simplification and expand angler opportunity

Parker Lake – Mono County

- Historically fast action Brook Trout fishery with trophy-sized Brown Trout
    - Brook Trout densities 10% of normal; Brown Trout size declined 50%
    - Current declines due in part to increased angler usage
- Reducing harvest of smaller fish will allow Brook Trout to repopulate and protect mid-sized Brown Trout
- Continue to allow anglers to harvest fish
    - Original proposal: open all year, catch and release, artificial lures with barbless hooks
    - Amended proposal: open all year, 2 fish bag limit, 14-inch minimum size limit, artificial lures

Deep Creek – San Bernardino County

- Amend the fishing boundary description for clarity purposes
  - Current: from headwaters at Little Green Valley to confluence of Willow Creek
    - Problem: Little Green Valley does not exist
  - Proposed: from below Green Valley Lake Dam to the confluence of Willow Creek
  - Necessity: to ensure anglers are clear on which area the regulations apply

Spearfishing – Valley District

- Allow spearfishing as a method of take for American Shad in the Valley District
- Clarify spearfishing boundaries in the Valley District
- Add language directing anglers to check their local city and/or county ordinances for speargun (firearm) restrictions

Low-Flow Information Platform Change

- Remove the low-flow closure phone lines and include instream closure information on the CDFW website
- 10 counties affected: Del Norte, Humboldt, Mendocino, Sonoma, Marin, Napa, San Mateo, Santa Cruz, Santa Clara, and Monterey

Platform Change Justification

- A single source of information will be more efficient for anglers
  - Regulations which state the streams, seasons, and relevant phone numbers are online
  - The phone line messages require the public to navigate a phone line and potentially listen to information that is not relevant to their needs
- Constituents have requested a web-based message

Willow Creek – Alpine County

- Proposal addresses Fish and Game Commission Petition No. 2022-13, received on August 5, 2022
- Area: upstream from the confluence with the West Fork Carson River to the main tributary of Willow Creek
- Current regulation: open all year, 5 trout bag limit, no gear restrictions
- Public proposal: open all year, 0 trout bag limit, artificial flies with barbless hooks only
- Purpose is to protect all species of trout in Willow Creek including Lahontan Cutthroat Trout

Willow Creek – CDFW Proposal and Justification

- **CDFW proposal: open all year, 0 trout bag limit, artificial lures with barbless hooks only**
  - Artificial flies are not inclusive to all angling groups
  - Small watershed and multiple exceptional droughts of past decade
  - Department supports action to ensure the fishery continues to be viable
  - Aligns with CDFW's mission to conserve and provide fishing opportunities for future generations

Timeline

- April 18, 2024 Commission Meeting – Request to go Notice
- June 20, 2024 Commission Meeting – Discussion hearing
- August 15, 2024 Commission Meeting – Adoption hearing
- January 1, 2025 – If approved, new regulations go into effect

STAFF SUMMARY FOR OCTOBER 11-12, 2023

For background purposes only

9. WHITE STURGEON EMERGENCY REGULATION

Today's Item **Information ☐** **Action ☒**

Discuss and consider adopting emergency regulations concerning recreational take of white sturgeon to support recovery of sturgeon populations and to track fishing pressure and success.

Summary of Previous/Future Actions

- Wildlife Resources Committee (WRC) discussion and recommendation — September 19, 2023; WRC
- **Today's adoption hearing — October 11-12, 2023**

Background

White sturgeon is an anadromous fish species that resides primarily in the San Francisco Bay-Delta and migrates as adults into the major rivers of the Central Valley to spawn. White sturgeon are long lived, potentially in excess of 100 years, with most individuals reaching maturity by approximately 14 to 15 years. Mature white sturgeon spawn every 2 to 5 years. Successful recruitment to the adult population is uncommon, occurring approximately every s6to 7 years, and is highly correlated with above normal water years as measured by high mean daily Sacramento–San Joaquin River Delta outflow. The abundance of legal-sized white sturgeon in California has declined considerably since the 1980s, when abundance was estimated to be approximately 175,000 fish. In 2015, the Department estimated abundance in California at about 48,000 fish, and the Department's 2023 estimate was about 33,000 fish.

At present, recreational anglers can keep one white sturgeon per day, with a combined total of three per year, between 40 and 60 inches (fork length). The season is open year-round, with some limited regional and/or seasonal closures. Fishing pressure for white sturgeon, as measured by the number of fish harvested by anglers, has remained relatively stable; however, the number of fish caught and released has declined precipitously, indicating that fewer fish overall are being caught. The exploitation rate (i.e., the age-specific proportion of the population or biomass that is removed each year) of white sturgeon is estimated to be very high, ranging from 8 to 29.6% between 2007 and 2015. It has been suggested that the highest exploitation rate that a white sturgeon population can sustain is approximately 5 to 10%.

During July and August 2022, the San Francisco Bay region experienced a major harmful algal bloom (HAB) of *Heterosigma akashiwo* that resulted in significant mortality of fishes, including sturgeon. The resulting mortality has exacerbated what the Department believes to be an already unsustainable level of fishery exploitation of white sturgeon into a crisis situation.

Synopsis of Events

The Commission was first informed about the existence of an emergency through WRC. At the January 2023 WRC meeting at the request of the chair, the Department responded to an op-ed written by various sturgeon researchers in the academic field, calling on the Department to close the recreational white sturgeon fishery. The Department's response included a brief discussion of white sturgeon population declines, and the status of white sturgeon data being processed from various sources, including ongoing evaluation of impacts caused to the species by the summer of 2022 HAB, the possibility of future regulatory actions, data collection and modelling, and future stakeholder input. At the January meeting, the Department indicated that, based on the information available at the time, emergency action was not warranted, but that data was still being analyzed.

During the May 2023 WRC meeting, the Department outlined its previous and future plans for stakeholder engagement on the subject of potential white sturgeon regulation changes, stating its intent to develop a proposed regular rulemaking for Commission consideration that would change white sturgeon regulations for the 2025 calendar year, and that the Department was continuing to analyze data to determine the status of white sturgeon and appropriate management measures, including options for changes to sport fishing.

At the September 2023 WRC meeting, the Department presented new evidence on the white sturgeon population, the effects of the HAB, current and historical rates of sturgeon exploitation, and other information, all of which led the Department to conclude that an emergency situation exists. To protect the surviving population of white sturgeon and maintain a recreational fishery into the future, the Department stated that immediate steps are necessary to (1) stop angler-associated harvest of adult white sturgeon and (2) minimize harassment and handling on the spawning grounds so that adults can successfully spawn, and new individuals can recruit to the population.

Given this new information, WRC decided to recommend to the full Commission that it consider an emergency regulation at its next scheduled meeting, in October 2023. As a result of that WRC decision, Commission staff requested the Commission president add an agenda item to the October meeting to allow the Commission to consider emergency action.

Proposed Emergency Regulations

This proposed regulatory action amends sections 5.79, 5.80, 27.90 and 29.72, which describe report card and tagging requirements, seasons, and associated bag limits for white sturgeon recreational fishing in inland waters.

- Section 5.79: Removes language regarding white sturgeon harvest tags, as no harvest would be allowed under the proposed emergency regulations. Adds a requirement for anglers to report the length of any fish caught, to provide the Department with additional data for future management options. Adds language to instruct anglers to report additional sturgeon caught and released to provide data on fishing pressure and success.
- Section 5.80: Specifies white sturgeon fishing seasons from the west Carquinez Bridge east to the Highway 50 bridge on the Sacramento River, and above the Highway 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River; changes the fishing to catch-and-release only; and changes the daily bag limit to 0.
- Section 27.90: Specifies white sturgeon fishing seasons for the Carquinez Bridge area, which falls under the jurisdiction of marine fisheries; changes the fishing to catch-and-release only; and changes the daily bag limit to 0.
- Section 27.92: Updates language to a bag limit of 0 and specifies that white sturgeon is catch-and-release only in ocean waters.

Further details on the proposed changes are available in the emergency statement and proposed regulatory language (exhibits 4 and 5).

Significant Public Comments

1. An owner of a bait shop writes in opposition to the proposed emergency regulations, stating that the closure is not necessary and will have a dire effect on small businesses and the fishing industry (Exhibit 6).
2. A member of the public expresses concern that the urgency for the rulemaking is exaggerated. They state that the information provided is only from the last 4 years and that historical information from the past 80 years should also be considered. Lastly, they indicate that they are unaware of any successful catch-and-release fisheries on the West Coast, and are skeptical of the survey results that inquired if people would continue to fish without the option of harvest (Exhibit 7).

Recommendation

Commission staff: Adopt the emergency regulations amending sections 5.79, 5.80, 27.90, and 27.92 related to white sturgeon catch and release as recommended by the Department.

Committee: The Wildlife Resources Committee recommends the Commission adopt an emergency regulation regarding recreational take of white sturgeon.

Department: Adopt the emergency regulations as presented in the emergency statement in Exhibit 4 to pause all harvest of white sturgeon within the recreational fishery until new regulations can be developed that will limit exploitation to sustainable rates based on monitoring data.

Exhibits

1. Department presentation
2. Supplementary material from the Department, received October 4, 2023
3. Department memo, received September 22, 2023
4. Draft emergency statement and informative digest
5. Draft proposed regulatory language
6. Email from Leonard Butcher, received September 18, 2023
7. Email from Jacob Linard, received September 25, 2023

Motion

The Commission determines, pursuant to Section 399 of the California Fish and Game Code, that adopting these regulations is necessary for the immediate conservation, preservation, and protection of birds, mammals, fish, amphibians, or reptiles, including, but not limited to, their nests or eggs.

The Commission further determines, pursuant to Section 11346.1 of the California Government Code, that an emergency situation exists and finds the proposed regulations are necessary to address the emergency.

STAFF SUMMARY FOR OCTOBER 11-12, 2023
For background purposes only

Moved by ___________ and seconded by ___________ that the Commission adopts the emergency regulations amending sections 5.79, 5.80, 27.90 and 27.92 related to white sturgeon catch and release fishing regulations.

Recevied April 8, 2024

Date: March 14, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: Submission of Initial Statement of Reasons/Certificate of Compliance for the April 17-18, 2024 Fish and Game Commission meeting to Amend Sections 5.79, 5.80, 27.90 and 27.92, Title 14, California Code of Regulations, Re: White Sturgeon

Please find attached the Initial Statement of Reasons (for a Certificate of Compliance) to amend sections 5.79, 5.80, 27.90 and 27.92, Title 14, California Code of Regulations. The proposed changes to the White Sturgeon sport fishing regulations aim to continue the existing one fish annual bag limit, reduced size limit, per-day vessel limit, and fishing closures established by emergency regulatory action on October 13, 2023. The existing regulations are set to expire in November 2024, following two planned readoptions of the emergency regulations in April and August. It is anticipated that a standard rulemaking with long-term changes to the White Sturgeon fishery will be received by the Commission this summer. It is expected that the new long-term regulations would become effective January 2025. The proposed Certificate of Compliance action is necessary to protect the White Sturgeon population until a long-term regulation can be implemented.

If you have any questions or need additional information, please contact Jay Rowan, Chief, Fisheries Branch at fisheries@wildlife.ca.gov. The Department point of contact for this regulation should identify Statewide Sturgeon Coordinator, John Kelly. He can be reached at sturgeon@wildlife.ca.gov.

Initial Statement of Reasons for Regulatory Action
Certificate of Compliance

Amend Sections 5.79, 5.80, 27.90, and 29.72,
Title 14, California Code of Regulations
Re: White Sturgeon Fishing

I. Date of Initial Statement of Reasons:

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing:

Date: April 18, 2024 Location: San Jose

(b) Discussion Hearing:

Date: June 20, 2024 Location: Mammoth Lakes

(c) Adoption Hearing:

Date: August 15, 2024 Location: Fortuna

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR). Commission refers to the California Fish and Game Commission unless otherwise specified. Department and CDFW both refer to the California Department of Fish and Wildlife unless otherwise specified.

The proposed changes to the White Sturgeon (*Acipenser transmontanus*) sport fishing regulations aim to continue the one fish annual bag limit, reduced size limit, per-day vessel limit, and fishing closures established by emergency regulatory action on October 13, 2023 (Office of Administrative Law file #2023-1106-01E). The existing emergency regulations are set to expire in November 2024, following planned readoptions of the emergency regulations in April and August. It is anticipated that a standard rulemaking with long-term changes to the White Sturgeon fishery will be received by the Commission in summer 2024. The proposed amendments in this current rulemaking are necessary to protect the White Sturgeon population until the long-term regulation can be implemented.

Background

White Sturgeon Sport Fishing

White Sturgeon are an anadromous species of fish that reside primarily in the San Francisco Bay Delta (SF Bay) and migrate as adults into the major rivers of the Central Valley to spawn. Most spawning occurs in the Sacramento River approximately between

Verona and Colusa (Schaffter 1997), with a lesser amount of spawning on the lower San Joaquin River (Jackson et al. 2015). Some additional spawning may occur in tributaries such as the Feather, Bear, and Yuba rivers. White Surgeon are long lived, potentially in excess of 100 years, with most reaching maturity by approximately 19 years, spawning every two to five years once mature (Chapman et al. 1996; Hildebrand et al. 2016). Successful recruitment to the adult population is uncommon, occurring approximately every six to seven years, highly correlated with above normal water years as measured by high mean daily Delta outflow (CDFW 2023; Fish 2010). The abundance of legal-sized White Sturgeon has declined considerably since the 1980s, when abundance was estimated to be approximately 175,000 fish (CDFW 2023; Danos et al. 2019). In 2015, the Department estimated abundance at about 48,000 fish (Danos et al. 2019), and the most recent estimate was about 33,000 fish (CDFW 2023).

Until the start of the emergency action on November 16, 2023, recreational anglers were permitted to keep one White Sturgeon per day, and a combined total of three per year, between 40 and 60 in. fork length (FL), meaning the measurement of the fish from the front of its head to the fork in its tail. The season was open year-round, with some limited regional and/or seasonal closures. As of November 16, 2023, the emergency action a) reduced the annual bag limit for White Sturgeon from three to one fish, b) reduced the legal-sized slot limit from 40-60" FL to 42-48" FL, c) placed a limit of two fish per day per boat, and d) closed White Sturgeon fishing in the migrating and spawning reaches of the Sacramento and San Joaquin rivers from January 1 through May 31.

Fishing pressure for White Sturgeon has remained stable at roughly 40,000 to 45,000 anglers per year since 2013 when fees were first charged for the Sturgeon Fishing Report Card (Card). Based on Card returns, the number of fish harvested by anglers has remained relatively stable. However, the number of fish caught and released has declined precipitously, indicating that fewer fish overall are being caught. According to Card data, in 2021, anglers kept 46% of landed fish (Hause et al. 2021). The majority of anglers that harvest fish keep only one per year (75%), with only about 5% of anglers that harvest (1% of Card-holders) keeping the full three-fish limit. Exploitation rate of White Sturgeon is estimated to be very high, ranging from 8 to 29.6% between 2007 and 2015 (Blackburn et al. 2019) and averaging 8.1% in the years since then (CDFW 2023). It is suggested that the highest exploitation rate that a sturgeon population can sustain is approximately 5 to 10% (Beamesderfer and Farr 1997) and that does not account for other anthropogenic sources of mortality such as habitat loss, altered hydrology, or contaminants. For comparison, Washington and Oregon use 3.8% as a target for management in areas that permit harvest.

During July and August 2022, the San Francisco Bay region experienced a major Harmful Algal Bloom (HAB) of *Heterosigma akashiwo* that resulted in significant mortality of fishes, including sturgeon. The Department recorded over 850 sturgeon carcasses, the majority legal-sized or larger and within the age range of the core spawning population (CDFW 2023). The number of carcasses observed during the HAB was 62% of the number harvested by anglers in 2022. Based on carcass studies and fish kills of other species of sturgeon, it is thought that only a small percentage of the fish killed floated long enough to be detected (Fox et al. 2020). While the absolute magnitude of the HAB’s impact on the

White Sturgeon population is unknown, it is thought to be quite significant. In addition, in July and August of 2023, a HAB of the same species was detected in San Francisco Bay and at least 15 white sturgeon carcasses were reported, though the total impacts are unknown.

The fish kill resulting from the HAB exacerbated what the Department believed to be an already unsustainable level of fishery exploitation of White Sturgeon into a crisis situation. In order to protect the surviving population of White Sturgeon and maintain a recreational fishery into the future, immediate steps were necessary to reduce angler associated harvest of adult White Sturgeon and to minimize harassment and handling on the spawning grounds so that these adults can spawn successfully and new individuals can recruit to the population. The Department recommended that all harvest of White Sturgeon within the recreational fishery be paused starting January 2024, until new regulations could be developed to limit exploitation to sustainable rates based on monitoring, which was opposed by the recreational sturgeon fishing industry. At its October 11, 2023 meeting, the Commission voted in support of an emergency action that limited harvest via reductions in the bag and legal slot limits, and institution of per-day vessel limits and seasonal and geographic closures of migrating and spawning habitat. This was intended to protect the existing population in the short term while allowing time for the Department to develop new long-term management measures for the future population.

Proposed Regulations

This proposed regulatory action seeks to continue amendments to sections 5.79, 5.80, 27.90, and 27.92, Title 14, CCR, which describe report card and tagging requirements, and seasons and bag limits for White Sturgeon sport fishing in inland and ocean waters. The proposed changes aim to continue the existing one fish annual bag limit, reduced size limit, per-day vessel limit, and fishing closures established by emergency regulatory action on October 13, 2023.

Subsection 5.79, White Sturgeon Report Card and Tagging Requirements for Inland Waters

The proposed regulations amend White Sturgeon report card and tagging requirements for inland waters in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (b): Edit text to reflect that report cards will come with only one tag rather than three. Add subsections (7) and (8) to clarify when anglers can continue to fish catch and release after harvesting a fish. Anglers will not be permitted to fish catch and release the same day they harvest a fish in order to prevent 1) take over the daily possession limit and 2) “high grading” (holding a fish in captivity while continuing to fish in the hopes of catching a larger individual).
- Subsection (c)(1): Add a requirement for anglers to report length of fish caught and released. This is necessary to provide more data availability on the nature of size to inform future management options related to age.

- Subsection (c)(2): Remove the current language that tells anglers if all lines on the card are filled, any additional sturgeon caught and released do not need to be recorded, and replace with language specifying that anglers may report additional sturgeon caught and released on the back of the card. This is necessary in order to track fishing pressure and success. It is valuable to track all fish caught by anglers and this should not be restricted simply by the size of the printed card. This type of data allows the Department to form a better understanding of the fishery as it plans long-term regulations for the fishery.

Section 5.80, White Sturgeon

The proposed regulations amend the White Sturgeon open season and daily and annual bag limit in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (a): From the west Carquinez Bridge east to the Highway 50 bridge on the Sacramento River and the Interstate 5 bridge on the San Joaquin River, the fishing season will remain open all year. Above the Highway 50 bridge on the Sacramento River and the Interstate 5 bridge on the San Joaquin River, including all tributaries of both rivers, fishing will be allowed from June 1 through December 31 and all fishing for sturgeon will be unlawful from January 1 to May 31. This is necessary to maintain recreational fishing, which has economic and cultural benefits, while preventing additional mortality of the impacted White Sturgeon population and minimizing harassment and handling of migrating and spawning individuals. White Sturgeon are known to handle catch and release fishing with minimal adverse impacts except during migration and spawning season when additional stress of catch can cause fish to abort spawning activities.
- Subsection (b), now (b) and (c): Divide this subsection so there are individual subsections for daily and annual limits. Proposed subsection (b) specifies the daily limit and provides unambiguous clarification of when catch and release angling is permitted. Proposed subsection (c) changes the annual bag limit of “three fish per year statewide” to “one fish per calendar year statewide”. This is necessary to reduce harvest of White Sturgeon in inland waters to ensure protection of the population impacted by the HAB-induced fish kill and provide protection during migration and spawning.
- Add subsection (d): Add a daily vessel maximum limit of two fish per day per vessel, regardless of how many anglers are on board. This will help reduce the daily amount of harvest associated with multi-angler vessels, both private and professional, and should contribute to less overall harvest of the adult population.
- Subsection (c), now (e): Change the minimum legal size from 40 to 42 in. fork length and the maximum size from 60 to 48 in. fork length. Reducing the slot limit to target a lower size range of adults is expected to reduce overall harvest and provide more protection of the larger, most reproductively valuable fish in the population.

- Subsections (d) through (j) will need to be re-lettered as subsections (f) through (l) to account for the splitting of subsection (b) and the addition of subsection (d) daily vessel maximum harvest.

Section 27.90, White Sturgeon

These regulations refer to areas west of the Carquinez Bridge, which fall under the jurisdiction of marine fisheries. The proposed regulations amend the White Sturgeon open season and daily and annual bag limit in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (a): West of the Carquinez Bridge, angling will be allowed all year, except as described in Section 27.95. This note has been added to explicitly draw attention the existing seasonal closure in San Francisco Bay.
- Subsection (b), now (b) and (c): Divide this subsection so there are individual subsections for daily and annual limits. Proposed subsection (b) specifies the daily limit and provides unambiguous clarification of when catch and release angling is permitted. Proposed subsection (c) changes the annual bag limit of “three fish per year statewide” to “one fish per calendar year statewide.” This is necessary to reduce harvest of White Sturgeon in marine waters to ensure protection of the population impacted by the HAB-induced fish kill and provide protection during migration and spawning.
- Add subsection (d): Add a daily vessel maximum limit of two fish per day per vessel, regardless of how many anglersl a are on board. This will help reduce the daily amount of harvest associated with multi-angler vessels, both private and professional, and should contribute to less overall harvest of the adult population.
- Subsection (c), now (e): Change the minimum legal size from 40 to 42 in. fork length and the maximum size from 60 to 48 in. fork length. Reducing the slot limit to target a lower size range of adults is expected to reduce overall harvest and provide more protection of the larger, most reproductively valuable fish in the population.
- Subsections (d) through (h) will need to be re-lettered as subsections (f) through (j) to account for the splitting of subsection (b) and the addition of subsection (d) daily vessel maximum harvest.

Subsection 27.92, White Sturgeon Report Card and Tagging Requirements for Ocean Waters

The proposed regulations amend White Sturgeon report card and tagging requirements for ocean waters in the following subsections:

- All subsections: White Sturgeon has been capitalized for consistency throughout the regulation.
- Subsection (b): Edit text to reflect that report cards will come with only one tag rather than three. Add subsections (7) and (8) to clarify when anglers can continue to fish catch and release after harvesting a fish. Anglers will not be permitted to fish catch and release the same day they harvest a fish in order to prevent 1) take over the

daily possession limit and 2) “high grading” (holding a fish in captivity while continuing to fish in the hopes of catching a larger individual).

- Subsection (c)(1): Add a requirement for anglers to report length of caught fish to provide more data availability to inform future management options.
- Subsection (c)(2): Remove the current language that tells anglers if all lines on the card are filled any additional sturgeon caught and released do not need to be recorded and replace with language specifying that anglers may report additional sturgeon caught and released on the back of the card. This is necessary in order to track fishing pressure and success. It is valuable to track all fish caught by anglers and this should not be restricted simply by the size of the printed card. This type of data allows the Department to form a better understanding of the fishery as we plan long-term regulations for the fishery.

(b) Goals and Benefits of the Regulation

These harvest restrictions will protect the remaining population while new long-term regulations are developed, providing opportunity for surviving fish to spawn unmolested.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Section 5.79

Authority cited: Sections 200, 205, 265 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 265, Fish and Game Code.

Section 5.80

Authority cited: Sections 200, 205, 265, 270, 275, 315 and 399, Fish and Game Code.
Reference: Sections 110, 200 and 205, Fish and Game Code.

(note: Sections 270 and 315 were added to the authority with this action to allow for Commission consideration for actions needed to manage the White Sturgeon fishery.)

Section 27.90

Authority cited: Sections 200, 205, 265, 275 and 399, Fish and Game Code.
Reference: Sections 110, 200, and 205, Fish and Game Code.

Section 27.92

Authority cited: Sections 200, 205, 265 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 265, Fish and Game Code.

(g) Public Discussions of Proposed Regulations Prior to Notice Publication

Wildlife Resources Committee meeting, September 19, 2023

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

No alternatives to a regulatory change were identified by or brought to the attention of Commission staff that would have the same desired effect. At the October 11, 2023 Commission meeting, the Department recommended that all harvest of White Sturgeon within the recreational fishery be paused until new regulations could be developed to limit exploitation to sustainable rates based on monitoring, which was opposed by the recreational sturgeon fishing industry. Following a discussion between Department staff and sturgeon fishing industry representatives, the Commission voted in support of an emergency action that limited harvest via reductions in the bag and legal slot limits and instituted per-day vessel limits and seasonal and geographic closures of migrating and spawning habitat.

(b) No Change Alternative

A delay in prompt action to amend the regulations for White Sturgeon puts the species at risk. Under current environmental and management conditions, the White Sturgeon population cannot handle the current rate of exploitation and is not sustainable. The fish kill resulting from the 2022 HAB exacerbated what the Department believes to be an already unsustainable level of fishery exploitation of White Sturgeon. In order to protect the surviving population of White Sturgeon and maintain a recreational fishery into the future, it is necessary to reduce angler associated harvest of adult White Sturgeon and to minimize harassment and handling on the spawning grounds so that these adults can spawn successfully, and new individuals can recruit to the population.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. A bag limit maintains the existing economic climate because the reduction is not significant enough to alter fishing behavior beyond reducing daily harvest.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission does not anticipate any impacts on the creation or elimination of jobs, the creation of new business, the elimination of existing businesses or the expansion of businesses in California. This proposed action should allow for ongoing fishing activity similar to current and historical levels which would not affect the demand for jobs or the demand for goods and services.The Commission does not anticipate any benefits to the health and welfare of California residents, or worker safety. The Commission anticipates benefits to the State's environment by sustainably managing California's sportfishing resources.

(c) Cost Impacts on a Representative Private Person or Business

The Department is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action. No change in fees, nor gear or equipment requirements are introduced for the recreational White Sturgeon fishery.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

No costs or savings to state agencies or costs/savings in federal funding to the state are anticipated. The Department's existing level of monitoring and enforcement activities is expected to be unchanged by the proposed regulation. However, the Department anticipates a continuation of the reduction in White Sturgeon Report Cards sales revenue since the emergency had been implemented. Card sales revenue losses are estimated to be about $20,000 in the 2024 license year.

(e) Nondiscretionary Costs/Savings to Local Agencies: None

(f) Programs Mandated on Local Agencies or School Districts: None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None

(h) Effect on Housing Costs: None

VII. Economic Impact Assessment

The proposed rulemaking would make the emergency White Sturgeon fishing regulations permanent. This is necessary to maintain current and future recreational fishing's economic and cultural benefits, while preventing additional mortality of the impacted White Sturgeon population and minimizing harassment of spawning individuals.

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

The Commission does not anticipate any impacts on the creation or elimination of jobs within the state because this proposed action should allow for ongoing fishing activity similar to current and historical levels which would not affect the demand for jobs.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The Commission does not anticipate any impacts on the creation of new business or the elimination of existing businesses within the state because this proposed action should allow for ongoing fishing activity similar to current and historical levels which would not affect the demand for goods and services related to White Sturgeon fishing within the state.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The Commission does not anticipate any impacts on the expansion of businesses in California because this action will not affect the demand for goods and services related to White Sturgeon fishing within the state.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

The Commission does not anticipate impacts on the health and welfare of California residents.

(e) Benefits of the Regulation to Worker Safety

The Commission does not anticipate any impacts to worker safety because the proposed regulation does not impact working conditions.

(f) Benefits of the Regulation to the State's Environment

The Commission anticipates benefits to the state's environment through this regulatory action to make near-term changes directed at reducing exploitation rate and protecting reproduction of the species until more updated management actions for the fishery are enacted that will adequately protect the remaining White Sturgeon population in the long-term. Based on fishery data, the White Sturgeon population was already overexploited under current regulations, and updated regulations were needed and are being considered.

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

White Sturgeon are an anadromous species of fish that reside primarily in the San Francisco Bay Delta (SF Bay) and migrate as adults into the major rivers of the Central Valley to spawn. Most spawning occurs in the Sacramento River approximately between Verona and Colusa (Schaffter 1997), with a lesser amount of spawning on the lower San Joaquin River (Jackson et al. 2015). Some additional spawning may occur in tributaries such as the Feather, Bear, and Yuba rivers. White Surgeon are long lived, potentially in excess of 100 years, with most reaching maturity by approximately 19 years, spawning every two to five years once mature (Chapman et al. 1996; Hildebrand et al. 2016). Successful recruitment to the adult population is uncommon, occurring approximately every six to seven years, highly correlated with above normal water years as measured by high mean daily Delta outflow (CDFW 2023; Fish 2010). The abundance of legal-sized White Sturgeon has declined considerably since the 1980s, when abundance was estimated to be approximately 175,000 fish (CDFW 2023; Danos et al. 2019). In 2015, the Department estimated abundance at about 48,000 fish (Danos et al. 2019), and the most recent estimate was about 33,000 fish (CDFW 2023).

Until the start of the emergency action on November 16, 2023, recreational anglers were permitted to keep one White Sturgeon per day, and a combined total of three per year, between 40 and 60 in. fork length (FL), meaning the measurement of the fish from the front of its head to the fork in its tail. The season was open year-round, with some limited regional and/or seasonal closures. As of November 16, 2023, the emergency action a) reduced the annual bag limit for White Sturgeon from three to one fish, b) reduced the legal-sized slot limit from 40-60" FL to 42-48" FL, c) placed a limit of two fish per day per boat, and d) closed White Sturgeon fishing in the migrating and spawning reaches of the Sacramento and San Joaquin rivers from January 1 through May 31.

Fishing pressure for White Sturgeon has remained stable at roughly 40,000 to 45,000 anglers per year since 2013 when fees were first charged for the Sturgeon Fishing Report Card (Card). Based on Card returns, the number of fish harvested by anglers has remained relatively stable. However, the number of fish caught and released has declined precipitously, indicating that fewer fish overall are being caught. According to Card data, in 2021, anglers kept 46% of landed fish (Hause et al. 2021). The majority of anglers that harvest fish keep only one a year (75%), with only about 5% of anglers that harvest (1% of Card-holders) keeping the full three-fish limit. Exploitation rate of White Sturgeon is estimated to be very high, ranging from 8 to 29.6% between 2007 and 2015 (Blackburn et al. 2019) and averaging 8.1% in the years since then (CDFW 2023). It is suggested that the highest exploitation rate that a sturgeon population can sustain is approximately 5 to 10% (Beamesderfer and Farr 1997) and that does not account for other anthropogenic sources of mortality such as habitat loss, altered hydrology, or contaminants. For comparison, Washington and Oregon use 3.8% as a target for management in areas that permit harvest.

During July and August 2022, the San Francisco Bay region experienced a major Harmful Algal Bloom (HAB) of *Heterosigma akashiwo* that resulted in significant mortality of fishes, including sturgeon. The Department recorded over 850 sturgeon carcasses, the majority legal-sized or larger and within the age range of the core spawning population (CDFW 2023). The number of carcasses observed during the HAB was 62% of the number harvested by anglers in 2022. Based on carcass studies and fish kills of other species of sturgeon, it is thought that only a small percentage of the fish killed floated long enough to be detected (Fox et al. 2020). While the absolute magnitude of the HAB's impact on the White Sturgeon population is unknown, it is thought to be quite significant. In addition, in July and August of 2023, a HAB of the same species was detected in San Francisco Bay and at least 15 white sturgeon carcasses were reported, though the total impacts are unknown.

The fish kill resulting from the HAB exacerbated what the Department believed to be an already unsustainable level of fishery exploitation of White Sturgeon into a crisis situation. In order to protect the surviving population of White Sturgeon and maintain a recreational fishery into the future, immediate steps were necessary to reduce angler associated harvest of adult White Sturgeon and to minimize harassment and handling on the spawning grounds so that these adults can spawn successfully and new individuals can recruit to the population. The Department recommended that all harvest of White Sturgeon within the recreational fishery be paused starting January 2024, until new regulations could be developed to limit exploitation to sustainable rates based on monitoring, which was opposed by the recreational sturgeon fishing industry.

At its October 11, 2023 meeting, the Commission voted in support of an emergency action that limited harvest via reductions in the bag and legal slot limits, and institution of per-day vessel limits and seasonal and geographic closures of migrating and spawning habitat. This was intended to protect the existing population in the short term while allowing time for the Department to develop new long-term management measures for the future population. The proposed subject standard rulemaking would continue the existing one fish annual bag limit, reduced size limit, per-day vessel limit, and fishing closures established by emergency regulatory action on October 13, 2023.

Benefit of the Regulations:

The Commission anticipates benefits to the state's environment through this regulatory action to make near-term the emergency action directed at reducing exploitation rate and protecting reproduction of the species is necessary until more updated management actions for the fishery are enacted that will adequately protect the remaining White Sturgeon population in the long-term. Based on fishery data, the White Sturgeon population was already overexploited under current regulations, and updated regulations were needed and are being considered.

Consistency and Compatibility with Existing Regulations:

Article IV, Section 20 of the State Constitution specifies that the Legislature may delegate to Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to regulate sport fishing in waters of the state (Fish and Game Code sections 200, 205, and 315). The Commission has reviewed its own regulations and finds that the proposed regulations are consistent with other recreational fishing regulations in Title 14, CCR, and therefore finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the California Code of Regulations and finds no other state agency regulations pertaining to temporarily prohibiting harvest of White Sturgeon due to population decline.

Proposed Regulatory Language

Sections 5.79, Title 14, CCR, is amended to read as follows:

§ 5.79. White Sturgeon Report Card and Tagging Requirements for Inland Waters(FG 683, See Section 701).

(a) Sturgeon Fishing Report Card Required. All anglers must have a valid Sturgeon Fishing Report Card in their possession while fishing for or taking W~~w~~hite S~~s~~turgeon. Cardholders must complete and return the card pursuant to regulations in this Section and in Section 1.74.

(b) Tagging and Recording Requirements for Retained Fish. A Sturgeon Fishing Report Card includes a detachable ~~tags~~tag that shall be used to tag any W~~w~~hite S~~s~~turgeon that is taken and retained in the sport fishery. Any W~~w~~hite S~~s~~turgeon possessed by any person shall be tagged.

(1) Upon taking and retaining a W~~w~~hite S~~s~~turgeon, the cardholder shall immediately record the following information:

(A) The fishing location, time of catch and length of the fish shall be recorded legibly and permanently in the appropriate spaces on the tag. The cardholder shall immediately and completely punch out the date of catch (month and day) on the sturgeon tag. ~~Tags shall be used in sequential order.~~

(B) The month, day, fishing location and length of the fish shall be recorded in the appropriate space~~s~~ on the Sturgeon Fishing Report Card ~~which corresponds to the number on the tag~~.

(2) Immediately after recording the information above, the cardholder shall remove and completely detach the tag from the card and affix it to the W~~w~~hite S~~s~~turgeon. Cardholders shall not wait until completion of fishing activity to tag any W~~w~~hite S~~s~~turgeon in possession.

(3) The tag shall be securely fastened to the fish. To affix the tag, a "zip tie", string, line or other suitable material shall be passed through the tag at the location specified on the sturgeon tag and attached to the fish.

(4) ~~Tags~~The tag shall not be removed from the report card until immediately prior to affixing to a W~~w~~hite S~~s~~turgeon. Any tag~~s~~ detached from the report card and not affixed to a W~~w~~hite S~~s~~turgeon shall be considered used and therefore invalid. No person shall possess any used or otherwise invalid sturgeon tags.

(5) Records of Prior Activity. The tag ~~All tags~~ must be accounted for at all times by entry of a record on the Sturgeon Fishing Report Card ~~corresponding to all tags that are not in the cardholder's possession~~. Any tag that was lost or destroyed shall be recorded as such on the corresponding line on the Sturgeon Fishing Report Card.

(6) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(7) After retaining and tagging a White Sturgeon, a cardholder shall not continue to fish catch and release for White Sturgeon on the same day.

(8) Cardholders that have retained and tagged a White Sturgeon are permitted to catch and release White Sturgeon starting on the day after the tag was used.

(c) Reporting Requirements for Released Fish.

(1) Whenever the cardholder catches and releases a sturgeon, the cardholder shall immediately record the month, day, location code, length, and species of sturgeon.

(2) If all lines in the "sturgeon released" field of the report card are filled, any additional sturgeon caught and released ~~need not be recorded on the card~~may be recorded on the back of the card.

(3) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(d) Sturgeon tags must be left affixed to the fish in place, including while stored at a residence or non-transient location, until the fish is processed for immediate consumption.

(e) The annual fee for the Sturgeon Fishing Report Card is specified in Section 701(c).

NOTE: Authority cited: Sections 200, 205~~ and 265~~, 265 and 399, Fish and Game Code.
Reference: Sections 200, 205 and 265, Fish and Game Code.

Proposed Regulatory Language

Section 5.80, Title 14, CCR, is amended to read as follows:

§ 5.80. White Sturgeon.

(a) Open season: ~~All year, except for closures listed under special regulations.~~

(1) All year: from the west Carquinez Bridge east to the Hwy 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River.

(2) From June 1 through December 31: above the Hwy 50 bridge on the Sacramento River and the I-5 bridge on the San Joaquin River, including all tributaries of both rivers. From January 1 through May 31: it is unlawful to take White Sturgeon.

~~(b) Daily and annual bag limit: One fish per day. Three fish per year statewide.~~

(b) Daily limit: One fish per day. After harvesting a White Sturgeon, anglers shall not continue to catch and release White Sturgeon on the same day. Anglers that have retained and tagged a fish are permitted to fish catch and release for White Sturgeon starting on the day after the tag was used.

(c) Annual bag limit: One fish per calendar year statewide.

(d) Daily vessel maximum harvest: All persons aboard a vessel may be cited for violation of a daily vessel maximum harvest limit. No more than two White Sturgeon may be harvested per day on a vessel, regardless of the number of anglers on board. Anglers must have in their possession a report card with a valid tag in order to retain a White Sturgeon. When the daily vessel maximum harvest is reached, only anglers that have not tagged a White Sturgeon that day may continue to fish catch and release for White Sturgeon.

(~~c~~e) Size limit: No fish less than ~~40~~42 inches fork length or greater than ~~60~~48 inchesfork length may be taken or possessed.

(~~d~~f) Methods of take: Only one single point, single shank, barbless hook may be used on a line when taking sturgeon. The sturgeon must voluntarily take the bait or lure inside its mouth. No sturgeon may be taken by trolling, snagging or by the use of firearms. Sturgeon may not be gaffed, nor shall any person use any type of firearm or snare to take any sturgeon. For the purposes of this section, a snare is a flexible loop made from any material that can be tightened like a noose around any part of the fish.

(~~e~~g) Removal from water. Any sturgeon greater than 68 inches fork length may not be removed from the water and shall be released immediately.

(~~f~~h) Report card required: Any person fishing for or taking sturgeon shall have in their possession a nontransferable Sturgeon Fishing Report Card issued by the department and shall adhere to all reporting and tagging requirements for sturgeon defined in Sections 1.74 and 5.79, Title 14, CCR.

(~~g~~i) Special North Coast District Sturgeon Closure (Humboldt, Del Norte, Trinity and Siskiyou cos.). It is unlawful to take any sturgeon in the North Coast District at anytime.

(~~h~~j) For regulations on take and possession of sturgeon in ocean waters as defined in Section 27.00, see Sections 27.90, 27.91, and 27.95.

(~~i~~k) Special Sierra and Valley District Sturgeon Closure from January 1 to December 31 (Shasta, Tehama, Butte and Glenn cos.).

(1) Sacramento River from Keswick Dam to the Highway 162 Bridge.

(A) It is unlawful to take any sturgeon.

(B) It is unlawful to use wire leaders.

(C) It is unlawful to use lamprey or any type of shrimp as bait.

(~~j~~l) Special Yolo Bypass Flood Control System Sturgeon Closure. It is unlawful to takeany sturgeon in the Yolo Bypass, Toe Drain Canal, and Tule Canal upstream of Lisbon Weir at any time.

NOTE: Authority cited: Sections 200, 205, 265~~ and 275~~, 270, 275, 315 and 399, Fish and Game Code.
Reference: Sections 110, 200 and 205, Fish and Game Code.

Proposed Regulatory Language

Section 27.90, Title 14, CCR, is amended to read as follows:

§ 27.90. White Sturgeon.

(a) Open season: All year except as described in Section 27.95 of these regulations.

~~(b) Daily and annual bag limit: One fish per day. Three fish per year statewide.~~

(b) Daily limit: One fish per day. After harvesting a White Sturgeon, anglers shall not continue to catch and release White Sturgeon on the same day. Anglers that have retained and tagged a fish are permitted to fish catch and release for White Sturgeon starting on the day after the tag was used.

(c) Annual bag limit: One fish per calendar year statewide.

(d) Daily vessel maximum harvest: All persons aboard a vessel may be cited for violation of a daily vessel maximum harvest limit. No more than two White Sturgeon may be harvested per day on a vessel, regardless of the number of anglers on board. Anglers must have in their possession a report card with a valid tag in order to retain a White Sturgeon. When the daily vessel maximum harvest is reached, only anglers that have not tagged a White Sturgeon that day may continue to fish catch and release for White Sturgeon.

(~~c~~e) Size limit: No fish less than ~~40~~42 inches fork length or greater than ~~60~~48 inches fork length may be taken or possessed.

(~~d~~f) Methods of take: Only one single point, single shank, barbless hook may be used on a line when taking sturgeon. The sturgeon must voluntarily take the bait or lure in its mouth. No sturgeon may be taken by trolling, snagging or by the use of firearms. Sturgeon may not be gaffed, nor shall any person use any type of firearm or snare to take any sturgeon. For the purposes of this section, a snare is a flexible loop made from any material that can be tightened like a noose around any part of the fish.

(~~e~~g) Removal from water. Any sturgeon greater than 68 inches fork length may not be removed from the water and shall be released immediately.

(~~f~~h) Report card required: Any person fishing for or taking sturgeon shall have in their possession a nontransferable Sturgeon Fishing Report Card issued by the department and shall adhere to all reporting and tagging requirements for sturgeon defined in Sections 1.74 and 27.92, Title 14, CCR.

(~~g~~i) For regulations on take and possession of sturgeon in inland waters as defined in Section 1.53, see Section 5.80 and Section 5.81.

(~~h~~j) Boat limits, as defined in Subsection 27.60(c) and Section 195, are not authorized for sturgeon fishing and shall not apply to the take, possession or retention of W~~w~~hite S~~s~~turgeon.

NOTE: Authority cited: Sections 200, ~~202,~~ 205~~ and 220~~, 265, 275, and 399, Fish and Game Code.
Reference: Sections 110, 200, and 205, ~~and 206,~~ Fish and Game Code.

Proposed Regulatory Language

Section 27.92, Title 14, CCR, is amended to read as follows:

§ 27.92. White Sturgeon Report Card and Tagging Requirements for OceanWaters (FG 683, See Section 701).

(a) Sturgeon Fishing Report Card Required. All anglers must have a valid Sturgeon Fishing Report Card in their possession while fishing for or taking W~~w~~hite S~~s~~turgeon.Cardholders must complete and return the card pursuant to regulations in this Section and in Section 1.74.

(b) Tagging and Recording Requirements for Retained Fish. A Sturgeon Fishing Report Card includes a detachable tag~~s~~ that shall be used to tag any W~~w~~hite S~~s~~turgeon thatis taken and retained in the sport fishery. Any W~~w~~hite S~~s~~turgeon possessed by any person shall be tagged.

(1) Upon taking and retaining a W~~w~~hite S~~s~~turgeon, the cardholder shall immediately record the following information:

(A) The fishing location, time of catch and length of the fish shall be recorded legibly and permanently in the appropriate spaces on the tag. The cardholder shall immediately and completely punch out the date of catch (month and day) on the sturgeon tag.~~ Tags shall be used in sequential order.~~

(B) The month, day, fishing location and length of the fish shall be recorded in the appropriate space~~s~~ on the Sturgeon Fishing Report Card~~ which corresponds to the number on the tag~~.

(2) Immediately after recording the information above, the cardholder shall remove and completely detach the tag from the card and affix it to the W~~w~~hite S~~s~~turgeon.Cardholders shall not wait until completion of fishing activity to tag any W~~w~~hite S~~s~~turgeon in possession.

(3) The tag shall be securely fastened to the fish. To affix the tag, a “zip tie”, string, line or other suitable material shall be passed through the tag at the location specified on the sturgeon tag and attached to the fish.

(4) The ~~Tags~~tag shall not be removed from the report card until immediately prior to affixing to a W~~w~~hite S~~s~~turgeon. Any tag~~s~~ detached from the report card and not affixed to a W~~w~~hite S~~s~~turgeon shall be considered used and therefore invalid. Noperson shall possess any used or otherwise invalid sturgeon tags.

(5) Records of Prior Activity. The tag~~ All tags~~ must be accounted for at all times by entry of a record on the Sturgeon Fishing Report Card ~~corresponding to all tags that are not in the cardholder’s possession~~. Any tag that was lost or destroyed shall be recorded as such on the corresponding line on the Sturgeon Fishing Report Card.

(6) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(7) After retaining and tagging a White Sturgeon, cardholders shall not continue to catch and release White Sturgeon on the same day.

(8) Cardholders that have retained and tagged a White Sturgeon are permitted to fish catch and release for White Sturgeon starting on the day after the tag was used.

(c) Reporting Requirements for Released Fish.

(1) Whenever the cardholder catches and releases a sturgeon, the cardholder shall immediately record the month, day, location code, length, and species of sturgeon.

(2) If all lines in the "sturgeon released" field of the report card are filled, any additional sturgeon caught and released ~~need not be recorded on the card~~may be recorded on the back of the card.

(3) If the sturgeon has a department reward disk attached, write the reward disk number in the space provided on the report card.

(d) Sturgeon tags must be left affixed to the fish in place, including while stored at a residence or non-transient location, until the fish is processed for immediate consumption.

(e) The annual fee for the Sturgeon Fishing Report Card is specified in Section 701, Title 14, CCR.

NOTE: Authority cited: Sections 200, 205~~ and 265~~, 265 and 399, Fish and Game Code. Reference: Sections 200, 205 and 265, Fish and Game Code.

STATE OF CALIFORNIA — DEPARTMENT OF FINANCE

DRAFT DOCUMENT

ECONOMIC AND FISCAL IMPACT STATEMENT
(REGULATIONS AND ORDERS)

STD. 399 (Rev. 10/2019)

ECONOMIC IMPACT STATEMENT

DEPARTMENT NAME	CONTACT PERSON	EMAIL ADDRESS	TELEPHONE NUMBER
Fish and Game Commission	David Thesell	fgc@fgc.ca.gov	916 902-9291
DESCRIPTIVE TITLE FROM NOTICE REGISTER OR FORM 400			NOTICE FILE NUMBER
Amend Section 5.79, Title 14, CCR, Re: White Sturgeon Fishing			Z

A. ESTIMATED PRIVATE SECTOR COST IMPACTS *Include calculations and assumptions in the rulemaking record.*

1. Check the appropriate box(es) below to indicate whether this regulation:

- [ ] a. Impacts business and/or employees
- [x] b. Impacts small businesses
- [ ] c. Impacts jobs or occupations
- [ ] d. Impacts California competitiveness
- [ ] e. Imposes reporting requirements
- [ ] f. Imposes prescriptive instead of performance
- [x] g. Impacts individuals
- [ ] h. None of the above (Explain below):

Note: no new compliance costs necessarily incurred with reduced bag limit.

If any box in Items 1 a through g is checked, complete this Economic Impact Statement.
If box in Item 1.h. is checked, complete the Fiscal Impact Statement as appropriate.

2. The Fish and Game Commission (Agency/Department) estimates that the economic impact of this regulation (which includes the fiscal impact) is:

- [x] Below $10 million
- [ ] Between $10 and $25 million
- [ ] Between $25 and $50 million
- [ ] Over $50 million *[If the economic impact is over $50 million, agencies are required to submit a Standardized Regulatory Impact Assessment as specified in Government Code Section 11346.3(c)]*

3. Enter the total number of businesses impacted: ~35 only indirect

Describe the types of businesses (Include nonprofits): Fishing boat owners, tackle stores, guides, food, fuel, and lodging.

Enter the number or percentage of total businesses impacted that are small businesses: 90 %

4. Enter the number of businesses that will be created: 0 eliminated: 0

Explain: Changes in fishing for one species will not greatly change market demand so as to induce business loss or creation.

5. Indicate the geographic extent of impacts:
- [x] Statewide
- [ ] Local or regional (List areas): Sacramento-San Joaquin Delta Sturgeon habitat

6. Enter the number of jobs created: 0 and eliminated: 0

Describe the types of jobs or occupations impacted: Fishing Guides may experience reduced demand for guided fishing trips for White Sturgeon.

7. Will the regulation affect the ability of California businesses to compete with other states by making it more costly to produce goods or services here? [ ] YES [x] NO

If YES, explain briefly:

DRAFT DOCUMENT

ECONOMIC IMPACT STATEMENT (CONTINUED)

B. ESTIMATED COSTS *Include calculations and assumptions in the rulemaking record.*

1. What are the total statewide dollar costs that businesses and individuals may incur to comply with this regulation over its lifetime? $ 0

   a. Initial costs for a small business: $0 Annual ongoing costs: $ 0 Years:

   b. Initial costs for a typical business: $0 Annual ongoing costs: $ 0 Years:

   c. Initial costs for an individual: $0 Annual ongoing costs: $ 0 Years:

   d. Describe other economic costs that may occur: No direct costs to comply with proposed regulations. Possible decline (or not) in fishing trips may affect bait and tackle shop, CPFV, and sturgeon guide revenue.

2. If multiple industries are impacted, enter the share of total costs for each industry: No new costs; possible revenue declines for Guides 50%; CPFVs 30%; bait and tackle shops 10%.

3. If the regulation imposes reporting requirements, enter the annual costs a typical business may incur to comply with these requirements. *Include the dollar costs to do programming, record keeping, reporting, and other paperwork, whether or not the paperwork must be submitted.* $N/A

4. Will this regulation directly impact housing costs? ☐ YES ☒ NO

   If YES, enter the annual dollar cost per housing unit: $

   Number of units:

5. Are there comparable Federal regulations? ☐ YES ☒ NO

   Explain the need for State regulation given the existence or absence of Federal regulations: Inland water species under Fish and Game Commission authority (Fish and Game Code (FGC) sections 200 and 205).

   Enter any additional costs to businesses and/or individuals that may be due to State - Federal differences: $ N/A

C. ESTIMATED BENEFITS *Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. Briefly summarize the benefits of the regulation, which may include among others, the health and welfare of California residents, worker safety and the State's environment: This action is intended to support the continued sustainability of White Sturgeon sport fisheries that benefit sport anglers, the health and welfare of California residents, the State's environment and businesses that support sport fishing activities.

2. Are the benefits the result of: ☐ specific statutory requirements, or ☒ goals developed by the agency based on broad statutory authority?

   Explain: Statute provides Fish & Game Commission the authority to establish sport fishing regulations (FGC sec. 200, 205).

3. What are the total statewide benefits from this regulation over its lifetime? $ Sturgeon preservation

4. Briefly describe any expansion of businesses currently doing business within the State of California that would result from this regulation: N/A

D. ALTERNATIVES TO THE REGULATION *Include calculations and assumptions in the rulemaking record. Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. List alternatives considered and describe them below. If no alternatives were considered, explain why not: No Alternatives were identified that would have the same desired regulatory effect (See ISOR).

DRAFT DOCUMENT

ECONOMIC IMPACT STATEMENT (CONTINUED)

2. Summarize the total statewide costs and benefits from this regulation and each alternative considered:

Regulation: Benefit: $ White Sturgeon Cost: $ No direct costs

Alternative 1: Benefit: $ N/A Cost: $ N/A

Alternative 2: Benefit: $ N/A Cost: $ N/A

3. Briefly discuss any quantification issues that are relevant to a comparison of estimated costs and benefits for this regulation or alternatives: Difficult-to-monetize benefit of Sturgeon preservation is at stake. Costs are the temporary reduction in White Sturgeon take to avoid long-run over-fishing costs.

4. Rulemaking law requires agencies to consider performance standards as an alternative, if a regulation mandates the use of specific technologies or equipment, or prescribes specific actions or procedures. Were performance standards considered to lower compliance costs? ☐ YES ☒ NO

Explain: Fisheries management regulations traditionally involve setting harvest quotas, seasons, bag and possession limits.

E. MAJOR REGULATIONS *Include calculations and assumptions in the rulemaking record.*

California Environmental Protection Agency (Cal/EPA) boards, offices and departments are required to submit the following (per Health and Safety Code section 57005). Otherwise, skip to E4.

1. Will the estimated costs of this regulation to California business enterprises **exceed $10 million**? ☐ YES ☐ NO

If YES, complete E2. and E3
If NO, skip to E4

2. Briefly describe each alternative, or combination of alternatives, for which a cost-effectiveness analysis was performed:

Alternative 1: ____________________

Alternative 2: ____________________

(Attach additional pages for other alternatives)

3. For the regulation, and each alternative just described, enter the estimated total cost and overall cost-effectiveness ratio:

Regulation: Total Cost $ ____________ Cost-effectiveness ratio: $ ____________

Alternative 1: Total Cost $ ____________ Cost-effectiveness ratio: $ ____________

Alternative 2: Total Cost $ ____________ Cost-effectiveness ratio: $ ____________

4. Will the regulation subject to OAL review have an estimated economic impact to business enterprises and individuals located in or doing business in California exceeding $50 million in any 12-month period between the date the major regulation is estimated to be filed with the Secretary of State through12 months after the major regulation is estimated to be fully implemented?

☐ YES ☒ NO

If YES, agencies are required to submit a Standardized Regulatory Impact Assessment (SRIA) as specified in Government Code Section 11346.3(c) and to include the SRIA in the Initial Statement of Reasons.

5. Briefly describe the following:

The increase or decrease of investment in the State: No effect on level of investment in the State.

The incentive for innovation in products, materials or processes: No effect on the incentive for innovation in products, materials, or processes.

The benefits of the regulations, including, but not limited to, benefits to the health, safety, and welfare of California residents, worker safety, and the state's environment and quality of life, among any other benefits identified by the agency: Benefits to the state's environment and quality of life, recreational angling, and the businesses that support fishing.

Economic and Fiscal Impact Statement

Certificate of Compliance

Amend Sections 5.79, 5.80, 27.90, and 29.72,
Title 14, California Code of Regulations
Re: White Sturgeon Fishing

Economic Impact Statement

The proposed rulemaking would make the emergency White Sturgeon fishing regulations permanent. This is necessary to maintain current and future recreational fishing's economic and cultural benefits, while preventing additional mortality of the impacted White Sturgeon population and minimizing harassment of spawning individuals. The proposed regulations aim to continue the existing one fish annual bag limit, reduced size limit, per-day vessel limit, and fishing closures in migrating and spawning habitat established by emergency regulatory action on October 13, 2023. The existing emergency regulations are set to expire in November 2024, following readoption of the emergency regulations in April and August. It is anticipated that a standard rulemaking with long-term changes to the White Sturgeon fishery will be received by the Commission at its April 17-18, 2024 meeting. It is expected that the new long-term regulations would become effective January 2025. The proposed amendments are necessary to protect the White Sturgeon population until the long-term regulation can be implemented.

Although the fishery has been historically open year-round, the majority of White Sturgeon catches are in winter and spring, with a notable decrease in fishing success in the summer months. During the summer months, catch rates for Striped Bass, Chinook Salmon, and other common recreational targets are higher so fishermen switch to those species. Unfortunately, the winter period also coincides with the White Sturgeon spawning migration, and fishing during this time may have a greater impact on the long-term population health.

The primary region targeted by the recreational White Sturgeon fishery is the San Francisco Estuary, including central San Francisco Bay, San Pablo Bay, Suisun Bay and the Sacramento-San Joaquin Delta; however, fishing also occurs in the Sacramento, San Joaquin and Feather rivers. White Sturgeon are successfully harvested throughout the estuary in various depths, salinities, and locations. Commercial fishing for White Sturgeon in California has been banned since 1917.

A. ESTIMATED PRIVATE SECTOR COST IMPACTS

1. Answer: b Impacts small businesses and g. Impacts individuals

No new private sector costs are necessarily incurred by a representative private person or business in reasonable compliance with the proposed regulations. No change in fees, nor gear or equipment requirements are introduced for the recreational White Sturgeon fishery. However, the proposed regulations limit harvest opportunities for individuals and may result in fewer White Sturgeon sportfishing trips. Fewer sportfishing trips would have the potential to reduce revenues for chartered boats, boat rentals, or fishing guide services, as well as for other retail businesses that serve sport fishers.

Recreational fishing for White Sturgeon is often conducted via chartered boats, with many fishing guides in San Francisco and the Bay-Delta area offering sturgeon fishing trips. Advertised rates for chartered fishing trips to catch White Sturgeon are somewhat variable by season and guide, but can range from $200 to $450 per person per day. Information from CPFVs and Sturgeon report cards provide data for estimating total number of White Sturgeon caught in the fishery. Other studies have estimated that 1,200 anglers participated in guided trips in 2018, showing that the recreational White Sturgeon fishery is a relatively small contributor to California's $2.9 billion annual recreational fishing industry[1].

Fiscal Impact Statement

A. FISCAL EFFECT ON LOCAL GOVERNMENT

Answer: 5. No fiscal impact.

The proposed amendment to Section 5.79, 5.80, 27.90, and 29.72, Title 14, CCR will not have the potential for a fiscal effect on local governments.

B. FISCAL EFFECT ON STATE GOVERNMENT

Answer: 4. Other.

The Fish and Game Commission (Commission) anticipates that the proposed certificate of compliance after the recent emergency action will not introduce new costs or savings for any state agency or program. The Department of Fish and Wildlife's (Department) existing level of monitoring and enforcement activities is expected to be unchanged. However, the Department anticipates that the continued reduced take limits may result in a continued drop in White Sturgeon Report Cards sales revenue estimated to be about $20,000 during that later part of fiscal year 2023-2024.

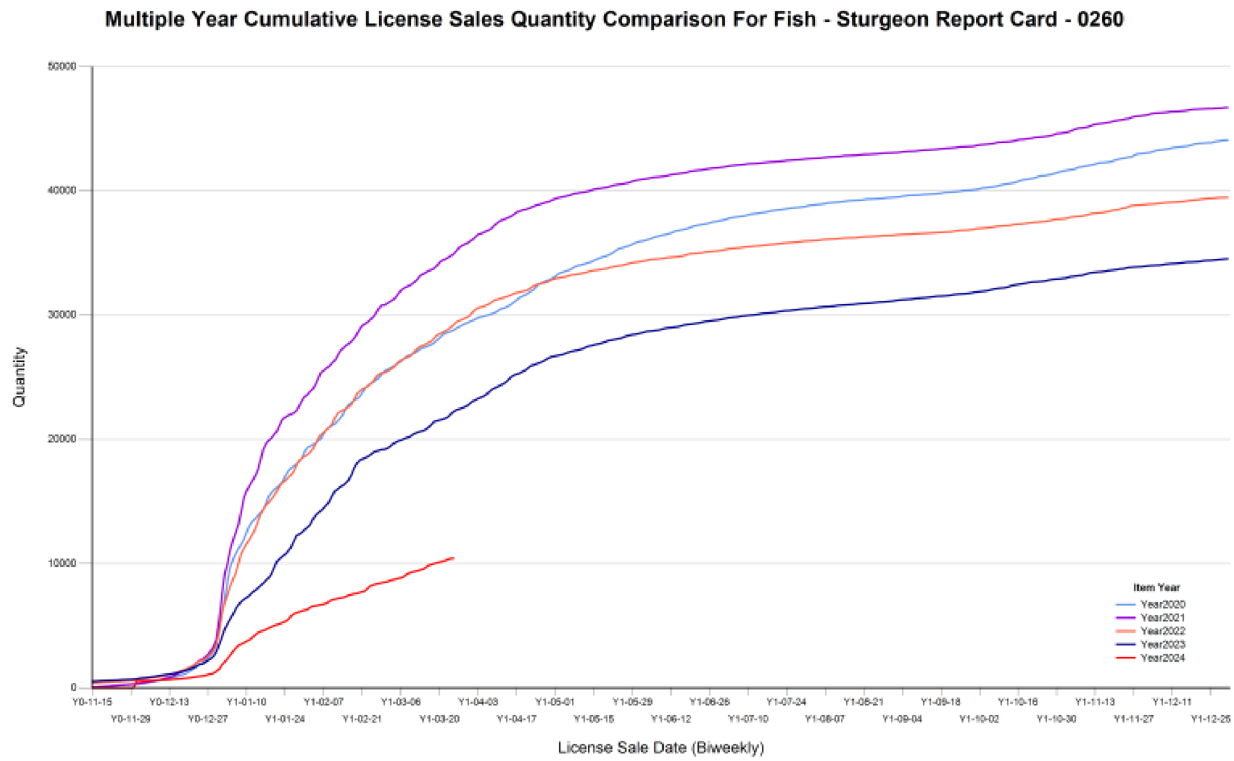
Pandemic and 365-day License Impacts

Sales of Sturgeon report cards are plotted in Figure 1, showing purchases throughout the year. Most cards are sold in the first months of the year, with a small bump in sales in the later months of the year. Sales in years 2020 and 2021 may have been elevated due to the Covid-19 pandemic surge in outdoor recreation. For the early part of this fiscal year, and through to March 2024, Sturgeon card sales have reached about 11,000, which is about 6% less than the amount sold in 2022 over the same period, and 19% less than 2019, which are more historically-typical years with no pandemic affects. While difficult to discern with certainty, the lower 2023-2024 numbers to date may be

[1] **American** Sportfishing Association, (ASA) 2019.

primarily driven by the new 365-day sportfish license and also the closures of Salmon fishing in various parts of the state. Many other states with 365-day licenses experienced absolute declines in license sales and for some sport fishers, no Salmon opportunity induces them to forego all fishing trips for any other fish. Thus, acknowledging the probable influence of those factors, 2023-24 fiscal year total sales were already projected to be less than the 40,844 average sold during a typical pre-pandemic and pre 365-day license year.

Figure 1. Cumulative license sales quantity 2020-2024 for sturgeon report card



Source: Department License and Revenue Branch sales statistics, 2024.

Proposed Regulation Impacts

A Department survey of White Sturgeon fishery participants reveals that while over 67 percent report the main reason to fish for White Sturgeon is recreation and 70 percent state that their goal is only or mostly catch and release; approximately 27 percent state their goal is to fish for food and 43 percent answer that they would not participate in a catch and release only fishery. These sentiments have been recognized in the proposed emergency action in efforts to balance resource protection with recreational fishery opportunity.

Recent spatial and temporal take patterns suggest that the proposed January to May upper spanning ground closure is the one component that may induce a small decline in report card sales during. The evidence that six percent of the seasonal catch has occurred in the area of the proposed January to May spanning ground closure, may induce those individual fishers to not purchase a Sturgeon Report Card, if that is the only time and area that they fish. Many may pursue Sturgeon in other areas at different times as well as the spawning grounds. But for some, that may be the only area and time for Sturgeon fishing, so it is reasonable to project a continued six percent drop in card sales revenue in 2024. This amounts to an estimated 2,000 fewer cards sold in 2024. The projected revenue loss to the Department for reduced White Sturgeon report card sales ($10.70 per item) is about $20,000 throughout the 2024 calendar year.

C. FISCAL EFFECT ON FEDERAL FUNDING OF STATE PROGRAMS

Answer: 3. No fiscal impact.

The proposed action will not have the potential for a fiscal effect on the federal funding of state programs.

State of California
Fish and Game Commission
Initial Statement of Reasons for Regulatory Action
Amend Subsections (b)(4), (b)(43), (b)(66), and (b)(80) of Section 7.40
Title 14, California Code of Regulations
Re: Central Valley Sport Fishing Regulations

I. Date of Initial Statement of Reasons: January 9, 2024

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing

Date: February 15, 2024 Location: Sacramento

(b) Discussion Hearing

Date: April 18, 2024 Location: San Jose

(c) Adoption Hearing

Date: May 15, 2024 Location: Webinar/Teleconference

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

Current regulations in subsections (b)(4), (b)(43), (b)(66), and (b)(80) of Section 7.40 prescribe the 2023 season dates and daily bag and possession limits for Sacramento River fall-run Chinook Salmon (*Oncorhynchus tshawytscha*; SRFC) sport fishing in the American, Feather, Mokelumne, and Sacramento rivers, respectively. Collectively, these four rivers constitute the "Central Valley fishery" for SRFC for purposes of this document (Figure 1). Each year, the Department of Fish and Wildlife (Department) recommends new Chinook Salmon daily bag and possession limits for consideration by the Fish and Game Commission (Commission) to align with up-to-date management goals, as set forth below.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

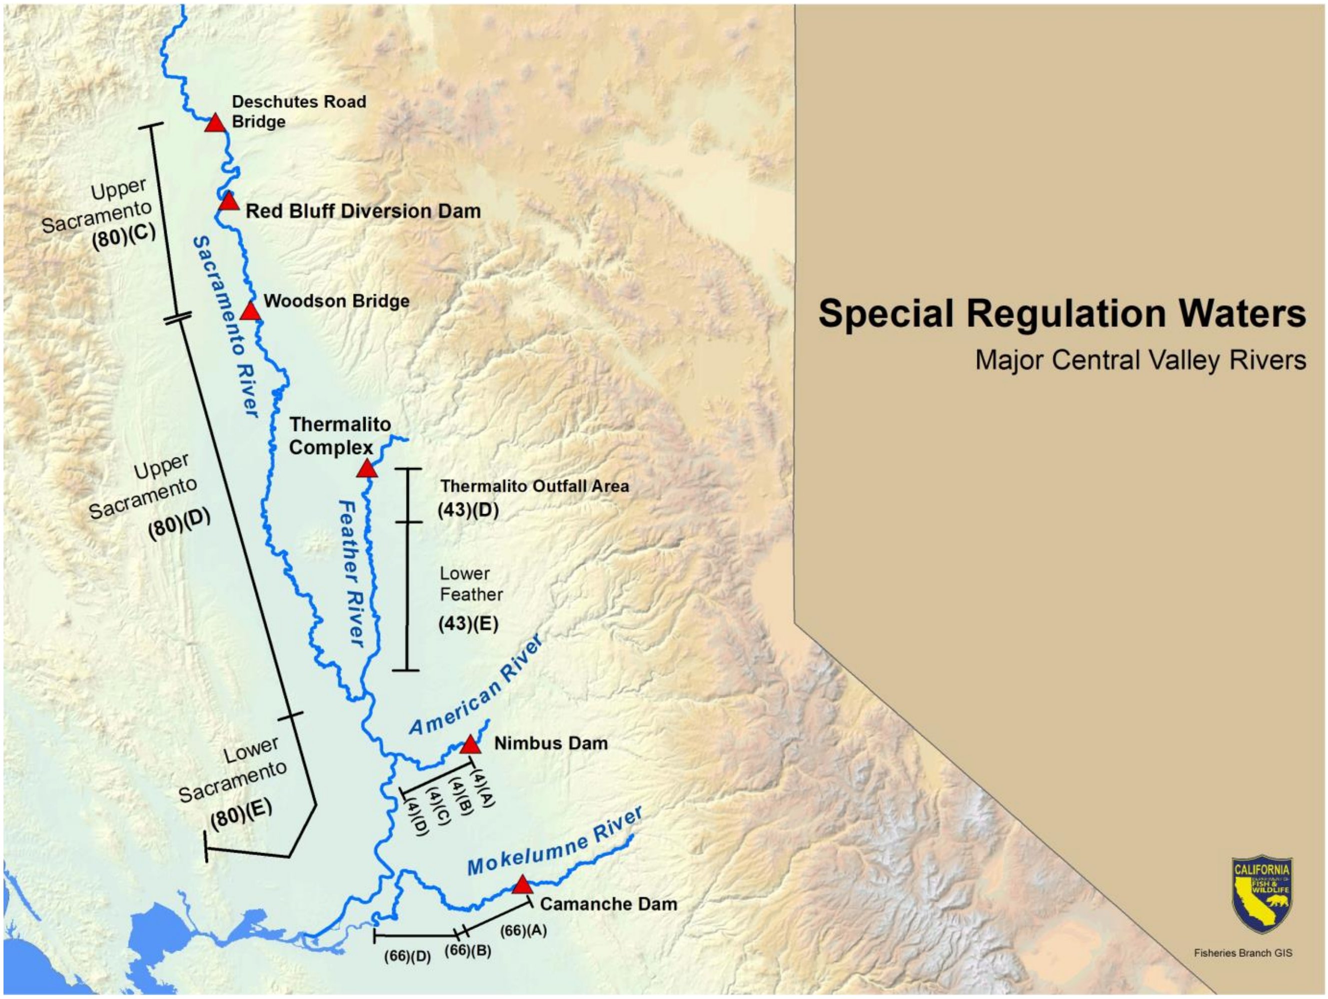


Figure 1. Map of the 2024 "Central Valley fishery" for Sacramento River fall-run Chinook Salmon, encompassing the following rivers and their respective subsections of Section 7.40: American (b)(4), Feather (b)(43), Mokelumne (b)(66), and Sacramento (b)(80).

The PFMC will develop the annual Pacific coast ocean salmon fisheries regulatory options for public review at its March 2024 meeting and will adopt its final regulatory recommendations at its April 2024 meeting based on the PFMC salmon abundance estimates and recommendations for ocean harvest for the coming season. Based on the April 2024 recommendation by PFMC, the Department will recommend specific bag and possession limit regulations for the Central Valley fishery to the Commission at its April 18, 2024 meeting. The Commission will then consider adoption of the Central Valley sport fishing regulations at its May 15, 2024, meeting.

(b) Proposed Regulations

CHINOOK SALMON BAG AND POSSESSION LIMITS

The Department recognizes the uncertainty of SRFC in-river harvest projections. Therefore, for the 2024 Central Valley fishery, the Department is presenting four regulatory options for the Commission's consideration to tailor 2024 Central Valley fishery management to target 2024 in-river fisheries harvest projections. The Commission may adopt these options for each river section independently, or in combination to meet PFMC SRFC management objectives and determine the recreational salmon fishing opportunities in the Central Valley.

- Option 1 is the most liberal of the options, and allows take of any size Chinook Salmon up to the daily bag and possession limits.
- Option 2 allows for take of a limited number of adult Chinook Salmon, with grilse Chinook Salmon (two-year old salmon) making up the remainder of the daily bag and possession limits.
- Option 3 is a more conservative option, and allows for a grilse-only Chinook Salmon fishery.
- Option 4 is the most conservative option, and prohibits the take and possession of Chinook Salmon in all anadromous areas of and tributaries to the American, Feather, Mokelumne, and Sacramento rivers.

Key to Proposed Regulatory Changes:

Because the PFMC recommendations are not known at this time, a range shown in [brackets] in the text below of bag and possession limits is indicated where it is desirable to continue Chinook Salmon fishing in the American, Feather, Mokelumne, and Sacramento rivers.

The following options are provided for Commission consideration:

Option 1 – Any Size Chinook Salmon Fishery

This option would allow anglers to take up to [0-4] Chinook Salmon of any size per day and have [0-12] Chinook Salmon in possession. This option is the Department's preferred option if the 2024 SRFC stock abundance forecast is sufficiently high to avoid the need to constrain in-river SRFC harvest.

American River, subsection 7.40(b)(4):

(B) From the United States Geological Survey (USGS) gauging station cable crossing about 300 yards downstream from the Nimbus Hatchery fish rack site to the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park.

July 16 through October 31 with a bag limit of [0-4] Chinook Salmon.

Possession limit - [0-12] Chinook Salmon.

(C) From the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park downstream to the Jibboom Street bridge.

July 16 through December 31 with a bag limit of [0-4] Chinook Salmon.

Possession limit - [0-12] Chinook Salmon.

(D) From the Jibboom Street bridge to the mouth.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon.

Possession limit - [0-12] Chinook Salmon.

Feather River, subsection 7.40(b)(43):

(D) From the unimproved boat ramp above the Thermalito Afterbay Outfall to 200 yards above the Live Oak boat ramp.

July 16 through October 31 with a daily bag limit of [0-4] Chinook Salmon.

Possession limit - [0-12] Chinook Salmon.

(E) From 200 yards above the Live Oak boat ramp to the mouth. For purposes of this subsection, the lower boundary is defined as a straight line drawn from the peninsula point on the west bank to the Verona Marine boat ramp.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon.

Possession limit – [0-12] Chinook Salmon.

Mokelumne River, subsection 7.40(b)(66):

(A) From Camanche Dam to Elliott Road.

July 16 through October 15 with a bag limit of [0-4] Chinook Salmon.

Possession limit – [0-12] Chinook Salmon.

(B) From Elliott Road to the Woodbridge Irrigation District Dam and including Lodi Lake.

From July 16 through December 31 with a bag limit of [0-4] Chinook Salmon.

Possession limit – [0-12] Chinook Salmon.

(D) From the Lower Sacramento Road bridge to the mouth. For purposes of this subsection, this river segment is defined as Mokelumne River and its tributary sloughs downstream of the Lower Sacramento Road bridge and east of Highway 160 and north of Highway 12.

From July 16 through December 16 with a bag limit of [0-4] Chinook Salmon.

Possession limit – [0-12] Chinook Salmon.

Sacramento River and tributaries below Keswick Dam, subsection 7.40(b)(80):

(C) Sacramento River from the Deschutes Road bridge to Woodson Bridge.

August 1 through October 31, and November 1 through December 31, with a bag limit of [0-4] Chinook Salmon.

Possession limit – [0-12] Chinook Salmon.

(D) Sacramento River from Woodson Bridge to the Highway 113 bridge near Knights Landing.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon.

Possession limit – [0-12] Chinook Salmon.

(E) Sacramento River from the Highway 113 bridge near Knights Landing to the Carquinez Bridge (includes Suisun Bay, Grizzly Bay and all tributary sloughs west of Highway 160).

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon.

Possession limit – [0-12] Chinook Salmon.

Option 2 – Limited Adult and Grilse Salmon Fishery

This option would allow the take of a limited number of adult Chinook Salmon, with grilse Chinook Salmon (two-year old salmon) making up the remainder of the daily bag and possession limits. This option would allow anglers to take up to [0-4] Chinook Salmon per day, with no more than [0-4] of those salmon over 27 inches total length, and have [0-12] Chinook Salmon in possession, of which no more than [0-12] salmon may be over 27 inches total length. Should a reduction in the adult component of the stock be indicated by PFMC harvest projections, the Department is recommending specifying angling opportunities on the smaller, and possibly more numerous grilse salmon to increase angling harvest opportunities. Grilse returns from the previous season are included in pre-season stock abundance forecasts, but are not included in the current season adult returns used for evaluating conservation targets for SRFC. Due to their smaller size, grilse are typically outcompeted by larger adults, and contribute significantly less to the spawning population, and so they would be available for harvest with minimal impact to juvenile recruitment for the current season. Take of adult salmon would be limited under regulation, and the subsequent juvenile production would help rebuild the depressed stock size at a time when there is the need to restrict harvest of adult salmon.

The Department recommends a grilse salmon size limit of less than or equal to 27 inches total length based on an analysis of grilse data conducted by Department staff in 2018 (refer to Section III(g) below). A 27-inch total length grilse salmon cutoff is the best balance between angling harvest opportunity of possibly abundant smaller, two-year old male salmon and preserving the limited number of females available to spawn.

American River, subsection 7.40(b)(4):

(B) From the U.S. Geological Survey gauging station cable crossing about 300 yards downstream from the Nimbus Hatchery fish rack site to the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park.

July 16 through October 31 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit - [0-12] Chinook Salmon of which no more than [0–12] fish may be over 27 inches total length.

(C) From the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park downstream to the Jibboom Street bridge

July 16 through December 31 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit - [0-12] Chinook Salmon of which no more than [0–12] fish may be over 27 inches total length.

(D) From the Jibboom Street bridge to the mouth.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit - [0-12] Chinook Salmon of which no more than [0–12] fish may be over 27 inches total length.

Feather River, subsection 7.40(b)(43):

(D) From the unimproved boat ramp above the Thermalito Afterbay Outfall to 200 yards above the Live Oak boat ramp.

July 16 through October 31 with a daily bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit - [0-12] Chinook Salmon of which no more than [0–12] fish may be over 27 inches total length.

(E) From 200 yards above Live Oak boat ramp to the mouth. For purposes of this subsection, the lower boundary is defined as a straight line drawn from the peninsula point on the west bank to the Verona Marine boat ramp.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit – [0-12] Chinook Salmon of which no more than [0-12] fish may be over 27 inches total length.

Mokelumne River, subsection 7.40(b)(66)

(A) From Camanche Dam to Elliott Road.

July 16 through October 15 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit – [0-12] Chinook Salmon of which no more than [0-12] fish may be over 27 inches total length.

(B) From Elliott Road to the Woodbridge Irrigation District Dam and including Lodi Lake.

From July 16 through December 31 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit – [0-12] Chinook Salmon of which no more than [0-12] fish may be over 27 inches total length.

(D) From the Lower Sacramento Road bridge to the mouth. For purposes of this subsection, this river segment is defined as Mokelumne River and its tributary sloughs downstream of the Lower Sacramento Road bridge and east of Highway 160 and north of Highway 12.

From July 16 through December 16 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit – [0-12] Chinook Salmon of which no more than [0-12] fish may be over 27 inches total length.

Sacramento River and tributaries below Keswick Dam, subsection 7.40(b)(80):

(C) Sacramento River from the Deschutes Road bridge to Woodson Bridge.

August 1 through October 31, and November 1 through December 31, with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit – [0-12] Chinook Salmon of which no more than [0-12] fish may be over 27 inches total length.

(D) Sacramento River from Woodson Bridge to the Highway 113 bridge near Knights Landing.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit – [0-12] Chinook Salmon of which no more than [0-12] fish may be over 27 inches total length.

(E) Sacramento River from the Highway 113 bridge near Knights Landing to the Carquinez Bridge (includes Suisun Bay, Grizzly Bay and all tributary sloughs west of Highway 160).

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit – [0-12] Chinook Salmon of which no more than [0-12] fish may be over 27 inches total length.

Option 3 – Grilse-only Salmon Fishery

This option would allow for a grilse-only salmon fishery. This option would allow anglers to take [0-4] Chinook Salmon with a maximum size of 27 inches total length and have [0-12] Chinook Salmon in possession, with a maximum size of 27 inches total length. Should a reduction in the adult component of the stock be indicated by PFMC harvest projections, the Department is recommending specifying angling opportunities on the smaller, and possibly more numerous grilse salmon to increase angling harvest opportunities. Grilse returns from the previous season are included in pre-season stock abundance forecasts, but are not included in the current season adult returns used for evaluating conservation targets for SRFC. Due to their smaller size, grilse are typically outcompeted by larger adults, and contribute significantly less to the spawning population, and so they would be available for harvest with minimal impact to juvenile recruitment for the current season. Take of adult salmon would be prohibited under regulation, and the subsequent juvenile production would help rebuild the depressed stock size at a time when there is the need to restrict harvest of adult salmon.

The Department recommends a grilse salmon size limit of less than or equal to 27 inches total length based on an analysis of grilse data conducted by Department staff in 2018 (refer to Section III(g) below). A 27-inch total length grilse salmon cutoff is the best balance between angling harvest opportunity of possibly abundant smaller, two-year old male salmon and preserving the limited number of female salmon available to spawn.

American River, subsection 7.40(b)(4):

(B) From the U.S. Geological Survey gauging station cable crossing about 300 yards downstream from the Nimbus Hatchery fish rack site to the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park.

July 16 through October 31 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

(C) From the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park downstream to the Jibboom Street bridge.

July 16 through December 31 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

(D) From the Jibboom Street bridge to the mouth.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

Feather River, subsection 7.40(b)(43):

(D) From the unimproved boat ramp above the Thermalito Afterbay Outfall to 200 yards above the Live Oak boat ramp.

July 16 through October 31 with a daily bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

(E) From 200 yards above Live Oak boat ramp to the mouth. For purposes of this subsection, the lower boundary is defined as a straight line drawn from the peninsula point on the west bank to the Verona Marine boat ramp.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

Mokelumne River, subsection 7.40(b)(66):

(A) From Camanche Dam to Elliott Road.

July 16 through October 15 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

(B) From Elliott Road to the Woodbridge Irrigation District Dam and including lake Lodi.

From July 16 through December 31 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

(D) From the Lower Sacramento Road bridge to the mouth. For purposes of this subsection, this river segment is defined as Mokelumne River and its tributary sloughs downstream of the Lower Sacramento Road bridge and east of Highway 160 and north of Highway 12.

From July 16 through December 16 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

Sacramento River and tributaries below Keswick Dam, subsection 7.40(b)(80):

(C) Sacramento River from the Deschutes Road bridge to Woodson Bridge.

August 1 through October 31, and November 1 through December 31, with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

(D) Sacramento River from Woodson Bridge to the Highway 113 bridge near Knights Landing.

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

(E) Sacramento River from the Highway 113 bridge near Knights Landing to the Carquinez Bridge (includes Suisun Bay, Grizzly Bay and all tributary sloughs west of Highway 160).

July 16 through December 16 with a bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

Option 4 – No Salmon Fishing in all Central Valley Rivers, Streams, and Tributaries

This option would close salmon fishing in the American, Feather, Mokelumne, and/or Sacramento rivers, and all associated tributaries, or specific areas/bodies of water, as specified by river reach(es) in subsection 7.40(b) to provide protection to SRFC should a reduction in the stock be indicated by PFMC abundance projections. In any year, should the PFMC recommend a complete or near complete closure to ocean recreational salmon fishing, this option will give the Department flexibility to respond to and support any federal action in the ocean. This option prohibits all methods of targeting salmon including catch and release fishing. Unless otherwise noted, this option would still allow take of other species in specific areas/bodies of water, as specified by river reach(es) in subsection 7.40(b) (See Section VII below).

American River, subsection 7.40(b)(4):

(B) From the U.S. Geological Survey gauging station cable crossing about 300 yards downstream from the Nimbus Hatchery fish rack site to the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park.

July 16 through October 31. No take or possession of Chinook Salmon.

(C) From the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park downstream to the Jibboom Street bridge.

July 16 through December 31. No take or possession of Chinook Salmon.

(D) From the Jibboom Street bridge to the mouth.

July 16 through December 16. No take or possession of Chinook Salmon.

Feather River, subsection 7.40(b)(43):

(D) From the unimproved boat ramp above the Thermalito Afterbay Outfall to 200 yards above the Live Oak boat ramp.

July 16 through October 31. No take or possession of Chinook Salmon.

(E) From 200 yards above Live Oak boat ramp to the mouth. For purposes of this subsection, the lower boundary is defined as a straight line drawn from the peninsula point on the west bank to the Verona Marine boat ramp.

July 16 through December 16. No take or possession of Chinook Salmon.

Mokelumne River, subsection 7.40(b)(66):

(A) From Camanche Dam to Elliott Road.

July 16 through October 15. No take or possession of Chinook Salmon.

(B) From Elliott Road to the Woodbridge Irrigation District Dam and including Lodi Lake.

From July 16 through December 31. No take or possession of Chinook Salmon.

(D) From the Lower Sacramento Road bridge to the mouth. For purposes of this subsection, this river segment is defined as Mokelumne River and its tributary sloughs downstream of the Lower Sacramento Road bridge and east of Highway 160 and north of Highway 12.

From July 16 through December 16. No take or possession of Chinook Salmon.

Sacramento River and tributaries below Keswick Dam, subsection 7.40(b)(80):

(C) Sacramento River from the Deschutes Road bridge to Woodson Bridge.

August 1 through October 31, and November 1 through December 31. No take or possession of Chinook Salmon.

(D) Sacramento River from Woodson Bridge to the Highway 113 bridge near Knights Landing.

July 16 through December 16. No take or possession of Chinook Salmon.

(E) Sacramento River from the Highway 113 bridge near Knights Landing to the Carquinez Bridge (includes Suisun Bay, Grizzly Bay and all tributary sloughs west of Highway 160).

July 16 through December 16. No take or possession of Chinook Salmon.

(c) Necessity of the Proposed Regulation Changes

The proposed regulations are necessary to adjust Chinook Salmon bag and possession limits, size limits, and open seasons for the American, Feather, Mokelumne, and Sacramento rivers for consistency with PFMC salmon abundance estimates and recommendations for ocean harvest for the coming season.

(d) Goals and Benefits of the Regulation

As stated in Fish and Game Code Section 1700, Conservation of Aquatic Resources: It is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant water fisheries based in California in harmony with international law, respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the state. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence, and the maintenance of a sufficient resource to support a reasonable sport use.

Adoption of science-based SRFC bag and possession limits provides for the maintenance of sufficient populations of Chinook Salmon to ensure their continued existence.

The benefits of the proposed regulations are consistency with federal fishery management goals, sustainable management of the SRFC fishery, and general health and welfare of California residents.

(e) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: Sections 200, 205, 265, 270, 315, 316.5, 399 and 2084, Fish and Game Code.

Reference: Sections 200, 205, 265, 270, 316.5 and 2084, Fish and Game Code.

(f) Specific Technology or Equipment Required by Regulatory Change

None.

(g) Identification of Reports or Documents Supporting Regulation Change

(h) Public Discussions of Proposed Regulations Prior to Notice Publication

The Department presented the proposed amendments to the SRFC bag and possession limits at the Commission's Wildlife Resources Committee meeting on September 19, 2023.

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

No alternatives were identified by or brought to the attention of Commission staff that would have the same desired regulatory effect.

(b) No Change Alternative

SRFC Adult Stocks

The no change alternative would leave existing 2023 regulations in place. The no change alternative would not allow for appropriate harvest rates, while the proposed regulations will allow the state to harmonize its bag and possession limits with NMFS' regulations.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed changes are necessary for the continued preservation of the resource, while providing inland sport fishing opportunities and thus, the prevention of adverse economic impacts.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission does not anticipate significant adverse economic impacts but acknowledges the potential for short-term negative impacts on the creation or elimination of jobs within the state. The Commission anticipates no adverse impacts on the creation of new business, the elimination of existing businesses or the expansion of businesses in California. The management of an ongoing Chinook Salmon sport fishery with annual variations in the bag and possession limits and/or the implementation of a size limit is not anticipated to significantly impact the volume of business activity.

The loss of up to 22 jobs with Option 2, 43 jobs for Option 3, and 108 jobs for Option 4 is not expected to eliminate businesses because projected reduction in fishing days is expected to be partially offset by opportunities to fish for grilse Chinook Salmon and other species for Option 2 and 3 and continued opportunities for other non-salmonid species for Option 4.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a Chinook Salmon sport fishery encourages consumption of a nutritious food. The Commission anticipates benefits to the environment by the sustainable management of Chinook Salmon resources in the Central Valley.

The Commission does not anticipate any benefits to worker safety.

Other benefits of the proposed regulations are concurrence with federal fishery management goals and promotion of businesses that rely on Central Valley sport fishing.

(c) Cost Impacts on a Representative Private Person or Business

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.

(e) Nondiscretionary Costs/Savings to Local Agencies: None.

(f) Programs Mandated on Local Agencies or School Districts: None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None.

(h) Effect on Housing Costs: None.

VII. Economic Impact Assessment

This action is expected to sustain fishery activity within the range of historically typical seasons. Lower PFMC harvest forecasts can result in a smaller bag and possession limit, (more conservative), whereas larger PFMC harvest forecasts can result in a higher bag and possession limit (more liberal), both of which can skew the average fishing activity over seasons. The potential difference in total economic impact between a typical season and the options under consideration range from $0 to -$13.2 M as shown in Table 1 below. However, the anticipated total economic impacts may vary a bit more or less than the estimates of any one single option, as the proposed options may be adopted as a combination of bag and possession limits by body of water so as to minimize adverse impacts to fishing opportunity and economic activity.

A five-year average over the 2017-2021 seasons (the 2023 salmon closure year is excluded in the baseline) for the Central Valley fishery experiences about 174,192 sport salmon angler days in which anglers spend an average of $108 per day contributing a total of $18.8 M (2022$) in direct expenditures to California businesses. This expenditure is received by area businesses that spend a share on inputs and payroll. As employees receive income, their household spending again circulates in the local economy and statewide. These multiplier effects have historically resulted in an estimated total economic impact of $26.4 M (2022$), that supports up to 216 jobs throughout the state.

The regional and statewide economic impacts factor into the effort to balance the maintenance of the recreational fishery with resource preservation, while complying with PFMC allocations. The potential economic impacts that may result from each in-river harvest projection as specified in Option 1, Option 2, Option 3, and Option 4 are evaluated in terms of each scenario's probable impact on the number of Chinook Salmon and other species' angler days, and thus angler expenditures that circulate within the area and throughout the state.

Table 1. Central Valley Fishery Projected Economic Impacts 2024

Regulation	Angler Days	Angler Expenditures	Total Econ Impact	Jobs
Option 1	174,192[1]	$ 18,812,736	$ 26,453,598	216
Option 2	156,773	$ 16,931,462	$ 23,808,238	194
Option 3	139,354	$ 15,050,189	$ 21,162,878	173
Option 4	87,096	$ 9,406,368	$ 13,226,799	108

Difference	Angler Day Loss	Expenditure Loss	Total Impact Loss	Job Loss
Option 1	0	$ -	$ -	0
Option 2	-17,419	- $1,881,274	- $ 2,645,360	(22)
Option 3	-34,838	- $3,762,547	- $ 5,290,720	(43)
Option 4	-87,096[2]	-$9,406,368	-$13,226,799	(108)

[1]The base year for angler days is the five-year average of 2017–2021 derived from Department creel survey data. The 2017-2021 time period is more historically typical with no emergency actions that reduced fishing opportunity. [2]Projected angler days with a salmon closure assumes that 50% of effort will persist as anglers shift or continue to pursue opportunities for other fish species. Sources: California Department of Fish and Wildlife, Fisheries Branch economic analysis; U.S. Fish and Wildlife Service, 2016 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation; expenditure figures are in (2022$), adjusted for inflation with Implicit Price Deflator for Personal Consumption Expenditures, Bureau of Economic Analysis.

Historical correlations between catch limits and fishery participation levels suggest that Option 1 could enable a historically typical (5-year average) number of angler days for the 2024 Chinook Salmon season on the American, Feather, Mokelumne, and Sacramento rivers. Option 2 may result in declines in angler days of 17,419 below a typical year. Option 3 may result in larger declines, or an estimated 34,838 fewer angler days. Option 4 may result in an estimated 50 percent reduction or 87,096 fewer angler days throughout the Central Valley fishery.

A share (approximately 50% for Option 4) of anglers are assumed to continue to pursue other in-river sport fish aside from Chinook Salmon, such as steelhead (*Oncorhynchus mykiss*), Striped Bass (*Morone saxatilis*), Largemouth Bass (*Micropterus salmoides*), White Sturgeon (*Acipenser transmontanus*) and catfish (*Ictalurus spp.*), that may mitigate any adverse impacts from any reductions in salmon fishing. In sum, the options presented to the Commission were conceived with the goal of enabling levels of recreational SRFC fishing in the range of historical averages, and thus should not be a source of significant adverse economic impacts.

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

The Commission does not anticipate that any of the proposed options would induce substantial impacts on the creation or elimination of jobs. For Option 1, no change in job creation or elimination is anticipated. Option 2, Option 3, and Option 4 have the potential to result in fewer angler visits, and absent substitution toward other sportfish and/or activities in the affected areas, the reduction in angler spending could reduce the support for 0-108 jobs statewide.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The Commission does not anticipate that any of the proposed options would induce substantial impacts on the creation of new business or the elimination of existing businesses, because the proposed economic impacts of the regulations are unlikely to be substantial enough to stimulate the creation of new businesses or cause the elimination of existing businesses.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The Commission does not anticipate that any of the proposed options would induce substantial impacts on the expansion of businesses currently doing business within the state. The proposed regulations are not anticipated to increase demand for services or products from the existing businesses that serve inland sport fishermen. The number of fishing trips and angler economic contributions are expected to remain within the range of historical averages.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

The Commission anticipates benefits to the health and welfare of California residents. Chinook Salmon is a nutritious food source and providing inland sport fishery opportunities encourages consumption of this nutritious food. Sport fishing also contributes to increased mental health of its practitioners, as fishing is a hobby and form of relaxation for many. Sport fishing also provides opportunities for multi-generational family activities and promotes respect for California’s environment by younger generations, the future stewards of California’s natural resources.

(e) Benefits of the Regulation to Worker Safety

The Commission does not anticipate any benefits to worker safety from the proposed regulations because inland sport fishing does not impact working conditions.

(f) Benefits of the Regulation to the State’s Environment

Under all options the Commission anticipates benefits to the environment in the sustainable management of SRFC. It is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant water fisheries based in California in harmony with international law, respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the state. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence, and the maintenance of a sufficient resource to support a reasonable sport use.

In accordance with this policy, adoption of science-based inland Chinook Salmon bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence and thus continued economic stimulus.

(g) Other Benefits of the Regulation

Other benefits of the regulation include consistency with federal fishery management goals.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations.

Current regulations in subsections (b)(4), (b)(43), (b)(66), and (b)(80) of Section 7.40 prescribe the 2023 seasons and daily bag and possession limits for Sacramento River fall-run Chinook Salmon (*Oncorhynchus tshawytscha*; SRFC) sport fishing in the American, Feather, Mokelumne, and Sacramento rivers, respectively. Collectively, these four rivers constitute the "Central Valley fishery" for SRFC for purposes of this document. In considering the current 2023 regulations the Fish and Game Commission (Commission) accepted the Department of Fish and Wildlife's (Department) recommendation for the most conservative option that prohibited fishing for Chinook Salmon in the Central Valley.

Each year, the Department recommends new Chinook Salmon bag and possession limits for consideration by the Commission to align the fishing limits with up-to-date management goals, as set forth below.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

The PFMC will develop the annual Pacific coast ocean salmon fisheries regulatory options for public review at its March 2024 meeting and will adopt its final regulatory recommendations at its April 2024 meeting based on the PFMC salmon abundance estimates and recommendations for ocean harvest for the coming season. Based on the April 2024 recommendation by PFMC, the Department will recommend specific bag and possession limit regulations to the Commission at its April 18, 2024, meeting. The Commission will then consider adoption of the Central Valley sport fishing regulations at its May 15, 2024, meeting.

Proposed Regulations

Chinook Salmon Bag and Possession Limits

The Department recognizes the uncertainty of SRFC in-river harvest projections. Therefore, for the 2024 Central Valley fishery, the Department is presenting four regulatory options for the Commission's consideration to tailor 2024 Central Valley fishery management to target 2024 in-river fisheries harvest projections. The Commission may adopt these options for each river section independently, or in combination to meet PFMC SRFC management objectives.

- American River, subsections 7.40(b)(4)(B), (C) and (D).
- Feather River, subsection 7.40(b)(43)(D) and (E).
- Mokelumne River, subsection 7.40(b)(66)(A), (B) and (D).
- Sacramento River below Keswick Dam, subsection 7.40(b)(80)(C), (D) and (E).

The following options are provided for Commission consideration:

Option 1 – Any Size Chinook Salmon Fishery

This option is the Department's preferred option if the 2024 SRFC stock abundance forecast is sufficiently high to avoid the need to constrain in-river SRFC harvest.

Bag limit of [0-4] Chinook Salmon.

Possession limit - [0-12] Chinook Salmon.

Option 2 – Limited Adult and Grilse Salmon Fishery

Bag limit of [0-4] Chinook Salmon of which no more than [0-4] fish over 27 inches total length may be retained.

Possession limit - [0-12] Chinook Salmon of which no more than [0–12] fish may be over 27 inches total length.

Option 3 – Grilse Salmon Fishery Only

Bag limit of [0-4] Chinook Salmon less than or equal to 27 inches total length.

Possession limit - [0-12] Chinook Salmon less than or equal to 27 inches total length.

Option 4– No Salmon Fishing in all Central Valley Rivers, Streams, and Tributaries

No take or possession of Chinook Salmon.

Benefits of the Proposed Regulations

The Commission anticipates benefits to the environment in the sustainable management of Central Valley Chinook Salmon resources. Other benefits of the proposed regulations are consistency with federal fishery management goals, and health and welfare of California residents.

Consistency and Compatibility with Existing Regulations

Article IV, Section 20 of the State Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to regulate sport fishing in waters of the state (Fish and Game Code sections 200, 205, 315 and 316.5). The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the California Code of Regulations and finds no other state agency regulations pertaining to Chinook Salmon sport fishing seasons, bag, and possession limits for Central Valley sport fishing.

State of California
Department of Fish and Wildlife

Memorandum

Original on file;
Received April 8, 2024

Date: April 5, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: Submittal of Addenda to the 2022 Negative Declarations Regarding Central Valley and Klamath River Basin Sport Fishing Regulations, Title 14, Section 7.40, California Code of Regulations (CCR)

In compliance with the California Environmental Quality Act, the Department of Fish and Wildlife (Department) has prepared the enclosed addenda pursuant to the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 et seq., to inform consideration by the California Fish and Game Commission (Commission) of proposed amendments to existing regulations governing Klamath River Basin (KRB) sport fishing. The Commission proposes to amend the sport fishing regulations for the “Central Valley fishery” for Sacramento River fall-run Chinook Salmon (SRFC), encompassing the following rivers and their respective subsections of Section 7.40, Title 14, CCR: American (b)(4), Feather (b)(43), Mokelumne (b)(66), and Sacramento (b)(80). The Commission also proposes to amend the KRB sport fishing regulations as set forth in Title 14, Section 7.40(b)(50) for Klamath River fall-run Chinook Salmon (KRFC).

In 2022, the Commission certified a Final Negative Declaration (ND) Regarding Central Valley Sport Fishing Regulations (2022 Central Valley Sport Fishing Regulations ND)(SCH No. 2018112036) as the lead agency under CEQA as part of the Commission’s review and adoption of the Central Valley sport fishing regulations which focused on the potential for significant environmental impacts from a potential increase or decrease of SRFC daily bag and possession limits for the American, Feather, Mokelumne, and Sacramento rivers. The 2022 Central Valley Sport Fishing Regulations ND found no significant impacts for the range of daily bag and possession limits for SRFC sport fishing under regulatory Options 1, 2, and 3. The 2024 proposed daily bag and possession limits fall within the previously analyzed range of bag and possession limits and regulatory options. Therefore, there are no new significant or substantially more severe impacts from amending the SRFC sport fishing regulations to either decrease or increase the daily bag and possession limits on the American, Feather, Mokelumne, and Sacramento rivers.

In 2022, the Commission certified a Final ND Regarding Klamath River Basin Sport Fishing Regulations (2022 Klamath River Basin Sport Fishing Regulations ND)(SCH

No. 2022040251) as the lead agency under CEQA as part of the Commission's review and adoption of KRB sport fishing regulations which focused on the potential for significant environmental impacts from a potential increase or decrease of KRFC daily bag and possession limits for the Klamath and Trinity rivers. The 2022 Klamath River Basin Sport Fishing Regulations ND found no significant impacts for the KRB quota range and range of daily bag and possession limits for KRFC sport fishing. The 2024 proposed KRB quota, and daily bag and possession limit ranges fall within the previously analyzed ranges for the KRB quota and proposed bag and possession limits for KRFC stocks. Therefore, there are no new significant or substantially more severe impacts from amending the KRB sport fishing regulations to either decrease or increase the KRFC daily bag and possession limits on the Klamath and Trinity rivers.

If you have any questions regarding the enclosed documents, please contact Karen Mitchell, Senior Environmental Scientist, at (916) 205-0250.

ANALYSIS OF THE 2024

CENTRAL VALLEY SPORT FISHING REGULATIONS

ADDENDUM

to the 2022 NEGATIVE DECLARATION
REGARDING CENTRAL VALLEY
SPORT FISHING REGULATIONS

prepared by the

STATE OF CALIFORNIA
NATURAL RESOURCES AGENCY
CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

on behalf of

CALIFORNIA FISH AND GAME COMMISSION

as

LEAD AGENCY UNDER THE
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

for the

REGULARY NOTICED RULEMAKING ACTION TO AMEND
SECTION 7.40 TITLE 14,
CALIFORNIA CODE OF REGULATIONS
2024 FISHING SEASON

(OAL Notice File No. 2024-0223-01)

INTRODUCTION

The California Department of Fish and Wildlife (CDFW) has prepared this addendum pursuant to the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 *et seq*., to inform consideration by the California Fish and Game Commission (Commission) of proposed amendments to existing regulations governing Central Valley sport fishing. Annually, CDFW recommends Central Valley sport fishing regulations to the Commission. The Commission then makes the final determination on what amendments to the regulations should be implemented and is the lead agency for the purposes of CEQA. Under Fish and Game Code (F&G Code) Section 200, the Commission has the authority to regulate the taking or possession of fish for the purpose of sport fishing.

Current regulations in subsections (b)(4), (b)(43), (b)(66), and (b)(80) of Section 7.40 prescribe the 2023 season dates and daily bag and possession limits for Sacramento River fall-run Chinook Salmon (*Oncorhynchus tshawytscha*; SRFC) sport fishing in the American, Feather, Mokelumne, and Sacramento rivers, respectively. Collectively, these four rivers constitute the “Central Valley fishery” for SRFC for purposes of this document (Figure 1). Each year, CDFW recommends new SRFC daily bag and possession limits for consideration by the Commission to align with up-to-date management goals, as set forth below.

The Commission established daily bag and possession limits for SRFC on the American, Feather, Mokelumne, and Sacramento rivers in 2022 with the certification of a Final Negative Declaration under CEQA (2022 Central Valley Sport Fishing Regulations Negative Declaration (ND))(SCH No. 2022040250). The 2022 Central Valley Sport Fishing Regulations ND provides relevant and important informational value as the Commission, as the CEQA lead agency, considers proposed amendments to the existing regulations for the 2024 SRFC sport fishing season in California. This addendum documents the Commission’s consideration of related environmental effects.

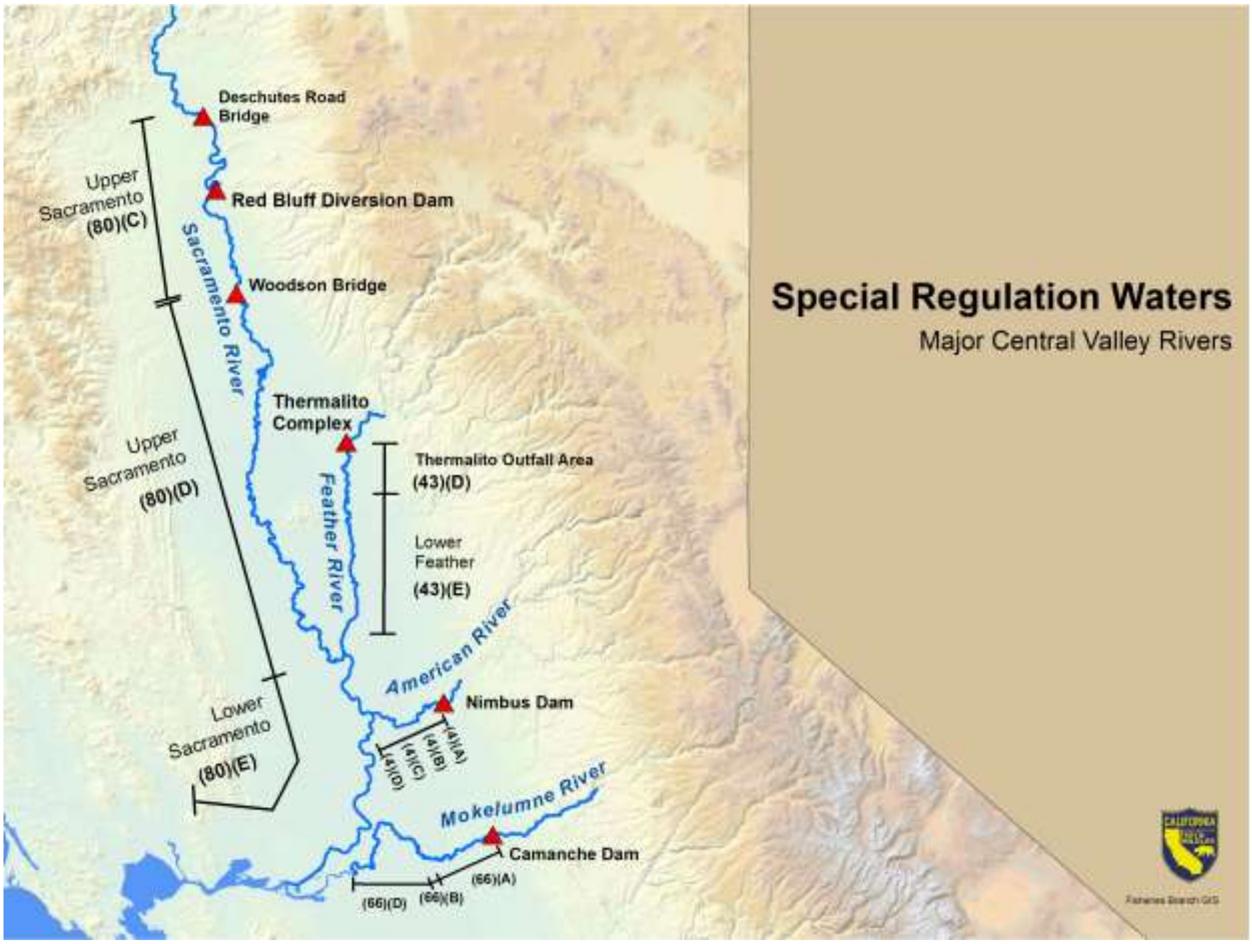

Figure 1. Map of the 2024 "Central Valley fishery" for Sacramento River fall-run Chinook Salmon, encompassing the following rivers and their respective subsections of Section 7.40: American (b)(4), Feather (b)(43), Mokelumne (b)(66), and Sacramento (b)(80).

EARLIER PROJECT APPROVAL

CEQA review of the proposed project was conducted in accordance with the Commission's certified regulatory program approved by the Secretary for the California Natural Resources Agency pursuant to Public Resources Code Section 21080.5 (See generally CCR, Title 14, Sections 781.5 and 15251(b)). CEQA requires all public agencies in the state to evaluate the environmental impacts of discretionary projects they propose to carry out or approve, including promulgating regulations, which may have a potential to significantly affect the environment.

In 2022, the Commission certified a Final ND Regarding Central Valley Sport Fishing Regulations (2022 Central Valley Sport Fishing Regulations ND)(SCH No. 2022040250) as the lead agency under CEQA as part of the Commission's review and adoption of the Central Valley sport fishing regulations which focused on the potential for significant environmental impacts from a potential decrease or increase of SRFC daily bag and possession limits for the American, Feather, Mokelumne, and Sacramento rivers. The

Commission considered the proposed project potential increase of daily bag and possession limits under three regulatory options (i.e., Options 1, 2, and 3 described below). The Commission, as the CEQA lead agency, certified the 2022 ND and determined adoption of the regulations as proposed under Options 1, 2, and 3 or a combination thereof would not result in any new significant or substantially more severe environmental effects. The Commission adopted Option 1 (take and possession of any size Chinook Salmon up to the daily bag and possision limits), with a daily bag limit of two SRFC and a possession limit of four SRFC. This resulted in maintaining the same daily bag and possession limits as the 2021 SRFC sport fishing season.

PROPOSED 2024 CHINOOK SALMON BAG AND POSSESSION LIMITS

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service.

The PFMC developed the annual Pacific coast ocean salmon fisheries regulatory options for public review at its March 2024 meeting and will adopt its final regulatory recommendations at its April 2024 meeting based on the PFMC salmon abundance estimates and recommendations for ocean harvest for the coming season. Based on the April 2024 recommendation by PFMC, CDFW will recommend specific bag and possession limit regulations for the Central Valley fishery to the Commission at its April 18, 2024 meeting. The Commission will then consider adoption of the Central Valley sport fishing regulations at its May 15, 2024, meeting.

CDFW is presenting four regulatory options for the Commission’s consideration to tailor 2024 Central Valley fishery management to target 2024 in-river fisheries harvest projections. The Commission may adopt these options for each river section independently, or in combination to meet SRFC management objectives and determine the recreational salmon fishing opportunities in the Central Valley. Because the PFMC recommendations are not known at this time, a range shown in [brackets] in the text below of bag and possession limits is indicated where it is desirable to continue Chinook Salmon fishing in the American, Feather, Mokelumne, and Sarcamento rivers.

1. Option 1 is the most liberal of the options, and allows take of up to [0-4] Chinook Salmon of any size per day and have [0-12] Chinook Salmon in possession.

2. Option 2 allows for take of up to [0-4] Chinook Salmon per day, with no more than [0-4] of those salmon over 27 inches total length, and have [0-12] Chinook Salmon in

possession, of which no more than [0-12] salmon may be over 27 inches total length.

3. Option 3 is a more conservative option, and allows anglers to take up to [0-4] Chinook Salmon with a maximum size of 27 inches total length and have [0-12] Chinook Salmon in possession, with a maximum size of 27 inches total length.

4. Option 4 is the most conservative option, and prohibits the take and possession of Chinook Salmon in all anadromous areas of and tributaries to the American, Feather, Mokelumne, and Sacramento rivers.

The 2022 Central Valley Sport Fishing Regulations ND found no significant impacts for the range of daily bag and possession limits for SRFC sport fishing under regulatory Options 1, 2, and 3. The 2024 proposed daily bag and possession limits fall within the previously analyzed range of bag and possession limits and regulatory options. Therefore, there are no new significant or substantially more severe impacts from amending the SRFC sport fishing regulations to either reduce or increase the daily bag and possession limits on the American, Feather, Mokelumne, and Sacramento rivers.

NO SUBSEQUENT ENVIRONMENTAL DOCUMENT IS REQUIRED

In general, CEQA applies whenever a public agency proposes to carry out or approve a discretionary project. (Public Resources Code Section 21080(a)). CEQA provides that, where a public agency proposes to modify a previously approved project for which a Final Environmental Document was prepared and certified:

> "An addendum to an adopted negative declaration may be prepared if only minor technical changes or additions are necessary or none of the conditions described in Section 15162 calling for the preparation of a subsequent EIR or negative declaration have occurred." (CCR, Title 14, Section 15164(b))

- A Subsequent Environment Document (Section 15162) when there is substantial evidence that:
  - Substantial changes are proposed in the project, which will require major revisions to the previous environmental impact report (EIR) or environmental document (ED).
  - Substantial changes occur with respect to the circumstances under which the project is being undertaken, which will require major revisions to the previous EIR or environmental documentation.
  - New information, which was not known and could not have been known at the time the previous EIR or ED was certified as complete, becomes available.
- A Supplement to an Environment Document (Section 15163) when:
  - A subsequent ED is not required.
  - Only minor changes to the project are described.

- Only that information to make the ED adequate is provided.
- An Addendum to the Certified ED (Section 15164) is proper when**:**
  - The changes or additions presented in this project are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent ED have occurred.
  - The Commission may properly prepare and may rely on an addendum in accordance with Section 15164 to fulfill its obligations under CEQA.

NO ADDITIONAL IMPACTS UNDER CEQA

The Commission has determined that amending the current SRFC sport fishing regulations based on PFMC salmon abundance estimates will not result in any new or significant or substantially more severe environmental impacts than previously analyzed and disclosed in the 2022 Central Valley Sport Fishing Regulations ND for this project.

This project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory. There are no impacts to the habitat of fish and wildlife species.

This approval action adjusts the previous year daily bag and possession limits based on more current salmon abundance estimates. No other aspect of the project is changed. No new significant or substantially more severe impacts under CEQA will occur due to this change.

AMENDMENT OF THE CENTRAL VALLEY SPORT FISHING REGULATIONS

In conclusion, the Commission finds that amending the SRFC sport fishing regulations in CCR, Title 14, Section 7.40, will not result in any new significant or substantially more severe environmental effects than previously analyzed and disclosed in the 2022 Central Valley Sport Fishing Regulations ND. The Commission also finds that subsequent or supplemental review beyond this Addendum is not warranted pursuant to the CCR, Title 14, Section 15164, in connection with this proposed action.

Melissa Miller-Henson, Executive Director Date

California Fish and Game Commission

State of California
Fish and Game Commission
Initial Statement of Reasons for Regulatory Action

Amend Subsection (b)(50) of Section 7.40
Title 14, California Code of Regulations
Re: Klamath River Basin Sport Fishing 2024

I. Date of Initial Statement of Reasons: January 15, 2024

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing

Date: February 15, 2024 Location: Sacramento

(b) Discussion Hearing

Date: April 18, 2024 Location: San Jose

(c) Adoption Hearing

Date: May 15, 2024 Location: Teleconference

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations.

The Klamath River Basin, which consists of the Klamath River and Trinity River systems, is managed for fall-run Chinook Salmon (*Oncorhynchus tshawytscha*) through a cooperative system of state, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean sport, ocean commercial, river sport, and tribal fisheries.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of sport and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon sport (inside three miles) and the Klamath River Basin (in-river) sport fisheries which are consistent with federal fishery management goals.

Tribal entities within the Klamath River Basin maintain fishing rights for ceremonial, subsistence, and commercial fisheries that are managed consistent with federal fishery management goals. Tribal fishing regulations are promulgated by individual tribal governments.

Klamath River Fall-Run Chinook Salmon
Adult Klamath River fall-run Chinook Salmon (KRFC) harvest allocations and natural-area spawning escapement goals are established by PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

PFMC Overfishing Review
KRFC stocks have been designated as “overfished” by PFMC. This designation is the result of not meeting conservation objectives for these stocks. Management objectives and criteria for KRFC are defined in the PFMC Salmon Fishery Management Plan (FMP). The threshold for overfished status of KRFC is a three-year geometric mean less than or equal to 30,525 natural area adult spawners. This overfished-threshold was met for KRFC during the 2015-2017 period. The 30,525 KRFC natural area adult spawners is considered the minimum stock size threshold, per the FMP. The KRFC adult natural area spawning escapement for 2022 was 22,051 natural area adult spawners, which is below the one-year conservation threshold of 40,700 natural area adult spawners. The most recent three-year geometric mean of 25,857 is still less than the required 40,700 natural area adult spawners conservation threshold, therefore the KRFC are still considered as an “overfished” stock.

Accordingly, the FMP outlines a process for preparing a “rebuilding plan” that includes assessment of the factors that led to the decline of the stock, including fishing, environmental factors, model errors, etc. The rebuilding plan includes recommendations to address conservation of KRFC, with the goal of achieving rebuilt status. Rebuilt status requires meeting a three-year geometric mean of 40,700 adult natural area KRFC spawner escapement. The plan developed by representatives of National Marine Fisheries Service (NMFS), PFMC, U.S. Fish and Wildlife Service, the Department, and tribal entities, was submitted to PFMC in February 2019, adopted by PFMC in June 2019, and submitted to NMFS in August 2019. Forthcoming recommendations from the rebuilding plan may alter how KRFC are managed in the future, including changing the in-river allocation number, and/or allocating less than the normal target number.

Klamath River Spring-Run Chinook Salmon
The Klamath River Basin also supports Klamath River spring-run Chinook Salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases. Presently, KRSC stocks are not managed or allocated by PFMC. This in-river sport fishery is managed by general basin seasons, daily bag limit, and possession limit regulations. KRSC harvest is monitored on the Klamath River below the Highway 96 bridge at Weitchpec to the mouth of the Klamath River by creel survey. The upper Trinity River, upstream of Junction City, is monitored using tag returns from anglers. When needed, KRSC regulations are amended in a separate rulemaking.

KRFC Allocation Management
The PFMC allocation for the Klamath River Basin sport harvest is normally a minimum of 15 percent of the non-tribal PFMC harvest allocation of KRFC. Preseason stock projections of 2024 adult KRFC abundance will not be available from PFMC until March 2024. The 2024 basin allocation will be recommended by PFMC in April 2024. That allocation will inform the

quota that the Department proposes to the Commission for adoption as a quota for the in-river sport harvest at the Commission's May 2024 teleconference meeting.

The Commission may adopt a KRFC in-river sport harvest quota that is different than the quota proposed by the Department or the PFMC 2024 allocation for that fishery. Commission modifications need to meet biological and fishery allocation goals specified in law or established in the FMP.

The annual KRFC in-river sport harvest quota is specified in subsection 7.40(b)(50)(D)1. The quota is split among four geographic areas with a subquota for each area, expressed as a percentage of the total in-river quota, specified in subsection 7.40(b)(50)(D)2. For angler convenience, the subquotas, expressed as the number of fish, are listed for the affected river segments in subsection 7.40(b)(50)(E).

The in-river sport subquota percentages are shown in Figure 1, and are as follows:

1. Main stem Klamath River from 3,500 feet downstream of Iron Gate Dam to the Highway 96 bridge at Weitchpec -- 17 percent of the in-river sport quota;

2. Main stem Klamath River downstream of the Highway 96 bridge at Weitchpec to the mouth of the Pacific Ocean -- 50 percent of the in-river sport quota;

The spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) closes to all fishing after 15 percent of the total Klamath River Basin quota has been taken downstream of the Highway 101 bridge.

3. Main stem Trinity River downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat -- 16.5 percent of the in-river sport quota; and

4. Main stem Trinity River downstream of the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River -- 16.5 percent of the in-river sport fishery quota.

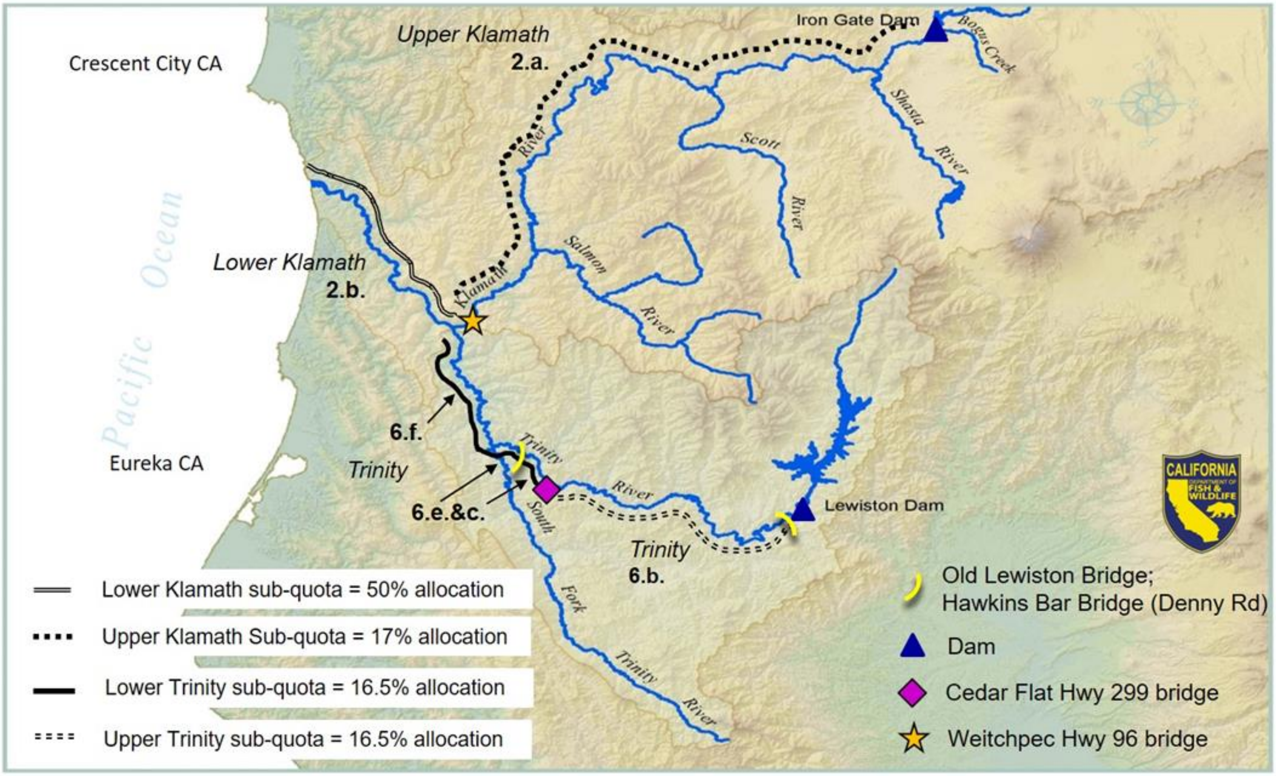

Figure 1. Map of the Klamath River Basin, showing the subquotas by reach of Trinity and Klamath rivers, and the associated subsections of 7.40(b)(50)(E).

These geographic areas are based upon the historical distribution of angler effort to ensure equitable harvest of adult KRFC in the Klamath River and Trinity River. The subquota system requires the Department to monitor or assess angler harvest of adult KRFC in each geographic area. All areas are monitored on a real time basis, except for the Klamath River upstream of Weitchpec and in the Trinity River. Due to funding and personnel reductions, the Department does not currently conduct real time harvest monitoring in the Klamath River upstream of the Weitchpec and in the Trinity River.

The Department has developed Harvest Predictor Models (HPM), which incorporate historic creel survey data from the Klamath River downstream of Iron Gate Dam to the confluence with the Pacific Ocean, and the Trinity River downstream of Lewiston Dam to the confluence with the Klamath River. Each HPM is driven by the positive relationship between KRFC harvested in the respective lower and upper subquota areas of the Klamath River and the Trinity River. The HPMs will be used by the Department to implement fishing closures to ensure that anglers do not exceed established subquota targets. Using this method, the upper Klamath River subquota area generally closes between 28-30 days after the lower Klamath River subquota is reached. Similarly, the upper Trinity River subquota area generally closes 45 days after the lower Klamath River subquota has been met. The Department also takes into consideration several other factors when implementing closure dates for subquota areas, including angler effort, KRFC run timing, weir counts, and ongoing recreational creel surveys performed by the Hoopa Valley Tribe in the lower Trinity River below Willow Creek.

Sport Fishery Management

The KRFC in-river sport harvest quota is divided into geographic areas, and harvest is monitored under real time subquota management. The KRSC in-river sport harvest is managed by general season, daily bag limit, and possession limit regulations.

The Department presently differentiates the two stocks by the following sport fish season in each sub-area:

Klamath River
July 1 through August 14 – General Season KRSC.

For purposes of clarity, daily bag and possession limits apply to that section of the Klamath River downstream of the Highway 96 bridge at Weitchpec to the mouth.

August 15 to December 31 **–** KRFC quota management.

Trinity River
July 1 through August 31 – General Season KRSC.

For purposes of clarity, daily bag and possession limits apply to that section of the Trinity River downstream of the Old Lewiston Bridge to the confluence with the South Fork Trinity River.

September 1 through December 31 – KRFC quota management.

The daily bag and possession limits apply to both stocks within the same sub-area and time period. Current regulations in subsections 7.40(b)(50)(E)2.a. and b. specify bag limits for KRFC stocks in the Klamath River. Current regulations in subsections 7.40(b)(50)(E)6.b., e., and f. specify bag limits for KRFC stocks in the Trinity River. Current regulations in subsection 7.40(b)(50)(C)2.b. specify KRFC possession limits.

Proposed Changes
Option 1: KRFC Adult Stocks (Sport Fishery Quota Management)
As in prior years, the Department is proposing a range for the quota and bag and possession limits for KRFC.

Quota: For public notice requirements, the Department recommends the Commission consider a quota range of 0–67,600 adult KRFC in the Klamath River Basin for the in-river sport fishery. This recommended range encompasses the historical range of the Klamath River Basin allocations and allows PFMC and Commission to make adjustments during the 2024 regulatory cycle.

Subquotas: The proposed subquotas for KRFC stocks are as follows:

1. Main stem Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec -- 17 percent of the total quota equates to [0-11,492];

2. Main stem Klamath River downstream of the Highway 96 bridge at Weitchpec to the mouth of the Pacific Ocean -- 50 percent of the total quota equates to [0-33,800];

3. Main stem Trinity River downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat -- 16.5 percent of the total quota equates to [0-11,154]; and

4. Main stem Trinity River downstream of the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River -- 16.5 percent of the total quota equates to [0-11,154].

Seasons: No changes are proposed for the Klamath River and Trinity River KRFC seasons:

- Klamath River - August 15 to December 31
- Trinity River - September 1 to December 31

Option 1 Bag and Possession Limits
Because the PFMC recommendations are not known at this time, ranges are shown in [brackets] below of bag and possession limits which encompass historical quotas. All are proposed for the 2024 KRFC fishery in the Klamath and Trinity rivers.

- Bag Limit - [0-4] Chinook Salmon – of which no more than [0-4] fish over [20-24] inches total length may be retained until the subquota is met, then 0 fish over [20-24] inches total length.
- Possession limit - [0-12] Chinook Salmon of which no more than [0–4] fish over [20-24] inches total length may be retained when the take of salmon over [20-24] inches total length is allowed.

The final KRFC bag and possession limits will align with the final federal regulations to meet biological and fishery allocation goals specified in law or established in the FMP.

As in previous years, no retention of adult KRFC is proposed once the subquota has been met.

Size Limits
KRFC are managed based on adult quotas which is the maximum number of adult fish (age three and older) that can be harvested. Last year, the Department moved away from the fixed standing cutoff size between grilse and adult Chinook Salmon of 23 inches total length to using a range between 20 to 24 inches total length as an annual option for cutoff size. This allows for annual variation in size cutoffs, as informed by previous year(s) data to manage the harvest of the adult KRFC quota more effectively. The Department is currently conducting a post season assessment of KRFC length and age data which will be used to help determine the proposed 2024 size cutoff. The 2024 proposed adult cutoff will be presented at the April Commission meeting.

Option 2: KRFC Fishery Closure
This option would close salmon fishing in the Klamath River Basin as specified by river reach(es) in subsection 7.40(b)(50) to provide protection to KRFC should a reduction in the stock be indicated by PFMC abundance projections. In any year, should the PFMC recommend a complete or near complete closure of ocean recreational salmon fishery and/or an allocation of 0 (zero) adult KRFC to the in-river fishery, this option would give the Department flexibility to respond to and support any federal action. This option prohibits all methods of targeting KRFC including catch and release fishing.

KRSC Sport Fishery
No regulatory changes are proposed in this rulemaking for the general KRSC opening and closing season dates, and bag, possession, and size limits.

Klamath River Dam Removal ISOR
At this time, the Commission is considering several proposed changes to the existing sport fishing regulations on the main stem Klamath River as part of the Klamath River Dam Removal project and contained in the *Klamath River Dam Removal Sport Fishing Updates ISOR* (OAL

Z2023-1106-05). Some of the proposed changes currently under consideration would affect Title 14 regulations contained in this ISOR specifically subsections (b)(50)(E)1. and (b)(50)(E)2. of Section 7.40. concerning the main stem Klamath River. The proposed changes to sport fishing regulations in anticipation of dam removals are anticipated to be approved by the Commission in February 2024 and in effect by mid-April, 2024. These new regulations for sport fishing for dam removal along the Klamath River would become the regulatory baseline for the proposed changes contained within this ISOR, and are planned to be updated as such for the Final Statement of Reasons.

(b) Goals and Benefits of the Regulation

It is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant water fisheries based in California in harmony with international law, respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the state. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence, and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based Klamath River Basin salmon seasons, size limits, and bag and possession limits provide for the maintenance of sufficient populations of salmon to ensure their continued existence.

The benefits of the proposed regulations are conformance with federal fishery management goals, sustainable management of Klamath River Basic fish resources, health and welfare of California residents, and promotion of businesses that rely on salmon sport fishing in the Klamath River Basin.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: Sections 200, 205, 265, 270, 315, 316.5, 399, and 2084, Fish and Game Code

Reference: Sections 200, 205, 265, 270, 316.5, and 2084, Fish and Game Code

(d) Specific Technology or Equipment Required by Regulatory Change

None.

(e) Identification of Reports or Documents Supporting Regulation Change

In-River Sport Fishing Economics Technical Report, National Oceanographic and Atmospheric Administration, National Marine Fisheries Service, September 2011. Available from: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=164441&inline

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

The Department discussed the proposed amendments to the annual Klamath River Basin regulations at the Commission's Wildlife Resources Committee meeting on September 19, 2023

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

No alternatives were identified by or brought to the attention of Commission staff concerning amendments for clarity that would have the same desired regulatory effect.

(b) No Change Alternative

The No Change Alternative for including amendments for clarity would leave the existing 2023 regulations in place. This may mean that anglers not fully understand the size limit cutoff that distinguishes a grilse salmon from an adult salmon in the Klamath River Basin.

(c) Description of Reasonable Alternatives that Would Lessen Adverse Impact on Small Business

None identified.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no significant adverse effect on the environment, and therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed regulation will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed regulations are projected to range from minor to no impact on the net revenues to local businesses servicing sport fishermen. If the 2024 KRFC quota is reduced, visitor spending may correspondingly be reduced, and in the absence of alternative visitor activities, the drop in spending could induce some business contraction. If the 2024 KRFC quota remains similar to the KRFC quotas allocated in previous years, then local economic impacts are expected to be unchanged. Neither scenario is expected to directly affect the ability of California businesses to compete with businesses in other states.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

An estimated 30-50 businesses that serve sport fishing activities are expected to be directly and/or indirectly affected depending on the final KRFC quota. The impacts range from no impact (Projection 1 under the Economic Impact Assessment (EIA), below) to small adverse impacts (Projection 3, EIA, below).

Depending on the final KRFC quota, the Commission anticipates the potential for some impact on the creation or elimination of jobs in California. The potential adverse employment impacts range from no impact to the loss of 13 jobs. Under all alternatives, due to the limited time period of this regulation's impact, the Commission anticipates no impact on the creation of new businesses, the elimination of existing businesses, or the expansion of businesses in California.

For all of the proposed scenarios, the possibility of growth of businesses to serve alternative recreational activities exists. Adverse impacts to jobs and/or businesses would be less if fishing of other species and grilse KRFC is permitted, than under a complete closure to all fishing. The impacted businesses are generally small businesses employing few individuals and, like all small businesses, are subject to failure for a variety of causes. Additionally, the long-term intent of the proposed regulatory action is to increase sustainability in fishable salmon stocks and, consequently, promote the long-term viability of these same small businesses.

(c) Cost Impacts on a Representative Private Person or Business

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State

None.

(e) Nondiscretionary Costs/Savings to Local Agencies

None.

(f) Programs Mandated on Local Agencies or School Districts

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code

None.

(h) Effect on Housing Costs

None.

VII. Economic Impact Assessment

The proposed amendments under consideration will set the 2024 Klamath River Basin salmon sport fishing regulations to conform to the PFMC KRFC allocation. The Klamath River Basin is anticipated to be open for salmon sport fishing at levels similar to the levels in the 2022 sport fishing season (no closure year); however, the possibility of marine fishery area closures still exists. Ocean closures may in turn result in PFMC recommendations for Klamath River Basin salmon sport fishery closures for the take of adult KRFC. Adverse or positive impacts to jobs and businesses will depend on the 2024 KRFC allocation ultimately adopted by the PFMC, and the specific regulations promulgated by the Commission, in conjunction with the Department.

The proposed quota of 0 to 67,600 adult KRFC in 2024 represents a range from 0 percent or no salmon fishing on adult KRFC to greater than 100 percent of the 2022 Klamath River Basin

KRFC quota. Under all scenarios, sport fishing may be allowed for other sport fish species and most likely for grilse KRFC, regardless of PFMC allocation. Thus, any adverse impacts to businesses could be less severe than under a complete closure of fishing.

The preservation of Klamath River salmon stocks is vital for the ongoing success of Klamath River Basin businesses that provide goods and services related to sportfishing. Scientifically-based KRFC allocations are necessary for the continued preservation of the resource, and therefore the prevention of adverse economic impacts.

A 2011 NMFS report (*In-River Sport Fishing Economics Technical Report*), reports that non-resident (outside the Eureka/Crescent City area) salmon or steelhead angler average expenditures are estimated to be $125.51 (2022$) per angler day (for lodging, food, gasoline, fishing gear, boat fuel, and guide fees). The projections do not distinguish between spring and fall runs, however, the report states that the in-river harvest is almost exclusively fall-run. The NMFS report also excluded the Trinity River, the largest tributary to the Klamath. Since the Trinity River is allocated 33 percent of the KRFC total quota, this share is used to expand salmon and steelhead angler effort, and thus impacts on associated businesses that support anglers.

In a normal year, the total non-resident angler contribution to the entire Klamath River Basin (including the Trinity River) is estimated to be about $1,268,757 (2022$) in direct expenditures, resulting in about $2,258,387 (2022$) in total economic output that supports an estimated 26 jobs throughout the state. This is a conservative estimate of total economic impact as it counts only non-resident angler expenditures. The total impact of non-resident angler direct expenditures on labor income, total economic output, and jobs are shown in Table 1.

Table 1. Klamath River Basin* Salmon and Steelhead Economic Impact 2022

Klamath Sportfishing	Salmon	Steelhead	Total Impact
Expenditures	$1,265,329	$3,428	$1,268,757
Labor Income	$708,036	$1,918	$709,954
Total Economic Impact	$2,252,286	$6,101	$2,258,387
Total Jobs Impact	26	0.1	26

Sources: Department Northern Region Creel 2022 surveys, *In-River Sport Fishing Economics Technical Report*, National Oceanographic and Atmospheric Administration, National Marine Fisheries Service, September 2011. * Lower Klamath and Trinity Rivers.

Local resident average expenditures per angler day are estimated to be 60 percent less (markedly reduced lodging, gasoline, and food expenditures), which yields an estimate of $50.25 per angler day. Local resident anglers comprise about 22 percent of Klamath River Basin anglers. Any decreases to expenditures by resident anglers associated with reduced fishing opportunities may be offset by increased expenditures on other locally purchased goods and services – with no net change in local economic activity. Thus, the economic impact analysis focuses on non-resident angler expenditures which represent new money whose injection serves to stimulate the local economy.

Creel surveys in the Department’s Northern Region (Del Norte, Humboldt, Lassen, Mendocino, Modoc, Shasta, Siskiyou, Tehama and Trinity counties) reveal that local resident (Eureka/Crescent City) anglers comprise about 22 percent of Klamath River Basin anglers, with a majority (78%) of anglers coming from outside the immediate locale.

Economic Impact Projections

To demonstrate the potential economic impacts that may result from a quota anywhere within the range of 0-67,600 KRFC, three adult salmon catch projections are as follows: 100 percent of the 2022 adult KRFC catch limit; 50 percent of the 2022 adult KRFC catch limit; and 0 percent of the 2022 adult KRFC catch limit.

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

Projection 1: 100 percent of the 2022 adult KRFC catch limit: The Commission does not anticipate any adverse impacts on the creation or elimination of jobs, as the quotas would not decrease effort nor curtail the number of visitors and thus probable visitor expenditures in the fisheries areas.

Projection 2: 50 percent of the 2022 adult KRFC catch limit: The Commission anticipates some impact on the creation or elimination of jobs, which may be partially offset by the potential for continued sport fishing allowed for other sportfish and grilse KRFC. A 50 percent salmon catch reduction will likely reduce visitor spending by slightly less than 50 percent, given price elasticities of demand for salmon fishing activity of less than one. As the “price” of fishing per unit catch increases, the demand for fishing trips declines by a lesser extent, particularly in the short-run. While difficult to predict, job losses associated with a 50 percent reduction in the adult KRFC catch limit are expected to be less than half of the 26 estimated total jobs supported by salmon angler visits (i.e. fewer than 13 jobs).

Projection 3: 0 percent of the 2022 adult KRFC catch limit: In the event of fisheries closures for adult KRFC in some or all Klamath River Basin areas, the Commission anticipates less than 50 percent reduction in fishery-related jobs. As mentioned above, sport fishing for other species and grilse KRFC may still be allowed, thus mitigating potential job losses. A closure on the take of all KRFC was instituted in 2017, and only steelhead could be legally harvested during the fall season. The 2017 closure resulted in nearly a 50 percent drop in angler days. However, job creation or elimination tends to lag in response to short-term changes in consumer demand. Thus, the potential impacts of a closure on the take of adult KRFC are estimated to result in the loss of less than 13 jobs due to adjustment lags, and the continued sport fishing allowed for other species and potentially for grilse KRFC.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

Projection 1: 100 percent of the 2022 adult KRFC catch limit: The Commission does not anticipate any impacts on the creation of new business or the elimination of existing businesses, as the quotas would not decrease effort nor curtail the number of visitors and thus probable visitor expenditures in the fisheries areas.

Projection 2: 50 percent of the 2022 adult KRFC catch limit: The Commission anticipates a decline in visits to the fishery areas of less than 50 percent due to the continued sport fishing allowed for other species and grilse KRFC. This may result in some decline in business activity, but the Commission does not anticipate any impacts on the creation of new businesses or the elimination of existing businesses directly related to fishing activities.

However, with less effort being expended on salmon fishing, the possibility of alternative sportfishing activities and the growth of businesses to serve those activities exists.

Projection 3: 0 percent of the 2022 adult KRFC catch limit: In the event of salmon fisheries closures for adult KRFC in some or all Klamath River Basin areas, the Commission anticipates a decline in regional spending and thus reduced revenues to the approximately 30 to 50 businesses that directly and indirectly serve sport fishing activities with unknown impacts on the creation of new business or the elimination of existing businesses. However, adverse impacts may be mitigated by the continued opportunity to harvest other sportfish and the potential for take of grilse KRFC. Additionally, the long-term intent of the proposed regulatory action is to increase sustainability in fishable salmon stocks and, consequently, promote the long-term viability of these same small businesses.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

Projection 1: 100 percent of the 2022 adult KRFC catch limit: The Commission does not anticipate any impacts on the expansion of businesses in California as the quotas would not increase effort nor increase the number of visitors and thus probable visitor expenditures in the fisheries areas.

Projection 2: 50 percent of the 2022 adult KRFC catch limit: The Commission does not anticipate any impacts on the expansion of businesses currently doing business within the State. Decreases in expenditures by resident anglers associated with reduced fishing opportunities may be offset by increased expenditures on other locally purchased goods and services – with no net change in local economic activity. For non-resident anglers, however, decreases in local expenditures associated with decreases in local fishing opportunities may result in increases in other expenditures outside the Klamath River Basin area.

Projection 3: 0 percent of the 2022 adult KRFC catch limit: In the event of salmon fisheries closures for adult KRFC in some or all Klamath River Basin areas, the Commission does not anticipate any expansion of businesses in California. Decreases in expenditures by anglers associated with reduced fishing opportunities may be partially offset by increased expenditures on other locally purchased goods and services as anglers pursue other sportfish, potentially including grilse KRFC, or the substitution of salmon fishing with other recreational activities.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

Under all projections, the Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a Klamath River Basin salmon sport fishery and other sport fisheries encourages a healthy outdoor activity and the consumption of a nutritious food. Sport fishing also contributes to increased mental health of its practitioners, as fishing is a hobby and form of relaxation for many. Sport fishing also provides opportunities for multi-generational family activities and promotes respect for California’s environment by the future stewards of California’s natural resources.

(e) Benefits of the Regulation to Worker Safety

Under all projections, the Commission does not anticipate benefits to worker safety because the proposed regulations will not impact working conditions.

(f) Benefits of the Regulation to the State's Environment

Under all projections, the Commission anticipates benefits to the environment in the sustainable management of Klamath River Basin salmonid resources. It is the policy of this State to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the State for the benefit of all the citizens of the State and to promote the development of local fisheries and distant water fisheries based in California in harmony with international law, respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence, and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based Klamath River Basin salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence.

(g) Other Benefits of the Regulation

Consistency with Federal Fishery Management Goals: California's salmon sport fishing regulations need to align with the new Federal regulations to achieve optimum yield in California. The PFMC annually reviews the status of west coast salmon populations. As part of that process, it recommends west coast adult salmon fisheries regulations aimed at meeting biological and fishery allocation goals specified in law or established in the FMP. These recommendations coordinate west coast management of sport and commercial ocean salmon fisheries off the coasts of Washington, Oregon, and California, and California inland salmon sport fisheries. These recommendations are subsequently implemented as ocean fishing regulations by the NMFS, and as salmon sport regulations for State marine and inland waters by the Commission.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations.

The Klamath River Basin, which consists of the Klamath River and Trinity River systems, is managed for fall-run Chinook Salmon (*Oncorhynchus tshawytscha*) through a cooperative system of state, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean sport, ocean commercial, river sport, and tribal fisheries.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of sport and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon sport (inside three miles) and the Klamath River Basin (in-river) sport fisheries which are consistent with federal fishery management goals.

Tribal entities within the Klamath River Basin maintain fishing rights for ceremonial, subsistence, and commercial fisheries that are managed consistent with federal fishery management goals. Tribal fishing regulations are promulgated by individual tribal governments.

Klamath River Fall-Run Chinook Salmon
Adult Klamath River fall-run Chinook Salmon (KRFC) harvest allocations and natural spawning escapement goals are established by PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

PFMC Overfishing Review
KRFC stocks have been designated as “overfished” by PFMC. This designation is the result of not meeting conservation objectives for these stocks. Management objectives and criteria for KRFC are defined in the PFMC Salmon Fishery Management Plan (FMP). The threshold for overfished status of KRFC is a three-year geometric mean less than or equal to 30,525 natural area adult spawners. This overfished-threshold was met for KRFC during the 2015-2017 period. The 30,525 KRFC natural area adult spawners is considered the minimum stock size threshold, per the FMP. The KRFC adult natural area spawning escapement for 2022 was 22,051 natural area adult spawners, which is below the one-year conservation threshold of 40,700 natural area adult spawners. The most recent three-year geometric mean of 25,857 is still less than the required 40,700 natural area adult spawners conservation threshold, therefore the KRFC are still considered as an “overfished” stock.

Accordingly, the FMP outlines a process for preparing a “rebuilding plan” that includes assessment of the factors that led to the decline of the stock, including fishing, environmental factors, model errors, etc. The rebuilding plan includes recommendations to address conservation of KRFC, with the goal of achieving rebuilt status. Rebuilt status requires meeting a three-year geometric mean of 40,700 adult natural area KRFC spawner escapement. The plan developed by representatives of National Marine Fisheries Service (NMFS), PFMC, U.S. Fish and Wildlife Service, the Department, and tribal entities, was submitted to PFMC in February 2019, adopted by PFMC in June 2019, and submitted to NMFS in August 2019. Forthcoming recommendations from the rebuilding plan may alter how KRFC are managed in the future, including changing the in-river allocation number, and/or allocating less than the normal target number.

Klamath River Spring-Run Chinook Salmon
The Klamath River Basin also supports Klamath River spring-run Chinook Salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases. Presently, KRSC stocks are not managed or allocated by PFMC. This in-river sport fishery is managed by general basin seasons, daily bag limit, and possession limit regulations. KRSC harvest is monitored on the Klamath River below the Highway 96 bridge at Weitchpec to the mouth of the Klamath River by creel survey. The upper Trinity River, upstream of Junction City, is monitored using tag returns from anglers. When needed, KRSC regulations are amended in a separate rulemaking.

KRFC Allocation Management
The PFMC allocation for the Klamath River Basin sport harvest is normally a minimum of 15 percent of the non-tribal PFMC harvest allocation of KRFC. Preseason stock projections of 2024 adult KRFC abundance will not be available from PFMC until March 2024. The 2024 basin allocation will be recommended by PFMC in April 2024. That allocation will inform the quota that the Department proposes to the Commission for adoption as a quota for the in-river sport harvest at the Commission's May 2024 teleconference meeting.

The Commission may adopt a KRFC in-river sport harvest quota that is different than the quota proposed by the Department or the PFMC 2024 allocation for that fishery. Commission modifications need to meet biological and fishery allocation goals specified in law or established in the FMP.

The annual KRFC in-river sport harvest quota is specified in subsection 7.40(b)(50)(D)1. The quota is split among four geographic areas with a subquota for each area, expressed as a percentage of the total in-river quota, specified in subsection 7.40(b)(50)(D)2. For angler convenience, the subquotas, expressed as the number of fish, are listed for the affected river segments in subsection 7.40(b)(50)(E).

The in-river sport subquota percentages are as follows:

1. Main stem Klamath River from 3,500 feet downstream of Iron Gate Dam to the Highway 96 bridge at Weitchpec -- 17 percent of the in-river sport quota;

2. Main stem Klamath River downstream of the Highway 96 bridge at Weitchpec to the mouth of the Pacific Ocean -- 50 percent of the in-river sport quota;

   The spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) closes to all fishing after 15 percent of the total Klamath River Basin quota has been taken downstream of the Highway 101 bridge.

3. Main stem Trinity River downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat -- 16.5 percent of the in-river sport quota; and

4. Main stem Trinity River downstream of the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River -- 16.5 percent of the in-river sport fishery quota.

These geographic areas are based upon the historical distribution of angler effort to ensure equitable harvest of adult KRFC in the Klamath River and Trinity River. The subquota system requires the Department to monitor or assess angler harvest of adult KRFC in each geographic area. All areas are monitored on a real time basis, except for the Klamath River upstream of Weitchpec and in the Trinity River. Due to funding and personnel reductions, the Department does not currently conduct real time harvest monitoring in the Klamath River upstream of the Weitchpec and in the Trinity River.

The Department has developed Harvest Predictor Models (HPM), which incorporate historic creel survey data from the Klamath River downstream of Iron Gate Dam to the confluence with the Pacific Ocean, and the Trinity River downstream of Lewiston Dam to the confluence with the Klamath River. Each HPM is driven by the positive relationship between KRFC harvested in the respective lower and upper subquota areas of the Klamath River and the Trinity River. The HPMs will be used by the Department to implement fishing closures to ensure that anglers do not exceed established subquota targets. Using this method, the upper Klamath River subquota area generally closes between 28-30 days after the lower Klamath River subquota is reached. Similarly, the upper Trinity River subquota area generally closes 45 days after the lower Klamath River subquota has been met. The Department also takes into consideration several other factors when implementing closure dates for subquota areas, including angler effort, KRFC run timing, weir counts, and ongoing recreational creel surveys performed by the Hoopa Valley Tribe in the lower Trinity River below Willow Creek.

Sport Fishery Management
The KRFC in-river sport harvest quota is divided into geographic areas, and harvest is monitored under real time subquota management. The KRSC in-river sport harvest is managed by general season, daily bag limit, and possession limit regulations.

The Department presently differentiates the two stocks by the following sport fish season in each sub-area:

Klamath River
July 1 through August 14 – General Season KRSC.

For purposes of clarity, daily bag and possession limits apply to that section of the Klamath River downstream of the Highway 96 bridge at Weitchpec to the mouth.

August 15 to December 31 **–** KRFC quota management.

Trinity River
July 1 through August 31 – General Season KRSC.

For purposes of clarity, daily bag and possession limits apply to that section of the Trinity River downstream of the Old Lewiston Bridge to the confluence with the South Fork Trinity River.

September 1 through December 31 – KRFC quota management.

The daily bag and possession limits apply to both stocks within the same sub-area and time period. Current regulations in subsections 7.40(b)(50)(E)2.a. and b. specify bag limits for KRFC stocks in the Klamath River. Current regulations in subsections 7.40(b)(50)(E)6.b., e., and f. specify bag limits for KRFC stocks in the Trinity River. Current regulations in subsection 7.40(b)(50)(C)2.b. specify KRFC possession limits.

Proposed Changes

Option 1: KRFC Adult Stocks (Sport Fishery Quota Management)

Quota: For public notice requirements, the Department recommends the Commission consider a quota range of 0–67,600 adult KRFC in the Klamath River Basin for the in-river sport fishery. This recommended range encompasses the historical range of the Klamath River Basin allocations and allows PFMC and Commission to make adjustments during the 2024 regulatory cycle.

Subquotas: The proposed subquotas for KRFC stocks are as follows:

1. Main stem Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec -- 17 percent of the total quota equates to [0-11,492];

2. Main stem Klamath River downstream of the Highway 96 bridge at Weitchpec to the mouth of the Pacific Ocean -- 50 percent of the total quota equates to [0-33,800];

3. Main stem Trinity River downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat -- 16.5 percent of the total quota equates to [0-11,154]; and

4. Main stem Trinity River downstream of the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River -- 16.5 percent of the total quota equates to [0-11,154].

Seasons: No changes are proposed for the Klamath River and Trinity River KRFC seasons:

- Klamath River - August 15 to December 31
- Trinity River - September 1 to December 31

Bag and Possession Limits

Because the PFMC recommendations are not known at this time, ranges are shown in [brackets] below of bag and possession limits which encompass historical quotas. All are proposed for the 2024 KRFC fishery in the Klamath and Trinity rivers.

- Bag Limit - [0-4] Chinook Salmon – of which no more than [0-4] fish over [20-24] inches total length may be retained until the subquota is met, then 0 fish over [20-24] inches total length.
- Possession limit - [0-12] Chinook Salmon of which no more than [0–4] fish over [20-24] inches total length may be retained when the take of salmon over [20-24] inches total length is allowed.

The final KRFC bag and possession limits will align with the final federal regulations to meet biological and fishery allocation goals specified in law or established in the FMP.

As in previous years, no retention of adult KRFC is proposed once the subquota has been met.

Size Limits

KRFC are managed based on adult quotas which is the maximum number of adult fish (age three and older) that can be harvested. Last year, the Department moved away from the fixed standing cutoff size between grilse and adult Chinook Salmon of 23 inches total length to using a range between 20 to 24 inches total length as an annual option for cutoff size. This allows for annual variation in size cutoffs, as informed by previous year(s) data to manage the harvest of the adult KRFC quota more effectively. The Department is currently conducting a post season assessment of KRFC length and age data which will be used to help determine the proposed 2024 size cutoff. The 2024 proposed adult cutoff will be presented at the April Commission meeting.

Option 2: KRFC Fishery Closure
This option would close salmon fishing in the Klamath River Basin as specified by river reach(es) in subsection 7.40(b)(50) to provide protection to KRFC should a reduction in the stock be indicated by PFMC abundance projections. In any year, should the PFMC recommend a complete or near complete closure of ocean recreational salmon fishery and/or an allocation of 0 (zero) adult KRFC to the in-river fishery, this option would give the Department flexibility to respond to and support any federal action. This option prohibits all methods of targeting KRFC including catch and release fishing.

Klamath River Dam Removal ISOR
At this time, the Commission is considering several proposed changes to the existing sport fishing regulations on the main stem Klamath River as part of the Klamath River Dam Removal project and contained in the *Klamath River Dam Removal Sport Fishing Updates ISOR* (OAL Z2023-1106-05). Some of the proposed changes currently under consideration would affect Title 14 regulations contained in this ISOR specifically subsections (b)(50)(E)1. and (b)(50)(E)2. of Section 7.40. concerning the main steam Klamath River. The proposed changes to sport fishing regulations in anticipation of dam removals are anticipated to be approved by the Commission in February 2024 and in effect by mid-April, 2024. These new regulations for sport fishing for dam removal along the Klamath River would become the regulatory baseline for the proposed changes contained within this ISOR, and are planned to be updated as such for the Final Statement of Reasons.

Benefit of the Regulations

The benefits of the proposed regulations are conformance with federal fishery management goals, sustainable management of Klamath River Basic fish resources, health and welfare of California residents, and promotion of businesses that rely on salmon sport fishing in the Klamath River Basin.

Consistency and Compatibility with Existing Regulations

Article IV, Section 20 of the State Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated authority to the Commission to promulgate sport fishing regulations (Fish and Game Code sections 200, 205, 315, and 316.5). The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. Commission staff has searched the California Code of Regulations and has found no other state regulations related to sport fishing in the Klamath River Basin.

Subject: **Submittal of Addenda to the 2022 Negative Declarations Regarding Central Valley and Klamath River Basin Sport Fishing Regulations, Title 14, Section 7.40, California Code of Regulations (CCR)**

In compliance with the California Environmental Quality Act, the Department of Fish and Wildlife (Department) has prepared the enclosed addenda pursuant to the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 et seq., to inform consideration by the California Fish and Game Commission (Commission) of proposed amendments to existing regulations governing Klamath River Basin (KRB) sport fishing. The Commission proposes to amend the sport fishing regulations for the "Central Valley fishery" for Sacramento River fall-run Chinook Salmon (SRFC), encompassing the following rivers and their respective subsections of Section 7.40, Title 14, CCR: American (b)(4), Feather (b)(43), Mokelumne (b)(66), and Sacramento (b)(80). The Commission also proposes to amend the KRB sport fishing regulations as set forth in Title 14, Section 7.40(b)(50) for Klamath River fall-run Chinook Salmon (KRFC).

In 2022, the Commission certified a Final Negative Declaration (ND) Regarding Central Valley Sport Fishing Regulations (2022 Central Valley Sport Fishing Regulations ND)(SCH No. 2018112036) as the lead agency under CEQA as part of the Commission's review and adoption of the Central Valley sport fishing regulations which focused on the potential for significant environmental impacts from a potential increase or decrease of SRFC daily bag and possession limits for the American, Feather, Mokelumne, and Sacramento rivers. The 2022 Central Valley Sport Fishing Regulations ND found no significant impacts for the range of daily bag and possession limits for SRFC sport fishing under regulatory Options 1, 2, and 3. The 2024 proposed daily bag and possession limits fall within the previously analyzed range of bag and possession limits and regulatory options. Therefore, there are no new significant or substantially more severe impacts from amending the SRFC sport fishing regulations to either decrease or increase the daily bag and possession limits on the American, Feather, Mokelumne, and Sacramento rivers.

In 2022, the Commission certified a Final ND Regarding Klamath River Basin Sport Fishing Regulations (2022 Klamath River Basin Sport Fishing Regulations ND)(SCH

No. 2022040251) as the lead agency under CEQA as part of the Commission's review and adoption of KRB sport fishing regulations which focused on the potential for significant environmental impacts from a potential increase or decrease of KRFC daily bag and possession limits for the Klamath and Trinity rivers. The 2022 Klamath River Basin Sport Fishing Regulations ND found no significant impacts for the KRB quota range and range of daily bag and possession limits for KRFC sport fishing. The 2024 proposed KRB quota, and daily bag and possession limit ranges fall within the previously analyzed ranges for the KRB quota and proposed bag and possession limits for KRFC stocks. Therefore, there are no new significant or substantially more severe impacts from amending the KRB sport fishing regulations to either decrease or increase the KRFC daily bag and possession limits on the Klamath and Trinity rivers.

If you have any questions regarding the enclosed documents, please contact Karen Mitchell, Senior Environmental Scientist, at (916) 205-0250.

for the

REGULARY NOTICED RULEMAKING ACTION TO AMEND
SECTION 7.40 TITLE 14,
CALIFORNIA CODE OF REGULATIONS
2024 FISHING SEASON

(OAL Notice File No. 2024-0223-02)

INTRODUCTION

The California Department of Fish and Wildlife (CDFW) has prepared this addendum pursuant to the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 et seq., to inform consideration by the California Fish and Game Commission (Commission) of proposed amendments to existing regulations governing Klamath River Basin sport fishing. Annually, CDFW recommends Klamath River Basin (KRB) sport fishing regulations to the Commission. The Commission then makes the final determination on what amendments to the regulations should be implemented and is the lead agency for the purposes of CEQA. Under Fish and Game Code Section 200, the Commission has the authority to regulate the taking or possession of fish for the purpose of sport fishing.

The Commission proposes to amend the Klamath River Basin sport fishing regulations as set forth in Title 14, subsection 7.40(b)(50) of the California Code of Regulations for Klamath River fall-run Chinook Salmon (KRFC) based on federal fisheries management goals (project). Each year, CDFW evaluates the potential need to update the KRB sport fishing regulations for KRFC to align with federal fisheries management goals and presents any proposed amendments to the Commission for consideration.

The Commission established an in-basin quota and daily bag and possession limits for KRFC on the Klamath and Trinity rivers in 2022 with the certification of a Final Negative Declaration under CEQA (2022 Klamath River Basin Sport Fishing Regulations Negative Declaration (ND))(SCH No. 2022040251). The 2022 Klamath River Basin Sport Fishing Regulations ND provides relevant and important informational value as the Commission, as the CEQA lead agency, considers proposed amendments to the existing regulations for the 2024 KRB sport fishing season in California. This addendum documents the Commission's consideration of related environmental effects.

EARLIER PROJECT APPROVAL

CEQA review of the proposed project was conducted in accordance with the Commission's certified regulatory program approved by the Secretary for the California Natural Resources Agency pursuant to Public Resources Code Section 21080.5 (See generally CCR, Title 14, Sections 781.5 and 15251(b)). CEQA requires all public agencies in the state to evaluate the environmental impacts of discretionary projects they propose to carry out or approve, including promulgating regulations, which may have a potential to significantly affect the environment.

In 2022, the Commission certified a Final ND Regarding Klamath River Basin Sport Fishing Regulations (2022 Klamath River Basin Sport Fishing Regulations ND)(SCH No. 2022040251) as the lead agency under CEQA as part of the Commission's review and adoption of KRB sport fishing regulations which focused on the potential for significant environmental impacts from a potential decrease or increase of KRFC daily bag and possession limits for the Klamath and Trinity rivers. The Commission considered a quota range of 0–67,600 adult KRFC in the KRB, a daily bag limit range of 0-4 KRFC, and a possession limit range of 0-12 KRFC. The Commission, as the CEQA lead agency, certified the 2022 ND and determined adoption of the regulations as proposed would not result in any new significant or substantially more severe environmental effects. The Commission adopted a daily bag limit of two KRFC of which no more than one fish over 23 inches total length may be retained when the take of salmon over 23 inches total length is allowed and a possession limit of six KRFC of which no more than three fish over 23 inches total length may be retained when the take of salmon over 23 inches total length is allowed. The Commission also adopted a Klamath River Basin quota of 2,119 adult KRFC.

PROPOSED 2024 CHINOOK SALMON BAG AND POSSESSION LIMITS

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, the recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service.

The PFMC developed the annual Pacific coast ocean salmon fisheries regulatory options for public review at its March 2024 meeting and will adopt its final regulatory recommendations at its April 2024 meeting based on the PFMC salmon abundance estimates and recommendations for ocean harvest for the coming season. Based on the April 2024 recommendation by PFMC, CDFW will recommend a KRB quota and specific bag and possession limit regulations for the KRB sport fishery to the Commission at its April 18, 2024 meeting. The Commission will then consider adoption of the KRB sport fishing regulations at its May 15, 2024 meeting.

Annually, CDFW recommends the Commission consider a quota range of 0 - 67,600 adult KRFC in the Klamath River Basin for the in-river sport fishery. This recommended range encompasses the historical range of the Klamath River Basin allocations and allows PFMC and the Commission to make adjustments during the 2024 regulatory cycle.

The proposed subquotas for KRFC are shown in **Figure 1.**, and are as follows:

1. Main stem Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec -- 17 percent of the total quota equates to [0-11,492];
2. Main stem Klamath River from downstream of the Highway 96 bridge at

Weitchpec to the mouth -- 50 percent of the total quota equates to [0-33,800];

3. Main stem Trinity River downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat -- 16.5 percent of the total quota equates to [0- 11,154]; and

4. Main stem Trinity River downstream from the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River -- 16.5 percent of the total quota equates to [0-11,154]

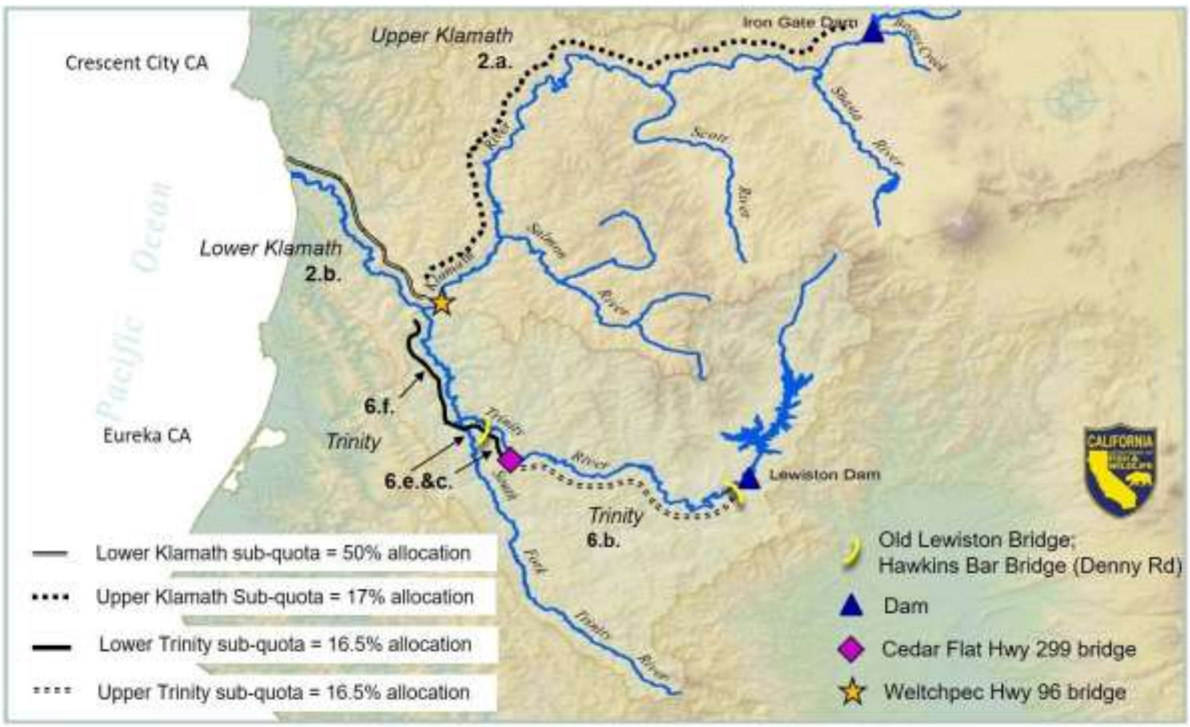

Figure 1. Map of the Klamath River Basin, showing the subquotas by reach of Trinity and Klamath rivers, and the associated subsections of 7.40(b)(50)(E).

No changes are proposed for the Klamath River and Trinity River KRFC seasons:

- Klamath River - August 15 to December 31
- Trinity River - September 1 to December 31

As in previous years, no retention of adult KRFC is proposed once the subquota has been met.

The range of proposed bag and possession limits for KRFC stocks are:

- Bag Limit - [0-4] Chinook Salmon – of which no more than [0-4] fish over [20-24] inches total length may be retained until the subquota is met, then 0 fish over [20-24] inches total length.

- Possession limit - [0-12] Chinook Salmon of which no more than [0–4] fish over [20-24] inches total length may be retained when the take of salmon over [20-24] inches total length is allowed.

In addition to the above quota, daily bag and possession limits, the 2024 proposed KRB fishing regulations include an option for closure of the KFRC should the PFMC recommend a complete or near complete closure of ocean recreational salmon fishery and/or an allocation of 0 (zero) adult KRFC to the in-river fishery. The 2022 Klamath River Basin Sport Fishing Regulations ND found no significant impacts for the KRB quota range and range of proposed daily bag and possession limits for KRFC sport fishing. The proposed 2024 KRB quota, and daily bag and possession limit ranges fall within the previously analyzed ranges for the KRB quota and proposed bag and possession limits for KRFC stocks. Therefore, there are no new significant or substantially more severe impacts from amending the KRB sport fishing regulations to either reduce or increase the KRFC daily bag and possession limits on the Klamath and Trinity rivers.

NO SUBSEQUENT ENVIRONMENTAL DOCUMENT IS REQUIRED

In general, CEQA applies whenever a public agency proposes to carry out or approve a discretionary project. (Public Resources Code, Section 21080(a)). CEQA provides that, where a public agency proposes to modify a previously approved project for which a Final Environmental Document was prepared and certified:

> "An addendum to an adopted negative declaration may be prepared if only minor technical changes or additions are necessary or none of the conditions described in Section 15162 calling for the preparation of a subsequent EIR or negative declaration have occurred.." (CCR, Title 14, section 15164(b))

- A Subsequent Environment Document (Section 15162) when there is substantial evidence that:
  - Substantial changes are proposed in the project, which will require major revisions to the previous environmental impact report (EIR) or environmental document (ED).
  - Substantial changes occur with respect to the circumstances under which the project is being undertaken, which will require major revisions to the previous EIR or environmental documentation.
  - New information, which was not known and could not have been known at the time the previous EIR or ED was certified as complete, becomes available.
- A Supplement to an Environment Document (Section 15163) when:
  - A subsequent ED is not required.
  - Only minor changes to the project are described.
  - Only that information to make the ED adequate is provided.

- An Addendum to the Certified ED (Section 15164) is proper when**:**
  - The changes or additions presented in this project are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent ED have occurred.
  - The Commission may properly prepare and may rely on an addendum in accordance with Section 15164 to fulfill its obligations under CEQA.

NO ADDITIONAL IMPACTS UNDER CEQA

The Commission has determined that amending the current KRB sport fishing regulations based on PFMC salmon abundance estimates will not result in any new or significant or substantially more severe environmental impacts than previously analyzed and disclosed in the 2022 Klamath River Basin Sport Fishing Regulations ND for this project.

This project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory. There are no impacts to the habitat of fish and wildlife species.

This approval action adjusts the previous year daily bag and possession limits based on more current salmon abundance estimates. No other aspect of the project is changed. No new significant or substantially more severe impacts under CEQA will occur due to this change.

AMENDMENT OF THE KLAMATH RIVER BASIN SPORT FISHING REGULATIONS

In conclusion, the Commission finds that amending the KRB sport fishing regulations in CCR, Title 14, Section 7.40, will not result in any new significant or substantially more severe environmental effects than previously analyzed and disclosed in the 2022 Klamath River Basin Sport Fishing Regulations ND. The Commission also finds that subsequent or supplemental review beyond this Addendum is not warranted pursuant to the CCR, Title 14, Section 15164, in connection with this proposed action.

Melissa Miller-Henson, Executive Director Date

California Fish and Game Commission

State of California
Fish and Game Commission
Initial Statement of Reasons for Regulatory Action

Amend Section 502
Title 14, California Code of Regulations
Re: Waterfowl, Migratory; American Coot and Common Moorhen (Common Gallinule)

I. Date of Initial Statement of Reasons: October 2, 2023

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing

Date: December 13, 2023 Location: San Diego, CA

(b) Discussion Hearing

Date: February 15, 2024 Location: Sacramento, CA

(c) Adoption Hearing

Date: April 18, 2024 Location: San Jose, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

The U.S. Fish and Wildlife Service (Service) annually establishes federal regulation frameworks (Frameworks) for migratory bird hunting. California shall set its waterfowl hunting regulations within the Frameworks. The Frameworks describe the earliest dates that waterfowl hunting seasons may open, the maximum number of days hunting can occur, the latest dates that hunting seasons must close, and the maximum daily bag limit. The proposed hunting season Frameworks for a given year are developed in the fall of the prior year for a majority of species and populations. For example, the breeding populations (including the California Breeding Population Survey) and habitat conditions observed in 2023 and the regulatory alternatives selected for the 2023 hunting season will be used to develop the Frameworks for the 2024-25 season.

States may make recommendations to change the Frameworks. These recommendations are made to the four regional Flyway councils in late summer (July, August or September). Flyway councils may elect to forward recommendations to the Service. The Service may elect to incorporate proposed changes in the Frameworks. The Service considers these and other recommendations at the Service’s Regulation Committee public meeting held in September or October. Proposed season Frameworks are typically published in the Federal Register by mid-December and final Frameworks published by late February.

Section 355 of the Fish and Game Code authorizes the Fish and Game Commission (Commission) to adopt annual regulations pertaining to the hunting of migratory birds that conform with or further restrict the regulations prescribed by the Service pursuant to its authority under the Migratory Bird Treaty Act. The Commission selects and establishes state regulations that specify hunting season dates and daily bag limits.

Current regulations in Section 502, Title 14, California Code of Regulations (CCR), provide definitions, hunting zone descriptions, season opening and closing dates, and daily bag and possession limits for hunting of waterfowl. The proposed Frameworks for the 2024-25 season were approved by the Flyway councils in August and at the Service's Regulations Committee meeting in October. The Frameworks allow for a liberal duck season which includes: a 107-day season; a 7 daily duck limit including 7 mallards but only 2 hen mallards, 1 pintail, 2 canvasback, 2 redheads, and 2 scaup (during an 86-day season); and closing no later than January 31. The duck daily bag limits and season length, as well as the season lengths for geese, are provided as ranges below, to allow the Commission flexibility in determining the final regulations.

A range of season length and bag limit (zero bag limit represents a closed season) are also provided for black brant. The range is necessary, as the black brant Framework cannot be determined until the Pacific Flyway Winter Brant Survey is conducted in January 2024. The black brant regulatory package is determined by the most current Winter Brant Survey, rather than the prior year survey. The proposed season length and bag limit will be updated per the Black Brant Harvest Strategy pending results of the January 2024 survey. See the Summary of Proposed Waterfowl Hunting Regulations for 2024-25 table in the Informative Digest/Policy Statement Overview for the range of season and bag limits.

Lastly, federal regulations provide that California's hunting regulations shall conform to those of Arizona in the Colorado River Zone and those of Oregon in the North Coast Special Management Area.

The Department-recommended changes to Section 502 are:

1) Decrease the duck season length to 98 days in subsection 502(d)(2)(B) for the Southern San Joaquin Valley Zone, in subsection 502(d)(3)(B) for the Southern California Zone, and in subsection 502(d)(5)(B) for the Balance of State Zone.

   The existing duck season length for the referenced zones is 103 days. Adjusting the season length from 103 to 98 days is necessary for the upcoming season in order to close on January 31 and maintain a traditional opening Saturday in late October. In prior rulemakings, the Commission adopted the latest possible closing date of January 31 rather than the historical closing day of the last Sunday in January. This annual adjustment also results in modifications to falconry-only seasons.

2) Decrease the goose season length to 98 days in subsection 502(d)(2)(B) for the Southern San Joaquin Valley Zone,in subsection 502(d)(3)(B) for the Southern California Zone, and in subsection 502(d)(5)(B) for the Balance of State Zone.

   The existing goose season length for the Southern San Joaquin Valley and Southern California zones is 103 days and 100 days in the Balance of State Zone. See item 1 above for the justification. This annual adjustment also results in modifications to Veterans and Active Military Personnel Waterfowl Hunting Days (VAMP Days) and falconry-only seasons.

3) Allow geese to be taken during VAMP Days in subsection 502(f)(B)4 for the Balance of

State Zone.

The existing regulation does not allow geese because all available hunting days in the Balance of State Zone were allocated prior to implementation of VAMP Days. See item 1 above. The decrease in the goose season to 98 days allows the option of goose hunting during VAMP Days in this zone while still offering the existing early and late goose seasons. See option 2 in regulatory text in subsection 502(f)(B)4. However, in future rulemakings, either modifying the timing or reducing the Late Season will need to be considered to allow goose hunting during VAMP Days in this zone.

4) Allow up to five days of falconry-only season in subsection 502(g)(1)(B) for the Southern San Joaquin Valley, Southern California and Balance of State zones.

   The existing regulation does not allow a falconry-only season because all available hunting days have been allocated. The length of the falconry-only season is contingent upon the number of days used for the general duck and goose seasons, in addition to the Youth and Veteran Hunt Days, as seasons cannot exceed 107 days.

   In addition, an alternative was offered by the public regarding timing of the Late Season for geese in subsection 502(d)(5)(B) for the Balance of State Zone, see item IV below. The proposal was to move the Late Season for geese to coincide with VAMP Days in subsection 502(f)(B)4. Two options have been provided for consideration to both subsections: option 1 retains the closure of geese on Type A and B wildlife areas during the Late Season and does not allow geese during VAMP Days; option 2 allows goose hunting during the Late Season on Type A and B wildlife areas and allows geese during VAMP Days.

Minor editorial changes are also proposed to clarify and simplify the regulations and to comply with existing federal Frameworks.

(b) Goals and Benefits of the Regulation

The goals and benefits of the regulations are to provide for the conservation and maintenance of sufficient waterfowl populations to ensure their continued existence, while providing for balanced hunting opportunity, consistent with Commission and Department policies.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: Section(s) 265 and 355, Fish and Game Code
Reference: Section(s) 265, 355, and 356, Fish and Game Code

(d) Specific Technology or Equipment Required by Regulatory Change: None.

(e) Identification of Reports or Documents Supporting Regulation Change: None.

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

This proposal was discussed at the Commission’s Wildlife Resources Committee (WRC) meeting held on September 19, 2023, and a public scoping session will be held in late November 2022.

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

An alternative was offered by the public regarding timing of the Late Season for geese in the Balance of State Zone. The proposal was to move the Late Season for geese to coincide with the VAMP Days. The current regulation for VAMP Days in this zone does not allow geese because all goose days have been allocated. This was discussed at the Wildlife Resources Committee (WRC) meeting on September 19, 2023. The WRC indicated further consideration of this proposal would be warranted.

The Department did not include this recommendation because the intent of the Late Season for geese. The Late Season was implemented for the 2011-12 season as a tool to alleviate crop depredation on private pasture lands due to increasing concerns raised by the agricultural community. The timing of the Late Season was placed in later February when geese were still present in large concentrations in the Balance of State Zone. Further, the Type A and B wildlife areas are closed during the Late Season so geese can move onto public lands.

The Department has recommended to maintain the timing and length for the Early and Late goose seasons, and a 98 day Regular Season for geese. This allows goose hunting during the two VAMP days (see item 3 above). However, in the following seasons (2025-26 and later) the Regular Season length may be subject to increases so excess goose days for VAMP Days is reduced or eliminated. For the 2025-26 season, the Late Season would have to be reduced to allow geese during VAMP Days in addition to ducks. Prior to moving the Late Season, the Department would like feedback from the agricultural community on the effectiveness of the regulation to alleviate crop depredation. The Department is concerned about reducing the effectiveness of the Late Season for geese, regulation complexity, and enforcement concerns.

(b) No Change Alternative

The No Change Alternative would retain the 2023-24 regulations for the 2024-25 season which may place the state out of compliance with federal regulations. This alternative was rejected because in prior rulemakings, the Commission preferred the latest possible closing date of January 31 and maintaining a traditional opening Saturday in late October. This results in an annual adjustment to the season length; 98 days rather than 103 days for the 2024-25 season because of calendar progression. In addition, modifying the season length affects available days for falconry-only seasons, and must also be adjusted annually so as not to exceed 107 days.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states.

The proposed regulations are expected to maintain a similar level of recreational waterfowl hunting opportunity for the public. Shifting days for general duck season affects available days for falconry-only seasons, which must also be adjusted annually so total season length does not exceed 107 days.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission does not anticipate any impacts on the creation or elimination of jobs, the creation of new business, the elimination of existing businesses, or the expansion of businesses in California. The proposed waterfowl regulations will set the 2024-25 waterfowl hunting season dates and bag limits within the federal Frameworks. The total hunting season length of 107 remains the same, with only modifications to the season types (duck, goose or falconry-only) will have little to no impacts to jobs and/or businesses that provide services to waterfowl hunters. The Commission anticipates that the proposed 2024-25 waterfowl hunting regulations provide benefit for the health and welfare of California residents by providing opportunity for outdoor activity. The Commission expects no benefits to worker safety but does expect benefit to the environment in that setting these regulations facilitates maintenance of sufficient waterfowl populations and their habitats while providing for the public's beneficial use and enjoyment. The most recent Service National Survey of Fishing, Hunting, and Wildlife-Associated Recreation for California estimated that migratory bird hunters contributed about $169 million to the state economy during the 2011 migratory bird hunting season. However, minor variations in hunting regulations such as the ones proposed for waterfowl are, by themselves, unlikely to provide notable economic stimulus to the state. Businesses that support waterfowl hunting are generally small businesses employing a few individuals and, like all small businesses, are subject to failure for a variety of causes. The long-term intent of the proposed regulations is to sustainably manage waterfowl populations, and consequently, the long-term viability of the same small businesses.

(c) Cost Impacts on a Representative Private Person or Business

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.

(e) Nondiscretionary Costs/Savings to Local Agencies: None.

(f) Programs Mandated on Local Agencies or School Districts: None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None.

(h) Effect on Housing Costs: None.

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

The proposed conformance to federal regulations is expected to maintain similar levels of hunting opportunity and activity as previous seasons such that little to no net impacts on the creation or elimination of jobs are anticipated within the state from the adoption of the proposed waterfowl hunting regulations for the 2024-25 season. The most recent Service National Survey of Fishing, Hunting, and Wildlife-Associated Recreation for California estimated that waterfowl hunters contributed about $169,115,000 to businesses in California during the 2011 waterfowl hunting season. The proposed regulations in themselves should not affect the typical level of waterfowl hunting expenditures. Businesses within the state that provide goods and services to waterfowl hunters are generally small businesses employing few individuals and, like all small businesses, are subject to failure for a variety of causes. The long-term intent of the proposed regulations is to sustainably manage waterfowl populations, and consequently, the long-term viability of the same small businesses.

The 2011 National Survey is posted on the U.S. Census Bureau website https://www.census.gov/content/dam/Census/library/publications/2014/demo/fhw11-nat.pdf and the 2011 National Survey of Fishing and Hunting, and Wildlife-Associated Recreation Report for California can be found at https://www2.census.gov/programs-surveys/fhwar/publications/2011/fhw11-ca.pdf.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The proposed regulation is not anticipated to prompt the creation of new businesses or the elimination of existing businesses within the state. Minor variations in regulations pertaining to hunting are, by themselves, unlikely to stimulate the creation of new businesses or cause the elimination of existing businesses. The number of hunting trips and the economic contributions from the trips are not expected to change substantially.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The proposed minor variations in season lengths are, by themselves, unlikely to stimulate substantial expansion of businesses currently doing business in the state. The long-term intent of the proposed regulations is to sustainably manage waterfowl populations, and consequently, the long-term viability of various businesses that serve recreational waterfowl hunters.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

Hunting is an outdoor activity that can provide several health and welfare benefits to California residents. Hunters and their families benefit from fresh game to eat, and from the benefits of outdoor recreation, including exercise. People who hunt have a special connection with the outdoors and an awareness of the relationships between wildlife, habitat and humans. With that awareness comes an understanding of the role humans play in being caretakers of the environment. Hunting is a tradition that is often passed from one generation to the next, creating a special bond between family members and friends.

(e) Benefits of the Regulation to Worker Safety

The regulations will not affect worker safety because they do not address working conditions.

(f) Benefits of the Regulation to the State's Environment

As set forth in Fish and Game Code Section 1801, it is the policy of the state to encourage the preservation, conservation, and maintenance of waterfowl resources for all citizens of the state. The objectives of this policy include, but are not limited to, maintenance of sufficient populations and their habitats, provide for beneficial use and enjoyment, to perpetuate the waterfowl resource for their intrinsic and ecological values, and to maintain diversified recreation use including sport hunting consistent with the status of this resource. Adoption of scientifically based waterfowl hunting regulations provides for the maintenance of sufficient waterfowl populations to ensure these objectives are met. Further, the fees that hunters pay for licenses and stamps fund wildlife conservation.

(g) Other Benefits of the Regulation

Hunting seasons provide an incentive for private landowners to maintain waterfowl habitat, mainly wetlands, that benefit waterfowl and other wetland dependent wildlife.

Informative Digest/Policy Statement Overview

Current regulations in Section 502, Title 14, California Code of Regulations (CCR), provide definitions, hunting zone descriptions, season opening and closing dates, and daily bag and possession limits for hunting of waterfowl. The proposed Frameworks for the 2024-25 season were approved by the four regional Flyway councils in August and at the U.S. Fish and Wildlife Service (Service's) Regulations Committee meeting in October. The Frameworks allow for a liberal duck season which includes: a 107-day season; a 7 daily duck limit including 7 mallards but only 2 hen mallards, 1 pintail, 2 canvasback, 2 redheads, and 2 scaup (during an 86-day season); and closing no later than January 31. The duck daily bag limits and season length, as well as the season lengths for geese, are provided as ranges below, to allow the Commission flexibility in determining the final regulations.

A range of season length and bag limit (zero bag limit represents a closed season) are also provided for black brant. The range is necessary, as the black brant Framework cannot be determined until the Pacific Flyway Winter Brant Survey is conducted in January 2024. The black brant regulatory package is determined by the most current Winter Brant Survey, rather than the prior year survey. The proposed season length and bag limit will be updated per the Black Brant Harvest Strategy pending results of the January 2024 survey. See the Summary of Proposed Waterfowl Hunting Regulations for 2024-25 table, below.

Lastly, Federal regulations provide that California's hunting regulations shall conform to those of Arizona in the Colorado River Zone and those of Oregon in the North Coast Special Management Area.

The Department recommended changes to Section 502 are:

1) Decrease the duck season length to 98 days in subsection 502(d)(2)(B) for the Southern San Joaquin Valley Zone, in subsection 502(d)(3)(B) for the Southern California Zone, and in subsection 502(d)(5)(B) for the Balance of State Zone.
2) Decrease the goose season length to 98 days in subsection 502(d)(2)(B) for the Southern San Joaquin Valley Zone and in subsection 502(d)(3)(B) for the Southern California Zone.
3) Allow geese to be taken during Veterans and Active Military Personnel Waterfowl Hunting (VAMP) Days in subsection 502(f)(B)4. for the Balance of State Zone.
4) Allow up to five days of falconry-only season in subsection 502(g)(1)(B) for the Southern San Joaquin Valley, Southern California and Balance of State zones.

In addition, an alternative was offered by the public regarding timing of the Late Season for geese in subsection 502(d)(5)(B) for the Balance of State Zone. The proposal was to move the Late Season for geese to coincide with VAMP Days in subsection 502(f)(B)4. Two options have been provided for consideration in the regulatory text to both subsections: option 1 retains the closure of geese on Type A and B wildlife areas during the Late Season and does not allow geese during VAMP Days; option 2 allows goose hunting during the Late Season on Type A and B wildlife areas and allows geese during VAMP Days.

The Department has recommended to maintain the timing and length for the Early and Late goose seasons, and a 98 day Regular Season for geese. This allows goose hunting during the two VAMP days (see item 3 above). However, in the following seasons (2025-26 and later) the Regular Season length may be subject to increases so excess goose days for VAMP Days is reduced or eliminated. For the 2025-26 season, the Late Season would have to be reduced to allow geese during VAMP Days in addition to ducks. Prior to moving the Late Season, the Department would like feedback from the agricultural community on the effectiveness of the regulation to alleviate crop depredation. The Department is concerned about reducing the effectiveness of the Late Season for geese, regulation complexity, and enforcement concerns.

Minor editorial changes are also proposed to clarify and simplify the regulations and to comply with existing federal Frameworks.

Benefits of the regulations

The benefits of the proposed regulations are consistency with federal law and the sustainable management of the state’s waterfowl resources. Continued benefits to jobs and/or businesses that provide services to waterfowl hunters will be realized with the continued adoption of waterfowl hunting seasons in 2024-25.

Evaluation of incompatibility with existing regulations

The Commission has reviewed its regulations in Title 14, CCR, and conducted a search of other regulations on this topic and has concluded that the proposed amendments to Section 502 are neither inconsistent nor incompatible with existing State regulations. No other State agency has the authority to promulgate waterfowl hunting regulations.

Summary of Proposed Waterfowl Hunting Regulations for 2024-25

AREA	SPECIES	SEASONS	DAILY BAG & POSSESSION LIMITS
Statewide	Coots & Moorhens (Gallinules)	Concurrent w/duck season	25/day. Possession limit triple the daily bag.
Northeastern Zone	Ducks	No longer than 103 days	[4-7]/day, which may include: [3-7] mallards no more than [1-2] females. 1 pintail, 2 canvasback, 2 redheads. Possession limit triple the daily bag.
Northeastern Zone *Season may be split for Scaup*	Scaup	No longer than 86 days	2 scaup. Possession limit triple the daily bag.
Northeastern Zone *Season may be split*	Geese	No longer than 105 days except for Canada geese	30/day, which may include: 20 white geese, 10 dark

AREA	SPECIES	SEASONS	DAILY BAG & POSSESSION LIMITS
for Dark and White geese		which cannot exceed 100 days or beyond Jan 12	geese, no more than 2 Large Canada geese. Possession limit triple the daily bag.
Southern San Joaquin Valley Zone	Ducks	No longer than 98 days	[4-7]/day, which may include: [3-7] mallards no more than [1-2] females. 1 pintail, 2 canvasback, 2 redheads. Possession limit triple the daily bag.
Southern San Joaquin Valley Zone *Season may be split for Scaup*	Scaup	No longer than 86 days	2 scaup. Possession limit triple the daily bag.
Southern San Joaquin Valley Zone	Geese	No longer than 98 days	30/day, which may include: 20 white geese, 10 dark geese. Possession limit triple the daily bag.
Southern California Zone	Ducks	No longer than 98 days	[4-7]/day, which may include: [3-7] mallards no more than [1-2] females. 1 pintail, 2 canvasback, 2 redheads. Possession limit triple the daily bag.
Southern California Zone *Season may be split for Scaup*	Scaup	No longer than 86 days	2 scaup. Possession limit triple the daily bag.
Southern California Zone	Geese	No longer than 98 days	23/day, which may include: 20 white geese, 3 dark geese. Possession limit triple the daily bag.
Colorado River Zone	Ducks	No longer than 101 days	7/day, which may include: 7 mallards no more than 2 females or Mexican ducks. 1 pintail, 2 canvasback, 2 redheads. Possession limit triple the daily bag.

AREA	SPECIES	SEASONS	DAILY BAG & POSSESSION LIMITS
Colorado River Zone *Season may be split for Scaup*	Scaup	No longer than 86 days	2 scaup. Possession limit triple the daily bag.
Colorado River Zone	Geese	No longer than 101 days	25/day, up to 20 white geese, up to 5 dark geese. Possession limit triple the daily bag.
Balance of State Zone	Ducks	No longer than 98 days	[4-7]/day, which may include: [3-7] mallards no more than [1-2] females. 1 pintail, 2 canvasback, 2 redheads. Possession limit triple the daily bag.
Balance of State Zone *Season may be split for Scaup*	Scaup	No longer than 86 days	2 scaup. Possession limit triple the daily bag.
Balance of State Zone *Season may be split for Dark and White Geese.*	Geese	Early Season: 3 days (Canada goose only) Regular Season: no longer than 98 days Late Season: Canada geese no longer than 2 days and white-fronted and white geese no longer than 5 days	30/day, which may include: 20 white geese, 10 dark geese. Possession limit triple the daily bag.

SPECIAL MANAGEMENT AREAS

AREA	SPECIES	SEASON	DAILY BAG & POSSESSION LIMITS
North Coast *Season may be split*	All Canada Geese	No longer than 105 days except for Large Canada geese which cannot exceed 100 days or extend beyond Jan 31	10/day, only 1 may be a Large Canada goose. Possession limit triple the daily bag. Large Canada geese are closed during the Late Season.
Humboldt Bay South Spit (West Side)	All species	Closed during brant season	
Klamath Basin	Dark and white geese	105 days except for Canada geese which cannot exceed 100 days or extend beyond Jan 12	30/day, which may include: 20 white geese, 10 dark geese only 2 may be a Large Canada goose.

AREA	SPECIES	SEASON	DAILY BAG & POSSESSION LIMITS
			Possession limit triple the daily bag.
Sacramento Valley	White-fronted geese	Open concurrently with general goose season through Dec 21	3/day. Possession limit triple the daily bag.
Morro Bay	All species	Open in designated areas only	Waterfowl season opens concurrently with brant season.
Martis Creek Lake	All species	Closed until Nov 16	
Northern Brant	Black Brant	No longer than 37 days and closing no later than Dec 14.	[0-2]/day. Possession limit triple the daily bag.
Balance of State Brant	Black Brant	No longer than 37 days and closing no later than Dec 15.	[0-2]/day. Possession limit triple the daily bag.
Imperial County *Season may be split*	White Geese	No longer than 105 days	20/day. Possession limit triple the daily bag.

YOUTH WATERFOWL HUNTING DAYS (NOTE: To participate in these Youth Waterfowl Hunts, youth must be accompanied by a non-hunting adult 18 years of age or older. Federal regulations require that hunters must be 17 years of age or younger.)

AREA	SPECIES	SEASON	DAILY BAG & POSSESSION LIMITS
Northeastern Zone	Same as regular season	The Saturday fourteen days before the opening of waterfowl season extending for 2 days.	Same as regular season
Southern San Joaquin Valley Zone	Same as regular season	The first Saturday in February extending for 2 days.	Same as regular season
Southern California Zone	Same as regular season	The first Saturday in February extending for 2 days.	Same as regular season
Colorado River Zone	Same as regular season	The first Saturday in February extending for 2 days.	Same as regular season
Balance of State Zone	Same as regular season	The first Saturday in February extending for 2 days.	Same as regular season

Veterans and Active Military Personnel Waterfowl Hunting Days (NOTE: Veterans (as defined in Section 101 of Title 38, United States Code) and members of the Armed Forces on active duty, including members of the National Guard and Reserves on active duty (other than training), may participate.

AREA	SPECIES	SEASON	DAILY BAG & POSSESSION LIMITS
Northeastern Zone	Ducks, Coots, and Moorhens	The Saturday following the closing of the regular duck season extending for 2 days.	Same as regular season
Balance of State Zone	Same as regular season	The second Saturday in February extending for 2 days.	Same as regular season
Southern San Joaquin Valley Zone	Same as regular season	The second Saturday in February extending for 2 days.	Same as regular season
Southern California Zone	Same as regular season	The second Saturday in February extending for 2 days.	Same as regular season

FALCONRY

AREA	SPECIES	SEASON	DAILY BAG & POSSESSION LIMITS
Northeastern Zone	Same as regular season	No longer than 107 days.	3/day. Possession limit 9
Balance of State Zone	Same as regular season	No longer than 107 days.	3/day. Possession limit 9
Southern San Joaquin Valley Zone	Ducks, Coots, and Moorhens	No longer than 107 days.	3/day. Possession limit 9
Southern California Zone	Same as regular season	No longer than 107 days.	3/day. Possession limit 9
Colorado River Zone	Ducks, Coots, and Moorhens	No longer than 107 days.	3/day. Possession limit 9

Proposed Regulatory Language

Section 502, Title 14, CCR, is amended as follows:

§502. Waterfowl, Migratory; American Coot and Common Moorhen (Common Gallinule).

[No changes to subsections (a) through (b)]

(c) Seasons and Bag and Possession Limits for American Coots, and Common Moorhens.

(1) Statewide Provisions.

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
American Coot and Common Moorhen	Concurrent with duck season(s)	Daily bag limit: 25, either all of one species or a mixture of these species. Possession limit: triple the daily bag limit.

(d) Seasons and Bag and Possession Limits for Ducks and Geese by Zone.

(1) Northeastern California Zone (NOTE: SEE SUBSECTION 502(d)(6) BELOW FOR SPECIAL SEASONS AND CLOSURES.)

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
Ducks (including Mergansers)	~~From the first Saturday in October extending for 103 days.~~ ~~Scaup: from the first Saturday in October extending for a period of 58 days and from the third Thursday in December extending for a period of 28 days.~~ [Opening no earlier than the first Saturday in October and closing no later than January 31. Season may be split into two segments and no longer than 103 days except for scaup season can be no longer than 86 days.]	Daily bag limit: ~~7~~ [4-7] Daily bag limit may include: • ~~7~~ [3-7] mallards, but not more than ~~2~~ [1-2] females. • 1 pintail (either sex). • 2 canvasback (either sex). • 2 redheads (either sex). • 2 scaup (either sex). Possession limit: triple the daily bag limit.

(A) Species	(B) Season	(C) Daily Bag and Possession Limits
Geese	Regular Season: ~~Small and Large~~ Canada Geese: ~~from the first Saturday in October extending for 100 days.~~ [Opening no earlier than the first Saturday in October and closing no later than January 12. Season will be no longer than 100 days.] White-fronted and white geese ~~from the first Saturday in October extending for a period of 58 days and from January 4 extending for a period of 14 days.~~ [Opening no earlier than the first Saturday in October and closing no later than January 31. Season may be split into two segments and no longer than 100 days.] Late Season: ~~White-fronted and white geese from February 7 extending for 33 days.~~ [Season will be no longer than 34 days and closing no later than March 10.] During the Late Season, hunting is only permitted on Type C wildlife areas listed in sections 550-552, navigable waters, and private lands with the permission of the landowner under provisions of Section 2016, Fish and Game Code. Hunting is prohibited on Type A and Type B wildlife areas, the Klamath Basin National Wildlife Refuge Complex, the Modoc National Wildlife Refuge, and any waters which are on, encompassed by, bounded over, flow over, flow through, or are adjacent to any Type A and Type B wildlife areas, the Klamath Basin National Wildlife Refuge Complex, or the Modoc National Wildlife Refuge.	Daily bag limit: 30 Daily bag limit may include: • 20 white geese. • 10 dark geese but not more than 2 Large Canada geese (see definitions: 502(a)). Possession limit: triple the daily bag limit.

(2) Southern San Joaquin Valley Zone (NOTE: SEE SUBSECTION 502(d)(6) BELOW FOR SPECIAL SEASONS AND CLOSURES.)

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
Ducks (including Mergansers)	~~From the third Saturday in October extending for 103 days.~~ ~~Scaup: from November 7 extending for 86 days.~~ [Opening no earlier than the fourth Saturday in October and closing no later than January 31. Season may be split into two segments and no longer than 98 days except for scaup season can be no longer than 86 days.]	Daily bag limit: ~~7~~ [4-7] Daily bag limit may include: • ~~7~~ [3-7] mallards, but not more than ~~2~~ [1-2] females. • 1 pintail (either sex). • 2 canvasback (either sex). • 2 redheads (either sex). • 2 scaup (either sex). Possession limit: triple the daily bag limit.
Geese	~~From the third Saturday in October extending for 103 days.~~ [Opening no earlier than the fourth Saturday in October and closing no later than January 31. Season will be no longer than 98 days.]	Daily bag limit: 30 Daily bag limit may include: • 20 white geese. • 10 dark geese (see definitions: 502(a)). Possession limit: triple the daily bag limit.

(3) Southern California Zone (NOTE: SEE SUBSECTION 502(d)(6) BELOW FOR SPECIAL SEASONS AND CLOSURES.)

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
Ducks (including Mergansers)	~~From the third Saturday in October extending for 103 days.~~ ~~Scaup: from November 7 extending for 86 days.~~ [Opening no earlier than the fourth Saturday in October and closing no later than January 31. Season may be split into two segments and no longer than 98 days except for scaup season can be no longer than 86 days.]	Daily bag limit: ~~7~~ [4-7] Daily bag limit may include: • ~~7~~ [3-7] mallards, but not more than ~~2~~ [1-2] females. • 1 pintail (either sex). • 2 canvasback (either sex). • 2 redheads (either sex). • 2 scaup (either sex). Possession limit: triple the daily bag limit.

(A) Species	(B) Season	(C) Daily Bag and Possession Limits
Geese	~~From the third Saturday in October extending for 103 days.~~ [Opening no earlier than the fourth Saturday in October and closing no later than January 31. Season will be no longer than 98 days.]	Daily bag limit: 23 Daily bag limit may include: • 20 white geese. • 3 dark geese (see definitions: 502(a)). Possession limit: triple the daily bag limit.

(4) Colorado River Zone (NOTE: SEE SUBSECTION 502(d)(6) BELOW FOR SPECIAL SEASONS AND CLOSURES.)

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
Ducks (including Mergansers).	From October 23 extending for 101 days. Scaup: from November extending for 86 days.	Daily bag limit: 7 Daily bag limit may include: • 7 mallards, but not more than 2 females or Mexican ducks. • 1 pintail (either sex). • 2 canvasback (either sex). • 2 redheads (either sex). • 2 scaup (either sex). Possession limit: triple the daily bag limit.
Geese	From October 23 extending for 101 days.	Daily bag limit: ~~24~~25 Daily bag limit may include: • 20 white geese. • ~~4~~5 dark geese (see definitions: 502(a)). Possession limit: triple the daily bag limit.

(5) Balance of State Zone (NOTE: SEE SUBSECTION 502(d)(6) BELOW FOR SPECIAL SEASONS AND CLOSURES.)

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
Ducks (including Mergansers).	~~From the third Saturday in October extending for 103 days.~~ ~~Scaup: from November 7 extending for 86 days.~~ [Opening no earlier than the fourth Saturday in October and closing no later than January 31. Season may be split into two segments and no longer than 98 days except for scaup season can be no longer than 86 days.]	Daily bag limit: ~~7~~ [4-7] Daily bag limit may include: • ~~7~~ [3-7] mallards, but not more than ~~2~~ [1-2] females. • 1 pintail (either sex). • 2 canvasback (either sex). • 2 redheads (either sex). • 2 scaup (either sex). Possession limit: triple the daily bag limit.

Geese	Early Season: Large Canada geese only from the Saturday closest to October 1 for a period of 3 days EXCEPT in the North Coast Special Management Area where Large Canada geese are closed during the early season. Regular Season: Dark and white geese [opening no earlier than the fourth Saturday in October and closing no later than January 31. Season will be no longer than 98 days] ~~from the third Saturday in October extending for 100 days~~ EXCEPT in the Sacramento Valley Special Management Area where the white-fronted goose season will close after December 21. Late Season: Canada geese ~~from~~ [opening after January 31 and closing no later than March 10. Season will be no longer than 2 days] ~~the third Saturday in February extending for 2 days~~. White-fronted and white geese ~~from~~ [opening after January 31 and closing no later than March 10. Season will be no longer than 5 days] ~~the third Saturday in February extending for a period of 5 days~~ EXCEPT in the Sacramento Valley Special Management Area where the white-fronted goose season is closed. **Option 1:** During the Late Season, hunting is not permitted on wildlife areas listed in sections 550-552 EXCEPT on Type C wildlife areas in the North Central and Central regions. **Option 2:** ~~During the Late Season, hunting is not permitted on wildlife areas listed in sections 550-552~~	Daily bag limit: 30 Daily bag limit may include: • 20 white geese. • 10 dark geese EXCEPT in the Sacramento Valley Special Management Area where only 3 may be white-fronted geese (see definitions: 502(a)). Possession limit: triple the daily bag limit.

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
	~~EXCEPT on Type C wildlife areas in the North Central and Central regions.~~	

(6) Special Management Areas (see descriptions in 502(b)(6))

	(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
1. North Coast	All Canada Geese	~~From October 7 extending for a period of 77 days (Regular Season) and from February 12 extending for a period of 28 days (Late Season).~~ [Season may be split and closing no later than March 10. Season will be no longer than 105 days.] During the Late Season, hunting is only permitted on private lands with the permission of the landowner under provisions Section 2016, Fish and Game Code.	Daily bag limit: 10 Canada Geese of which only 1 may be a Large Canada goose (see definitions: 502(a)), EXCEPT during the Late Season, the bag limit on Large Canada geese is zero. Possession limit: triple the daily bag limit.
2. Humboldt Bay South Spit (West Side)	All Species	Closed during brant season	
3. Klamath Basin	Geese	~~Small and Large~~ Canada Geese [opening no earlier than the first Saturday in October and closing no later than January 12. Season will be no longer than 100 days] ~~from the first Saturday in October extending for 100 days.~~ White-fronted and white geese [opening no earlier than the first Saturday in October and closing no later than January 31. Season will be no longer than 105 days] ~~from the first Saturday in October extending~~	Daily bag limit: 30 Daily bag limit may include: • 20 white geese. • 10 dark geese but not more than 2 Large Canada geese (see definitions: 502(a)). Possession limit: triple the daily bag limit.

	(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
		~~for 105 days.~~	
4. Sacramento Valley	White-Fronted Geese	Open concurrently with the goose season through December 21, and during Youth Waterfowl Hunting Days.	Daily bag limit: 3 white-fronted geese. Possession limit: triple the daily bag limit.
5. Morro Bay	All species	Open in designated area only from the opening day of brant season through the remainder of waterfowl season.	
6. Martis Creek Lake	All species	Closed until November 16.	
7. Northern Brant	Black Brant	~~From November 18 extending for 27 days.~~ [Season will be between 0 and 37 days, closing no later than December 14.]	Daily bag limit: 2 Possession limit: triple the daily bag limit.
8. Balance of State Brant	Black Brant	~~From November 19 extending for 27 days.~~ [Season will be between 0 and 37 days, closing no later than December 15.]	Daily bag limit: 2 Possession limit: triple the daily bag limit.
9. Imperial County	White Geese	~~From November 4 extending for a period of 89 days (Regular Season) and February 1-2, 2024, February 5-9, 2024 and February 12-20, 2024 (Late Season).~~ [Season may be split and closing no later than March 10. Season will be no longer than 105 days.] During the Late Season, hunting is only permitted on private lands with the permission of the landowner under provisions of Section 2016, Fish and Game Code.	Daily bag limit: 20 Possession limit: triple the daily bag limit.

(e) Youth Waterfowl Hunting Days Regulations (NOTE: To participate in these Youth Waterfowl Hunts, youth must be accompanied by a non-hunting adult 18 years of age or older. Federal regulations require that hunters must be 17 years of age or younger.)

(1) Statewide Provisions.

(A) Species	*(B) Season*	*(C) Daily Bag Limit*
Ducks (including Mergansers), American Coot, Common Moorhen, Black Brant, Geese	1. Northeastern California Zone: The Saturday fourteen days before the opening of waterfowl season extending for 2 days. 2. Southern San Joaquin Valley Zone: The first Saturday in February extending for 2 days. 3. Southern California Zone: The first Saturday in February extending for 2 days. 4. Colorado River Zone: The Saturday following the closing of waterfowl season extending for 2 days. 5. Balance of State Zone: The first Saturday in February extending for 2 days.	Same as regular season.

(f) Veterans and Active Military Personnel Waterfowl Hunting Days Regulations. NOTE: Veterans (as defined in Section 101 of Title 38, United States Code) and members of the Armed Forces on active duty, including members of the National Guard and Reserves on active duty (other than training), may participate. Persons participating in this special hunt must possess and present upon demand verification of eligibility to participate in this hunt. Verification includes: Veteran’s ID Card, or Military ID Card for active duty, or a State-issued driver’s license or Identification Card with Veteran Designation.

(1) Statewide Provisions.

(A) Species	*(B) Season*	*(C) Daily Bag Limit*
Ducks (including Mergansers), Geese, American Coot, Common Moorhen	1. Northeastern California Zone: The Saturday following the closing of the regular duck season extending for 2 days. Goose hunting in this zone is not permitted during these days. 2. Southern San Joaquin Valley Zone: The second Saturday in February extending for 2 days. 3. Southern California Zone: The second Saturday in February extending for 2 days. 4. Balance of State Zone: The second Saturday in February extending for 2 days. **Option 1:** Goose hunting in this zone is not permitted during these days. **Option 2:** ~~Goose hunting in this zone is not permitted during these days.~~	Same as regular season.

(g) Falconry Take of Ducks (including Mergansers), Geese, American Coots, and Common Moorhens.

(1) Statewide Provisions.

(A) Species	*(B) Season*	*(C) Daily Bag and Possession Limits*
Ducks (including Mergansers), Geese, American Coot and Common Moorhen	1. Northeastern California Zone. ~~Open concurrently with duck season through January 17, 2024.~~ [No longer than 107 days.] 2. Balance of State Zone. ~~Open concurrently with duck season, February 3-4, 2024 and February 17-18, 2024.~~ [No longer than 107 days.] EXCEPT in the North Coast Special Management Area where the falconry season for geese runs concurrently with the season for Small Canada geese (see 502(d)(6)). 3. Southern San Joaquin Valley Zone. ~~Open concurrently with duck season, February 3-4, 2024 and February 17-18, 2024~~ [No longer than 107 days.] Goose hunting in this zone by means of falconry is not permitted. 4. Southern California Zone. ~~Open concurrently with duck season, February 3-4, 2024 and February 17-18, 2024.~~ [No longer than 107 days.] EXCEPT in the Imperial County Special Management Area where the falconry season for geese runs concurrently with the season for white geese.	Daily bag limit: 3 Daily bag limit makeup: • Either all of 1 species or a mixture of species allowed for take. Possession limit: 9
	5. Colorado River Zone. ~~Open concurrently with duck season and February 1-4, 2024.~~ [No longer than 107 days.] Goose hunting in this zone by means of falconry is not permitted. Federal regulations require that California's hunting regulations conform to those of Arizona, where goose hunting by means of falconry is not permitted.

ECONOMIC IMPACT STATEMENT

DEPARTMENT NAME	CONTACT PERSON	EMAIL ADDRESS	TELEPHONE NUMBER
Fish and Game Commission	David Thesell	fgc@fgc.ca.gov	916 902-9291
DESCRIPTIVE TITLE FROM NOTICE REGISTER OR FORM 400			NOTICE FILE NUMBER
Amend Sect. 502, Title 14, CCR re: Waterfowl, Migratory; American Coot and Common Moorhen 2024-25			Z

A. ESTIMATED PRIVATE SECTOR COST IMPACTS *Include calculations and assumptions in the rulemaking record.*

1. Check the appropriate box(es) below to indicate whether this regulation:

- ☐ a. Impacts business and/or employees
- ☐ b. Impacts small businesses
- ☐ c. Impacts jobs or occupations
- ☐ d. Impacts California competitiveness
- ☐ e. Imposes reporting requirements
- ☐ f. Imposes prescriptive instead of performance
- ☐ g. Impacts individuals
- ☒ h. None of the above (Explain below):

Annual conformance with Federal Regulations introduces no cost impacts

If any box in Items 1 a through g is checked, complete this Economic Impact Statement.
If box in Item 1.h. is checked, complete the Fiscal Impact Statement as appropriate.

2. The ______________________ (Agency/Department) estimates that the economic impact of this regulation (which includes the fiscal impact) is:

- ☐ Below $10 million
- ☐ Between $10 and $25 million
- ☐ Between $25 and $50 million
- ☐ Over $50 million *[If the economic impact is over $50 million, agencies are required to submit a Standardized Regulatory Impact Assessment as specified in Government Code Section 11346.3(c)]*

3. Enter the total number of businesses impacted: ____________

Describe the types of businesses (Include nonprofits): ____________

Enter the number or percentage of total businesses impacted that are small businesses: ____________

4. Enter the number of businesses that will be created: ____________ eliminated: ____________

Explain: ____________

5. Indicate the geographic extent of impacts: ☐ Statewide

☐ Local or regional (List areas): ____________

6. Enter the number of jobs created: ____________ and eliminated: ____________

Describe the types of jobs or occupations impacted: ____________

7. Will the regulation affect the ability of California businesses to compete with other states by making it more costly to produce goods or services here? ☐ YES ☐ NO

If YES, explain briefly: ____________

ECONOMIC AND FISCAL IMPACT STATEMENT
(REGULATIONS AND ORDERS)

STD. 399 (Rev. 10/2019)

ECONOMIC IMPACT STATEMENT (CONTINUED)

B. ESTIMATED COSTS *Include calculations and assumptions in the rulemaking record.*

1. What are the total statewide dollar costs that businesses and individuals may incur to comply with this regulation over its lifetime? $ ______

   a. Initial costs for a small business: $ ______ Annual ongoing costs: $ ______ Years: ______

   b. Initial costs for a typical business: $ ______ Annual ongoing costs: $ ______ Years: ______

   c. Initial costs for an individual: $ ______ Annual ongoing costs: $ ______ Years: ______

   d. Describe other economic costs that may occur: ______

2. If multiple industries are impacted, enter the share of total costs for each industry: ______

3. If the regulation imposes reporting requirements, enter the annual costs a typical business may incur to comply with these requirements. *Include the dollar costs to do programming, record keeping, reporting, and other paperwork, whether or not the paperwork must be submitted.* $ ______

4. Will this regulation directly impact housing costs? ☐ YES ☐ NO

   If YES, enter the annual dollar cost per housing unit: $ ______

   Number of units: ______

5. Are there comparable Federal regulations? ☐ YES ☐ NO

   Explain the need for State regulation given the existence or absence of Federal regulations: ______

   Enter any additional costs to businesses and/or individuals that may be due to State - Federal differences: $ ______

C. ESTIMATED BENEFITS *Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. Briefly summarize the benefits of the regulation, which may include among others, the health and welfare of California residents, worker safety and the State's environment: ______

2. Are the benefits the result of: ☐ specific statutory requirements, or ☐ goals developed by the agency based on broad statutory authority?

   Explain: ______

3. What are the total statewide benefits from this regulation over its lifetime? $ ______

4. Briefly describe any expansion of businesses currently doing business within the State of California that would result from this regulation: ______

D. ALTERNATIVES TO THE REGULATION *Include calculations and assumptions in the rulemaking record. Estimation of the dollar value of benefits is not specifically required by rulemaking law, but encouraged.*

1. List alternatives considered and describe them below. If no alternatives were considered, explain why not: ______

Reset Form

STATE OF CALIFORNIA — DEPARTMENT OF FINANCE

ECONOMIC AND FISCAL IMPACT STATEMENT (REGULATIONS AND ORDERS)

STD. 399 (Rev. 10/2019)

ECONOMIC IMPACT STATEMENT (CONTINUED)

2. Summarize the total statewide costs and benefits from this regulation and each alternative considered:

   Regulation: Benefit: $ ____________ Cost: $ ____________

   Alternative 1: Benefit: $ ____________ Cost: $ ____________

   Alternative 2: Benefit: $ ____________ Cost: $ ____________

3. Briefly discuss any quantification issues that are relevant to a comparison of estimated costs and benefits for this regulation or alternatives: ____________

4. Rulemaking law requires agencies to consider performance standards as an alternative, if a regulation mandates the use of specific technologies or equipment, or prescribes specific actions or procedures. Were performance standards considered to lower compliance costs? ☐ YES ☐ NO

   Explain: ____________

E. MAJOR REGULATIONS *Include calculations and assumptions in the rulemaking record.*

California Environmental Protection Agency (Cal/EPA) boards, offices and departments are required to submit the following (per Health and Safety Code section 57005). Otherwise, skip to E4.

1. Will the estimated costs of this regulation to California business enterprises **exceed $10 million**? ☐ YES ☐ NO

If YES, complete E2. and E3
If NO, skip to E4

2. Briefly describe each alternative, or combination of alternatives, for which a cost-effectiveness analysis was performed:

   Alternative 1: ____________

   Alternative 2: ____________

   (Attach additional pages for other alternatives)

3. For the regulation, and each alternative just described, enter the estimated total cost and overall cost-effectiveness ratio:

   Regulation: Total Cost $ ____________ Cost-effectiveness ratio: $ ____________

   Alternative 1: Total Cost $ ____________ Cost-effectiveness ratio: $ ____________

   Alternative 2: Total Cost $ ____________ Cost-effectiveness ratio: $ ____________

4. Will the regulation subject to OAL review have an estimated economic impact to business enterprises and individuals located in or doing business in California exceeding $50 million in any 12-month period between the date the major regulation is estimated to be filed with the Secretary of State through12 months after the major regulation is estimated to be fully implemented?

   ☐ YES ☐ NO

   If YES, agencies are required to submit a Standardized Regulatory Impact Assessment (SRIA) as specified in Government Code Section 11346.3(c) and to include the SRIA in the Initial Statement of Reasons.

5. Briefly describe the following:

   The increase or decrease of investment in the State: ____________

   The incentive for innovation in products, materials or processes: ____________

   The benefits of the regulations, including, but not limited to, benefits to the health, safety, and welfare of California residents, worker safety, and the state's environment and quality of life, among any other benefits identified by the agency: ____________

FISCAL OFFICER SIGNATURE	DATE
DocuSigned by: Dan Reagan 6550B701E2D347D...	1/12/2024

The signature attests that the agency has completed the STD. 399 according to the instructions in SAM sections 6601-6616, and understands the impacts of the proposed rulemaking. State boards, offices, or departments not under an Agency Secretary must have the form signed by the highest ranking official in the organization.

AGENCY SECRETARY	DATE
DocuSigned by: Melissa A. Miller-Henson 74DED80ABE5A488... Bryan Cash 1/16/2024	1/9/2024

Finance approval and signature is required when SAM sections 6601-6616 require completion of Fiscal Impact Statement in the STD. 399.

DEPARTMENT OF FINANCE PROGRAM BUDGET MANAGER	DATE

STD. 399 Addendum

Amend Section 502
Title 14, California Code of Regulations
Re: Waterfowl, Migratory; American Coot and Common Moorhen (Common Gallinule)

ECONOMIC IMPACT STATEMENT

Proposed Regulations

Section 355 of the Fish and Game Code authorizes the Fish and Game Commission (Commission) to adopt annual regulations pertaining to the hunting of migratory birds that conform with or further restrict the regulations prescribed by the U.S. Fish and Wildlife Service (Service) pursuant to its authority under the Migratory Bird Treaty Act. The Service annually establishes federal regulation frameworks (Frameworks) for migratory bird hunting. The Frameworks describe the earliest dates that waterfowl hunting seasons may open, the maximum number of days hunting can occur, the latest dates that hunting seasons must close, and the maximum daily bag limit. States may make recommendations to change the Frameworks. This annual update allows the Commission to select and establish state regulations that specify hunting season dates and daily bag limits.

The Department-recommended changes to Section 502, Title 14, California Code of regulations are:

1) Decrease the duck season length to 98 days in subsection 502(d)(2)(B) for the Southern San Joaquin Valley Zone, in subsection 502(d)(3)(B) for the Southern California Zone, and in subsection 502(d)(5)(B) for the Balance of State Zone.

The existing duck season length for the referenced zones is 103 days. Adjusting the season length from 103 to 98 days is necessary for the upcoming season in order to close on January 31 and maintain a traditional opening Saturday in late October. In prior rulemakings, the Commission adopted the latest possible closing date of January 31 rather than the historical closing day of the last Sunday in January. This annual adjustment also results in modifications to falconry-only seasons.

2) Decrease the goose season length to 98 days in subsection 502(d)(2)(B) for the Southern San Joaquin Valley Zone, in subsection 502(d)(3)(B) for the Southern California Zone, and in subsection 502(d)(5)(B) for the Balance of State Zone.

The existing goose season length for the Southern San Joaquin Valley and Southern California zones is 103 days and 100 days in the Balance of State Zone. See item 1 above for the justification. This annual adjustment also results in modifications to Veterans and Active Military Personnel Waterfowl Hunting Days (VAMP Days) and falconry-only seasons.

3) Allow geese to be taken during VAMP Days in subsection 502(f)(B)4 for the Balance of State Zone.

The existing regulation does not allow geese because all available hunting days in the Balance of State Zone were allocated prior to implementation of VAMP Days. See item 1 above. The decrease in the goose season to 98 days allows the option of goose hunting during VAMP Days in this zone while still offering the existing early and late goose seasons. See option 2 in regulatory text in subsection 502(f)(B)4. However, in future rulemakings, either modifying the timing or reducing the Late Season will need to be considered to allow goose hunting during VAMP Days in this zone.

4) Allow up to five days of falconry-only season in subsection 502(g)(1)(B) for the Southern San Joaquin Valley, Southern California and Balance of State zones.

The existing regulation does not allow a falconry-only season because all available hunting days have been allocated. The length of the falconry-only season is contingent upon the number of days used for the general duck and goose seasons, in addition to the Youth and Veteran Hunt Days, as seasons cannot exceed 107 days.

SECTION A. ESTIMATED PRIVATE SECTOR COST IMPACTS

Question 1. Answer h. None of the above (Explain below):

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action because the proposed amendments to state regulations in accordance with Federal Frameworks will not introduce new compliance costs to the private sector – the total season length of 107 remains the same.

FISCAL IMPACT STATEMENT

SECTION A. FISCAL EFFECT ON LOCAL GOVERNMENT

Answer 5. No Fiscal impact exists. This regulation does not affect any local entity or program.

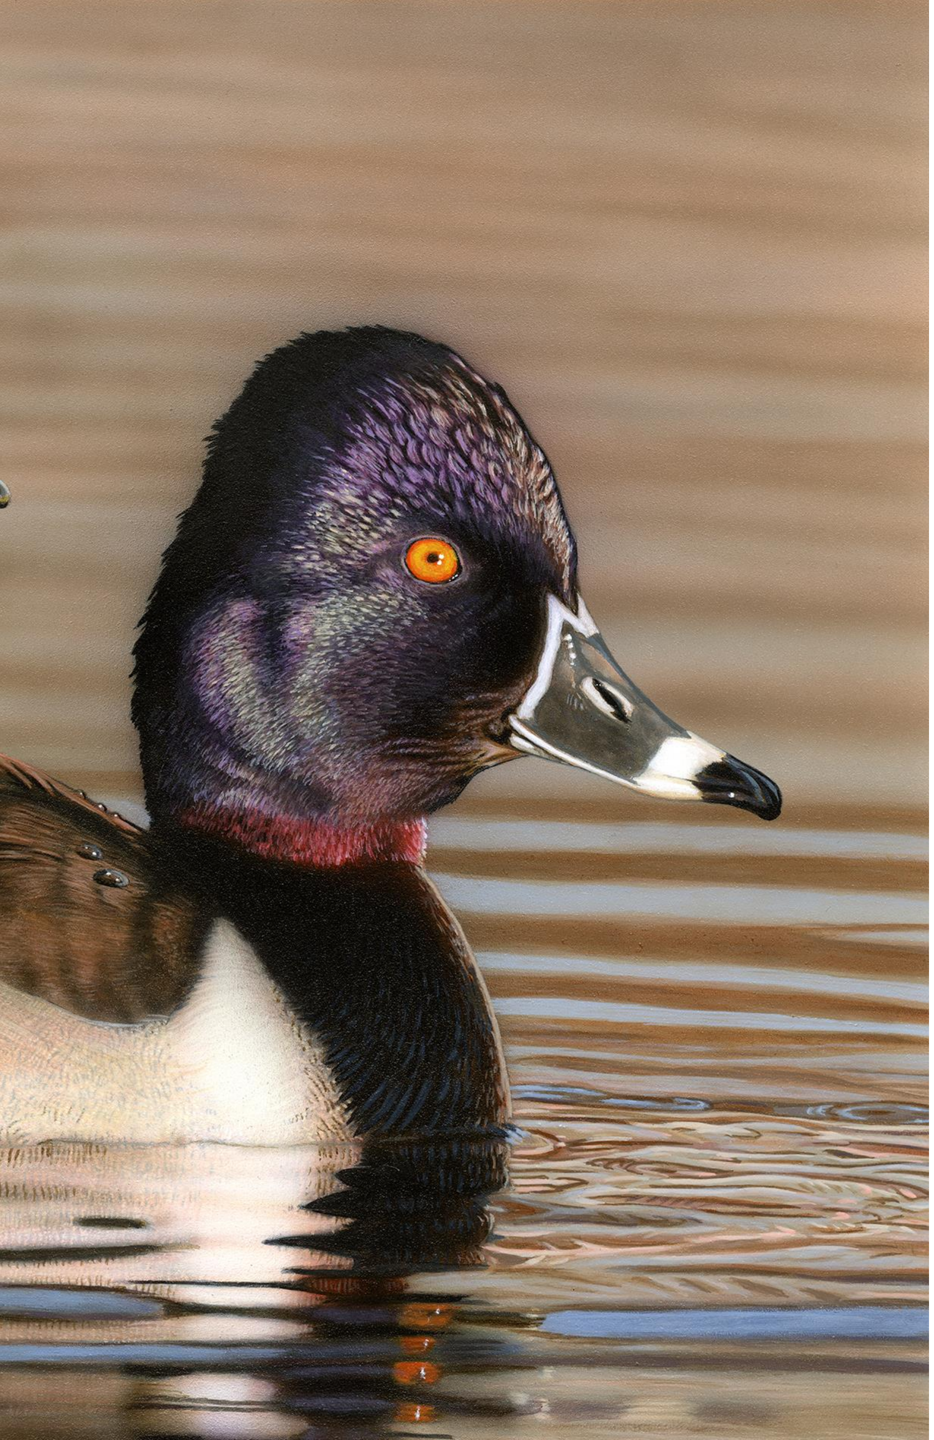
SECTION B. FISCAL IMPACT ON STATE GOVERNMENT

Answer 3. No Fiscal impact exists. This regulation does not affect any state agency or program.

Explanation: The Department Wildlife program oversight, Law Enforcement Branch, and License and Revenue Branch work is projected to be unchanged from currently existing budgets and resources.

SECTION C. FISCAL EFFECT ON FEDERAL FUNDING OF STATE PROGRAMS

Answer 3. No fiscal impact exists. This regulation does not affect any federally funded State agency or program.



2024-25 SECTION 502 WATERFOWL HUNTING

Adoption Meeting

PRESENTATION TO THE CALIFORNIA FISH AND GAME COMMISSION

April 18, 2024
Melanie Weaver
Wildlife Branch

CALIFORNIA DEPARTMENT OF FISH & WILDLIFE

Overview

Federal Frameworks

No Change

Department Recommendation

Summary of Department Recommendation

Decrease duck season length in most zones to 98 days

Allow geese during VAMP Days in the Balance of State Zone*

Falconry-only season 5 days in most zones

Duck Season Recommendation

Northeast Zone

- Regular Season: Oct 5 – Jan 15
- Scaup: Oct 5 – Dec 1 & Dec 19 – Jan 15

Bal of State, So San Joaquin Valley, So CA zones

- Regular Season: Oct 26 – Jan 31 (98 days)
- Scaup: Nov 7 – Jan 31

Colorado River Zone

- Regular Season: Oct 23 – Jan 31
- Scaup: Nov 7 – Jan 31

7 ducks/7 mallards (2 hens)/1 pintail/ 2 scaup, canvasback, redhead

Balance of State Zone – Goose Season Recommendation

Early Season Canada geese
- Sept 28 – 30

Regular Season
- Oct 26 – Jan 31 (98 days)

Late Season*
- Canada geese: Feb 15 – 16 or Feb 8 – 9
- White & white-fronted geese: Feb 15 – 19 or Feb 8 – 12
  - **Option 1** maintain goose closure on Type A/B areas
  - **Option 2** allow geese on Type A/B areas

30/day: 20 white/10 dark geese

Northeast Zone Goose Recommendation

Regular Season

- Canada geese: Oct 5 – Jan 12
- White & white-fronted geese: Oct 5 – Dec 1 & Jan 3 – 15

Late Season

- White & white-fronted geese: Feb 5 – Mar 10

30/day: 20 white/10 dark geese, no more than 2 Large Canada geese

Goose Season Recommendation Continued

So San Joaquin Valley and So CA zones

- Oct 26 – Jan 31 (98 days)
- 30/day: 20 white/10 dark geese in S.S.J. Valley Zone
- 3 dark geese in So CA Zone

Colorado River Zone

- Oct 23 – Jan 31
- 25/day: up to 20 white/5 dark geese

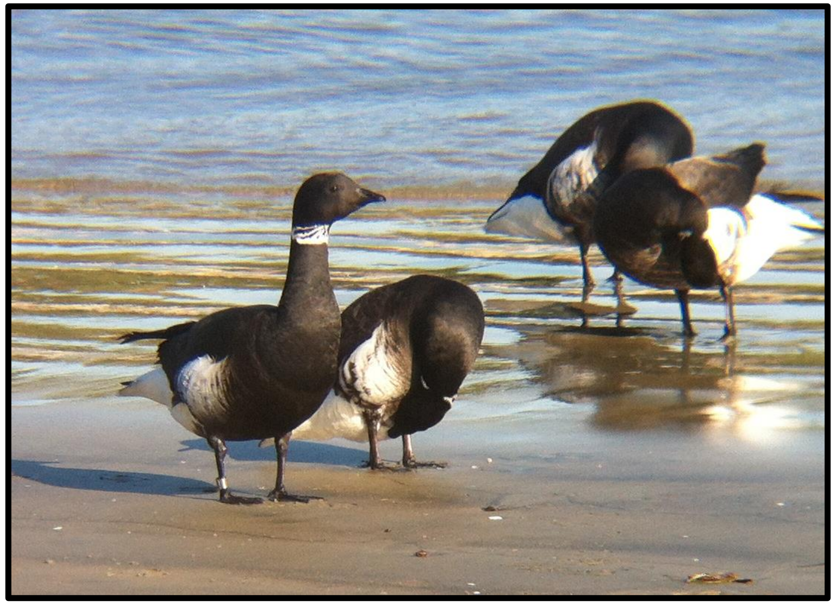
Brant Season Recommendation

Northern Brant

- Nov 18 – Dec 14

Balance of State Brant

- Nov 19 – Dec 15



Special Management Area Recommendation

North Coast

- Regular Season: Oct 5 – Dec 21
- Late Season: Feb 12 – Mar 10

Klamath Basin

- Canada Goose: Oct 5 – Jan 12
- White & white-fronted Geese: Oct 5 – Jan 17

Sac Valley

- Oct 26 – Dec 21

Imperial County

- Regular Season: Nov 4 – Jan 31
- Late Season: Feb 3 – 9, 12- 20

Youth & Veteran Hunt Days Recommendation

Youth Hunt Days

- NE Zone: Sept 21 – 22
- Other zones: Feb 1 – 2 (except Co Zone: Feb 8 – 9)

Veteran Hunt Days

- NE Zone: Jan 18 – 19
- All other zones: Feb 8 – 9
    - **Option 1** Goose hunting not allowed
    - **Option 2** Goose hunting allowed

Options to Allow Goose Hunting on VAMP Days in Bal of State Zone

- **Provide 2 unused goose days to VAMP**

  Will not be possible after 24/25, occurs every 5-6 years (like Falconry-only days)

- **Move Late Goose Season to overlap VAMP Days (Feb 8 – 12)**
  - Maintain closure on type a/b areas in North Central/Central regions

  Or

  - Allow geese during Late Goose Season

Falconry-Only Recommendation

Northeastern Zone: None

Balance of State, So San Joaquin Valley & So CA zones:
Feb 22 - 26 (5 days)

Colorado River Zone: Feb 1 – 4

President Eric Sklar
California Fish and Game Commission
1416 Ninth Street, Room 1320 (fgc@fgc.ca.gov)
Sacramento, CA 95814

RE: Section 502, Balance of State Zone Late Goose Season

Dear President Sklar:

On behalf of the California Farm Bureau, which represents more than 30,000 members who strive to protect and improve the ability of farmers and ranchers engaged in production agriculture all over this state. We are also proud stewards of the land who provide reliable and affordable food and fiber for not only Californians but for people around the world. The focus of our comments will be on late-season hunting, which has proven important in reducing crop and pasture losses.

Our two areas of interest center around two issues. First, we believe that goose hunting should not include a change to allow public land to be hunted on during late season because it could scare birds to go back to agricultural properties with the potential for increased damage for impacted farms in those areas. Secondly, the change in date to move to the start of the season met with differing opinions within our membership. After looking at all the available options, the bottom line of all this is that we urge the duration of the goose hunt to stay the same and not be shortened.

The Farm Bureau recognizes there is no perfect solution to this issue. The California Department of Fish and Wildlife (DFW) has been responsive to many concerns surrounding late season hunting and we will continue to work with the department, California Fish and Game Commission and interested parties to insure we can continue this in the future. As always, we appreciate your thoughtful review of our comments and look forward to working with you in the future.

Sincerely,

Chris Reardon
Director, Government Affairs
California Farm Bureau

Subject: 2024 Waterfowl Regs Comment (North Coast Management Area)

Dear CAFGC,

Dear California Fish and Game Commission,

I am your average, everyday waterfowl hunter, and I am writing to respectfully urge you to place the early Aleutian Goose season dates back into the regular season for the North Coast Management Area. The current regulations are inequitable and only benefit the select few that have private property or private property access. I'm unclear as to why the dates were taken out of the peak part of the season and moved to early October when hardly any Aleutian Geese are around, public refuges and areas are closed to hunting, and most hunters in the area are out in the mountains big game hunting and could care less about shooting geese. I've heard rumors that the commission succumbed to pressure from a select group of private ranchers and did not have the general public at heart. It was extremely painful this year to watch tens of thousands of geese fly mere feet over my head in the peak of the waterfowl season for weeks on end with me unable to pull the trigger because the season was closed. Most Aleutian geese I harvest are in late December and early January. It is the prime part of the season when Aleutians number in the tens of thousands, yet these days were taken away from us for what reason? To appease ranchers? To benefit only a select few? In a state that prides itself on equity, the current goose regulations in the North Coast Management Area are anything but equitable. Please place the Aleutian Goose season dates back into the regular season to benefit everyone and not the few.

Respectfully,

Dustin Kuehn

Fish and Game Commission
Initial Statement of Reasons for Regulatory Action

Amend Sections 362
Title 14, California Code of Regulations
Re: Nelson bighorn sheep

I. Date of Initial Statement of Reasons: October 1, 2023

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing:

Date: December 13, 2023 Location: San Diego, CA

(b) Discussion Hearing:

Date: February 15, 2024 Location: Sacramento, CA

(c) Adoption Hearing:

Date: April 18, 2024 Location: San Jose, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

The Fish and Game Commission (Commission) periodically considers the recommendations of the Department of Fish and Wildlife (Department) in updating Nelson bighorn sheep regulations. Considerations include recommendations for adjusting tag quotas, setting hunt periods, modifying zone boundaries, authorizing methods of take, among others, to help achieve management goals and objectives for Nelson bighorn sheep. Section 362 provides descriptions of hunt zone boundaries, season opening and closing dates, and tag quotas (total number of hunting tags to be made available) for Nelson bighorn sheep. To maintain appropriate harvest levels and hunting quality, tags must be adjusted periodically in response to dynamic environmental, biological, and social conditions.

The proposed changes focus on Nelson bighorn sheep hunting tag quotas under Section 362(d). The last time these regulations were subject to major amendment was 2022-2023. The proposed amendments here represent the cumulation of the Department’s internal discussions/data analysis. The proposed changes are necessary to maintain sustainable hunt opportunities, consistency with management unit plan recommendations, and Fish and Game Code. Subdivision (b)(2) of Fish and Game Code Section 4902 states the Commission may not adopt regulations authorizing the sport hunting in a single year of more than 15 percent of the mature Nelson bighorn rams in a single management unit, management recommendations are consistent with this mandate.

BACKGROUND

Current regulations in Section 362 specify Nelson bighorn sheep tag quotas for each hunt zone and establish hunt zone boundaries in accordance with management goals and objectives described in the management unit plans. The Department's goal is to increase bighorn sheep hunting opportunities where feasible and compatible with population objectives, in which case recommendations will be offered to the Commission.

CURRENT REGULATIONS

Current laws governing bighorn sheep hunting are as follows:

Section 362 provides definitions, hunting zone descriptions, season opening and closing dates, tag quotas (total number of hunting tags to be made available), and bag and possession limits for bighorn sheep hunting. Individuals are awarded a bighorn sheep hunting tag through the Department's Big Game Drawing. A limited number of fundraising tags are also available for purchase, usually by auction, via non-governmental organizations that assist the Department with fundraising.

Harvest of a bighorn sheep is authorized for an individual with a tag for a respective hunt zone and season. Tag quotas are established based on a variety of factors, including population density and abundance, age and sex composition, and distribution.

PROPOSED REGULATIONS

The proposed changes to Section 362 include amending Subsection 362(d) to modify hunt tag quotas for each zone to ranges as identified in the 2019 Environmental Document on Bighorn Sheep Hunting. Periodic adjustments of tag quotas in response to dynamic environmental, and biological conditions are necessary to maintain sustainable populations of bighorn sheep and hunt opportunities, as well as keeping with mandates and management recommendations. Unfortunately, administrative procedures and the Fish and Game Code require the Fish and Game Commission to receive proposed changes to existing regulations prior the completion of surveys and analyses, thus necessitating a range of numbers. Analyses are scheduled for completion by March 2024.

Additional changes are made in subsection 362(a) for punctuation and re-arrangement of certain language regarding the descriptions of the hunt zones adds clarity to how the hunt zone areas are described and consistency with other big game sections in Title 14. Additional changes in subsection 362(b) clarify the duration of the hunt seasons per zone, and other corrections to punctuation throughout Section 362 are non-substantive.

(b) Goals and Benefits of the Regulation

The goals and benefits of the regulations are to help maintain sustainable populations of desert bighorn sheep, maintain sustainable hunt opportunities, achieve management recommendations in existing unit plans, and so as not to exceed the 15 percent threshold identified in subdivision (b)(2) of Fish and Game Code Section 4902.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: 200, 203, 203.1, 265, 1050, and 4902 Fish and Game Code

Reference: 1050, 3950, and 4902 Fish and Game Code

(d) Specific Technology or Equipment Required by Regulatory Change: None

(e) Identification of Reports or Documents Supporting Regulation Change:

- 2019 Environmental Document Regarding Bighorn Sheep Hunting

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

- Wildlife Resources Committee, May 2023
- Wildlife Resources Committee, September 2023

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

No alternatives were identified or brought to the attention of the Commission staff that would have the same desired regulatory effect.

(b) No Change Alternative

Without the proposed changes, the outstanding issues concerning the regulations currently governing bighorn sheep hunting would remain unaddressed. The no change alternative was considered and rejected because it would not be consistent with maintaining bighorn sheep populations within desired population objectives. Subdivision (b) of Fish and Game Code Section 4902 and management unit plans specify desired harvest levels. Retaining the current tag quota for each zone may not be responsive to environmental and biological changes in the status of various herds. The no-change alternative would not allow for adjustment of tag quotas in response to changing environmental and biological conditions.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing hunts. Given the number of tags available and the area over which they are distributed, these proposals are economically neutral to business.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission does not anticipate impacts on the creation or elimination of jobs within the state, the creation of new business, the elimination of existing businesses, or the expansion of businesses in California because the expected economic impacts of the proposed regulations are unlikely to be substantial enough to substantially stimulate demand for goods or services related to Nelson bighorn sheep hunting. If greater numbers of hunters visit the areas in the state with increased opportunities, businesses that provide goods and services to Nelson bighorn sheep hunters could benefit from small increases in sales. Conversely, if fewer tags are awarded and less hunters visit the areas in the state with decreased opportunities, businesses that provide goods and services to Nelson bighorn sheep hunters could be negatively affected from small decreases in sales. The Commission does not anticipate direct benefits to the general health and welfare of California residents, the environment, or to worker safety, however California residents will benefit generally through access to recreational opportunities created by the proposed changes.

(c) Cost Impacts on a Representative Private Person or Business

The total net number of tags is anticipated to be same as the previous year, so no net economic impacts to individuals or to businesses that support Nelson bighorn sheep hunts are anticipated. As such, the Commission does not anticipate significant impacts on the representative private persons or businesses.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None

(e) Nondiscretionary Costs/Savings to Local Agencies: None

(f) Programs Mandated on Local Agencies or School Districts: None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None

(h) Effect on Housing Costs: None

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

The Commission does not anticipate impacts on the creation or elimination of jobs within the State.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The Commission does not anticipate impacts on the creation of new business, the elimination of existing businesses within the state because the expected economic impacts of the proposed regulations are unlikely to be substantial enough to stimulate demand for goods or services related to Nelson bighorn sheep hunting.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The Commission does not anticipate impacts on the expansion of businesses currently doing business within the state because the expected economic impacts of the proposed regulations are unlikely to be substantial enough to stimulate demand for goods or services related to Nelson bighorn sheep hunting.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

Hunting is an outdoor activity that can provide several health and welfare benefits to California residents. Hunters and their families benefit from fresh game to eat, and from the benefits of outdoor recreation, including exercise. People who hunt have a special connection with the outdoors and an awareness of the relationships between wildlife, habitat, and humans, and can be a family tradition and a bonding activity.

(e) Benefits of the Regulation to Worker Safety

The Commission does not anticipate impacts on worker safety.

(f) Benefits of the Regulation to the State's Environment

As set forth in Fish and Game Code section 1700, it is the policy of the state to encourage the conservation, maintenance, and utilization of fish and wildlife resources for the benefit of all the citizens of the state. The objectives of this policy include, but are not limited to, the maintenance of populations of Nelson bighorn sheep to ensure their continued existence and supporting recreational opportunity. Adoption of scientifically tag quotas provides for the maintenance of Nelson bighorn sheep populations to ensure those objectives are met. The fees that hunters pay for licenses and tags help fund wildlife conservation.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

Current regulations in Section 362 provide definitions, hunting zone descriptions, season opening and closing dates, tag quotas (total number of hunting tags to be made available), and bag and possession limits for bighorn sheep hunting. Individuals are awarded a bighorn sheep hunting tag through the California Department of Fish and Wildlife (Department's) Big Game Drawing. A limited number of fundraising tags are also available for purchase, usually by auction, via non-governmental organizations that assist the Department with fundraising.

Harvest of a bighorn sheep is authorized for an individual with a tag for a respective hunt zone and season. Tag quotas are established based on a variety of factors including population density and abundance, age and sex composition, and distribution.

The proposed changes are as follows:

> **Amend Subsection 362(d)** to modify hunt tag quotas to ranges for each hunt zone.
>
> Periodic adjustments of tag quotas in response to dynamic environmental and biological conditions are necessary to maintain sustainable populations of bighorn sheep and hunt opportunities, as well as keeping with mandates and management recommendations. Unfortunately, administrative procedures and the Fish and Game Code require the Fish and Game Commission to receive proposed changes to existing regulations prior the completion of surveys and analyses, thus necessitating a range of numbers. Analyses are scheduled for completion by March 2024.
>
> Non-substantive editing to improve the clarity and consistency of the regulatory language has been made in section 362.

Benefit of the Regulations:

The goals and benefits of the regulations are to help maintain sustainable populations of desert bighorn sheep, maintain sustainable hunt opportunities, achieve management recommendations in existing unit plans, and so as not to exceed the 15 percent threshold identified in subdivision (b)(2) of Fish and Game Code Section 4902.

Consistency and Compatibility with Existing Regulations:

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. Section 20, Article IV, of the state Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to adopt regulations governing nelson bighorn sheep (California Fish and Game Code Section 4902). No other state agency has the authority to adopt regulations governing Nelson bighorn sheep. The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the CCR for any regulations regarding the adoption of Nelson bighorn sheep regulations; therefore, the Commission has concluded that the proposed regulations are neither inconsistent nor incompatible with existing state regulations.

Proposed Regulatory Language

Section 362, Title 14 CCR, is amended to read:

§ 362. Nelson Bighorn Sheep.

(a) Areas:

(1) ~~Zone 1—Marble/Clipper Mountains:~~ Zone 1 (Marble/Clipper Mountains)

(A) Area: In that ~~That~~ portion of San Bernardino County beginning at the intersection of Kelbaker Road and the National Trails Highway; north on Kelbaker Road to the junction with Interstate Highway 40; east on Interstate Highway 40 to the intersection with National Trails Highway; southwest on National Trails Highway to junction with Kelbaker Road.

(2) ~~Zone 2—Kelso Peak and Old Dad Mountains:~~ Zone 2 (Kelso Peak and Old Dad Mountains)

(A) Area: In that ~~That~~ portion of San Bernardino County beginning at the intersection of Kelbaker Road and the Union Pacific Railroad in Kelso; southwest along the Union Pacific Railroad to intersection with unnamed road at Crucero; north on unnamed road to the merging with Mojave Road; northeast on Mojave Road to the junction with Zzyzx Road; north on Zzyzx Road to intersection with Interstate Highway 15; northeast on Interstate Highway 15 to the intersection with Cima Road; south on Cima Road to the intersection with the Union Pacific Railroad in Cima; southwest on the Union Pacific Railroad to the intersection with Kelbaker Road in Kelso.

(3) ~~Zone 3—Clark and Kingston Mountain Ranges:~~ Zone 3 (Clark and Kingston Mountain Ranges)

(A) Area: In that ~~That~~ portion of San Bernardino and Inyo counties beginning at the intersection of Interstate Highway 15 and California State Highway 127 in Baker; north on California State Highway 127 to the junction with Old Spanish Gentry Road at Tecopa; southeast on Old Spanish Gentry Road to the junction with Furnace Creek Road; southeast on Furnace Creek Road to the junction with Mesquite Valley Road; north on Mesquite Valley Road to Old Spanish Trail Highway; north and east on Old Spanish Trail Highway to the~~California/Nevada~~ California-Nevada state line; southeast ~~on California/Nevada~~ along the California-Nevada state line to the intersection with Interstate Highway 15; southwest on Interstate Highway 15 to the junction with California State Highway 127.

(4) ~~Zone 4—Orocopia Mountains:~~ Zone 4 (Orocopia Mountains)

(A) Area: In that ~~That~~ portion of Riverside County beginning at the intersection of Interstate Highway 10 and Cottonwood Springs Road; east on Interstate Highway 10 to the junction with Red Cloud Mine Road; south on Red Cloud Mine Road to the junction with the Eagle Mountain Mining Railroad; southwest on the Eagle Mountain Mining Railroad to the junction with the Bradshaw Trail; southwest on the Bradshaw Trail to the Intersection with the Coachella Canal; west along the Coachella Canal to the junction with Box Canyon Road; northeast on Box Canyon Road to the junction with Cottonwood Springs Road; north on Cottonwood Springs Road to the intersection with Interstate Highway 10.

(5) ~~Zone 5—San Gorgonio Wilderness:~~ Zone 5 (San Gorgonio Wilderness)

(A) Area: In that ~~That~~ portion of Riverside and San Bernardino counties beginning at the intersection of Interstate Highway 10 and California State Highway 62, west on Interstate Highway 10 to the junction with California State Highway 30; north on California State Highway 30 to the junction with California State Highway 38; east and north on California State Highway 38 to the junction with Forest Service Route 1N01; east on Forest Service Route 1N01 to its joining with Pipes Road; east on Pipes Road to the junction with Pioneertown Road; southeast on Pioneertown Road to the junction with California State Highway 62; southwest on California State Highway 62 to the intersection with Interstate Highway 10.

(6) ~~Zone 6—Sheep Hole Mountains:~~ Zone 6 (Sheep Hole Mountains)

(A) Area: In that ~~That~~ portion of San Bernardino County beginning at the junction of California State Highway 62 and Ironage Road; northwest on Ironage Road to the intersection with Amboy Road; north on Amboy Road to the intersection with National Trails Highway; east on National Trails Highway to the junction with Saltus Road; southeast on Saltus Road to the junction with unnamed road in Saltus that runs through Cadiz Valley; southeast on unnamed road to the intersection with California State Highway 62; west on California State Highway 62 to the junction with Ironage Road.

(7) ~~Zone 7—White Mountains:~~ Zone 7 (White Mountains)

(A) Area: In that ~~That~~ portion of Mono County within a line beginning at U.S. Highway 6 and the Mono−Inyo county line; northward on Highway 6 to the California−Nevada ~~State Line~~ state line; southeasterly along the California−Nevada ~~State Line~~ state line to the Mono−Inyo ~~County Line~~ county line; westward along the Mono−Inyo ~~County Line~~ county line to the point of beginning.

(8) ~~Zone 8 — South Bristol Mountains:~~ Zone 8 (South Bristol Mountains)

(A) Area: In that ~~That~~ portion of San Bernardino County beginning at the junction of Kelbaker Road and the National Trails Highway; west on the National Trails Highway to the intersection with Interstate Highway 40; east on Interstate Highway 40 to the junction with Kelbaker Road; south on Kelbaker Road to the point of beginning.

(9) ~~Zone 9 — Cady Mountains:~~ Zone 9 (Cady Mountains)

(A) Area: In that ~~That~~ portion of San Bernardino County beginning at the junction of Interstate Highway 40 and Newberry Road; north on Newberry Road to intersection with Riverside Road; ~~East~~east on Riverside Road to junction with Harvard Road; north on Harvard Road to junction with Interstate Highway 15; northeast on Interstate Highway 15 to junction with Basin Road; south on Basin Road to intersection with Union Pacific Railroad; east ~~on~~ along Union Pacific Railroad to intersection with Crucero Road; south on Crucero Road to intersection with Interstate Highway 40; west on Interstate Highway 40 to the point of beginning.

(10) ~~Zone 10 — Newberry, Rodman and Ord Mountains:~~ Zone 10 (Newberry, Rodman, and Ord Mountains)

(A) Area: In that ~~That~~ portion of San Bernardino County beginning at the junction Interstate 40 and Barstow Road; ~~South~~ south on Barstow Road to the junction with Northside Road; ~~East~~ east on Northside Road to the intersection with Camp Rock Road; ~~Northeast~~ northeast on Camp Rock Road to the intersection with Powerline Road; ~~East~~ east on Powerline Road ~~and continue on~~ to Transmission Line Road to the intersection with Interstate 40~~, West along Interstate 40,~~ ; west on Interstate 40 to the point of the beginning.

(b) Seasons:

(1) Open Zone ~~Fund-raising~~ Fundraising Tag: The holder of the ~~fund-raising~~ fundraising license tag issued pursuant to subsection 4902(d) of the Fish and Game Code may hunt:

(A) Zones 1 through 4, 6, 8 and 9: Beginning the first Saturday in November and extending through the first Sunday in February.

(B) Zone 5: Beginning the third Saturday in November and extending through the third Sunday in February.

(C) Zone 7: Beginning the first Saturday in August and extending through the last Sunday in September.

(2) Marble/Clipper/South Bristol Mountains ~~Fund-raising~~ Fundraising Tag: The holder of the ~~fund-raising~~ fundraising license tag issued pursuant to subsection 4902(d) of the Fish and Game Code may hunt:

(A) Zones 1 and 8: Beginning the first Saturday in November and extending through the first Sunday in February.

(3) Cady Mountains ~~Fund-raising~~ Fundraising Tag: The holder of the ~~fund-raising~~ fundraising license tag issued pursuant to subsection 4902(d) of the Fish and Game Code may hunt:

(A) Zone 9: Beginning the first Saturday in November and extending through the first Sunday in February.

(4) Except as provided in subsection 362(b)(1), the Nelson bighorn sheep season in the areas described in subsection 362(a) shall be defined as follows:

(A) Zones 1, 2, 3, 4, 6, 8, 9, and 10: Beginning the ~~The~~ first Saturday in December and ~~extend~~ extending through the first Sunday in February.

(B) Zone 5: Beginning the ~~The~~ third Saturday in December and ~~extend~~ extending through the third Sunday in February.

(C) Zone 7: Beginning the third Saturday in August and extending through the last Sunday in September.

(5) Except as specifically provided in section 362, the take of bighorn sheep is prohibited.

(c) Bag and possession Limit: One mature ram defined as follows: a male Nelson bighorn sheep (Ovis canadensis nelsoni) having at least one horn, the tip of which extends beyond a point in a straight line beginning at the front (anterior) edge of the horn base, and extending downward through the rear (posterior) edge of the visible portion of the eye and continuing downward through the horn. All reference points are based on viewing the ram directly from a 90 degree angle from which the head is facing. A diagram showing the correct viewing procedure shall be distributed by the department to each successful applicant.

(d) Number of License Tags:

Nelson Bighorn Sheep Hunt Zones	*Tag Allocation*

Total:	~~26~~ 0-42

(e) Conditions:

(1) Nelson bighorn rams shall only be taken between one−half hour before sunrise and one−half hour after sunset.

(2) Only methods specified in sections 353 and 354, Title 14, CCR, for taking bighorn sheep may be used.

(3) Each tagholder shall possess a spotting telescope capable of magnification of 15 power (15X), which is not affixed to a rifle, while hunting.

(4) Successful general tagholders shall present the head and edible portion of the carcass of a bighorn ram to the department's checking station within 48 hours after killing the animal. All successful tagholders shall notify the department's Bishop office by telephone at (760) 872−1171 or (760) 872−1346 within 24 hours of killing the animal and arrange for the head and carcass to be examined.

(5) All successful bighorn sheep tagholders shall make the horns of each ram available to the department to be permanently marked in the manner prescribed by the department for identification purposes within 48 hours of killing the animal. The purpose of the permanent marking shall be to identify Nelson bighorn rams which were legally taken and which may be transported and possessed outside the areas described in subsection 362(a).

(6) The department reserves the right to take and use any part of the tagholder's bighorn ram, except the horns, for biological analysis as long as no more than one pound of edible meat is removed.

Memorandum

Date: April 10, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the April 17-18, 2024, Fish and Game Commission Meeting Re: Nelson Bighorn Sheep Hunting – Pre-Adoption Memo**

The Department of Fish and Wildlife (Department) has prepared this Memorandum to transmit its final recommended tag allocations for Nelson bighorn sheep hunting for the 2024-2025 season. The Department is not recommending changes to the proposed regulatory language in the original public notice, and all tag allocation recommendations fall within the proposed tag range included in the notice.

The Department recommends the Commission adopt the proposed rulemaking for Nelson bighorn sheep hunting with the tag allocations listed below.

362(d) Number of License Tags

Nelson Bighorn Sheep Hunt Zones	*2023-2024 Tag Allocation*	*2024-2025 Proposed Tag Range*	*2024-2025 Recommended Tag Allocation*
Zone 1 – Marble/Clipper Mountains	1	0-5	1
Zone 2 – Kelso Peak/Old Dad Mountains	1	0-2	2

ANALYSIS OF THE 2024 BIGHORN SHEEP HUNTING REGULATIONS

ADDENDUM

to the 2019 ENVIRONMENTAL DOCUMENT

REGARDING BIGHORN SHEEP HUNTING

prepared by the

STATE OF CALIFORNIA

NATURAL RESOURCES AGENCY

CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

on behalf of

CALIFORNIA FISH AND GAME COMMISSION

as

LEAD AGENCY UNDER THE

CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

for the

REGULARY NOTICED RULEMAKING ACTION TO AMEND

SECTION 362 BIGHORN SHEEP

TITLE 14, CALIFORNIA CODE OF REGULATIONS

2024 HUNTING SEASON

(OAL Notice File No. **2024-0123-07**)

INTRODUCTION

The California Department of Fish and Wildlife (CDFW) has prepared this addendum pursuant to the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 et seq., to inform consideration by the California Fish and Game Commission (Commission) of proposed amendments to existing regulations governing bighorn sheep hunting in California. (California Code of Regulations (CCR), Title 14, Section 362.) Fish and Game Code (F&G Code), Section 3950(b) designates Nelson bighorn sheep as a game mammal in California. F&G Code Section 203 authorizes the Commission to fix the area or areas, seasons and hours, bag and possession limit, sex, and total number of bighorn sheep that may be taken pursuant to its regulations. F&G Code Section 203.1 requires the Commission to consider populations, habitat, food supplies, the welfare of individual animals, and other pertinent facts when establishing hunting regulations for bighorn sheep. The Commission establishes bighorn sheep hunting tag quotas through regulations amended annually, as needed, based on current population estimates derived from surveys by CDFW.

The Commission serves as the CEQA lead agency when it promulgates and amends the bighorn sheep hunting regulations. (Public Resources Code, Section 21067; CEQA Guidelines Section 15367.)[1] The Commission established maximum tag quotas for all bighorn sheep hunting zones in California in 2019 with the certification of a Final Environmental Document under CEQA (2019 Bighorn Sheep Hunting ED) (SCH No. 2018112036). The 2019 Bighorn Sheep ED provides relevant and important informational value as the Commission as CEQA lead agency considers proposed amendments to the existing regulations for bighorn sheep hunting in California. In 2023, an addendum documented the Commission’s consideration of adjusting tag quotas for the 2023-2024 hunt season and subsequently determined that the adjustments would have no additional effects than previously analyzed in the 2019 Bighorn Sheep Hunting ED. This addendum documents the Commission’s consideration of related environmental effects for 2024 and subsequent hunt seasons.

EARLIER PROJECT APPROVAL

CEQA review of the proposed project was conducted in accordance with the Commission’s certified regulatory program approved by the Secretary for the California Natural Resources Agency pursuant to Public Resources Code Section 21080.5 (See generally Title 14, CCR, Sections 781.5 and 15251(b)). CEQA requires all public agencies in the State to evaluate the environmental impacts of discretionary projects

[1] The “CEQA Guidelines” are found in Title 14 of the California Code of Regulations, commencing with section 15000.

they propose to carry out or approve, including promulgating regulations, which may have a potential to significantly affect the environment.

In 2019, the Commission certified a Final Environmental Document Regarding Bighorn Sheep Hunting (2019 Bighorn Sheep Hunting ED) (SCH No. 2018112036) as the lead agency under CEQA as part of the Commission's review and adoption of the Bighorn Sheep Hunting regulations which focused on the potential for significant environmental impacts from 1) an increase in the tag quota ranges for Marble Mountains Hunt Zone by one tag, the Clark/Kingston Mountain Range Hunt Zone by two tags, and the White Mountains Hunt Zone by one tag; 2) increasing the individual tag quotas in other zones within previously analyzed quota ranges; 3) establishing a new hunt zone in the Newberry, Rodman, and Ord Mountains; and 4) reallocating a fundraising tag. The Commission considered the proposed project increase of 10 tags and two alternatives. The Commission as lead agency certified the ED and determined adoption of the amended regulations as proposed would not result in any new significant or substantially more severe environmental effects The Commission approved the increase of 10 tags for the 2019-20 bighorn sheep hunting regulations.

PROPOSED 2024 TAG ALLOCATIONS FOR THE MARBLE AND CLIPPER MOUNTAINS HUNT ZONE

The bighorn sheep tag quota ranges described in the 2019 Bighorn Sheep Hunting ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 bighorn sheep hunting season by the Commission are based on survey data collected by the Department in its survey efforts. Data collection and analyses for hunt zones was completed in March of 2024, resulting in the below proposed tag allocations.

Nelson Bighorn Sheep Hunt Zones	*2019 ED Tag Allocation Range*	*2024 Proposed Tag Allocation*
Zone 1 – Marble/Clipper Mountains	0-5	1
Zone 2 – Kelso Peak/Old Dad Mountains	0-2	2
Zone 3 – Clark/Kingston Mountain Ranges	0-4	3
Zone 4 – Orocopia Mountains	0-2	1
Zone 5 – San Gorgonio Wilderness	0-3	0
Zone 6 – Sheep Hole Mountains	0-2	1
Zone 7 – White Mountains	0-6	4
Zone 8 – South Bristol Mountains	0-3	1
Zone 9 – Cady Mountains	0-4	2
Zone 10 – Newberry, Rodman, Ord Mountains	0-6	6
Open Zone Fundraising Tag	0-1	1
Marble/Clipper/South Bristol Mountains Fundraising Tag	0-1	0

Nelson Bighorn Sheep Hunt Zones	*2019 ED Tag Allocation Range*	*2024 Proposed Tag Allocation*
Cady Mountains Fundraising Tag	0-1	1
Total:	0-40	23

The 2024 proposed tag allocation falls within the previously analyzed range. Therefore, there are no new significant or substantially more severe impacts from amending the bighorn sheep hunt regulations to reduce tags in the Marble and Clipper Mountains.

NO SUBSEQUENT ENVIRONMENTAL DOCUMENT IS REQUIRED

In general, CEQA applies whenever a public agency proposes to carry out or approve a discretionary project. (Public Resources Code Section 21080(a)). CEQA provides that, where a public agency proposes to modify a previously approved project for which a Final Environmental Document was prepared and certified:

> “The lead agency or a responsible agency shall prepare an ***addendum*** to a previously certified EIR if some changes or additions are necessary but none of the conditions described in §15162 calling for preparation of a subsequent EIR have occurred.” (Title 14, CCR, Section 15164)

- A Subsequent Environment Document (Section 15162) when there is substantial evidence that:
  - Substantial changes are proposed in the project, which will require major revisions to the previous environmental impact report (EIR) or environmental document (ED).
  - Substantial changes occur with respect to the circumstances under which the project is being undertaken, which will require major revisions to the previous EIR or environmental documentation.
  - New information, which was not known and could not have been known at the time the previous EIR or ED was certified as complete, becomes available.
- A Supplement to an Environment Document (Section 15163) when:
  - A subsequent ED is not required.
  - Only minor changes to the project are described.
  - Only that information to make the ED adequate is provided.
- An Addendum to the Certified ED (Section 15164) is proper when**:**
  - The changes or additions presented in this project are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent ED have occurred.

- The Commission may properly prepare and may rely on an addendum in accordance with Section 15164 to fulfill its obligations under CEQA.

NO ADDITIONAL IMPACTS UNDER CEQA

The Commission has determined that amending the current bighorn sheep hunting regulations based on annual survey results will not result in any new or significant or substantially more severe environmental impacts than previously analyzed and disclosed in the 2019 Bighorn Sheep ED for this project.

This project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory. There are no impacts to the habitat of fish and wildlife species.

This approval action adjusts the previous year tag quotas based on more current population information. No other aspect of the project is changed. No new significant or substantially more severe impacts under CEQA will occur due to this change.

AMENDMENT OF THE BIGHORN SHEEP HUNTING REGULATIONS

In conclusion, the Commission finds that amending the bighorn sheep hunt regulations in Title 14, CCR, Section 362, will not result in any new significant or substantially more severe environmental effects than previously analyzed and disclosed in the 2019 Bighorn Sheep Hunting ED. The Commission also finds that subsequent or supplemental review beyond this Addendum is not warranted pursuant to the Title 14, Section 15164, in connection with this proposed action.

Melissa Miller-Henson, Executive Director　　　　Date

California Fish and Game Commission

State of California
Fish and Game Commission
Initial Statement of Reasons for Regulatory Action

Amend Section 363
Title 14, California Code of Regulations
Re: Pronghorn Antelope

I. Date of Initial Statement of Reasons: October 1, 2023

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing:

Date: December 13, 2023 Location: San Diego, CA

(b) Discussion Hearing:

Date: February 15, 2024 Location: Sacramento, CA

(c) Adoption Hearing:

Date: April 18, 2023 Location: San Jose, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

The Fish and Game Commission (Commission) periodically considers the recommendations of the Department of Fish and Wildlife (Department) in updating pronghorn antelope regulations. Considerations include recommendations for adjusting tag quotas, setting hunt periods, modifying zone boundaries, authorizing methods of take, among others, to help achieve management goals and objectives for pronghorn antelope. Section 363 provides descriptions of hunt zone boundaries, season opening and closing dates, methods of take (e.g., general methods, archery only, apprentice), tag designations (buck, doe), tag quotas (total number of hunting tags to be made available), bag and possession limits, and special conditions for pronghorn antelope. To maintain appropriate harvest levels and hunting quality, tags must be adjusted periodically in response to dynamic environmental, biological, and social conditions.

The proposed changes focus on pronghorn antelope tag quotas under subsection 363(m). The last time these regulations were subject to major amendment was 2020-2021. The proposed amendments here represent the cumulation of the Department’s internal discussion/data analysis. The proposed changes are necessary to maintain appropriate harvest levels.

BACKGROUND

The goal of the Department’s pronghorn antelope program is to maintain viable, healthy pronghorn populations, provide a variety of recreational activities, including harvest opportunity, and to minimize conflicts with humans (Pyshora 1982, California Department of Fish and Game [CDFG] 2004). A limited number of pronghorn antelope hunting tags are offered annually via the Big Game Drawing, and public demand for pronghorn antelope hunting tags has annually exceeded tag availability for the last ten years. In addition to harvest opportunity, public pronghorn antelope hunting also provides data that enhances the Department's ability to monitor pronghorn antelope populations including spatial, age, genetic, and disease information.

CURRENT REGULATIONS

Current regulations provide descriptions of hunt zone boundaries, season opening and closing dates, methods of take (e.g., general methods, archery only, apprentice), tag designations (buck, doe), tag quotas (total number of hunting tags to be made available), bag and possession limits, and special conditions for pronghorn antelope. Individuals are awarded a pronghorn antelope hunting tag through the Department's Big Game Drawing.

PROPOSED REGULATIONS

The proposed regulations amend subsection 363(m) to adjust hunting tag numbers across all six hunt zones. While the observed range wide buck (bb) -doe (dd) ratio (42 bb:100dd) is above objective (24bb:100dd), fawn-doe ratios, hunter harvest success, and age-at-harvest data suggest pronghorn antelope populations may be declining in Hunt Zone 3 – Likely Tables and Hunt Zone 5 – Big Valley (Batter 2023). Data for other hunt zones suggest populations may be relatively stable. Proposed regulations are in compliance with CDFW's Pronghorn Antelope Management Plan (Pyshora 1982, Sommer 2012). The proposed amendment to the number of pronghorn antelope hunting tags in subsection 363(m) is necessary to allow for a biologically appropriate harvest of bucks in the pronghorn antelope populations and will achieve/maintain buck ratios at or above the 24bb:100dd objective in relation to population abundance/trends as described in the appropriate management plans and related documents (Pyshora 1982, Sommer 2012, Batter 2023). Proposed tag quota ranges provided in Table 1 are the recommendations of the Department and are within conservative ranges identified in the 2004 Final Environmental Document Regarding Pronghorn Antelope Hunting (CDFG 2004). Administrative procedures and the Fish and Game Code require the Commission to receive proposed changes to existing regulations prior the completion of surveys and analyses, thus necessitating the proposed range of tags per zone. Analyses are scheduled for completion by March 2024.

Additional changes are made in subsection 363 for punctuation and re-arrangement of certain language regarding the descriptions of the hunt zones adds clarity to how the hunt zone areas and seasons are described and consistency with other big game sections in Title 14. Additional changes include corrections for gender neutral language, updates to the Department's name, and other corrections to punctuation throughout Section 363 are non-substantive.

Section 363(m).

The regulatory changes the Department is proposing are described below by subsection.

The proposed changes to Section 363 include the following:

- Amend subsection 363(m) to modify tag quotas as ranges for general season pronghorn antelope Period 1 and Period 2 (Table 1, Table 2).

The Department recommends decreasing tag quotas for Hunt Zones 3 and 5 (Likely Tables Period 1 and Period 2 and Big Valley), respectively, to adjust for reduced population abundance and depressed productivity (low fawn ratios). Adjustments in other zones may also be recommended as appropriate. The final recommended number of tags will be based upon findings from annual harvest, summer composition counts, and 2023–2024 winter abundance estimates.

Table 1. Subsection 363(m) with proposed tag ranges for pronghorn antelope to begin with the 2024 hunt season. Parenthetical values next to ranges indicate the current condition. Numbers without ranges indicate no change from the current condition is proposed. Final recommendations will be made after completion of winter abundance surveys.

Hunt Area	Archery-Only Season Buck	Archery-Only Season Doe	General Season Period 1 Buck	General Season Period 1 Doe	General Season Period 1 Apprentice Either-Sex	General Season Period 2 Buck	General Season Period 2 Doe	Fundraising
Zone 1 - Mount Dome	0	0	0-5	0	N/A	0	0	0
Zone 2 - Clear Lake	1	0	5-15	0	N/A	0	0	0
Zone 3 - Likely Tables	15	0	15-25	0	5	10-25	0	0
Zone 4 - Lassen	5	0	25-50	0	5	25-50	0	0
Zone 5 - Big Valley	1	0	5-20	0	1	0	0	0
Zone 6 - Surprise Valley	1	0	10-15	0	4	0	0	0
Zones 1-6	0	0	0	0	0	0	0	2

Table 2. Current buck tag quota (2023), proposed buck tag quota range (2024), and the potential net change from the current and proposed conditions for general season pronghorn antelope tag quota adjustments.

Hunt Code	**Hunt Zone**	***2023***	***2024***	***Potential Net Change***
710	Zone 1 – Mount Dome	2	0-5	-2, +3
720	Zone 2 – Clear Lake	15	5-15	-10, +0
730	Zone 3 – Likely Tables Period 1	25	15-25	-10, +0
732	Zone 3 – Likely Tables Period 2	25	10-25	-15, +0
740	Zone 4 – Lassen Period 1	35	25-50	-10, +15
742	Zone 4 – Lassen Period 2	35	25-50	-10, +15
750	Zone 5 – Big Valley	20	5-20	-15, +0
760	Zone 6 – Surprise Valley	10	10-15	-0, +5
	Total General Tags	167		-65, +18

(b) Goals and Benefits of the Regulation

The proposed regulations will contribute to the sustainable management of pronghorn antelope populations in California. Population objectives are maintained and managed in part by periodically modifying the number of hunting tags distributed.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: Sections 200, 204, 219, 331, 1050, and 10502, Fish and Game Code

Reference: Sections 331, 1050, 10500, and 10502, Fish and Game Code.

(d) Specific Technology or Equipment Required by Regulatory Change: None

(e) Identification of Reports or Documents Supporting Regulation Change

Batter, T.J. 2023. Summary report on pronghorn antelope road composition surveys in northeastern California, July 2023. West Sacramento, CA. 11 pp. https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=213789

CDFG (California Department of Fish and Game). 2004. Final environmental document regarding pronghorn antelope hunting. Sacramento, CA. 91 pp.

Pyshora, L. 1982. Pronghorn antelope management plan. California Department of Fish and Game. Redding, CA. 122 pp. https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=216423

Sommer, M. 2012. 2012 California pronghorn antelope status report and management plan update. Sacramento, CA. 48 pp. https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=216424

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

- Wildlife Resources Committee, May 2023
- Wildlife Resources Committee, September 2023

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

No alternatives were identified or brought to the attention of the Commission staff that would have the same desired regulatory effect.

(b) No Change Alternative

Without the proposed changes, the outstanding issues concerning the regulations currently governing subsection 363(m) would remain unaddressed. Retaining the current number of tags for the hunts listed would not be responsive to changes in population status. The pronghorn antelope management plant specifies objective levels for pronghorn numbers and the proportion of bucks in the herds. These numbers and ratios are maintained and managed in part by modifying the number of tags allocated for hunting. The “no change” alternative would not allow management of the desired proportion of bucks stated in the pronghorn management plan (Pyshora 1982).

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The maximum number of tags available in the proposed range is at or below the number of tags analyzed in the 2004 Final Environmental Document Regarding Pronghorn Antelope Hunting.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed regulation will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. This regulatory action will not impose cost impacts that a representative business would necessarily incur in reasonable compliance with the proposed regulation.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission does not anticipate impacts on the creation or elimination of jobs within the state, the creation of new business, the elimination of existing businesses, or the expansion of businesses in California because the expected economic impacts of the proposed regulations are unlikely to be substantial enough to substantially stimulate demand for goods or services related to pronghorn antelope hunting. If greater numbers of hunters visit the areas in the state with increased opportunities, businesses that provide goods and services to pronghorn antelope hunters could benefit from small increases in sales. Conversely, if fewer tags are awarded and less hunters visit the areas in the state with decreased opportunities, businesses that provide goods and services to pronghorn antelope hunters could be negatively affected from small decreases in sales. The Commission does not anticipate direct benefits to the general health and welfare of California residents, the environment, or to worker safety, however California residents will benefit generally through access to the expanded recreational opportunities created by the proposed changes.

(c) Cost Impacts on a Representative Private Person or Business

The Commission does not anticipate significant impacts on the representative private persons or businesses.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None. The Department Wildlife program oversight, Law Enforcement Branch, and License and Revenue Branch work is projected to be unchanged from currently existing budgets and resources. However, the Department revenue is expected to decline with a reduced number of tags available in zones 3 and 5 (See STD399 and Addendum).

(e) Nondiscretionary Costs/Savings to Local Agencies: None.

(f) Programs Mandated on Local Agencies or School Districts: None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed

Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None

(h) Effect on Housing Costs: None

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

The Commission does not anticipate impacts on the creation or elimination of jobs within the state.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The Commission does not anticipate impacts on the creation of new business, the elimination of existing businesses within the state because the expected economic impacts of the proposed regulations are unlikely to be substantial enough to stimulate demand for goods or services related to pronghorn antelope hunting.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The Commission does not anticipate impacts on the expansion of businesses currently doing business within the state because the expected economic impacts of the proposed regulations are unlikely to be substantial enough to stimulate demand for goods or services related to pronghorn antelope hunting.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

Hunting is an outdoor activity that can provide several health and welfare benefits to California residents. Hunters and their families benefit from fresh game to eat, and from the benefits of outdoor recreation, including exercise. People who hunt have a special connection with the outdoors and an awareness of the relationships between wildlife, habitat, and humans, and can be a family tradition and a bonding activity.

(e) Benefits of the Regulation to Worker Safety

The Commission does not anticipate impacts on worker safety.

(f) Benefits of the Regulation to the State's Environment

As set forth in Fish and Game Code section 1700, it is the policy of the state to encourage the conservation, maintenance, and utilization of fish and wildlife resources for the benefit of all the citizens of the state. The objectives of this policy include, but are not limited to, the maintenance of populations of pronghorn antelope to ensure their continued existence and supporting recreational opportunity. Adoption of scientifically based pronghorn antelope seasons and tag quotas provides for the maintenance of pronghorn antelope populations to ensure those objectives are met. The fees that hunters pay for licenses and tags help fund wildlife conservation.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

Current regulations in Section 363 provide definitions, hunting zone descriptions, season opening and closing dates, tag quotas (total number of hunting tags to be made available), and bag and possession limits for pronghorn antelope hunting. Individuals are awarded a pronghorn antelope hunting tag through the California Department of Fish and Wildlife (Department's) Big Game Drawing. A limited number of fundraising tags are also available for purchase, usually by auction, via non-governmental organizations that assist the Department with fundraising.

Harvest of a pronghorn antelope is authorized for an individual with a tag for a respective hunt zone and season. Tag quotas are established based on a variety of factors including population density and abundance, age and sex composition, and distribution.

The proposed changes are as follows:

Amend Subsection 363(m) to modify hunt tag quotas as ranges for each zone.

Periodic adjustments of tag quotas in response to dynamic environmental and biological conditions are necessary to maintain sustainable populations of pronghorn antelope and hunt opportunities, as well as keeping with mandates and management recommendations. Unfortunately, administrative procedures and the Fish and Game Code require the Fish and Game Commission (Commission) to receive proposed changes to existing regulations prior to the completion of surveys and analyses, thus necessitating a range of numbers. Analyses are scheduled for completion by March 2024.

Non-substantive editing and renumbering to improve the clarity and consistency of the regulatory language have been made in Section 363.

Benefit of the Regulations:

The goals and benefits of the regulations are to help maintain sustainable populations of pronghorn antelope, maintain sustainable hunt opportunities, and achieve management recommendations in existing unit plans.

Consistency and Compatibility with Existing Regulations:

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. Section 20, Article IV, of the state Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to adopt regulations governing pronghorn antelope hunting (California Fish and Game Code Section 331). No other state agency has the authority to adopt regulations governing pronghorn antelope hunting. The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the CCR for any regulations regarding the adoption of pronghorn antelope hunting regulations; therefore, the Commission has concluded that the proposed regulations are neither inconsistent nor incompatible with existing state regulations.

Section 363, Title 14 CCR, is amended to read:

§ 363. Pronghorn Antelope.

The Lava Beds National Monument and Federal and State Game Refuges lying within ~~the~~ a given pronghorn hunt boundary are closed to pronghorn antelope hunting, except for the state's Hayden Hill (1S) and Blacks Mountain (1F) game refuges in Lassen County and the Clear Lake National Wildlife Refuge in Modoc County. Refer to subsection 363(b)(5) for special conditions for permission to enter and hunt pronghorn antelope in the Clear Lake National Wildlife Refuge.

(a) ~~Zone 1—Mount Dome:~~ Zone 1 (Mount Dome):

(1) Area: That portion of Siskiyou County within a line beginning at the junction of Interstate 5 and the California-Oregon state line; east along the California-Oregon state line to ~~the~~ Ainsworth Corners-Lava Beds National Monument Road; south ~~along~~ on ~~the~~ Ainsworth Corners-Lava Beds National Monument Road to ~~the~~ Mammoth Crater-Medicine Lake Road; southwest ~~along the~~ on Mammoth Crater-Medicine Lake Road to ~~the~~ Medicine Lake-Telephone Flat Road; east and south ~~along the~~ on Medicine Lake-Telephone Flat Road to ~~the~~ Telephone Flat-Bartle Road; southwest ~~along the~~ on Telephone Flat-Bartle Road to Highway 89; west ~~along~~ on Highway 89 to Interstate 5; north ~~along~~ on Interstate 5 to the California-Oregon state line to the point of beginning.

(2) Seasons:

(A) The general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(b) ~~Zone 2—Clear Lake:~~ Zone 2 (Clear Lake):

(1) Area: Those portions of Modoc and Siskiyou counties within a line beginning at the junction of the Lava Beds National Monument Road and the California-Oregon state line at Ainsworth Corners; east along the California-Oregon state line to ~~the~~ Crowder Flat Road; south ~~along the~~ on Crowder Flat Road to Modoc County Road 73; south ~~along~~ on Modoc County Road 73 to Modoc County Road 136; west ~~along~~ on Modoc County Road 136 to ~~the~~ Blue Mountain-Mowitz Road; west and south ~~along the~~ on Blue Mountain-Mowitz Road to ~~the~~ Deadhorse Flat-Badger Well Road; southwest ~~along the~~ on Deadhorse Flat-Badger Well Road to ~~the~~ Badger Well-Browns Well Road; south ~~along the~~ on Badger Well-Browns Well Road to ~~the~~ Sorholus Tank-Hackamore Road; southwest ~~along the~~ on Sorholus Tank-Hackamore Road to Highway 139; southeast ~~along~~ on Highway 139 to Modoc County Road 91; south ~~along~~ on Modoc County Road 91 to ~~the~~ Mud Lake-Mud Springs Road; west ~~along the~~ on Mud Lake-Mud Springs Road to ~~the~~ North Main Road; southwest ~~along the~~ on North Main Road to ~~the~~ Long Bell-Iodine Prairie Road at Long Bell Forest Service Station; northwest ~~along the~~ on Long Bell-Iodine Prairie Road to ~~the~~ Bartle-Telephone Flat Road; north ~~along the~~ on Bartle-Telephone Flat Road to ~~the~~ Telephone Flat-Medicine Lake Road; north and west ~~along the~~ on Telephone Flat-Medicine Lake Road to ~~the~~ Medicine Lake-Mammoth Crater Road; northeast ~~along the~~ on Medicine Lake-Mammoth Crater Road to ~~the~~ Lava Beds National

Monument-Ainsworth Corners Road; north ~~along the~~ on Lava Beds National Monument-Ainsworth Corners Road to the California-Oregon state line to the point of beginning.

(2) Seasons:

(A) The general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: The special regulations regarding the Peninsula "U" portion of the Clear Lake National Wildlife Refuge are summarized as follows:

(A) The area will be open on weekends and holidays only during the general season.

(B) Permission to enter this area must be obtained at the gate entrance located on the Clear Lake Road. Hunters for this area will be selected by public drawing. Persons selected for pronghorn antelope tags for Zone 2 (Clear Lake) may apply for this drawing by submitting an application upon receipt of their license tag to the ~~Department of Fish and Game~~ Department of Fish and Wildlife, 601 Locust Street, Redding, CA 96001. Applicants may apply as a party of two. Applications shall consist of the following: a standard U.S. Postal Service postcard with the applicant's tag number, name, address, city, zip code, area code, telephone number, and the notation "Application for Pronghorn Antelope Hunt Access Permit, Clear Lake Peninsula." Applications must reach the Redding office before the close of the business day on the first Friday in August. Successful applicants will be notified. A two-party application will not be split. The specific number of hunters will be determined each year by the Department. No more than five hunters will be allowed on the area at any one time unless a party of two is drawn for the fifth place. If the fifth place is the first member of a party, then no more than six hunters will be allowed on the area at any time.

(C) The gate entrance will be open from 6:00 a.m. to one hour after sunset.

(D) The fence near the gate entrance constitutes the south boundary of the area.

(E) The specific number of pronghorn antelope to be taken from this area is determined by the number of pronghorn antelope present. This area will be closed once this number is reached.

(c) ~~Zone 3—Likely Tables:~~ Zone 3 (Likely Tables):

(1) Area: Those portions of Modoc and Lassen counties within a line beginning at the junction of the Crowder Flat Road and the California-Oregon state line; east along the California-Oregon state line to the crest of the Warner Mountains; south along the crest of the Warner Mountains to the Summit Trail at Pepperdine Camp; south along the Summit Trail to the South Warner Road near Patterson Forest Service Station; west along the South Warner Road to ~~the~~ Long Valley-Clarks Valley Road; south ~~along the~~ on Long Valley-Clarks Valley Road to ~~the~~ Clarks Valley-Madeline Road; west ~~along the~~ on Clarks Valley-Madeline Road to Highway 395 at the town of Madeline; north ~~along~~ on Highway 395 to ~~the~~ Madeline-Adin Road; northwest ~~along the~~ on Madeline-Adin Road to ~~the~~ Hunsinger Draw-Sweagert Flat Road; east and north ~~along the~~ on Hunsinger Draw-Sweagert Flat Road to ~~the~~ Sweagert Flat-Hunters Ridge Road; north and west ~~along the~~ on Sweagert Flat-Hunters Ridge Road to Highway 299 near Lower Rush Creek Recreation Site; north ~~along~~ on Highway 299 to ~~the~~ Canby Bridge-Cottonwood Flat Road; northwest ~~along the~~ on Canby Bridge-Cottonwood Flat

Road to ~~the~~ Cottonwood Flat-Happy Camp Road; northwest ~~along the~~ on Cottonwood Flat-Happy Camp Road to Modoc County Road 91; north ~~along~~ on Modoc County Road 91 to Highway 139; north ~~along~~ on Highway 139 to ~~the~~ on Hackamore-Sorholus Tank Road; northeast ~~along the~~ on Hackamore-Sorholus Tank Road to ~~the~~ Browns Well-Badger Well Road; north ~~along the~~ on Browns Well-Badger Well Road to ~~the~~ Badger Well-Deadhorse Flat Road; northeast and east ~~along the~~ on Badger Well-Deadhorse Flat Road to ~~the~~ Mowitz-Blue Mountain Road; north and east ~~along the~~ on Mowitz-Blue Mountain Road to Modoc County Road 136; east ~~along~~ on Modoc County Road 136 to Modoc County Road 73; north ~~along~~ on Modoc County Road 73 to ~~the~~ Crowder Flat Road; north ~~along the~~ on Crowder Flat Road to the California-Oregon state line~~,~~ to the point of beginning.

(2) Seasons:

(A) Period One of the general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days. Period Two of the general season shall open on the first Saturday in September and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the earliest general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(d) ~~Zone 4—Lassen:~~ Zone 4 (Lassen):

(1) Area: Those portions of Lassen, Plumas and Shasta counties within a line beginning at the ~~junction~~ intersection of Highway 36 and ~~the~~ Juniper Lake Road in the town of Chester; north ~~along the~~ on Juniper Lake Road to the Lassen National Park boundary; north and west along the Lassen National Park boundary to Highway 89; north ~~along~~ on Highway 89 to U.S. Forest Service Road 22 near the Hat Creek Ranger Station; east ~~along~~ on U.S. Forest Service Road 22 to U.S. Forest Service Road 35N06; east and north ~~along~~ on U.S. Forest Service Road 35N06 to the State Game Refuge 1S boundary; northwest along the State Game Refuge 1S boundary to ~~the~~ Coyote Canyon-Dixie Valley Road; northwest ~~along the~~ on Coyote Canyon-Dixie Valley Road to ~~the~~ Dixie Valley-Boyd Hill Road; northwest ~~along the~~ on Dixie Valley-Boyd Hill Road to ~~the~~ Snag Hill-Hayden Hill Road; northeast and north ~~along the~~ on Snag Hill-Hayden Hill Road to Highway 139; southeast on Highway 139 to ~~the~~ Willow Creek-Hunsinger Flat Road; northeast and northwest ~~along the~~ on Willow Creek-Hunsinger Flat Road to ~~the~~ Adin-Madeline Road; southeast ~~along the~~ on Adin-Madeline Road to Highway 395 at the town of Madeline; south ~~along~~ on Highway 395 to ~~the~~ Madeline-Clarks Valley Road; east ~~along the~~ on Madeline-Clarks Valley Road to ~~the~~ Clarks Valley-Tuledad Road; east and southeast ~~along the~~ on Clarks Valley-Tuledad Road to the California-Nevada state line; south along the California-Nevada state line to the Lassen-Sierra county line; west along the Lassen-Sierra county line to the Lassen-Plumas county line; north and west along the Lassen-Plumas county line to Highway 36; west ~~along~~ on Highway 36 to ~~the~~ Juniper Lake Road~~,~~ to the point of beginning.

(2) Seasons:

(A) Period One of the general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days. Period Two of the general season shall open on the first Saturday in September and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the earliest general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(e) ~~Zone 5—Big Valley:~~ Zone 5 (Big Valley):

(1) Area: Those portions of Modoc, Lassen, Shasta, and Siskiyou counties within a line beginning at the intersection of Highways 299 and 89; north and northwest ~~along~~ on Highway 89 to ~~the~~ Bartle-Telephone Flat Road; northeast ~~along the~~ on Bartle-Telephone Flat Road to ~~the~~ Iodine Prairie-Long Bell Road; southeast ~~along the~~ on Iodine Prairie-Long Bell Road to ~~the~~ North Main Road at Long Bell Forest Service Station; northeast ~~along the~~ on North Main Road and ~~the~~ Mud Springs-Mud Lake Road to Modoc County Road 91; south ~~along~~ on Modoc County Road 91 to ~~the~~ Happy Camp-Cottonwood Flat Road; southeast ~~along the~~ on Happy Camp-Cottonwood Flat Road to ~~the~~ Cottonwood Flat-Canby Bridge Road; southeast ~~along the~~ on Cottonwood Flat-Canby Bridge Road to Highway 299; south ~~along~~ on Highway 299 to ~~the~~ Hunters Ridge-Sweagert Flat Road near Lower Rush Creek Recreation Site; east and south ~~along the~~ on Hunters Ridge-Sweagert Flat Road to ~~the~~ Sweagert Flat-Hunsinger Draw Road; south and west ~~along the~~ on Sweagert Flat-Hunsinger Draw Road to ~~the~~ Adin-Madeline Road; southeast ~~along the~~ on Adin-Madeline Road to ~~the~~ Hunsinger Flat-Willow Creek Road; southeast and southwest ~~along the~~ on Hunsinger Flat-Willow Creek Road to Highway 139; northwest ~~along~~ on Highway 139 to ~~the~~ Hayden Hill-Snag Hill Road; south and southwest ~~along the~~ on Hayden Hill-Snag Hill Road to ~~the~~ Boyd Hill-Dixie Valley Road; southeast ~~along the~~ on Boyd Hill-Dixie Valley Road to ~~the~~ Dixie Valley-Coyote Canyon Road; southeast ~~along the~~ on Dixie Valley-Coyote Canyon Road to the State Game Refuge 1S boundary; southeast along the State Game Refuge 1S boundary to U.S. Forest Service Road 35N06; south and west ~~along~~ on U.S. Forest Service Road 35N06 to U.S. Forest Service Road 22; west ~~along~~ on U.S. Forest Service Road 22 to Highway 89 near the Hat Creek Ranger Station; north ~~along~~ on Highway 89 to Highway 299~~,~~ to the point of beginning.

(2) Seasons:

(A) The general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the earliest general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(f) ~~Zone 6—Surprise Valley:~~ Zone 6 (Surprise Valley):

(1) Area: Those portions of Modoc and Lassen counties within a line beginning at the ~~intersection~~ junction of the crest of the Warner Mountains and the California-Oregon state line; east along the California-Oregon state line to the California-Nevada state line; south along the California-Nevada state line to ~~the~~ Tuledad-Clarks Valley Road; west and northwest ~~along the~~ on Tuledad-Clarks Valley Road to ~~the~~ Clarks Valley-Long Valley Road; north on ~~the~~ Clarks Valley-Long Valley Road to ~~the~~ South Warner Road; east ~~along the~~ on South Warner Road to the Summit Trail near Patterson Guard Station; north along the Summit Trail to the crest of the Warner Mountains at Pepperdine Camp; north along the crest of the Warner Mountains to the California-Oregon state line to the point of beginning.

(2) Seasons:

(A) The general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(g) Big Valley Pronghorn Antelope Apprentice Hunt:

(1) Area: The tag shall be valid in the area described in subsection 363(e)(1).

(2) Season: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders wishing to hunt the Ash Creek Wildlife Area may contact Ash Creek Wildlife Area by telephone at (530) 294–5824, and shall attend an orientation meeting before hunting. Only persons possessing valid junior hunting licenses and apprentice hunt license tags may hunt during the pronghorn antelope apprentice hunt season in the Ash Creek Wildlife Area. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting.

(h) Lassen Pronghorn Antelope Apprentice Hunt:

(1) Area: The tag shall be valid in the area described in subsection 363(d)(1).

(2) Season: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting. The Honey Lake Wildlife Area shall not be open to antelope apprentice hunt tag holders.

(i) Surprise Valley Pronghorn Antelope Apprentice Hunt:

(1) Area: The tag shall be valid in the area described in subsection 363(f)(1).

(2) Season: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting.

(j) Likely Tables Pronghorn Antelope Apprentice Hunt

(1) Area: The tag shall be valid in the area described in subsection 363(c)(1).

(2) Seasons: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting.

(k) ~~Fund-raising~~ Fundraising Hunt:

(1) Area: Those portions of Lassen, Modoc, Plumas, Shasta, and Siskiyou counties described as zones 1 through 6 in subsections 363(a) through (f).

(2) Season: The season for the ~~Fund-Raising~~ Fundraising Hunt shall open on the Saturday before the first Wednesday in August and continue for 51 consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(*l*) Conditions:

(1) Pronghorn antelope license tags do not give the tagholders the right of entry onto privately-owned lands.

(2) Buck pronghorn antelope are defined as pronghorn antelope with horns longer than the ears. Doe pronghorn antelope are defined as pronghorn antelope with horns shorter than the ears. Either-sex pronghorn antelope are defined as buck or doe pronghorn antelope.

(3) Shooting time shall be from one-half hour before sunrise to one-half hour after sunset.

(4) Method of take:

(A) The holder of any archery-only pronghorn antelope license tag may only take pronghorn antelope using archery equipment, as defined in Section 354 of these regulations.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(e) ~~Zone 5—Big Valley:~~ Zone 5 (Big Valley):

(1) Area: Those portions of Modoc, Lassen, Shasta, and Siskiyou counties within a line beginning at the intersection of Highways 299 and 89; north and northwest ~~along~~ on Highway 89 to ~~the~~ Bartle-Telephone Flat Road; northeast ~~along the~~ on Bartle-Telephone Flat Road to ~~the~~ Iodine Prairie-Long Bell Road; southeast ~~along the~~ on Iodine Prairie-Long Bell Road to ~~the~~ North Main Road at Long Bell Forest Service Station; northeast ~~along the~~ on North Main Road and ~~the~~ Mud Springs-Mud Lake Road to Modoc County Road 91; south ~~along~~ on Modoc County Road 91 to ~~the~~ Happy Camp-Cottonwood Flat Road; southeast ~~along the~~ on Happy Camp-Cottonwood Flat Road to ~~the~~ Cottonwood Flat-Canby Bridge Road; southeast ~~along the~~ on Cottonwood Flat-Canby Bridge Road to Highway 299; south ~~along~~ on Highway 299 to ~~the~~ Hunters Ridge-Sweagert Flat Road near Lower Rush Creek Recreation Site; east and south ~~along the~~ on Hunters Ridge-Sweagert Flat Road to ~~the~~ Sweagert Flat-Hunsinger Draw Road; south and west ~~along the~~ on Sweagert Flat-Hunsinger Draw Road to ~~the~~ Adin-Madeline Road; southeast ~~along the~~ on Adin-Madeline Road to ~~the~~ Hunsinger Flat-Willow Creek Road; southeast and southwest ~~along the~~ on Hunsinger Flat-Willow Creek Road to Highway 139; northwest ~~along~~ on Highway 139 to ~~the~~ Hayden Hill-Snag Hill Road; south and southwest ~~along the~~ on Hayden Hill-Snag Hill Road to ~~the~~ Boyd Hill-Dixie Valley Road; southeast ~~along the~~ on Boyd Hill-Dixie Valley Road to ~~the~~ Dixie Valley-Coyote Canyon Road; southeast ~~along the~~ on Dixie Valley-Coyote Canyon Road to the State Game Refuge 1S boundary; southeast along the State Game Refuge 1S boundary to U.S. Forest Service Road 35N06; south and west ~~along~~ on U.S. Forest Service Road 35N06 to U.S. Forest Service Road 22; west ~~along~~ on U.S. Forest Service Road 22 to Highway 89 near the Hat Creek Ranger Station; north ~~along~~ on Highway 89 to Highway 299~~,~~ to the point of beginning.

(2) Seasons:

(A) The general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the earliest general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(f) ~~Zone 6—Surprise Valley:~~ Zone 6 (Surprise Valley):

(1) Area: Those portions of Modoc and Lassen counties within a line beginning at the ~~intersection~~ junction of the crest of the Warner Mountains and the California-Oregon state line; east along the California-Oregon state line to the California-Nevada state line; south along the California-Nevada state line to ~~the~~ Tuledad-Clarks Valley Road; west and northwest ~~along the~~ on Tuledad-Clarks Valley Road to ~~the~~ Clarks Valley-Long Valley Road; north on ~~the~~ Clarks Valley-Long Valley Road to ~~the~~ South Warner Road; east ~~along the~~ on South Warner Road to the Summit Trail near Patterson Guard Station; north along the Summit Trail to the crest of the Warner Mountains at Pepperdine Camp; north along the crest of the Warner Mountains to the California-Oregon state line to the point of beginning.

(2) Seasons:

(A) The general season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(B) The archery only season shall open 14 days prior to the general season and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(g) Big Valley Pronghorn Antelope Apprentice Hunt:

(1) Area: The tag shall be valid in the area described in subsection 363(e)(1).

(2) Season: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders wishing to hunt the Ash Creek Wildlife Area may contact Ash Creek Wildlife Area by telephone at (530) 294–5824, and shall attend an orientation meeting before hunting. Only persons possessing valid junior hunting licenses and apprentice hunt license tags may hunt during the pronghorn antelope apprentice hunt season in the Ash Creek Wildlife Area. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting.

(h) Lassen Pronghorn Antelope Apprentice Hunt:

(1) Area: The tag shall be valid in the area described in subsection 363(d)(1).

(2) Season: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting. The Honey Lake Wildlife Area shall not be open to antelope apprentice hunt tag holders.

(i) Surprise Valley Pronghorn Antelope Apprentice Hunt:

(1) Area: The tag shall be valid in the area described in subsection 363(f)(1).

(2) Season: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting.

(j) Likely Tables Pronghorn Antelope Apprentice Hunt

(1) Area: The tag shall be valid in the area described in subsection 363(c)(1).

(2) Seasons: The season shall open on the Saturday following the third Wednesday in August and continue for nine consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(4) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult ~~chaperon~~ chaperone 18 years of age or older while hunting.

(k) ~~Fund-raising~~ Fundraising Hunt:

(1) Area: Those portions of Lassen, Modoc, Plumas, Shasta, and Siskiyou counties described as zones 1 through 6 in subsections 363(a) through (f).

(2) Season: The season for the ~~Fund-Raising~~ Fundraising Hunt shall open on the Saturday before the first Wednesday in August and continue for 51 consecutive days.

(3) Bag and Possession Limit: One pronghorn antelope in a license year.

(*l*) Conditions:

(1) Pronghorn antelope license tags do not give the tagholders the right of entry onto privately-owned lands.

(2) Buck pronghorn antelope are defined as pronghorn antelope with horns longer than the ears. Doe pronghorn antelope are defined as pronghorn antelope with horns shorter than the ears. Either-sex pronghorn antelope are defined as buck or doe pronghorn antelope.

(3) Shooting time shall be from one-half hour before sunrise to one-half hour after sunset.

(4) Method of take:

(A) The holder of any archery-only pronghorn antelope license tag may only take pronghorn antelope using archery equipment, as defined in Section 354 of these regulations.

(B) The holder of a general season, ~~fund-raising~~ fundraising hunt season, or junior hunt season license tag may take pronghorn antelope using legal firearms and archery equipment as described in sections 353 and 354 of these regulations.

(5) Any person taking any pronghorn antelope shall retain that portion of the head, which bears the horns during the open season and for 15 days thereafter, and shall produce it upon the demand of any officer authorized to enforce the provisions of these regulations.

(6) No person shall at any time capture or destroy any pronghorn antelope and detach or remove from the carcass only the head, hide or horns; nor shall any person at any time leave through carelessness or neglect any pronghorn antelope which is in ~~his~~ their possession or any portion of the flesh thereof usually eaten by humans, to go needlessly to waste.

(7) Prior to the acceptance or issuance of a pronghorn antelope license tag, all tagholders shall consent in writing to the terms and conditions set forth on the license tag.

(m) Pronghorn Antelope Tag Allocations Table.

~~Pronghorn Antelope Tag Allocations~~

Department of Fish and Wildlife

Signed Original on File
Received April 11, 2024

Memorandum

Date: April 10, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the April 17-18, 2024, Fish and Game Commission Meeting Re: Pronghorn Antelope Hunting – Pre-Adoption Memo of Revisions and Recommendations**

The Department of Fish and Wildlife (Department) has prepared this Memorandum to transmit its final recommended tag allocations for pronghorn antelope hunting.

The Department's field surveys indicated that this past winter presented harsh conditions for the Zone 3 pronghorn antelope population. As such, the Department requested the Commission circulate a continuation notice ahead of the planned April 18, 2024 Commission adoption hearing to update the proposed tag ranges for Zone 3: In the Pronghorn Antelope Tag Allocations table, where the proposed tag ranges for Zone 3 – Likely Tables are expanded from 15-25 to 0-25 and from 10-25 to 0-25 for General Season Period 1 Buck and General Season Period 2 Buck, respectively (see the table below outlining proposed changes to subsection 363(m), splitting General Season and Fundraising from Archery). A subsequent continuation notice revised the proposed tag allocation of 15 in Zone 3 - Likely Tables Archery Only Season (Buck) to a tag quota range of 0 to 15.

The Department recommends that each of these quotas for the General Season be adopted at 5 tags based on population numbers. The Department also recommends a tag quota of 5 in the Zone 3 – Likely Tables Archery Only Season (Buck).

There are no other amendments to the regulatory text based on the results of pronghorn population studies in the spring of 2024. No comments were received.

The Department recommends the Commission adopt the proposed changes as reflected in the continuation notice and in this Pre-Adoption Memo for pronghorn antelope hunting.

Hunt Area	2023-2024 General Season Period 1 Buck	2024-2025 Proposed Range General Season Period 1 Buck	2024-2025 Recommendation General Season Period 1 Buck	2023-2024 General Season Period 2 Buck	2024-2025 Proposed Range General Season Period 2 Buck	2024-2025 Recommendation General Season Period 2 Buck
Zone 1 – Mount Dome	2	0-5	2	0	0	
Zone 2 – Clear Lake	15	5-15	12	0	0	
Zone 3 – Likely Tables	25	~~15-25~~ [0-25][1] **5**[2]	5	25	~~10-25~~ [0-25][3] **5**[4]	5

ADDENDUM

TO THE

2004 FINAL ENVIRONMENTAL DOCUMENT

REGARDING PRONGHORN ANTELOPE HUNTING

prepared by the

STATE OF CALIFORNIA
NATURAL RESOURCES AGENCY
CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

on behalf of

CALIFORNIA FISH AND GAME COMMISSION

as

LEAD AGENCY UNDER THE
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

for the

REGULARY NOTICED RULEMAKING ACTION TO AMEND
SECTIONS 363 PRONGHORN ANTELOPE HUNTS
TITLE 14, CALIFORNIA CODE OF REGULATIONS
2024 HUNTING SEASON

(OAL Notice File No. **2024-0123-07**)

INTRODUCTION

The California Department of Fish and Wildlife (CDFW) has prepared this addendum pursuant to the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 et seq., to inform consideration by the California Fish and Game Commission (Commission) of proposed amendments to existing regulations governing pronghorn antelope hunting in California (California Code of Regulations (CCR), Title 14, Section 363). F&G Code, Section 3950 designates pronghorn antelope as a game mammal in California. F&G Code Sections 203 and 331 authorize the Commission to fix the area or areas, seasons and hours, bag and possession limit, sex, and total number of pronghorn antelope that may be taken pursuant to its regulations. F&G Code Section 203.1 requires the Commission to consider populations, habitat, food supplies, the welfare of individual animals, and other pertinent facts when establishing hunting regulations for pronghorn antelope. The Commission establishes pronghorn antelope hunting tag quotas through regulations amended annually, as needed, based on current population estimates derived from annual surveys by CDFW.

The Commission serves as the CEQA lead agency when it promulgates and amends the pronghorn antelope hunting regulations. (Public Resources Code Section 21067; CEQA Guidelines Section 15367.)[1] The Commission established maximum tag quotas for all pronghorn antelope hunting zones in California in 2004 with, among other things, the certification of a Final Environmental Document under CEQA (2004 Pronghorn Antelope ED)(SCH No. 2003112078). The 2004 Pronghorn Antelope ED provides relevant and important informational value as the Commission as CEQA lead agency considers proposed amendments to the existing regulations for the 2024 pronghorn antelope hunting season in California. This addendum documents the Commission's consideration of related environmental effects.

Periodic adjustments of tag quotas in response to dynamic environmental and biological conditions are necessary to maintain sustainable populations of pronghorn antelope and hunt opportunities, as well as keeping with mandates and management recommendations. Analysis of these conditions was completed in March of 2024. Based on the analysis, the proposed tag quota for 2024 falls within the conservative harvest range identified in the 2004 Pronghorn Antelope ED.

[1] The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

EARLIER PROJECT APPROVAL

CEQA review of the proposed project was conducted in accordance with the Commission's certified regulatory program approved by the Secretary for the California Natural Resources Agency pursuant to Public Resources Code Section 21080.5 (See generally Title 14, CCR, Sections 781.5 and 15251(b)). CEQA requires all public agencies in the State to evaluate the environmental impacts of discretionary projects they propose to carry out or approve, including promulgating regulations, which may have a potential to significantly affect the environment.

In 2004, the Commission certified a Final Environmental Document Regarding Pronghorn Antelope Hunting (2004 Pronghorn Antelope ED) (SCH No. 2003112078) as the lead agency under CEQA as part of the Commission's review and adoption of the Pronghorn antelope Hunting regulations.

PROPOSED 2024 TAG ALLOCATIONS FOR THE MOUNT DOME HUNT ZONE

The pronghorn antelope tag quotas described in the 2004 Pronghorn Antelope ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 pronghorn antelope hunting season by the Commission are based on survey data collected by the Department in its annual survey efforts. For 2024, the proposed tag allocation for the Mount Dome General Season Period 1 Buck is 2. Currently, the public tag quota (general draw) for the Mount Dome General Season Period 1 Buck is 2 tags.

The 2004 Pronghorn Antelope ED found no significant impacts for a range of pronghorn antelope tags for Mount Dome General Season Period 1 Buck not to exceed a maximum of 60 tags. Therefore, there are no new significant or substantially more severe impacts caused by keeping the buck tags in the Mount Dome Hunt Zone at 2 tags.

PROPOSED 2024 TAG ALLOCATIONS FOR THE CLEAR LAKE HUNT ZONE

The pronghorn antelope tag quotas described in the 2004 Pronghorn Antelope ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 pronghorn antelope hunting season by the Commission are based on survey data collected by the Department in its annual survey efforts. For 2024, the proposed tag allocation for the Clear Lake General Season Period 1 Buck is 12. Currently, the public tag quota (general draw) for the Clear Lake General Season Period 1 Buck is 15 tags.

The 2004 Pronghorn Antelope ED found no significant impacts for a range of pronghorn antelope tags for the Clear Lake General Season Period 1 Buck not to exceed a maximum of 80 tags. Therefore, there are no new significant or substantially more severe impacts from amending the pronghorn antelope hunt regulations to modify buck tags in the Clear Lake General Season Period 1 Buck to 12 tags.

PROPOSED 2024 TAG ALLOCATIONS FOR THE LIKELY TABLES HUNT ZONE

The pronghorn antelope tag quotas described in the 2004 Pronghorn Antelope ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 pronghorn antelope hunting season by the Commission are based on survey data collected by the Department in its annual survey efforts. For 2024, the proposed tag allocation for the Likely Tables General Season Period 1 and Period 2 Buck is 5. Currently, the public tag quota (general draw) for the Likely Tables General Season Periods 1 and 2 Buck is 25 tags each.

The 2004 Pronghorn Antelope ED found no significant impacts for a range of pronghorn antelope tags for the Likely Tables General Season Period 1 Buck not to exceed a maximum of 150 tags and for the Likely Tables General Season Period 2 Buck not to exceed a maximum of 130 tags. Therefore, there are no new significant or substantially more severe impacts from amending the pronghorn antelope hunt regulations to modify buck tags in the Likely Tables General Season Periods 1 and 2 Buck to 5 tags and 5 tags, respectively.

PROPOSED 2024 TAG ALLOCATIONS FOR THE LASSEN HUNT ZONE

The pronghorn antelope tag quotas described in the 2004 Pronghorn Antelope ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 pronghorn antelope hunting season by the Commission are based on survey data collected by the Department in its annual survey efforts. For 2024, the proposed tag allocation for the Lassen General Season Period 1 and Period 2 Buck is 35. Currently, the public tag quota (general draw) for the Likely Tables General Season Periods 1 and 2 Buck is 35 tags each.

The 2004 Pronghorn Antelope ED found no significant impacts for a range of pronghorn antelope tags for the Lassen General Season Periods 1 and 2 Buck not to exceed a maximum of 150 tags each. Therefore, there are no new significant or substantially more severe impacts from amending the pronghorn antelope hunt regulations caused by keeping buck tags in the Lassen General Season Periods 1 and 2 Buck at 35 tags each.

PROPOSED 2024 TAG ALLOCATIONS FOR THE BIG VALLEY HUNT ZONE

The pronghorn antelope tag quotas described in the 2004 Pronghorn Antelope ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 pronghorn antelope hunting season by the Commission are based on survey data collected by the Department in its annual survey efforts. For 2024, the proposed tag allocation for the Big Valley General Season Period 1 Buck is 5. Currently, the public tag quota (general draw) for the Big Valley General Season Period 1 Buck is 20 tags.

The previous Archery tag quota was 15 bucks during the 2023-2024 season. The new proposed tag quota is 5. This reduction is proposed because the March 2024 survey showed a smaller population of Pronghorn than anticipated, likely connected to a severe winter that increased winter mortality.

The 2004 Pronghorn Antelope ED found no significant impacts for a range of pronghorn antelope tags for the Big Valley General Season Period 1 Buck not to exceed a maximum of 150 tags. Therefore, there are no new significant or substantially more severe impacts from amending the pronghorn antelope hunt regulations to modify buck tags in the Big Valley General Season Period 1 Buck to 5 tags and reducing the Archery tags from 15 to 5.

PROPOSED 2024 TAG ALLOCATIONS FOR THE SURPRISE VALLEY HUNT ZONE

The pronghorn antelope tag quotas described in the 2004 Pronghorn Antelope ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 pronghorn antelope hunting season by the Commission are based on survey data collected by the Department in its annual survey efforts. For 2024, the proposed tag allocation for the Surprise Valley General Season Period 1 Buck is 10-15. Currently, the public tag quota (general draw) for the Big Valley General Season Period 1 Buck is 10 tags.

The 2004 Pronghorn Antelope ED found no significant impacts for a range of pronghorn antelope tags for the Surprise Valley General Season Period 1 Buck not to exceed a maximum of 25 tags. Therefore, there are no new significant or substantially more severe impacts caused by keeping the pronghorn antelope hunt regulations to modify buck tags in the Surprise Valley General Season Period 1 Buck at 10 tags.

NO SUBSEQUENT ENVIRONMENTAL DOCUMENT IS REQUIRED

In general, CEQA applies whenever a public agency proposes to carry out or approve a discretionary project. (Public Resources Code Section 21080(a)). CEQA provides that, where a public agency proposes to modify a previously approved project for which a Final Environmental Document was prepared and certified:

> "The lead agency or a responsible agency shall prepare an ***addendum*** to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred." (Title 14, CCR, Section 15164)

- A Subsequent Environment Document (Section 15162) when there is substantial evidence that:
  - Substantial changes are proposed in the project, which will require major revisions to the previous environmental impact report (EIR) or environmental document (ED).
  - Substantial changes occur with respect to the circumstances under which the project is being undertaken, which will require major revisions to the previous EIR or environmental documentation.
  - New information, which was not known and could not have been known at the time the previous EIR or ED was certified as complete, becomes available.
- A Supplement to an Environment Document (Section 15163) when:
  - A subsequent ED is not required.
  - Only minor changes to the project are described.
  - Only that information to make the ED adequate is provided.
- An Addendum to the Certified ED (Section 15164) is proper when**:**
  - The changes or additions presented in this project are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent ED have occurred.
  - The Commission may properly prepare and may rely on an addendum in accordance with Section 15164 to fulfill its obligations under CEQA.

NO ADDITIONAL IMPACTS UNDER CEQA

The Commission has determined that amending the current pronghorn antelope hunting regulations based on annual survey results will not result in any new or significant or substantially more severe environmental impacts than previously analyzed and disclosed in the 2004 Pronghorn antelope ED for this project.

This project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory. There are no impacts to the habitat of fish and wildlife species.

This approval action adjusts the previous year tag quotas based on more current population information, modifies existing hunt zone boundaries, and establishes three new hunt zones. No other aspect of the project is changed. No new significant or substantially more severe impacts under CEQA will occur due to this change.

AMENDMENT OF THE PRONGHORN ANTELOPE HUNT REGULATIONS

In conclusion, the Commission finds that amending the pronghorn antelope hunt regulations in Title 14, CCR Section 363, will not result in any new significant or substantially more severe environmental effects than previously analyzed and disclosed in the 2004 Pronghorn Antelope ED. The Commission also finds that subsequent or supplemental review beyond this Addendum is not warranted pursuant to Title 14, CCR Section 15164, in connection with this proposed action.

Initial Statement of Reasons for Regulatory Action

Amend Sections 364 and 364.1
Title 14, California Code of Regulations
Re: Elk Hunting

I. Date of Initial Statement of Reasons: October 1, 2023

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing:

Date: December 13, 2023 Location: San Diego, CA

(b) Discussion Hearing:

Date: February 15, 2024 Location: Sacramento, CA

(c) Adoption Hearing:

Date: April 18, 2024 Location: San Jose, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

The Fish and Game Commission (Commission) periodically considers the recommendations of the Department of Fish and Wildlife (Department) in updating elk hunting regulations. Considerations include recommendations for adjusting tag quotas, setting hunt periods, modifying zone boundaries, authorizing methods of take, among others, to help achieve management goals and objectives for elk. Section 364 provides descriptions of hunt zone boundaries, season opening and closing dates, methods of take (e.g., general methods, archery only, apprentice), tag designations (buck, doe), tag quotas (total number of hunting tags to be made available), bag and possession limits, and special conditions for elk. To maintain appropriate harvest levels and hunting quality, tags must be adjusted periodically in response to dynamic environmental, biological, and social conditions.

The proposed changes focus on elk tag quotas under Section 364(r-z). The last time these regulations were subject to a major amendment was 2022-2023. The proposed amendments here represent the cumulation of the Department's internal discussion/data analysis. Periodic adjustments of tag quotas in response to dynamic environmental and biological conditions are necessary to maintain sustainable populations of elk and hunt opportunities, as well as keeping with mandates and management recommendations. Unfortunately, administrative procedures and the Fish and Game Code require the Commission to receive proposed changes to existing regulations prior to the completion of surveys and analyses, thus necessitating a range of numbers. Analyses are scheduled for completion by March 2024. The proposed changes are necessary to maintain sustainable hunt opportunities, consistency with management unit plan recommendations, and Fish and Game Code.

BACKGROUND

Current regulations in Section 364 specify elk tag quotas for each hunt zone and establish hunt zone boundaries in accordance with management goals and objectives described in the Department's Elk Conservation and Management Plan. Similarly, current regulations in Section 364.1 specify elk tag quotas for each hunt zone that may be distributed to the public to allow access to hunt elk on specific properties that enter the Shared Habitat Alliance for Recreational Enhancement (SHARE) program. A limited number of public elk hunting tags are offered annually via the Big Game Drawing and SHARE program drawing, and public demand for elk hunting tags (as indicated by elk tag draw applications) has annually exceeded tag availability for the last ten years. In addition to harvest opportunity, public elk hunting also provides data that enhances the Department's ability to monitor elk populations including spatial, age, genetic, and disease information. As described in the Department's Elk Conservation and Management Plan (2018), the Department's goal is to increase elk hunting opportunities where feasible and compatible with population objectives, in which case recommendations will be offered to the Commission.

CURRENT REGULATIONS

Individuals are awarded an elk hunting tag through the Department's Big Game Drawing or SHARE hunt program drawing. Harvest of an elk is authorized for an individual awarded a tag for a respective hunt zone or SHARE property and season. Tag quotas are established based on a variety of factors including population density and abundance, age and sex composition, elk distribution, and human-elk conflict levels, among other population objectives, factors, and considerations. The Department has identified several areas where increased public elk hunting opportunities under section 364 and section 364.1 are feasible and support achievement of population objectives.

Current laws governing 364 and 364.1 tag allocations for the identified areas are as follows:

- Grizzly Island General Methods Tule Elk Hunts: 364(u)(13)(A) through 364(u)(13)(M); 16 antlerless tags, 10 spike bull tags, 7 bull tags
- Siskiyou SHARE Roosevelt Elk Hunt: 364.1(i)(1); 2 bull tags, 2 antlerless tags
- Northwestern SHARE Roosevelt Elk Hunt: 364.1(i)(2); 34 bull tags, 34 antlerless tags
- Tehachapi SHARE Rocky Mountain Elk Hunt: 364.1(j)(2); 20 bull tags, 15 antlerless tags
- Mendocino SHARE Roosevelt/Tule Elk Hunt: 364.1(k)(1); 2 bull tags, 4 antlerless tags

PROPOSED REGULATIONS

The proposed regulations are in compliance with CDFW's Elk Conservation and Management Plan (CDFW 2018):

Grizzly Island Tule Elk Hunt Zone Section 364(u)(13)(A) through 364(u)(13)(M)

Amend subsections 364(u)(13)(J), 364(u)(13)(L), and 364(u)(13)(M) to increase bull harvest in Periods 10 (364(u)(13)(J)), 12 (364(u)(13)(L)), and 13 (364(u)(13)(M)).

Period 10: [4-5] bull; current 3

Period 12: [4-5] bull; current 3

Period 13: [2-4] bull: current 0

Grizzly Island Tule Elk Hunt Zone: Current (2023) public tag quota for the Grizzly Island Hunt Zone is 16 antlerless, 10 spike bull, and 7 bull tags. The observed bull (bb): cow (cc) ratio (86bb:100 cc) is above objective (50bb:100 cc). The Department recommends increased bull harvest with the addition of 4-8 bull tags across three hunt periods (Periods 10, 12, and 13). The intended results of this recommendation will provide more public hunt opportunity and help achieve the sex ratio objective.

Nonsubstantive Changes

Additional changes are made in subsections 364(a) through (d) for punctuation and capitalization.

Siskiyou SHARE Roosevelt Elk Section 364.1(i)(1).

Amend subsection 364.1(i)(1) to increase SHARE bull and antlerless harvest.

Siskiyou SHARE Roosevelt Elk Hunt Zone: current (2023) SHARE tags for the Siskiyou Hunt Zone is 2 bull and 2 antlerless tags. Elk populations in this hunt zone tend to concentrate on private property and human-elk conflict has exceeded tolerable levels in some areas. High elk density may also contribute to increased disease transmission.

The Department recommends adding 18 bull and 18 antlerless SHARE tags to result in a total of 40 (20 bull and 20 antlerless) SHARE tags. The intended results of this recommendation will provide more public hunt opportunity and reduce elk conflict.

Northwestern SHARE Roosevelt Elk Section 364.1(i)(2).

Amend subsection 364.1(i)(2) to increase SHARE bull and antlerless harvest.

Northwestern SHARE Roosevelt Elk Hunt Zone: current (2023) SHARE tags for the Northwestern Hunt Zone include 34 bull and 34 antlerless tags. Elk populations in this Hunt Zone tend to concentrate on private property and human-elk conflict has exceeded tolerable levels in some areas. High elk density may also contribute to increased disease transmission.

The Department recommends adding 6 bull and 26 antlerless SHARE tags to result in a total of 100 (40 bull and 60 antlerless) SHARE tags. The intended results of this recommendation will provide more public hunt opportunity, reduce disease transmission, and reduce elk conflict.

Tehachapi SHARE Rocky Mountain Elk Section 364.1(j)(2).

Amend subsection 364.1(j)(2) to increase SHARE bull and antlerless harvest.

Tehachapi SHARE Rocky Mountain Elk Hunt Zone: current (2023) SHARE tags for the Tehachapi Hunt Zone include 20 bull and 15 antlerless tags. Elk populations in this Hunt Zone tend to concentrate on private property and human-elk conflict has exceeded tolerable levels in some areas.

The Department recommends adding 20 bull and 45 antlerless SHARE tags to result in a total of 100 (40 bull and 60 antlerless) SHARE tags. The intended results of this recommendation will provide more public hunt opportunity and reduce elk conflict.

Mendocino SHARE Roosevelt/Tule Elk Section 364.1(k)(1).

Amend subsection 364.1(k)(1) to increase SHARE bull and antlerless harvest.

Mendocino SHARE Roosevelt/Tule Elk Hunt Zone: current (2023) SHARE tags for the Mendocino Hunt Zone include 2 bull and 4 antlerless tags. Elk populations in this Hunt Zone tend to concentrate on private property and human-elk conflict has exceeded tolerable levels in some areas. High elk density may also contribute to increased disease transmission.

The Department recommends adding 18 bull and 26 antlerless SHARE tags to result in a total of 50 (20 bull and 30 antlerless) SHARE tags. The intended results of this recommendation will provide more public hunt opportunity, reduce disease transmission, and reduce elk conflict.

(b) Goals and Benefits of the Regulation

The proposed regulations will contribute to the sustainable management of elk populations in California while providing additional hunting opportunity in certain zones. Population objectives are maintained and managed in part by periodically modifying the number of hunting tags distributed.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: Sections 200, 203, 203.1, 265, 332, and 1050, Fish and Game Code

Reference: Sections 325, 332, 1050, 1570, 1571, 1573, and 1574, Fish and Game Code

(d) Specific Technology or Equipment Required by Regulatory Change: None

(e) Identification of Reports or Documents Supporting Regulation Change

California Department of Fish and Wildlife. (2018). 2018 Elk Management Plan. https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=162912&inline

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

- Wildlife Resources Committee, May 2023
- Wildlife Resources Committee, September 2023

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

No alternatives were identified by or brought to the attention of Commission staff that would have the same desired regulatory effect.

(b) No Change Alternative

Without the proposed changes, the outstanding issues concerning the regulations currently governing 364 and 364.1 would remain unaddressed. Retaining the current number of tags for the hunts listed would not be responsive to changes in population status or levels of human-elk conflict.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing hunts. Given the number of tags available and the area over which they are distributed, these proposals are economically neutral to business.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission does not anticipate impacts on the creation or elimination of jobs or businesses within the State; no significant impacts to the creation of new business, the elimination of existing businesses, or the expansion of businesses in California are anticipated. The Commission does not anticipate direct benefits to the general health and welfare of California residents or to worker safety but anticipates benefits to the environment.

(c) Cost Impacts on a Representative Private Person or Business

The Commission does not anticipate significant impacts on the representative private persons or businesses.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: Non new costs/savings or change to federal funding are anticipated for state agencies. However, the Department is projected to experience higher elk tag sales that may result in revenue increases (see STD399 and Addendum).

(e) Nondiscretionary Costs/Savings to Local Agencies: None

(f) Programs Mandated on Local Agencies or School Districts: None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None

(h) Effect on Housing Costs: None

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

The Commission does not anticipate impacts on the creation or elimination of jobs within the state.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The Commission does not anticipate impacts on the creation of new business, the elimination of existing businesses within the state because the proposed regulations are not anticipated to create impacts that are substantial enough to stimulate demand for goods or services related to elk hunting.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The Commission does not anticipate impacts on the expansion of businesses currently doing business within the state because the proposed regulations are not anticipated to create impacts that are substantial enough to stimulate demand for goods or services related to elk hunting.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

Hunting is an outdoor activity that can provide several health and welfare benefits to California residents. Hunters and their families benefit from fresh game to eat, and from the benefits of outdoor recreation, including exercise. People who hunt have a special connection with the outdoors and an awareness of the relationships between wildlife, habitat, and humans, and can be a family tradition and a bonding activity.

(e) Benefits of the Regulation to Worker Safety

The Commission does not anticipate impacts on worker safety.

(f) Benefits of the Regulation to the State's Environment

As set forth in Fish and Game Code section 1700, it is the policy of the state to encourage the conservation, maintenance, and utilization of fish and wildlife resources for the benefit of all the citizens of the state. The objectives of this policy include, but are not limited to, the maintenance of populations of elk to ensure their continued existence and supporting recreational opportunity. Adoption of scientifically based elk seasons and tag quotas provides for the maintenance of elk populations to ensure those objectives are met. The fees that hunters pay for licenses and tags help fund wildlife conservation.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

Current regulations in Section 364 provide definitions, hunting zone descriptions, season opening and closing dates, tag quotas (total number of hunting tags to be made available), and bag and possession limits for elk hunting. Currently, elk tags are distributed through four issuance types governed by different sections under Title 14. Issuance types for elk tags include Section 364 General Public tags awarded via the Big Game Drawing, Section 364.1 Shared Habitat Alliance for Recreational Enhancement (SHARE) tags, Section 555 Cooperative Elk Hunting Area "Landowner" tags, and Section 601 Private Lands Wildlife Habitat Enhancement and Management Area (PLM) tags. A limited number of fundraising tags are also available for purchase, usually by auction, via non-governmental organizations that assist the Department with fundraising.

Harvest of an elk is authorized for an individual with a tag for a respective hunt zone and season or specific property, depending on the tag issuance type. Tag quotas are established based on a variety of factors including population density and abundance, age and sex composition, and distribution as well as environmental and social factors.

The proposed changes are as follows:

Amend 364(u) to modify hunt quotas for Grizzly Island Periods 10, 12, and 13.

Amend 364.1(i-k) to modify hunt quotas for Siskiyou, Northwestern, Tehachapi, and Mendocino SHARE elk hunts.

Periodic adjustments of tag quotas in response to dynamic environmental and biological conditions are necessary to maintain sustainable populations of elk and hunt opportunities, as well as keeping with mandates and management recommendations. Unfortunately, administrative procedures and the Fish and Game Code require the Fish and Game Commission to receive proposed changes to existing regulations prior to the completion of surveys and analyses, thus necessitating a range of numbers. Analyses are scheduled for completion by March 2024.

Non-substantive editing and renumbering to improve the clarity and consistency of the regulatory language have been made in sections 364 and 364.1.

Benefit of the Regulations:

The goals and benefits of the regulations are to help maintain sustainable populations of elk, maintain sustainable hunt opportunities, and achieve management recommendations in existing unit plans.

Consistency and Compatibility with Existing Regulations:

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. Section 20, Article IV, of the state Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to adopt regulations governing elk hunting (California Fish and Game Code sections 332 and 3951. No other state agency has the authority to adopt regulations governing elk hunting. The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the CCR for any regulations regarding the adoption of elk hunting regulations; therefore, the Commission has concluded that the proposed regulations are neither inconsistent nor incompatible with existing state regulations.

Proposed Regulatory Language

Section 364, Title 14 CCR, is amended to read:

§ 364. Elk Hunts, Seasons, and Number of Tags.

(a) Department Administered General Methods Roosevelt Elk Hunts:

(1) Siskiyou General Methods Roosevelt Elk Hunt:

(A) Area: In that portion of Siskiyou County within a line beginning at the junction of Interstate 5 and the California-Oregon state line; east along the California-Oregon state line to Hill Road at Ainsworth Corner; south on Hill Road to Lava Beds National Monument Road; south on Lava Beds National Monument Road to USDA Forest Service Road 49; south on USDA Forest Service Road 49 to USDA Forest Service Road 77; west on USDA Forest Service Road 77 to USDA Forest Service Road 15 (Harris Spring Road); south on USDA Forest Service Road 15 to USDA Forest Service Road 13 (Pilgrim Creek Road); southwest on USDA Forest Service Road 13 to Highway 89; northwest on Highway 89 to Interstate 5; north on Interstate 5 to the point of beginning.

(2) Northwestern Roosevelt Elk Hunt:

(A) Area: In those portions of Humboldt and Del Norte ~~Counties~~ counties within a line beginning at the intersection of Highway 299 and Highway 96; north on Highway 96 to the Del Norte-Siskiyou county line; north along the Del Norte-Siskiyou county line to the California-Oregon state line; west along the California-Oregon state line to the Pacific coastline; south along the Pacific coastline to the Humboldt-Mendocino county line; east along the Humboldt-Mendocino county line to the Humboldt-Trinity county line; north along the Humboldt-Trinity county line to Highway 299; west on Highway 299 to the point of beginning.

(3) Marble Mountains General Methods Roosevelt Elk Hunt:

(A) Area: In those portions of Humboldt, Tehama, Trinity, Shasta and Siskiyou Counties within a line beginning at the intersection of Interstate 5 and the California-Oregon state line; west along the California-Oregon state line to the Del Norte county line; south along the Del Norte county line to the junction of the Siskiyou-Humboldt county line; east along the Siskiyou-Humboldt county line to Highway 96; south on Highway 96 to Highway 299; south on Highway 299 to the Humboldt-Trinity county line; south along the Humboldt-Trinity county line to Highway 36; east on Highway 36 to Interstate 5; north on Interstate 5 to the point of beginning.

(b) Department Administered General Methods Rocky Mountain Elk Hunts:

(1) Northeastern General Methods Rocky Mountain Elk Hunt:

(A) Area: Those portions of Siskiyou, Modoc, Lassen, and Shasta ~~Counties~~ counties within a line beginning in Siskiyou County at the junction of the California-Oregon state line and Hill Road at Ainsworth Corner; east along the California-Oregon state line to the California-Nevada state line; south along the California-Nevada state line to Lassen County Road 506 ~~Tuledad~~ (Tuledad) Road; west on Lassen County Road 506 to Lassen County Road 512 (Red Rock Road); west on Lassen County Road 512 to Lassen County Road 510 (Clark’s Valley Road); west on Lassen County Road 510 to Highway 395 at Madeline; west on Lassen County Road

527 (Ash Valley Road) to Highway ~~139/299~~ 299/139 in Adin; south on Highway 299/139, then Highway 139 to Highway 36 in Susanville; west on Highway 36 to Interstate 5 in Red Bluff; north on Interstate 5 to Highway 89; southeast on Highway 89 to USDA Forest Service Road 13 (Pilgrim Creek Road); northeast on USDA Forest Service Road 13 to USDA Forest Service Road 15 (Harris Spring Road); north on USDA Forest Service Road 15 to USDA Forest Service Road 77; east on USDA Forest Service Road 77 to USDA Forest Service Road 49; north on USDA Forest Service Road 49 to Lava Beds National Monument Road; north on Lava Beds National Monument Road to Hill Road; north on Hill Road to the point of beginning.

(2) Tehachapi Rocky Mountain Elk Hunt:

(A) Area: In those portions of Kern and Los Angeles ~~Counties~~ counties within a line beginning at the intersection of Highways 99 and 65; north on Highway 65 to the Kern-Tulare county line; east along the Kern-Tulare county line to Highway 395; south on Highway 395 to Highway 14; southwest on Highway 14 to Highway 138; west on Highway 138 to Interstate 5; north on Interstate 5 to Highway 99; north on Highway 99 to the point of beginning.

(c) Department Administered General Methods Roosevelt/Tule Elk Hunt:

(1) Mendocino General Methods Roosevelt/Tule Elk Hunt:

(A) Area: In that portion of Mendocino County within a line beginning at the Pacific coastline and the Mendocino-Humboldt county line south of Shelter Cove; east along the Mendocino-Humboldt county line to the Mendocino-Trinity county line; south and east along the Mendocino-Trinity county line to the Mendocino-Tehama county line; south along the Mendocino-Glenn county line, then the Mendocino-Lake county line to Highway 20; north and west on Highway 20 to Highway 101 near Calpella; south on Highway 101 to Highway 253; southwest on Highway 253 to Highway 128; north on Highway 128 to Mountain View Road near the town of Boonville; west on Mountain View Road to Highway 1; south on Highway 1 to the junction of the Garcia River; west along the Garcia River to the Pacific coastline; north along the Pacific coastline to the point of beginning.

(d) Department Administered General Methods Tule Elk Hunts:

(1) Cache Creek General Methods Tule Elk Hunt:

(A) Area: In those portions of Lake, Colusa and Yolo ~~Counties~~ counties within a line beginning at the junction of Highway 20 and the Colusa-Lake county line (County Line Ridge); south along the Colusa-Lake county line to the Yolo county line; east along the Yolo ~~County~~ county line to Highway 16; south on Highway 16 to Reiff-Rayhouse Road; west on Reiff-Rayhouse Road to Morgan Valley Road; west on Morgan Valley Road to Highway 53; north on Highway 53 to Highway 20; west on Highway 20 to Forest Road 303; north and east on Forest Road 303 to Walker Ridge Road; south on Walker Ridge Road to Highway 20; east on Highway 20 to the point of beginning.

(2) La Panza General Methods Tule Elk Hunt:

(A) Area: In those portions of San Luis Obispo, Kern, and Santa Barbara ~~Counties~~ counties within a line beginning in San Luis Obispo County at the intersection of Highway 101 and Highway 46; south on Highway 101 to Highway 166 in San Luis Obispo County; east on

Highway 166 to Highway 33 at Maricopa in Kern County; north and west on Highway 33 to Highway 46 in Kern County; west on Highway 46 to the point of beginning.

(B) Special Conditions: All tagholders will be required to attend a mandatory orientation. Tagholders will be notified of the time and location of the orientation meeting upon receipt of their elk license tags.

(3) Central Coast General Methods Tule Elk Hunt:

(A) Area: In those portions of Monterey and San Luis Obispo ~~Counties~~ counties within a line beginning in Monterey County at the junction of Highway 1 and Elkhorn Slough; westward to the Pacific coastline at the Moss Landing Harbor mouth entrance; south along the Pacific coastline to the junction of the mouth of Santa Rosa Creek in San Luis Obispo County; south and east along Santa Rosa Creek to the bridge at Highway 1; south on Highway 1 to Highway 46; east on Highway 46 to Highway 101; north on Highway 101 to North Main Street in Salinas in Monterey County; south on North Main Street to Highway 183; north on Highway 183 to Highway 1; north on Highway 1 to the point of beginning, excluding the full extent of the Fort Hunter Liggett military installation.

(B) Special Conditions: All tagholders will be required to attend a mandatory orientation. Tagholders will be notified of the time and location of the orientation meeting upon receipt of their elk license tags.

(4) Gabilan General Methods Tule Elk Hunt:

(A) Area: In those portions of Monterey, San Benito, and Fresno ~~Counties~~ counties within a line beginning in Monterey County at the junction of the Pajaro River and the Pacific coastline; east along the Pajaro River to Highway 25; south on Highway 25 to San Felipe Road; south on San Felipe Road to San Benito Street; south on San Benito Street to Nash Road; east on Nash Road to Highway 25; south on Highway 25 to County Road J1 (Panoche Road) near the town of Paicines; southeast on County Road J1 to County Road J1 (Little Panoche Road); north on County Road J1 to Interstate 5 in Fresno County; south on Interstate 5 to Highway 33; south on Highway 33 to Highway 46; west on Highway 46 to Highway 101; north on Highway 101 to North Main Street in Salinas in Monterey County; south on North Main Street to Highway 183; north on Highway 183 to Highway 1; north on Highway 1 to the junction with Elkhorn Slough; westward to the Pacific coastline at the Moss Landing Harbor mouth entrance; north along the Pacific coastline to the point of beginning.

(B) Special Conditions: All tagholders will be required to attend a mandatory orientation. Tagholders will be notified of the time and location of the orientation meeting upon receipt of their elk license tags.

(5) Bishop General Methods Tule Elk Hunt:

(A) Area: In that portion of Inyo County within a line beginning at the intersection of Highway 395 and Highway 6 in the town of Bishop; north and east ~~along~~ on Highway 6 to Silver Canyon Road; east on Silver Canyon Road to Forest Service Road 4S01 (White Mountain Road); south on Forest Service Road 4S01 to Highway 168 at Westgard Pass; south and west on Highway 168 to Highway 395; north on Highway 395 to the point of beginning.

(6) Independence General Methods Tule Elk Hunt:

(A) Area: In that portion of Inyo County within a line beginning at the intersection of Highway 395 and Aberdeen Station Road; east on Aberdeen Station Road to its terminus at the southern boundary of Section 5, Township 11S, Range 35E; east along the southern boundary of sections 5, 4, 3, and 2, Township 11S, Range 35E to ~~the~~ Papoose Flat Road at Papoose Flat; south and east on Papoose Flat Road to Mazourka Canyon Road; south, then west on Mazourka Canyon Road to Highway 395; north on Highway 395 to the point of beginning.

. . . [No change to subsections (d)(7) through (d)(10)]. . .

(11) Whitney General Methods Tule Elk Hunt:

(A) Area: In that portion of Inyo County within a line beginning at the intersection of Highway 395 and Onion Valley Road; south on Highway 395 to Whitney Portal Road; west on Whitney Portal Road to the northern boundary of Section 36, Township 15S, Range 34E; west along the northern boundary of sections 36, 35, 34 and 33 Township 15S, Range 34 E to the Inyo-Tulare county line; north along the ~~the~~ Inyo-Tulare county line to the junction of Section 27 Township 13S, range 33E; east along the southern boundary of sections 27, 26 and 25 Township 13S, Range 33E; north along the eastern boundary of Section 25 Township 13S, Range 33E to Onion Valley Road; east on Onion Valley Road to the point of beginning.

. . . [No change to subsections (d)(12) through(d)(14)]

(15) East Park Reservoir General Methods Tule Elk Hunt:

(A) Area: In those portions of Glenn and Colusa ~~Counties~~ counties within a line beginning in Glenn County at the intersection of Interstate 5 and Highway 162 at Willows; west on Highway 162 (Highway 162 becomes Alder Springs Road) to the Glenn-Mendocino county line; south along the Glenn-Mendocino county line to the Glenn-Lake county line; east and then south along the Glenn-Lake county line to the Colusa-Lake county line; west, and then southeast along the Colusa-Lake county line to Goat Mountain Road; north and east on Goat Mountain Road to Lodoga-Stonyford Road; east on Lodoga-Stonyford to Sites-Lodoga Road at Lodoga; east on Sites-Lodoga Road to Maxwell-Sites Road at Sites; east on Maxwell-Sites Road to Interstate 5 at Maxwell; north on Interstate 5 to the point of beginning.

(B) Special Conditions:

1. All tagholders will be required to attend a mandatory orientation. Tagholders will be notified of the time and location of the orientation meeting after receipt of their elk license tags.

2. Access to private land may be restricted or require payment of an access fee.

3. A Colusa County ordinance prohibits firearms on land administered by the USDI Bureau of Reclamation in the vicinity of East Park Reservoir. A county variance currently allows for the use of muzzleloaders (as defined in Section 353) on Bureau of Reclamation land within the hunt zone. Hunters are responsible for checking with county authorities for any change in the variance.

(16) San Luis Reservoir General Methods Tule Elk Hunt:

(A) Area: In those portions of Merced, Fresno, San Benito, and Santa Clara ~~Counties~~ counties within a line beginning in Merced County at the intersection of Highway 152 and

Interstate 5 near the town of Santa Nella; west on Highway 152 to Highway 156 in Santa Clara County; southwest on Highway 156 to Highway 25 near the town of Hollister in San Benito County; south on Highway 25 to County Road J1 (Panoche Road) in the town of Paicines; south and east on County Road J1 to County Road J1 (Little Panoche Road); north and east on County Road J1 (Little Panoche Road) to Interstate 5 in Fresno County; north on Interstate 5 to the point of beginning.

(17) Bear Valley General Methods Tule Elk Hunt

(A) Area: In those portions of Colusa, Lake, and Yolo ~~Counties~~ counties within a line beginning in Colusa County at the intersection of Interstate 5 and Maxwell-Sites Road at Maxwell; west on Maxwell-Sites Road to Sites-Lodoga Road; west on Sites-Lodoga Road to Lodoga-Stonyford Road; west Road to Goat Mountain Road; west and south on Goat Mountain Road to the Colusa-Lake county line; south and west along the Colusa-Lake county line to Forest Route M5; south on Forest Route M5 to Forest Road 303; east on Forest Road 303 to Walker Ridge Road; south on Walker Ridge Road to Highway 20; east on Highway 20 to the Colusa-Lake county line (County Line Ridge); south along the Colusa-Lake county line to the Yolo county line; east along the Yolo county line to Highway 16; south on Highway 16 to Rayhouse Road; south and west on Rayhouse Road to the Yolo-Napa county line; east and south along the Yolo-Napa county line to Road 8053; east on Road 8053 to County Road 78A; east on County Road 78A to Highway 16; east on Highway 16 to Route E4 at Capay; north and east on Route E4 to Interstate 5; north on Interstate 5 to the point of beginning.

(18) Lake Pillsbury General Methods Tule Elk Hunt:

(A) Area: In that portion of Lake County within a line beginning at the Glenn-Lake-Mendocino county line; south and west along the Mendocino-Lake county line to Highway 20; southeast on Highway 20 to the Bartlett Springs Road; north and east on Bartlett Springs Road to Forest Route M5; northwest on Forest Route M5 to the Colusa-Lake county line; northwest and east along the Colusa-Lake county line to the junction of the Glenn county line; north and west ~~on~~ along the Lake-Glenn County Line to the point of beginning.

(19) Santa Clara General Methods Tule Elk Hunt:

(A) Area: In those portions of Merced, Santa Clara, and Stanislaus ~~Counties~~ counties within a line beginning at the junction of Interstate 5 and the San Joaquin-Stanislaus county line; southeast on Interstate 5 to Highway 152; west on Highway 152 to Highway 101 near the town of Gilroy; north on Highway 101 to Interstate 680 near San Jose; north on Interstate 680 to the Alameda-Santa Clara county line; east along the Alameda-Santa Clara county line to the junction of the San Joaquin-Stanislaus-Alameda-Santa Clara county lines; northeast along the San Joaquin-Stanislaus county line to the point of beginning.

(20) Alameda General Methods Tule Elk Hunt:

(A) Area: In those portions of Alameda and San Joaquin ~~Counties~~ counties within a line beginning at the junction of Interstate 5 and the San Joaquin-Stanislaus county line; southwest along the San Joaquin-Stanislaus county line to junction of the San Joaquin-Stanislaus-Alameda-Santa Clara county lines; west along the Alameda-Santa Clara county line to Interstate 680; north on Interstate 680 to Interstate 580; east and south on Interstate 580 to Interstate 5; south on Interstate 5 to the point of beginning.

. . . [No change to subsections (e) through (u)(13)(I)]. . .

(u) Department Administered General Methods Tule Elk Hunts

§	Hunt	1. Bull Tags	2. Antlerless Tags	3. Either-Sex Tags	4. Spike Tags	5. Season
(13)(J)	Grizzly Island Period 10	~~3~~ [4-5]	0	0	0	Shall open on the first Thursday following the opening of Period 9 and continue for four consecutive days.
(13)(K)	Grizzly Island Period 11	0	4	0	0	Shall open on the first Tuesday following the opening of Period 10 and continue for four consecutive days.
(13)(L)	Grizzly Island Period 12	~~3~~ [4-5]	0	0	0	Shall open on the first Thursday following the opening of Period 11 and continue for four consecutive days.
(13)(M)	Grizzly Island Period 13	~~0~~ [2-4]	4	0	0	Shall open on the first Tuesday following the opening of Period 12 and continue for four consecutive days.

. . . [No change to subsections (u)(14)(A) through (aa)]. . .

NOTE: Authority cited: Sections 200, 203, 203.1, 265, 332 and 1050, Fish and Game Code.
Reference: Sections 332, 1050, 1570, 1571, 1572, 1573 and 1574, Fish and Game Code.

Proposed Regulatory Language

Section 364.1, Title 14 CCR, is amended to read:

§ 364.1. Department Administered Shared Habitat Alliance for Recreational Enhancement (SHARE) Elk Hunts

(a) Season: The overall season shall open on August 15 and continue through January 31. Individual SHARE properties will be assigned seasons corresponding with management goals.

(b) Bag and Possession Limit: Each elk tag is valid only for one elk per season and only in the SHARE hunt area drawn, and persons shall only be eligible for one elk tag per season through section 364.1.

(c) Individual property boundaries will be identified in the SHARE application package.

(d) Method of Take: Only methods for taking elk as defined in Sections 353 and 354 may be used.

(e) Tagholder Responsibilities: See subsection 364(n).

(f) The use of dogs to take or attempt to take elk is prohibited.

(g) Applicants shall apply for a SHARE Access Permit, and pay a nonrefundable application fee as specified in Section 602, through the department's Automated License Data System terminals at any department license agent, department license sales office, or online.

(h) Upon receipt of winner notification, successful applicants shall submit the appropriate tag fee as specified in Section 702 through any department license sales office or online through the department's Automated License Data System.

(i) Department Administered SHARE Roosevelt Elk Hunts

§	*(A) Hunts*	*1.Bull Tags*	*2.Antlerless Tags*	*3.Either-Sex Tags*	*4.Spike Tags*	*(B) Area*
(1)	Siskiyou	~~2~~ <u>20</u>	~~2~~ <u>20</u>	0	0	The tag shall be valid in the area described in subsection 364(a)(1)(A).
(2)	Northwestern	~~34~~ <u>40</u>	~~34~~ <u>60</u>	0	0	The tag shall be valid in the area described in subsection 364(a)(2)(A).

§	*(A) Hunts*	*1.Bull Tags*	*2.Antlerless Tags*	*3.Either-Sex Tags*	*4.Spike Tags*	*(B) Area*
(3)	Marble Mountain	1	2	0	0	The tag shall be valid in the area described in subsection 364(a)(3)(A).

(j) Department Administered General Methods SHARE Rocky Mountain Elk Hunts

§	*(A) Hunts*	*1.Bull Tags*	*2.Antlerless Tags*	*3.Either-Sex Tags*	*4.Spike Tags*	*(B) Area*
(1)	Northeastern	2	0	2	0	The tag shall be valid in the area described in subsection 364(b)(1)(A).
(2)	Tehachapi	~~20~~ 40	~~15~~ 60	0	0	The tag shall be valid in the area described in subsection 364(b)(2)(A).

(k) Department Administered SHARE Roosevelt/Tule Elk Hunts

§	*(A) Hunts*	*1.Bull Tags*	*2.Antlerless Tags*	*3.Either-Sex Tags*	*4.Spike Tags*	*(B) Area*
(1)	Mendocino	~~2~~ 20	~~4~~ 30	0	0	The tag shall be valid in the area described in subsection 364(c)(1)(A).

. . . [No change to subsection (l)] . . .

NOTE: Authority cited: Sections 332 and 1050, Fish and Game Code.
Reference: Sections 332, 1050 and 1574, Fish and Game Code.

State of California
Department of Fish and Wildlife

Signed Original on File
Received April 11, 2024

Memorandum

Date: April 10, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

**Subject: Agenda Item for the April 17-18, 2024, Fish and Game Commission Meeting
Re: Elk Hunting – Pre- Adoption Memo**

The Department of Fish and Wildlife (Department) has prepared this Memorandum to transmit its final recommendations on the proposed amendments to Sections 364 and 364.1, Title 14, California Code of Regulations, regarding proposing changes to elk hunt zone boundaries, seasons, and tag allocations.

The Department recommends the Commission adopt the proposed rulemaking for elk hunting with the following bag limits. The Department is not recommending changes to the proposed regulatory language in the original public notice, and all tag allocation recommendations fall within the proposed tag range included in the notice.

364(u) Department Administered General Methods Tule Elk Hunts

§	Hunt	1. Bull Tags	2. Antlerless Tags	3. Either-Sex Tags	4. Spike Tags	5. Season
(13)(J)	Grizzly Island Period 10	[4-5] 4	0	0	0	Shall open on the first Thursday following the opening of Period 9 and continue for four consecutive days.
(13)(L)	Grizzly Island Period 12	[4-5] 4	0	0	0	Shall open on the first Thursday following the opening of

§	Hunt	1. Bull Tags	2. Antlerless Tags	3. Either-Sex Tags	4. Spike Tags	5. Season
						Period 11 and continue for four consecutive days.
(13)(M)	Grizzly Island Period 13	[2-4] 3	4	0	0	Shall open on the first Tuesday following the opening of Period 12 and continue for four consecutive days.

If you have any questions on this item, please contact Scott Gardner, Wildlife Branch Chief, via phone at (916) 801-6257.

for the

REGULARLY NOTICED RULEMAKING ACTION TO AMEND

SECTIONS 364 ELK, 364.1 SHARE ELK, and 555 COOPERATIVE ELK HUNTS, AND ADDING SUBSECTION 555.1 CONFLICT ZONE COOPERATIVE ELK HUNTS

TITLE 14, CALIFORNIA CODE OF REGULATIONS

2024 HUNTING SEASON

(OAL Notice File No. **2024-0123-07**)

INTRODUCTION

The California Department of Fish and Wildlife (CDFW) has prepared this addendum pursuant to the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 et seq., to inform consideration by the California Fish and Game Commission (Commission) of proposed amendments to existing regulations governing elk hunting in California (California Code of Regulations (CCR), Title 14, Section Sections 364, 364.1., 555, 555.1). F&G Code Section 3950 designates elk as a game mammal in California. F&G Code Sections 203 and 332, authorize the Commission to fix the area or areas, seasons and hours, bag and possession limit, sex, and total number of elk that may be taken pursuant to its regulations. F&G Code Section 203.1 requires the Commission to consider populations, habitat, food supplies, the welfare of individual animals, and other pertinent facts when establishing hunting regulations for elk. The Commission establishes elk hunting tag quotas through regulations amended annually, as needed, based on current population estimates derived from annual surveys by CDFW.

The Commission serves as the CEQA lead agency when it promulgates and amends the elk hunting regulations. (Public Resources Code, Section 21067; CEQA Guidelines Section 15367.)[1] The Commission established maximum tag quotas for all elk hunting zones in California in 2010 with, among other things, the certification of a Final Environmental Document under CEQA (2010 Elk ED) (SCH No. 200912083). The Commission amended the existing regulations in 2019 by, among other things, certifying a Final Supplemental Environmental Document under CEQA (2019 Elk SED) (SCH No. 2018112037). The 2010 Elk ED and the 2019 Elk SED provide relevant and important informational value as the Commission as CEQA lead agency considers proposed amendments to the existing regulations for the 2024 elk hunting season in California. This addendum documents the Commission's consideration of related environmental effects.

EARLIER PROJECT APPROVAL

CEQA review of the proposed project was conducted in accordance with the Commission's certified regulatory program approved by the Secretary for the California Natural Resources Agency pursuant to Public Resources Code Section 21080.5 (See generally Title 14, CCR Sections 781.5 and 15251(b)). CEQA requires all public agencies in the State to evaluate the environmental impacts of discretionary projects they propose to carry out or approve, including promulgating regulations, which may have a potential to significantly affect the environment.

[1] The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

In 2010, the Commission certified a Final Environmental Document Regarding Elk Hunting (2010 Elk ED) (SCH No. 200912083) as the lead agency under CEQA as part of the Commission's review and adoption of the Elk Hunting regulations.

In 2019 the Commission amended the Elk Hunting regulations and certified a Final Supplemental Environmental Document Regarding Elk Hunting (2019 Elk SED) (SCH No. 2018112037) which focused on the potential for any new significant or substantially more severe environmental impacts from an increase in the tag quota range in the Northwestern Elk Zone (NW Zone). The Commission considered the proposed project increase of 20 tags and three alternatives. The Commission as lead agency certified the SED and determined adoption of the amended regulations as proposed would not result in any new significant or substantially more severe environmental effects than previously identified by the Commission in 2010. The Commission approved the increase of 20 tags for the 2019-20 elk hunting regulations. In 2023, the Commission amended the Elk Hunting tag quotas in the Siskiyou and Northwestern Hunt Zones, adding 10 and 22 tags, respectively; modified the boundaries of the Bear Valley, Cache Creek, and La Panza Hunt Zone; and created the Gabilan, Central Coast, and Tehachapi Hunt Zones, adding 70 elk tags across these new zones. The Commission approved the tag allocations, boundary modifications, and new Hunt Zones for the 2023-24 elk hunting regulations.

PROPOSED 2024 TAG ALLOCATIONS FOR THE GRIZZLY ISLAND HUNT ZONE

The elk tag quotas described in the 2010 Elk ED are the basis for the number of tags currently allocated to all zones in regulation. Amendments of tag quotas for the 2024 elk hunting season by the Commission are based on survey data collected by the Department in its annual survey efforts. The survey was completed in March of 2024. For 2024, the proposed tag allocation for the Grizzly Island Zone Periods 10, 12, and 13 bull hunts is 4, 4, and 3, respectively. Currently, the public tag quota (general draw) for the Grizzly Island Zone Periods 10, 12, and 13 bull hunts is 3, 3, and 0, respectively.

The 2010 Elk ED found no significant impacts for a range of bull elk tags for the Grizzly Island Zone from 0-36 across 13 hunt periods. Therefore, there are no new significant or substantially more severe impacts from amending the elk hunt regulations to increase the bull tags in the Grizzly Island Zone Periods 10, 12, and 13 by 1, 1, and 3 tags, respectively.

PROPOSED 2024 SHARE TAG ALLOCATIONS FOR THE SISKIYOU, NORTHWESTERN, TEHACHAPI, AND MENDOCINO HUNT ZONES

The 2024 Proposed Regulations includes adding 18 bull and 18 antlerless SHARE tags to the Siskiyou Hunt Zone, adding 6 bull and 26 antlerless SHARE tags to the Northwestern Hunt Zone, adding 20 bull and 15 antlerless SHARE tags to the Tehachapi Hunt Zone, and adding 18 bull and 26 antlerless SHARE tags to the Mendocino Hunt Zone.

To maintain sustainable populations of elk and meet natural resources management goals, the Commission establishes and closes hunt zones, allocates tags, and sets hunting season dates. SHARE hunts in all four zones are designed to keep elk abundance at a sustainable level based on the environmental, biological, and social conditions of the elk. Therefore, amending the elk hunt regulations to add SHARE tags will not cause any new significant or substantially severe impacts than previously considered by the Commission.

PROPOSED 2024 COOPERATIVE ELK HUNT TAG ALLOCATIONS FOR THE SISKIYOU, NORTHWESTERN, TEHACHAPI, AND MENDOCINO HUNT ZONES

The 2024 Proposed Regulations includes modifying the mechanism by which Cooperative Elk Hunt (“Landowner”) antlerless tags are distributed in the Siskiyou Hunt Zone, Northwestern Hunt Zone, Tehachapi Hunt Zone, and the Mendocino Hunt Zone. Specifically, Landowner antlerless tags will be distributed at a 1:1 ratio relative to the sum of the annual general + SHARE antlerless tags allocated.

To maintain sustainable populations of elk and meet natural resources management goals, the Commission establishes and closes hunt zones, allocates tags, and sets hunting season dates. Cooperative Landowner hunts in these four zones are designed to keep elk abundance at a sustainable level based on the environmental, biological, and social conditions of the elk. Therefore, amending the elk hunt regulations to modify Landowner antlerless tag distribution will not cause any new significant or substantially severe impacts than previously considered by the Commission.

NO SUBSEQUENT ENVIRONMENTAL DOCUMENT IS REQUIRED

In general, CEQA applies whenever a public agency proposes to carry out or approve a discretionary project. (Public Resources Code, Section 21080(a)). CEQA provides that, where a public agency proposes to modify a previously approved project for which a Final Environmental Document was prepared and certified:

"The lead agency or a responsible agency shall prepare an ***addendum*** to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred." (Title 14, CCR Section 15164)

- A Subsequent Environment Document (Section 15162) when there is substantial evidence that:
  - Substantial changes are proposed in the project, which will require major revisions to the previous environmental impact report (EIR) or environmental document (ED).
  - Substantial changes occur with respect to the circumstances under which the project is being undertaken, which will require major revisions to the previous EIR or environmental documentation.
  - New information, which was not known and could not have been known at the time the previous EIR or ED was certified as complete, becomes available.
- A Supplement to an Environment Document (Section 15163) when:
  - A subsequent ED is not required.
  - Only minor changes to the project are described.
  - Only that information to make the ED adequate is provided.
- An Addendum to the Certified ED (Section 15164) is proper when**:**
  - The changes or additions presented in this project are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent ED have occurred.
  - The Commission may properly prepare and may rely on an addendum in accordance with Section 15164 to fulfill its obligations under CEQA.

NO ADDITIONAL IMPACTS UNDER CEQA

The Commission has determined that amending the current elk hunting regulations based on annual survey results will not result in any new or significant or substantially more severe environmental impacts than previously analyzed and disclosed in the 2010 Elk ED and 2019 Elk SED for this project.

This project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory. There are no impacts to the habitat of fish and wildlife species.

This approval action adjusts the previous year tag quotas based on more current population information, modifies existing hunt zone boundaries, and establishes three new hunt zones. No other aspect of the project is changed. No new significant or substantially more severe impacts under CEQA will occur due to this change.

AMENDMENT OF THE ELK HUNT REGULATIONS

In conclusion, the Commission finds that amending the elk hunt regulations in Title 14, CCR Section 364, Section 364.1, Section 555, and Section 555.1, will not result in any new significant or substantially more severe environmental effects than previously analyzed and disclosed in the 2010 Elk ED and the 2019 Elk SED. The Commission also finds that subsequent or supplemental review beyond this Addendum is not warranted pursuant to Title 14, CCR Section 15164, in connection with this proposed action.

Melissa A. Miller-Henson ______________________ April 12, 2024 ______________

Melissa Miller-Henson, Executive Director Date

California Fish and Game Commission

State of California
Fish and Game Commission
Initial Statement of Reasons for Regulatory Action

Amend Section 554
Title 14, California Code of Regulations
Re: Cooperative Deer Hunting Areas

I. Date of Initial Statement of Reasons: October 1, 2023

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing:

Date: December 13, 2023 Location: San Diego, CA

(b) Discussion Hearing:

Date: February 15, 2024 Location: Sacramento, CA

(c) Adoption Hearing:

Date: April 18, 2024 Location: San Jose, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

BACKGROUND

The California Department of Fish and Wildlife (Department) has identified regulated hunting as a preferred tool to both manage deer populations and provide public recreation opportunities. The Fish and Game Commission (Commission) periodically considers the recommendations of the Department in establishing deer hunting regulations. Considerations included recommendations for adjusting tag quotas, setting hunt periods, modifying zone boundaries, and authorizing methods of take, among others, to help achieve management goals and objectives. Currently, deer tags are distributed through several issuance types governed by different sections under Title 14. Issuance types for deer tags include Section 360 and Section 361 for General and Archery hunting, respectively. Section 708.1 distinguishes between Premium, Restricted, and Unrestricted tags, and Section 708.14 specifies premium deer hunt tags distributed by drawing. First and second deer tags are explained in Section 708.3. Section 554 describes Cooperative Deer Hunting Area “Landowner” tags, and Section 601 Private Lands Wildlife Habitat Enhancement and Management Area (PLM) tags. Finally, Section 709.1 details the Hunter Education Instructor Incentive Program.

CURRENT REGULATIONS

The Cooperative Deer Hunting Area (deer "landowner (LO) tags") program was initially established as a public access program, to encourage protection and enhancement of deer habitat. With the creation of the Shared Habitat Alliance for Recreational Enhancement ("SHARE") public access program in 2010, it became a landowner tag program. Current regulations for Cooperative Deer Hunting Areas (Section 554) are:

> Landowners who own a minimum of 640 acres in a draw zone may apply for up to two deer tags. Landowners must apply for tags by the first Friday in August and must identify the customer(s) that the tags will be issued to and pay the appropriate fees with their application. For approved applications, the regions sell the tags to the identified customers in the Automated License Data System (ALDS).
>
> There may not be more than two cooperative deer hunting area applicants for a given parcel of land. Section 554 states, "the applicant for a cooperative deer hunting area permit shall be an owner of said land," but does not define the relationship of the second applicant.
>
> Currently, LO tags are not limited by zone and tags are issued in addition to public tag quotas resulting in some zones issuing a greater proportion of LO to public tags. Tag issuance needs to be reduced in these zones.
>
> The current regulation restricted applicants to using a 'one-deer' tag application – this ensured applicants could not get another premium or restricted tag at the time the Department had 'one-deer' tags. This is an outdated reference, as there is no longer a 'one-deer' application. The Department now uses first and second deer tags. Customers are prevented from getting more than one premium and restricted hunt through ALDS controls.
>
> The authority cited is outdated due to the repeal and subsequent reimplementation of this program after the SHARE program was established.

PROPOSED REGULATORY CHANGES

The Department has identified the necessity to modify regulations within Section 554 Cooperative Deer Hunting Areas to clarify the intent of the Cooperative Deer Hunting Area program.

Amend Section 554

The new subsections within subsection 554(b) are as follows:

(b) Application Process.
- (1) Definitions.
- (2) Eligibility Requirements.
- (3) Application Materials.
- (4) Application Form.
- (5) Review and Approval.

Necessity: Subsection (b) needs to be reorganized to accommodate an expanded application section and to clearly communicate the intent of the regulations. This includes updating the name of the Department, mentioning an application form, and where it can be found by interested parties (Department's website, as well as regional offices).

The following regional office addresses require updates:

Region 3: 2825 Cordelia Rd, Suite 100 Fairfield 94594 (707) 428-2002
Region 5: 3883 Ruffin Road, San Diego 92123 (858) 467-4201
Region 6: 3602 Inland Empire Blvd., Ste C-220, Ontario 91764 (909) 484-0167

Subsection 554(b)(1): Provide a definition for immediate family member to clarify eligibility for LO tags. Currently there is no definition.

Subsection 554(b)(2): Clarify that a landowner application can be for up to two deer tags that can be designated to the landowner or an immediate family member of the landowner. Add "as defined by Fish and Game Code Section 67" to clarify landowner eligibility as it related to a person.

Subsection 554(b)(2): Reduce the number of available tags to one per application in zones X3a, X5a, and X5b.

From 2021-2023, LO tags were issued on average over 20% of the public quota in Zone X3a, 28% of the public quota in X5a, and 34% of the public quota in X5b. For reference, the average percent public quota for all other zones during that time was 3%. The number of tags issued in zones X3a, X5b, and X5a need to be reduced to align landowner tag allocations in these zones with allocations in the other zones.

Subsection 554(b)(2) and (b)(5): Update "one deer tag" language. Clarify that individuals shall not be eligible for a cooperative deer hunting tag if they hold a deer tag in the same license year for a premium or restricted hunt as defined in 708.1.

Section 554 originally prevented customers from obtaining a public drawing premium tag and a landowner tag by requiring a "one deer application. The "one deer tag" is an outdated reference. The department now utilizes "first" and "second" deer tags, which ALDS uses to prevent customers from acquiring more than one premium and restricted hunt, regardless of the purchase order.

Subsection 554(b)(3): Add application materials.

This subsection is necessary for application materials to be added; these include the application, proof of ownership, proof of property size, and applicable fees. The Unsuccessful Deer Tag Letter can be used as proof of payment.

Subsection 554(b)(4): Add application form.

This subsection is necessary to list the information required within an application form that will be provided by the department. The requested information serves to provide the Department with necessary contact information, including name of first and second applicant, as well as the ability to cross reference to Department data systems (such as GO ID number and Driver's License number).

Subsection 554(b)(5): Review and approval.

Subsection 554(c): update the reference for the valid deer season listed on the tag to subsections 360(a) and (b) of these regulations for improved enforceability.

Subsection 554 Authority and Reference:

> The Cooperative Deer Hunting Area program was originally under the authority and reference of FGC sections 1570-1572. In 2004, FGC sections 1570-1572 were repealed and replaced with statutes establishing the SHARE program. The following year, Cooperative Hunting Areas were re-established for elk and deer hunting in FGC as Section 1575, but the authority and reference in Section 554 was not updated. Further, the fees referenced in Section 702 require a cross reference to Fish and Game Code Section 713 for annual adjustment pursuant to the Implicit Price Deflator. Accordingly, the authority and reference in Section 554 needs to be updated to reflect the change in FGC sections.

(b) Goals and Benefits of the Regulation

The goal and benefits of these regulations serve to update administration of the landowner tags through the Cooperative Deer Hunting Area program by updating the application instructions, correcting outdated terms within the regulation, and reducing the number of tags issued in zones of concern (X3a, X5a, and X5b).

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Section 554:

Authority: 1575, Fish and Game Code
Reference: 713 and 1575, Fish and Game Code

(d) Specific Technology or Equipment Required by Regulatory Change

None.

(e) Identification of Reports or Documents Supporting Regulation Change

None.

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

Wildlife Resources Committee, May 2023
Wildlife Resources Committee, September 2023

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

As an alternative to the one tag only rule for zones X3a, X5a, and X5b, a percentage (proposed 5-20 percent of the number of public license tags for the corresponding public hunt) could be used for the quota of deer landowner tags.

(b) No Change Alternative

Without the proposed changes, the outstanding issues concerning the regulations currently governing landowner tags would remain unaddressed.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. Considering the relatively small number of deer landowner tags over the entire state, this proposal is economically neutral to business.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment.

The Commission anticipates no impact on the creation or elimination of jobs within the state, no impact on the creation of new business, the elimination of existing businesses or the expansion of businesses in California as minor variations in hunting regulations are, by themselves, unlikely to provide a substantial economic stimulus to the state.

(c) Cost Impacts on a Representative Private Person or Business

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None

(e) Nondiscretionary Costs/Savings to Local Agencies:

None

(f) Programs Mandated on Local Agencies or School Districts:

None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None

(h) Effect on Housing Costs:

None

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

This regulatory action is not anticipated to induce the creation or elimination of jobs within the state.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The proposed regulation is not anticipated to prompt the creation of new businesses or the elimination of existing businesses within the state.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The proposed regulation changes are unlikely to impact expansion of businesses currently doing business in the state.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

Hunting is an outdoor activity that can provide several health and welfare benefits to California residents. Hunters and their families benefit from fresh game to eat, and from the benefits of outdoor recreation, including exercise. People who hunt have a special connection with the outdoors and an awareness of the relationships between wildlife, habitat, and humans, and can be a family tradition and a bonding activity.

(d) Benefits of the Regulation to Worker Safety

The proposed regulation will not affect worker safety.

(f) Benefits of the Regulation to the State's Environment

As set forth in Fish and Game Code section 1700, it is the policy of the state to encourage the conservation, maintenance, and utilization of fish and wildlife resources for the benefit of all the citizens of the state. The objectives of this policy include, but are not limited to, the maintenance of populations of deer to ensure their continued existence and supporting recreational opportunity. Adoption of scientifically based deer seasons and tag quotas provides for the maintenance of deer populations to ensure those objectives are met. The fees that hunters pay for licenses and tags help fund wildlife conservation.

(g) Other Benefits of the Regulation

Corrected over-issuance of tags in zones where this problem was identified, updated language and information that will facilitate the landowner application process.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

The Cooperative Deer Hunting Area (deer “landowner (LO) tags”) program that is administered by the California Department of Fish and Wildlife (Department) was initially established as a public access program to encourage protection and enhancement of deer habitat. With the creation of the Shared Habitat Alliance for Recreational Enhancement (“SHARE”) public access program in 2010, it shifted to a landowner tag program. Current regulations for Cooperative Deer Hunting Areas (Section 554) require that landowners who own a minimum of 640 acres in a draw zone may apply for up to two deer tags. Landowners must apply for tags and identify the customer(s) that the tags will be issued to and pay the appropriate fees with their application. For approved applications, the regions sell the tags to the identified customers in the Automated License Data System (ALDS). There are several instances of outdated and confusing language within the regulation that need to be updated and clarified.

Currently, LO tags are not limited by zone and tags are issued in addition to public tag quotas resulting in some zones issuing a greater proportion of LO to public tags. Tag issuance needs to be reduced in these zones.

The proposed changes are as follows:

Amend Section 554(b)

Update regional office addresses and provide clarity to the application process.

(b) Application Process.
(1) Definitions.
(2) Eligibility Requirements.
(3) Application Materials.
(4) Application Form.
(5) Review and Approval.

Add Section 554(b)(1): Provide a definition for immediate family member.

Add Section 554(b)(2): Clarify that a landowner application can be for up to two deer tags that can be designated to the landowner or an immediate family member of the landowner.

Add Section 554(b)(2): Reduce the number of available tags to one per application in zones X3a, X5a, and X5b.

Add Section 554(b)(2) and (b)(5): Update “one deer tag” language. Clarify that individuals shall not be eligible for a cooperative deer hunting tag if they hold a deer tag in the same license year for a premium or restricted hunt as defined in 708.1.

Section 554(b)(3): Add application materials.

Application materials need to be added; includes the application, proof of ownership, proof of property size, and applicable fees. Unsuccessful Deer Tag Letter can be used as proof of payment.

Section 554(b)(4): **Add application form.**

Need to list the information required within the application.

Add Section 554(b)(5): Review and approval process.

Benefit of the Regulations:

The goal and benefits of these regulations serve to update administration of the landowner tags through the Cooperative Deer Hunting Area program by updating the application instructions, correcting outdated terms within the regulation, and reducing the number of tags issued in zones of concern (X3a, X5a, and X5b).

Consistency and Compatibility with Existing Regulations:

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. Section 20, Article IV, of the state Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to adopt regulations governing landowner tags (California Fish and Game Code Section 1575). No other state agency has the authority to adopt regulations governing landowner tags. The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the CCR for any regulations regarding the adoption of landowner tag regulations; therefore, the Commission has concluded that the proposed regulations are neither inconsistent nor incompatible with existing state regulations.

Proposed Regulatory Language

Section 554, Title 14 CCR, is amended to read:

§ 554. Cooperative Deer Hunting Areas.

To encourage the protection and enhancement of critical deer habitat, to provide added protection to landowners from depredations of trespassers and to provide greater access for the public to hunt on privately owned or controlled lands, the department may establish cooperative hunting areas and issue permits for the take of deer as specified subject to the following conditions:

(a) Definition and Scope. A cooperative deer hunting area is an area of private land located within critical deer habitat as determined by the department in deer quota zones (see Section 360) which require public drawings. The cooperative hunting area shall encompass not less than a total of 5,000 acres, except that such area may consist of neighboring lands not less than 640 acres in size under the control of one or more owners.

(b) Application Process.

~~Application forms~~ Applications designated on a form issued by the department are available from the Department's website at https://wildlife.ca.gov/Hunting/Deer, ~~headquarters~~headquarters, and regional offices: ~~The applicant for a cooperative deer hunting area permit shall be an owner of said land. The completed application form and a completed one deer tag application for the appropriate deer zone shall be submitted to one of the following offices of the Department of Fish and Game~~

Region 1, 601 Locust Street, Redding 96001 (530) 225–2300

Region 2, 1701 Nimbus Road, Rancho Cordova 95670 (916) 358–2900

~~Region 3, 7329 Silverado Trail, Box 47, Yountville 94599 (707) 944– 5500~~ Region 3, 2825 Cordelia Rd., Suite 100, Fairfield 94594 (707) 428-2002

Region 4, 1234 East Shaw Avenue, Fresno 93710 (559) 243–4005

~~Region 5, 4949 View Ridge Avenue, San Diego 92123 (858) 467–4201~~ Region 5, 3883 Ruffin Rd., San Diego 92123 (858) 467-4201

~~Region 6, 4775 Bird Farm Road, Chino Hills 91709 (909) 597–9823~~ Region 6, 3602 Inland Empire Blvd., Ste. C-220, Ontario 91764 (909) 484-0167

~~The completed applications must be received prior to the first Friday in August. No individual may submit more than one cooperative deer hunting area application per deer season nor may there be more than two cooperative deer hunting area applicants for a given parcel of land.~~

(1) Definitions.

(A) 'Immediate family' is defined as 'the spouse of such person, any child or stepchild of such person or of the spouse of such person, any spouse of any such child or stepchild, any grandchild or step-grandchild of such person or of the spouse of such person, any spouse of such grandchild or step-grandchild, any sibling of such person sharing ownership in the property, and any spouse of any such sibling.' Immediate family need not live in the household or reside on the property to qualify.

(2) Eligibility Requirements.

(A) A person (as defined by Fish and Game Code Section 67) owning at least 640 acres within a cooperative deer hunting area shall be eligible to apply for a cooperative deer hunting area permit. Applicants shall designate up to two individuals eligible to receive deer tags by the date below, except for applicants in zones X3a, X5a, and X5b; applicants may apply for one deer tag in those zones. Such individuals shall be at least 12 years of age, possess a valid California hunting license, and be either the landowner or immediate family of the landowner. Individuals shall not be eligible for a cooperative deer hunting tag if they hold a deer tag in the same license year for a premium or restricted hunt as defined in 708.1 of these regulations.

(B) No individual may submit more than one cooperative deer hunting area application per deer season nor may there be more than two cooperative deer hunting area applicants for a given parcel of land.

(3) Application Materials.

The following application materials must be submitted to the department's regional office nearest the proposed cooperative deer hunting area and must be received prior to the first Friday in August.

(A) Completed application form pursuant to subsection (b)(4)

(B) Applicable fees for first deer tag resident, second deer tag resident, or non-resident, or previous year's Unsuccessful Deer Tag Letter per applicant, pursuant to subsection 702(c) of these regulations.

(C) Proof of property ownership (copy of deed)

(D) Proof of property size (property map)

(4) Application Form. Application forms are available pursuant to subsection (b).

(A) For both First and Second Applicant:

Applicant's name, relationship to owner, mailing address, home phone number, day phone number, driver's license number, GO ID number, printed name, applicant signature, and acknowledgement of compliance with provisions.

(B) Deer hunting zone in which qualifying lands are located.

(5) Review and Approval.

The department shall review the cooperative deer hunting application, verify the content thereof, and certify that the lands consist of critical deer habitat prior to the issuance of a cooperative deer hunting area permit and deer tag. Only those applications that are filled out completely will be accepted. ~~Incomplete applications will be returned within 15 days of receipt by the department.~~ There shall be no fee for a cooperative hunting area permit.

(c) A deer tag issued pursuant to the provisions of this section is valid only during the open deer season for the deer zone specified ~~on the tag~~in subsections 360(a) and 360(b) and may only be used on the lands specified in the landowner's application.

(d) All provisions of the Fish and Game Code relating to the take of birds and mammals shall be a condition of all permits and tags issued pursuant to this section.

(e) Any permit or tag issued pursuant to Section 554 may be cancelled or suspended at any time by the commission for cause after notice and opportunity to be heard, or without a hearing upon conviction of a violation of this regulation by a court of competent jurisdiction.

NOTE: Authority cited: Section ~~1572~~ 1575, Fish and Game Code.
Reference: Sections ~~1570–1572~~ 713 and 1575, Fish and Game Code.

DEPARTMENT OF FISH AND WILDLIFE
2024 APPLICATION FOR COOPERATIVE DEER HUNTING AREA PERMIT
DFW 1409 (Rev. 10/23)
FEES* Resident fee of $38.88 (first deer tag), $48.41 (second deer tag), or a Nonresident fee of $345.00 per applicant
Nonreporting fee of $20.60
***If applicable, the previous year's non-reporting fee must be included, or application will be rejected**

INSTRUCTIONS: Submit the following items to the Department of Fish and Wildlife (CDFW) regional office in the area where your property is located (see list on the back of this application): 1) application form; 2) submit the fee (above) per applicant for applicable Deer Tag by check or money order or each applicant's Unsuccessful Deer Tag Letter; 3) proof of ownership (i.e., copy of deed); and, 4) proof of property size (property map). **Individuals shall not be eligible for a cooperative deer hunting tag if they hold a deer tag in the same license year for a premium or restricted hunt as defined in Section 708.1, nor may there be more than two (2) applicants for a given parcel of land. See Title 14 regulations on reverse side.**

Unused deer tags will not be accepted as an exchange for a Cooperative deer tag.

COMPLETED APPLICATION MUST BE RECEIVED PRIOR TO THE FIRST FRIDAY IN AUGUST

FIRST APPLICANT (MUST BE LANDOWNER OR IMMEDIATE FAMILY)

NAME	RELATIONSHIP TO OWNER
MAILING ADDRESS (STREET, RURAL ROUTE, CITY, COUNTY STATE, ZIP)	
HOME PHONE NUMBER	DAY PHONE NUMBER (if different)
DMV/STATE ID NUMBER	GO ID NUMBER (FROM ALDS ISSUED LICENSE)

SECOND APPLICANT (MUST BE LANDOWNER OR IMMEDIATE FAMILY)

NAME	RELATIONSHIP TO LANDOWNER
MAILING ADDRESS (STREET, RURAL ROUTE, CITY, COUNTY STATE, ZIP)	
HOME PHONE NUMBER	DAY PHONE NUMBER (if different)
DMV/STATE ID NUMBER	GO ID NUMBER (FROM ALDS ISSUED LICENSE)

DEER HUNTING ZONE IN WHICH QUALIFYING LANDS ARE LOCATED:

Pursuant to the provisions of Section 554, Title 14, California Code of Regulations, as the owner(s)/fee title holder(s) of not less than 640 acres of critical deer habitat within a deer quota hunting zone requiring a drawing, I (we) hereby make application for a cooperative deer hunting area permit. I (we) hereby certify that this is the only application that I (we) have filed for the current year and that the information provided above is true and correct. I have read and understand the provisions of Section 554, Title 14, California Code of Regulations, and agree to abide by those provisions.

PRINTED NAME AND SIGNATURE(S) OF LANDOWNERS(S) *X*	*X*	DATE
PRINTED NAME AND SIGNATURE *X*	*X*	DATE

DEPARTMENT OF FISH AND WILDLIFE APPROVAL

The CDFW shall review the Application for Cooperative Deer Hunting Area Permit, verify the content thereof, and certify that the lands consist of critical deer habitat prior to the issuance of a Cooperative Deer Hunting Area Permit and deer tag.

REGIONAL MANAGER'S SIGNATURE	REGION	DATE

SECTION 554, TITLE 14, California Code of Regulations

554. Cooperative Deer Hunting Areas.

To encourage the protection and enhancement of critical deer habitat, to provide added protection to landowners from depredations of trespassers and to provide greater access for the public to hunt on privately owned or controlled lands, the department may establish cooperative hunting areas and issue permits for the take of deer as specified subject to the following conditions:

(a) Definition and Scope. A cooperative deer hunting area is an area of private land located within critical deer habitat as determined by the department in deer quota zones (see Section 360) which require public drawings. The cooperative hunting area shall encompass not less than a total of 5,000 acres, except that such area may consist of neighboring lands not less than 640 acres in size under the control of one or more owners.

(b) Application Process.

Applications designated on a form issued by the department are available from the Department's website at https://wildlife.ca.gov/Hunting/Deer, headquarters, and regional offices:

Region 1, 601 Locust Street, Redding 96001 (530) 225-2300
Region 2, 1701 Nimbus Road, Rancho Cordova 95670 (916) 358-2900
Region 3, 2825 Cordelia Rd., Suite 100, Fairfield 94594 (707) 428-2002
Region 4, 1234 East Shaw Avenue, Fresno 93710 (559) 243-4005
Region 5, 3883 Ruffin Rd., San Diego 92123 (858) 467-4201
Region 6, 3602 Inland Empire Blvd., Ste. C-220, Ontario 91764 (909) 484-0167

(1) Definitions.

(A) 'Immediate family' is defined as 'the spouse of such person, any child or stepchild of such person or of the spouse of such person, any spouse of any such child or stepchild, any grandchild or step-grandchild of such person or of the spouse of such person, any spouse of such grandchild or step-grandchild, any sibling of such person sharing ownership in the property, and any spouse of any such sibling.' Immediate family need not live in the household or reside on the property to qualify.

(2) Eligibility Requirements.

(A) A person (as defined by Fish and Game Code Section 67) owning at least 640 acres within a cooperative deer hunting area shall be eligible to apply for a cooperative deer hunting area permit. Applicants shall designate up to two individuals eligible to receive deer tags by the date below, except for applicants in zones X3a, X5a, and X5b; applicants may apply for one deer tag in those zones. Such individuals shall be at least 12 years of age, possess a valid California hunting license, and be either the landowner or immediate family of the landowner. Individuals shall not be eligible for a cooperative deer hunting tag if they hold a deer tag in the same license year for a premium or restricted hunt as defined in 708.1 of these regulations.

(B) No individual may submit more than one cooperative deer hunting area application per deer season nor may there be more than two cooperative deer hunting area applicants for a given parcel of land.

(3) Application Materials.

The following application materials must be submitted to the department's regional office nearest the proposed cooperative deer hunting area and must be received prior to the first Friday in August.

(A) Completed application form pursuant to subsection (b)(4)
(B) Applicable fees for first deer tag resident, second deer tag resident, or non-resident, or previous year's Unsuccessful Deer Tag Letter per applicant, pursuant to subsection 702(c) of these regulations.
(C) Proof of property ownership (copy of deed)
(D) Proof of property size (property map)

(4) Application Form. Application forms are available pursuant to subsection (b).

(A) For both First and Second Applicant:
Applicant's name, relationship to owner, mailing address, home phone number, day phone number, driver's license number, GO ID number, printed name, signature, and acknowledgement of compliance with provisions.
(B) Deer hunting zone in which qualifying lands are located.

(5) Review and Approval.

The department shall review the cooperative deer hunting application, verify the content thereof, and certify that the lands consist of critical deer habitat prior to the issuance of a cooperative deer hunting area permit and deer tag. Only those applications that are filled out completely will be accepted. There shall be no fee for a cooperative hunting area permit.

(c) A deer tag issued pursuant to the provisions of this section is valid only during the open deer season for the deer zone specified in subsections 360(a) and 360(b) and may only be used on the lands specified in the landowner's application.

(d) All provisions of the Fish and Game Code relating to the take of birds and mammals shall be a condition of all permits and tags issued pursuant to this section.

(e) Any permit or tag issued pursuant to Section 554 may be cancelled or suspended at any time by the commission for cause after notice and opportunity to be heard, or without a hearing upon conviction of a violation of this regulation by a court of competent jurisdiction.

Signed Original on File
Received April 11, 2024

Memorandum

Date: April 10, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the April 17-18, 2024, Fish and Game Commission Meeting Re: Cooperative Deer Hunts – Pre- Adoption Memo**

The Department of Fish and Wildlife (Department) has prepared this Memorandum to summarize and provide responses to public comments received by the Fish and Game Commission (Commission) on the proposed amendments to Section 554, Title 14, California Code of Regulations, regarding proposed changes to cooperative deer hunting areas application process and tag allocations. The Department is not recommending any further amendments to the regulatory text because there were no public comments received regarding this proposal.

The Department recommends the Commission adopt the proposed rulemaking for cooperative deer hunts.

If you have any questions on this item, please contact Scott Gardner, Wildlife Branch Chief, via phone at (916) 801-6257.

Initial Statement of Reasons for Regulatory Action

Amend Section 555 and add Section 555.1
Title 14, California Code of Regulations
Re: Cooperative Elk Hunting Areas

I. Date of Initial Statement of Reasons: October 1, 2023

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing:

Date: December 13, 2023 Location: San Diego, CA

(b) Discussion Hearing:

Date: February 15, 2024 Location: Sacramento, CA

(c) Adoption Hearing:

Date: April 18, 2024 Location: San Jose, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

BACKGROUND

The California Department of Fish and Wildlife (Department) has identified regulated hunting as a preferred tool to both manage elk populations and provide public recreation opportunities. The Fish and Game Commission (Commission) periodically considers the recommendations of the Department in establishing elk hunting regulations. Considerations included recommendations for adjusting tag quotas, setting hunt periods, modifying zone boundaries, and authorizing methods of take, among others, to help achieve management goals and objectives. Currently, elk tags are distributed through four issuance types governed by different sections under Title 14. Issuance types for elk tags include Section 364 General Public tags awarded via the Big Game Drawing, Section 364.1 Shared Habitat Alliance for Recreational Enhancement (SHARE) tags, Section 555 Cooperative Elk Hunting Area “Landowner” tags, and Section 601 Private Lands Wildlife Habitat Enhancement and Management Area (PLM) tags.

Regulated harvest is an effective management tool to help reduce human-elk conflict to tolerable levels. The Department aims to provide public hunting opportunity to the greatest extent possible, however, in some cases, elk almost exclusively occupy privately owned property causing significant conflict issues yet may be unavailable for harvest to a majority of general public tagholders. While hunters awarded an elk tag via the Big Game Drawing are authorized to harvest an elk, it does not authorize access to private property. Some properties are also not conducive to host public hunters through the SHARE program, yet still experience elk conflict. Tags issued under the PLM program are transferable but are often associated with a cost that precludes most hunters from participating. Furthermore, PLM properties enter into agreement with CDFW to manage habitat for the benefit of elk and other wildlife and is not a useful program to reduce unwanted elk activity. The efficacy of regulated harvest as a management tool in these areas may therefore be reduced due to land access constraints imposed on the general public, among other factors.

The Department has identified an opportunity to modify regulations within an existing framework, Section 555 Cooperative Elk Hunting Areas, to help reduce conflict and provide increased hunting opportunities for qualifying landowners. Chronic, elevated human-elk conflict, elk occupation of predominantly private property, and limited public hunting access has been documented by the Department in the Siskiyou, Northwestern, Mendocino, and Tehachapi Elk Hunt Zones.

CURRENT REGULATIONS

Regulations for Cooperative Elk Hunting Areas (elk “landowner (LO) tags”) are described in Section 555.The purpose of this program is to encourage protection and enhancement of elk habitat and provide eligible landowners with an opportunity for limited elk hunting on their lands. To be eligible for application, a person must own at least 640 acres of contiguous parcels within a cooperative elk hunting area that is open to the public, elk hunt zones as defined in Section 364, that shall be a minimum size of 5,000 acres. The number of LO tags issued annually shall not exceed 20% of the number of public license tags for the corresponding public hunt for the same tag designation type (i.e., antlerless, spike bull, bull, or either-sex).

Applicants must complete an application form to be received by the Department by the first business day following July 1. If the number of accepted applications exceeds the number of license tags available, the Department determines successful applicants and a list of alternates by conducting a random drawing from the pool of qualified applicants as soon as possible after the application deadline. Successful applicants who are awarded a tag are notified as soon as possible after completion of the drawing. Successful applicants can use the tag themselves, or transfer the tag to another individual. Applicants must submit the name, address, and valid California hunting license number of the designated elk license tag recipients to the Department by the first business day following August 1.

PROPOSED REGULATORY CHANGES

Amend Section 555

Subsection 555(a)

- Clarify distinction between 5,000 acres and 640 acres criteria
- Add sentence to clarify formula for allocating annual tag distribution relative to general methods public tags (sum of general methods public elk tags + SHARE elk tags issued annually)

- A cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting at least 5,000 acres (Fish and Game Code Section 1575) in size (elk hunt zones as identified in section 364). A cooperative elk hunting area must be composed of contiguous parcels of at least 640 acres within a hunting area that is open to the public.
- Amend this section to add: Public license tags shall equate to the sum of the general methods elk license tags under Section 364 and the SHARE elk license tags under Section 364.1 for the corresponding hunt and for the same designation issued annually.

Subsection 555(b)

- (b)(1): Move the location in the regulation, and update the following regional office addresses:

  Region 3: 2825 Cordelia Rd, Suite 100 Fairfield 94594 (707) 428-2002
  Region 5: 3883 Ruffin Road, San Diego 92123 (858) 467-4201
  Region 6: 3602 Inland Empire Blvd., Ste C-220, Ontario 91764 (909) 484-0167

  Clarify eligibility requirements regarding landownership as reiterated above for 555(a).
- Add (b)(2): This subsection is necessary for application materials to be clarified; these include the application form referenced in subsequent language, proof of ownership, proof of property size, and applicable fees.
- Add (b)(3): This subsection is necessary to list the information required within an application form that will be provided by the department. The requested information serves to provide the Department with necessary contact information, including name of first and second applicant, as well as the ability to cross reference to Department data systems (Driver's License number).
- (b)(4): Update the review and approval process, clarifying how lands will be verified.
- (b)(5): update a cross-reference to subsection 702 for elk license fees.

The Reference section under "Note" is updated as the fees referenced in Section 702 require a cross reference to Fish and Game Code Section 713 for annual adjustment pursuant to the Implicit Price Deflator.

Non-substantive editing and renumbering to improve the clarity and consistency of the regulatory language have been made in Section 555.

Add Subsection 555.1

- Describe and classify four "conflict zones"
- Reduce qualifying landowner criteria within identified conflict zones from 640 acres to 60 acres
- Increase antlerless tag distribution relative to public tags (general methods public elk tags + SHARE elk tags issued annually) from 20% to up to 100%
- Extend the hunt season through November 30th annually

Add: Subsection 555.1(a)

Begin this subsection with: Definition and Scope. In areas where landowners experience chronic, elevated levels of human-elk conflict as determined by the Department, landowner tags shall be issued in a modified fashion distinct from Section 555(a) to help reduce unwanted human-elk conflict. Minimum size of a conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size. Within the conflict zones open to public elk hunting as described in Subsection 555.1(b), the number of conflict zone cooperative elk hunting license general methods antlerless tags issued shall be up to 100 percent of the number of public license general methods antlerless tags issued annually for the corresponding public hunt (i.e., a 1 to 1 public license antlerless tag to landowner antlerless tag ratio). The corresponding public hunt is comprised of the annual sum of general methods license tags issued across 364 and 364.1. Within a conflict zone cooperative elk hunting area, the remaining tag designations (i.e., spike bull, bull, or either-sex) shall be issued consistent with Section 555(a). Any elk zones described in Section 364 excluded from this subsection shall conform to all criteria described in Section 555.

Add: Subsection 555.1(b)

Begin this subsection with: For the purposes of these regulations, a conflict zone cooperative elk hunting area is an area of private land as described in Subsection 555.1(a) located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(1)(A), 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A).

Add: Subsection 555.1(c)

Begin this subsection with: An elk license tag issued pursuant to the provisions of this subsection is valid commensurate with the first day of the general methods elk season in which the conflict zone cooperative elk hunting area occurs, as described under Section 364, through November 30th annually. All other provisions described under Section 555, including 555(b) shall apply to this subsection.

(b) Goals and Benefits of the Regulation

The goal and benefits of these regulations serve to update administration of the landowner tags through the Cooperative Elk Hunting Area program by updating the application instructions, correcting outdated references and provide clarification to eligibility within the regulation, and provide clarification for conflict zones to allow flexibility for active management.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Section 555

Authority: 1575, Fish and Game Code
Reference: 67, 713 and 1575, Fish and Game Code

Section 555.1

Authority: 1575, Fish and Game Code
Reference: 67 and 1575, Fish and Game Code

(d) Specific Technology or Equipment Required by Regulatory Change

None.

(e) Identification of Reports or Documents Supporting Regulation Change

None.

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

Wildlife Resources Committee, May 2023

Wildlife Resources Committee, September 2023

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

Various issuance percentages relative to the tag designation type may be used to increase hunting opportunity. For example, under the proposed 555.1 bull tags could be issued at 50% of the public tags for the corresponding public hunt, 100% for antlerless, 50% for spike bull, and 50% for either-sex, or some variation thereof.

(b) No Change Alternative

Without the proposed changes, elk conflict will continue and may increase in some areas, and result in increased requests for elk depredation permits to alleviate conflict; disease, including treponeme associated hoof disease (TAHD), may continue to spread resulting in significant animal welfare issues; the Department will miss opportunity to gain additional age and genetic data, among other information, from harvested elk to assist in population monitoring, lessening the Department's ability to better understand and manage the affected populations.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. Considering the relatively small number of deer landowner tags over the entire state, this proposal is economically neutral to business.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment.

The Commission anticipates no impact on the creation or elimination of jobs within the state, no impact on the creation of new business, the elimination of existing businesses or the expansion of businesses in California as minor variations in hunting regulations are, by themselves, unlikely to provide a substantial economic stimulus to the state.

(c) Cost Impacts on a Representative Private Person or Business

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None

(e) Nondiscretionary Costs/Savings to Local Agencies:

None

(f) Programs Mandated on Local Agencies or School Districts:

None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None

(h) Effect on Housing Costs:

None

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State

This regulatory action is not anticipated to create any adverse impacts to businesses or the state economy.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

The proposed regulation is not anticipated to prompt the creation of new businesses or the elimination of existing businesses within the state.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

The proposed regulation changes are unlikely to impact expansion of businesses currently doing business in the state.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

Hunting is an outdoor activity that can provide several health and welfare benefits to California residents. Hunters and their families benefit from fresh game to eat, and from the benefits of outdoor recreation, including exercise. People who hunt have a special connection with the outdoors and an awareness of the relationships between wildlife, habitat, and humans, and can be a family tradition and a bonding activity.

(e) Benefits of the Regulation to Worker Safety

The Commission does not anticipate impacts on worker safety.

(f) Benefits of the Regulation to the State's Environment

As set forth in Fish and Game Code section 1700, it is the policy of the state to encourage the conservation, maintenance, and utilization of fish and wildlife resources for the benefit of all the citizens of the state. The objectives of this policy include, but are not limited to, the maintenance of populations of elk to ensure their continued existence and supporting recreational opportunity. Adoption of scientifically based elk seasons and tag quotas provides for the maintenance of elk populations to ensure those objectives are met. The fees that hunters pay for licenses and tags help fund wildlife conservation.

(g) Other Benefits of the Regulation

Increased equity of opportunity in premium zones, updated language and information that will facilitate the landowner application process.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

The California Department of Fish and Wildlife (Department) has identified regulated hunting as a preferred tool to both manage elk populations and provide public recreation opportunities. The Fish and Game Commission (Commission) periodically considers the recommendations of the Department in establishing elk hunting regulations. Currently, elk tags are distributed through four issuance types governed by different sections under Title 14. Issuance types for elk tags include Section 364 General Public tags awarded via the Big Game Drawing, Section 364.1 Shared Habitat Alliance for Recreational Enhancement (SHARE) tags, Section 555 Cooperative Elk Hunting Area "Landowner" tags, and Section 601 Private Lands Wildlife Habitat Enhancement and Management Area (PLM) tags.

Regulated harvest is an effective management tool to help reduce human-elk conflict to tolerable levels. The Department aims to provide public hunting opportunity to the greatest extent possible, however, in some cases, elk almost exclusively occupy privately owned property causing significant conflict issues yet may be unavailable for harvest to a majority of general public tagholders. The efficacy of regulated harvest as a management tool in these areas may therefore be reduced due to land access constraints imposed on the general public, among other factors.

The Department has identified an opportunity to modify regulations within an existing framework, Section 555 Cooperative Elk Hunting Areas, to help reduce conflict and provide increased hunting opportunities for qualifying landowners. Chronic, elevated human-elk conflict, elk occupation of predominantly private property, and limited public hunting access has been documented by the Department in the Siskiyou, Northwestern, Mendocino, and Tehachapi Elk Hunt Zones.

The proposed changes are as follows:

Amend Section 555(a)

- Clarify distinction between 5,000 acres and 640 acres criteria
- Add sentence to clarify formula for allocating annual tag distribution relative to general methods public tags (sum of general methods public elk tags + SHARE elk tags issued annually)
- A clarification that a cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting at least 5,000 acres (Fish and Game Code Section 1575) in size (elk hunt zones as identified in section 364). A cooperative elk hunting area must be composed of contiguous parcels of at least 640 acres within a hunting area that is open to the public.
- Public license tags shall equate to the sum of the general methods elk license tags under Section 364 and the SHARE elk license tags under Section 364.1 for the corresponding hunt and for the same designation issued annually.

Amend subsection 555(b)

- (b)(1): Move the location in the regulation, and update the following regional office addresses:

  Region 3: 2825 Cordelia Rd, Suite 100 Fairfield 94594 (707) 428-2002
  Region 5: 3883 Ruffin Road, San Diego 92123 (858) 467-4201
  Region 6: 3602 Inland Empire Blvd., Ste C-220, Ontario 91764 (909) 484-0167

  Clarify eligibility requirements regarding landownership as reiterated above for 555(a).
- Add (b)(2): This subsection is necessary for application materials to be clarified; these include the application form referenced in subsequent language, proof of ownership, proof of property size, and applicable fees.
- Add (b)(3): This subsection is necessary to list the information required within an application form that will be provided by the department. The requested information serves to provide the Department with necessary contact information, including name of first and second applicant, as well as the ability to cross reference to Department data systems (Driver's License number).
- (b)(4): Update the review and approval process, clarifying how lands will be verified.
- (b)(5): update a cross-reference to subsection 702 for elk license fees.

  The Reference section under "Note" is updated as the fees referenced in Section 702 require a cross reference to Fish and Game Code Section 713 for annual adjustment pursuant to the Implicit Price Deflator.

  Non-substantive editing and renumbering to improve the clarity and consistency of the regulatory language have been made in Section 555.

Add Section 555.1

- Describe and classify four "conflict zones"
- Reduce qualifying landowner criteria within identified conflict zones from 640 acres to 60 acres
- Increase antlerless tag distribution relative to public tags (general methods public elk tags + SHARE elk tags issued annually) from 20% to up to 100%
- Extend the hunt season through November 30th annually

Benefit of the Regulations:

Elk conflict exceeds tolerable levels in some areas. Elk almost exclusively occupy privately owned property in some hunt zones, causing significant conflict issues yet may be unavailable for harvest to a majority of general public tagholders. The efficacy of regulated harvest as a management tool in these areas may therefore be reduced due to land access constraints imposed on the general public, among other factors. Chronic, elevated human-elk conflict, elk occupation of predominantly private property, and limited public hunting access has been documented by the Department in the Siskiyou, Northwestern, Mendocino, and Tehachapi Elk Hunt Zones. Modifying regulations within an existing framework, Section 555 Cooperative Elk Hunting Areas, will provide increased hunting opportunities for qualifying landowners and serve to help reduce human-elk conflict.

Consistency and Compatibility with Existing Regulations:

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. Section 20, Article IV, of the state Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to adopt regulations governing landowner tags (California Fish and Game Code Section 1575). No other state agency has the authority to adopt regulations governing landowner tags. The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the CCR for any regulations regarding the adoption of landowner tag regulations; therefore, the Commission has concluded that the proposed regulations are neither inconsistent nor incompatible with existing state regulations.

Proposed Regulatory Language

Section 555, Title 14 CCR, is amended to read:

§ 555. Cooperative Elk Hunting Areas.

To encourage protection and enhancement of elk habitat and provide eligible landowners an opportunity for limited elk hunting on their lands, the department may establish cooperative elk hunting areas and issue license tags to allow the take of elk as specified in Section 364, and subject to the following conditions:

(a) Definition and Scope. A cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk ~~hunting (as identified in Section 364). Minimum size of a cooperative elk hunting area shall be 5,000 acres, except that contiguous parcels of at least 640 acres in size may be combined to comprise a cooperative elk hunting area.~~ <u>hunting. The cooperative hunting area shall encompass not less than a total of 5,000 acres, except that such area may consist of neighboring lands not less than 640 acres in size under the control of one or more owners.</u>

Within an area open to public elk hunting, the number of cooperative elk hunting license tags issued shall not exceed 20 percent of the number of <u>general methods</u> public license tags for the corresponding public hunt and shall be of the same designation (i.e., antlerless, spike bull, bull or either-sex) as the public license tags. <u>Public license tags shall equate to the sum of the general methods elk license tags under Section 364 and the Shared Habitat Alliance for Recreational Enhancement (SHARE) elk license tags under Section 364.1 for the corresponding hunt and for the same designation issued annually.</u>

(b) Application Process. ~~Application forms~~ <u>Applications, designated on a form issued by the department,</u> are available from the department's headquarters and regional ~~offices.~~ offices<u>:</u>

<u>Region 1, 601 Locust Street, Redding 96001 (530) 225-2300</u>

<u>Region 2, 1701 Nimbus Road, Rancho Cordova 95670 (916) 358-2900</u>

<u>Region 3, 2825 Cordelia Rd., Suite 100, Fairfield 94594 (707) 428-2002</u>

<u>Region 4, 1234 East Shaw Avenue, Fresno 93710 (559) 243-4005</u>

<u>Region 5, 3883 Ruffin Rd., San Diego 92123 (858) 467-4201</u>

<u>Region 6, 3602 Inland Empire Blvd., Ste. C-220, Ontario 91764 (909) 484-0167</u>

<u>(1) Eligibility Requirements.</u>

A person (as defined by Fish and Game Code Section 67) owning at least 640 acres within a cooperative elk hunting area shall be eligible to apply for a cooperative elk hunting area permit. <u>The applicant for a cooperative elk hunting area permit shall be an owner of said land and they</u> ~~Applicants~~ shall designate one individual eligible to receive one elk license tag by the date indicated under subsection (~~3~~<u>5</u>) below. Such individuals shall be at least 12 years of age and possess a valid California hunting license. A person may annually submit a cooperative elk hunting area application where they own sufficient habitat as described in subsection (a) above, for each public hunt area in which their property occurs.

~~(1) Applications shall be submitted to the department's regional office nearest the proposed cooperative elk hunting area. Department of Fish and Game regional offices are located as follows:~~

~~Northern California and North Coast Region, 601 Locust Street, Redding 96001 (530) 225–2300~~

~~Sacramento Valley and Central Sierra Region, 1701 Nimbus Road, Rancho Cordova 95670 (916) 358–2900~~

~~Central Coast Region, 7329 Silverado Trail, Box 47, Yountville 94599 (707) 944–5500~~

~~San Joaquin Valley and Southern Sierra Region, 1234 East Shaw Avenue, Fresno 93710 (559) 243–4005~~

~~South Coast Region, 4949 View Crest Avenue, San Diego 92123 (858) 467–4201~~

~~Eastern Sierra and Inland Deserts Region, 4775 Bird Farm Road, Chino Hills 91709 (909) 597–9823~~

(2) Application Materials.

The following application materials must be submitted to the department's regional office nearest the proposed cooperative elk hunting area by the first business day following July 1.

(A) Completed application form pursuant to subsection (b)(3)

(B) Applicable fees for resident or non-resident elk tags, pursuant to Fish and Game Code Section 332, subdivision (c) and adjusted annually pursuant to Fish and Game Code Section 713.

(C) Proof of property ownership (copy of deed)

(D) Proof of property size (property map)

(3) Application Form. Application forms are available pursuant to subsection (b).

(A) Applicant: applicant's name, title (if applicable), mailing address, business name (if applicable), driver's license number, telephone number, applicant signature, and acknowledgement of compliance with provisions.

(B) Property: location of qualifying lands (county, section, township, and range), and name of elk zone where qualifying land is located.

(C) First through third preference tag: bull, antlerless, or either-sex, and hunt code.

(4) Review and Approval

~~(2) Completed applications must be received by the first business day following July 1.~~ Only those applications that are filled out completely will be accepted. The department shall review the cooperative elk hunting application, verify the content thereof, and certify that the lands consist of important elk habitat prior to the issuance of a cooperative elk hunting permit and elk tag. ~~The Department will evaluate applications to determine if the specified parcels are~~

~~of sufficient size within the boundary of a public elk hunt area, and contain important elk habitat. Rejected applications and those that are incomplete will be returned within 15 days of receipt by the department.~~ If the number of accepted applications exceeds the license tags available, the department will determine successful applicants and a list of alternates by conducting a random drawing from the pool of qualified applicants as soon as possible after the application deadline. For any license year that the demand for cooperative elk hunting license tags within an area open to public hunting (as identified in Section 364) exceeds the number of tags available, tags will be first issued to applicants that did not receive a tag the previous year. If the quota is not filled, tags will be issued to the remaining applicants by random drawing. ~~(3)~~ Successful applicants will be notified by the department as soon as possible after the application deadline.

(5) Designated Recipients. Applicants shall submit the name, address, and valid California hunting license number of designated elk license tag recipients and payment of elk license tag fees by check, money order, or credit card authorization in the amount specified by subsection 702(~~b~~c)(1)~~(L)(M),~~ to the department's regional office nearest the proposed cooperative elk hunting area, by the first business day following August 1.

(c) An elk license tag issued pursuant to the provisions of this section is valid only during the general elk season in which the cooperative elk hunting area occurs and shall only be used on land specified in the landowner's application. License tags are not transferable.

(d) All provisions of the Fish and Game Code and Title 14, CCR, relating to the take of birds and mammals shall be conditions of all license tags issued pursuant to this section.

(e) Any permit issued pursuant to Section 555 may be canceled or suspended at any time by the commission for cause after notice and opportunity to be heard, or without a hearing upon conviction of a violation of this regulation by a court of competent jurisdiction.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67, 713 and 1575, Fish and Game Code.

Proposed Regulatory Language

Section 555.1, Title 14 CCR, is added as follows:

§ 555.1. Conflict Zone Cooperative Elk Hunting Areas.

(a) Definition and Scope. A conflict zone cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(1)(A), 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A), in which landowners experience chronic, elevated levels of human-elk conflict, as determined by the department. The conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size.

(b) Within the conflict zones open to public elk hunting, the number of conflict zone cooperative elk hunting license general methods antlerless tags issued shall be up to 100 percent of the number of public license general methods antlerless tags issued annually for the corresponding public hunt (i.e., a 1 to 1 public license antlerless tag to landowner antlerless tag ratio). The corresponding public hunt is comprised of the annual sum of general methods license tags issued across sections 364 and 364.1. Within a conflict zone cooperative elk hunting area, the remaining tag designations (i.e., spike bull, bull, or either-sex) shall be issued consistent with subsection 555(a). Any elk zones described in Section 364 excluded from this subsection shall conform to all criteria described in Section 555.

(c) An elk license tag issued pursuant to the provisions of this subsection is valid commensurate with the first day of the general methods elk season in which the conflict zone cooperative elk hunting area occurs, as described under Section 364, through November 30 annually. All provisions described under Section 555, including 555(b) shall apply to this subsection.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67 and 1575, Fish and Game Code.

State of California – Department of Fish and Wildlife
2024 APPLICATION FOR COOPERATIVE ELK HUNTING AREA TAG
DFW 1449 (Rev. 10/23)
FEE*: RESIDENT—$528.75 | RESIDENT JUNIOR TAG — $24.21 | NONRESIDENT—$1,619.75

***FEE REQUIRED ONLY IF APPLICANT IS DRAWN. FEE MUST BE RECEIVED BY THE FIRST BUSINESS DAY AFTER AUGUST 1.**

COMPLETED APPLICATION MUST BE RECEIVED BY THE FIRST BUSINESS DAY AFTER JULY 1

If the number of accepted applications for a hunting area exceeds the tags available, the Department will determine successful applicants and a list of alternates by conducting a random drawing from the pool of qualified applicants as soon as possible after the application deadline. Qualified applicants will consist of applicants that were not issued the same tag in the previous year. Please contact your CDFW regional office for more information.

INSTRUCTIONS: Complete this application and mail with the following items to the Department of Fish and Wildlife (Department) regional office for the area where your property is located: 1) proof of ownership (such as copy of deed); and 2) Proof of property size (plat map from county assessor). See regulations on the back of this form.

SECTION 555 and 555.1, TITLE 14, California Code of Regulations

§Section 555. Cooperative Elk Hunting Areas

To encourage protection and enhancement of elk habitat and provide eligible landowners an opportunity for limited elk hunting on their lands, the department may establish cooperative elk hunting areas and issue license tags to allow the take of elk as specified in Section 364, and subject to the following conditions:

(a) Definition and Scope. A cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting. The cooperative hunting area shall encompass not less than a total of 5,000 acres, except that such area may consist of neighboring lands not less than 640 acres in size under the control of one or more owners.

Within an area open to public elk hunting, the number of cooperative elk hunting license tags issued shall not exceed 20 percent of the number of general methods public license tags for the corresponding public hunt and shall be of the same designation (i.e., antlerless, spike bull, bull or either-sex) as the public license tags. Public license tags shall equate to the sum of the general methods elk license tags under section 364 and the Shared Habitat Alliance for Recreational Enhancement (SHARE) elk license tags under section 364.1 for the corresponding hunt and for the same designation issued annually.

(b) Application Process.

Applications, designated on a form issued by the department, are available from the department's headquarters and regional offices:

Region 1, 601 Locust Street, Redding 96001 (530) 225-2300
Region 2, 1701 Nimbus Road, Rancho Cordova 95670 (916) 358-2900
Region 3, 2825 Cordelia Rd., Suite 100, Fairfield 94594 (707) 428-2002
Region 4, 1234 East Shaw Avenue, Fresno 93710 (559) 243-4005
Region 5, 3883 Ruffin Rd., San Diego 92123 (858) 467-4201
Region 6, 3602 Inland Empire Blvd., Ste. C-220, Ontario 91764 (909) 484-0167

(1) Eligibility Requirements.

A person (as defined by Fish and Game Code Section 67) owning at least 640 acres within a cooperative elk hunting area shall be eligible to apply for a cooperative elk hunting area permit. The applicant for a cooperative elk hunting area permit shall be an owner of said land and they shall designate one individual eligible to receive one elk license tag by the date indicated under subsection (6) below. Such individuals shall be at least 12 years of age and possess a valid California hunting license. A person may annually submit a cooperative elk hunting area application where they own sufficient habitat as described in subsection (a) above, for each public hunt area in which their property occurs.

(2) Application Materials.

The following application materials must be submitted to the department's regional office nearest the proposed cooperative elk hunting area by the first business day following July 1.

(A) Completed application form pursuant to subsection (b)(3)
(B) Applicable fees for resident or non-resident elk tags, pursuant to Fish and Game Code Section 332 (c) and adjusted annually pursuant to Fish and Game Code Section 713.
(C) Proof of property ownership (copy of deed)
(D) Proof of property size (property map)

(3) Application Form. Application forms are available pursuant to subsection (b).

(A) Applicant: applicant's name, title, mailing address, business name (if applicable), driver's license number, signature, and acknowledgement of compliance with provisions.

(B) Property: location of qualifying lands (county, section, township, and range), and name of elk zone where qualifying land is located.

(C) First through third preference tag: bull, antlerless, or either-sex, and hunt code

(5) Review and Approval

Only those applications that are filled out completely will be accepted. The department shall review the cooperative elk hunting application, verify the content thereof, and certify that the lands consist of important elk habitat prior to the issuance of a cooperative elk hunting permit and elk tag.

If the number of accepted applications exceeds the license tags available, the department will determine successful applicants and a list of alternates by conducting a random drawing from the pool of qualified applicants as soon as possible after the application deadline. For any license year that the demand for cooperative elk hunting license tags within an area open to public hunting (as identified in 364) exceeds the number of tags available, tags will be first issued to applicants that did not receive a tag the previous year. If the quota is not filled, tags will be issued to the remaining applicants by random drawing. Successful applicants will be notified by the department as soon as possible after the application deadline.

(6) Designated Recipients. Applicants shall submit the name, address, and valid California hunting license number of designated elk license tag recipients and payment of elk license tag fees by check, money order, or credit card authorization in the amount specified by subsection 702(c)(1) to the department's regional office nearest the proposed cooperative elk hunting area, by the first business day following August 1.

(c) An elk license tag issued pursuant to the provisions of this section is valid only during the general elk season in which the cooperative elk hunting area occurs and shall only be used on land specified in the landowner's application. License tags are not transferable.

(d) All provisions of the Fish and Game Code and Title 14, CCR, relating to the take of birds and mammals shall be conditions of all license tags issued pursuant to this section.

(e) Any permit issued pursuant to Section 555 may be canceled or suspended at any time by the commission for cause after notice and opportunity to be heard, or without a hearing upon conviction of a violation of this regulation by a court of competent jurisdiction.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67, 713 and 1575, Fish and Game Code.

§ 555.1. Conflict Zone Cooperative Elk Hunting Areas.

(a) Definition and Scope. A conflict zone cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(1)(A), 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A), in which landowners experience chronic, elevated levels of human-elk conflict, as determined by the department. The conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size.

(b) Within the conflict zones open to public elk hunting, the number of conflict zone cooperative elk hunting license general methods antlerless tags issued shall be up to 100 percent of the number of public license general methods antlerless tags issued annually for the corresponding public hunt (i.e., a 1 to 1 public license antlerless tag to landowner antlerless tag ratio). The corresponding public hunt is comprised of the annual sum of general methods license tags issued across sections 364 and 364.1. Within a conflict zone cooperative elk hunting area, the remaining tag designations (i.e., spike bull, bull, or either-sex) shall be issued consistent with subsection 555(a). Any elk zones described in Section 364 excluded from this subsection shall conform to all criteria described in Section 555.

(c) An elk license tag issued pursuant to the provisions of this subsection is valid commensurate with the first day of the general methods elk season in which the conflict zone cooperative elk hunting area occurs, as described under Section 364, through November 30 annually. All provisions described under Section 555, including 555(b) shall apply to this subsection.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67 and 1575, Fish and Game Code.

Proposed Regulatory Language

Section 555.1, Title 14 CCR, is added as follows:

§ 555.1. Conflict Zone Cooperative Elk Hunting Areas.

Option 1:

(a) Definition and Scope. A conflict zone cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(1)(A), 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A), in which landowners experience chronic, elevated levels of human-elk conflict, as determined by the department. The conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size.

(b) Within the conflict zones open to public elk hunting, the number of conflict zone cooperative elk hunting license general methods antlerless tags issued shall be up to 100 percent of the number of public license general methods antlerless tags issued annually for the corresponding public hunt (i.e., a 1 to 1 public license antlerless tag to landowner antlerless tag ratio). The corresponding public hunt is comprised of the annual sum of general methods license tags issued across sections 364 and 364.1. Within a conflict zone cooperative elk hunting area, the remaining tag designations (i.e., spike bull, bull, or either-sex) shall be issued consistent with subsection 555(a). Any elk zones described in Section 364 excluded from this subsection shall conform to all criteria described in Section 555.

(c) An elk license tag issued pursuant to the provisions of this subsection is valid commensurate with the first day of the general methods elk season in which the conflict zone cooperative elk hunting area occurs, as described under Section 364, through November 30 annually. All provisions described under Section 555, including 555(b) shall apply to this subsection.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67 and 1575, Fish and Game Code.

Option 2:

(a) Definition and Scope. A conflict zone cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A), in which landowners experience chronic, elevated levels of human-elk conflict, as determined by the department. The conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size.

(b) Within the conflict zones open to public elk hunting, the number of conflict zone cooperative elk hunting license general methods antlerless tags issued shall be up to 100 percent of the number of public license general methods antlerless tags issued annually for the corresponding public hunt (i.e., a 1 to 1 public license antlerless tag to landowner antlerless tag ratio). The corresponding public hunt is comprised of the annual sum of general methods license tags issued across sections 364 and 364.1. Within a conflict zone cooperative elk hunting area, the remaining tag designations (i.e., spike bull, bull, or either-sex) shall be issued consistent with subsection 555(a). Any elk zones described in Section 364 excluded from this subsection shall conform to all criteria described in Section 555.

(c) An elk license tag issued pursuant to the provisions of this subsection is valid commensurate with the first day of the general methods elk season in which the conflict zone cooperative elk hunting area occurs, as described under Section 364, through November 30 annually. All provisions described under Section 555, including 555(b) shall apply to this subsection.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67 and 1575, Fish and Game Code.

State of California
Fish and Game Commission
Pre-Adoption Statement of Reasons for Regulatory Action

Amend Section 555 and add Section 555.1
Title 14, California Code of Regulations
Re: Cooperative Elk Hunting

I. Dates of Statements of Reasons

(a) Initial Statement of Reasons Date: October 1, 2023

(b) Pre-Adoption Statement of Reasons Date: March 20, 2024

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing

Date: December 13, 2023 Location: San Diego

(b) Discussion Hearing

Date: February 15, 2024 Location: Sacramento

(c) Adoption Hearing

Date: April 18, 2024 Location: San Jose

III. Description of Modification of Originally Proposed Language of Initial Statement of Reasons (ISOR)

An Option 2 has been added to remove the Siskiyou hunt zone from the classification of "conflict zones," in Section 555.1 for consideration by the Fish and Game Commission (Commission) at its April 18, 2024 meeting. A continuation notice with the addition of Option 2 was publicly noticed on April 5, 2024 and is available on the Commission's website.

IV. Reasons for Modification of Originally Proposed Language of ISOR:

The originally proposed language has been modified in response to public comment (see attachment).

V. Summary of Primary Considerations Raised in Opposition and in Support

Siskiyou County Fish and Game Commission, dated February 7, 2024
Comment Summary:

1. Siskiyou County Fish and Game Commission (SGFGC) does not support the Department's classification of the Siskiyou EMU [Elk Management Unit] as a "conflict zone" and object to it being designated as a conflict zone. SCFGC proposes that the Siskiyou EMU continues to be managed under the current 555 program rules and regulations.
2. The SCFGC is supportive of the SHARE program and would like to see it grow beyond the two existing private landowners currently enrolled within the Siskiyou EMU. The SCFGC has concerns about the size of SHARE properties and supports a minimum acreage of 640 acres unless there are special circumstances. The SCFGC recommends allowing adjacent

properties to combine acreage to increase the size of the property enrolled in the program and does not recommend reducing the minimum acreage.

3. The SCFGC requests a meeting with the Department to review elk population data that allows for the current proposed increase in elk hunting tags, and, if the data support the proposed review, requests that tags are more evenly distributed to General Public Hunts, the SHARE program, and the Cooperative Hunting Area program.

See attachment for complete comment. (SGFGC comment letter)

Response: An Option 2 has been added to the proposed regulatory text to remove the Siskiyou hunt zone from the classification of “hunt zones,” in Section 555.1.

Updated Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

The California Department of Fish and Wildlife (Department) has identified regulated hunting as a preferred tool to both manage elk populations and provide public recreation opportunities. The Fish and Game Commission (Commission) periodically considers the recommendations of the Department in establishing elk hunting regulations. Currently, elk tags are distributed through four issuance types governed by different sections under Title 14. Issuance types for elk tags include Section 364 General Public tags awarded via the Big Game Drawing, Section 364.1 Shared Habitat Alliance for Recreational Enhancement (SHARE) tags, Section 555 Cooperative Elk Hunting Area "Landowner" tags, and Section 601 Private Lands Wildlife Habitat Enhancement and Management Area (PLM) tags.

Regulated harvest is an effective management tool to help reduce human-elk conflict to tolerable levels. The Department aims to provide public hunting opportunity to the greatest extent possible, however, in some cases, elk almost exclusively occupy privately owned property causing significant conflict issues yet may be unavailable for harvest to a majority of general public tagholders. The efficacy of regulated harvest as a management tool in these areas may therefore be reduced due to land access constraints imposed on the general public, among other factors.

The Department has identified an opportunity to modify regulations within an existing framework, Section 555 Cooperative Elk Hunting Areas, to help reduce conflict and provide increased hunting opportunities for qualifying landowners. Chronic, elevated human-elk conflict, elk occupation of predominantly private property, and limited public hunting access has been documented by the Department in the Siskiyou, Northwestern, Mendocino, and Tehachapi Elk Hunt Zones.

The proposed changes are as follows:

Amend Section 555(a)

- Clarify distinction between 5,000 acres and 640 acres criteria
- Add sentence to clarify formula for allocating annual tag distribution relative to general methods public tags (sum of general methods public elk tags + SHARE elk tags issued annually)
- A clarification that a cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting at least 5,000 acres (Fish and Game Code Section 1575) in size (elk hunt zones as identified in section 364). A cooperative elk hunting area must be composed of contiguous parcels of at least 640 acres within a hunting area that is open to the public.
- Public license tags shall equate to the sum of the general methods elk license tags under Section 364 and the SHARE elk license tags under Section 364.1 for the corresponding hunt and for the same designation issued annually.

Amend subsection 555(b)

- (b)(1): Move the location in the regulation, and update the following regional office addresses:

Region 3: 2825 Cordelia Rd, Suite 100 Fairfield 94594 (707) 428-2002
Region 5: 3883 Ruffin Road, San Diego 92123 (858) 467-4201
Region 6: 3602 Inland Empire Blvd., Ste C-220, Ontario 91764 (909) 484-0167

- Clarify eligibility requirements regarding landownership as reiterated above for 555(a).
- Add (b)(2): This subsection is necessary for application materials to be clarified; these include the application form referenced in subsequent language, proof of ownership, proof of property size, and applicable fees.
- Add (b)(3): This subsection is necessary to list the information required within an application form that will be provided by the department. The requested information serves to provide the Department with necessary contact information, including name of first and second applicant, as well as the ability to cross reference to Department data systems (Driver's License number).
- (b)(4): Update the review and approval process, clarifying how lands will be verified.
- (b)(5): update a cross-reference to subsection 702 for elk license fees.
- The Reference section under "Note" is updated as the fees referenced in Section 702 require a cross reference to Fish and Game Code Section 713 for annual adjustment pursuant to the Implicit Price Deflator.
- Non-substantive editing and renumbering to improve the clarity and consistency of the regulatory language have been made in Section 555.

Add Section 555.1

- Describe and classify four "conflict zones"
- Reduce qualifying landowner criteria within identified conflict zones from 640 acres to 60 acres
- Increase antlerless tag distribution relative to public tags (general methods public elk tags + SHARE elk tags issued annually) from 20% to up to 100%
- Extend the hunt season through November 30th annually

Benefit of the Regulations:

Elk conflict exceeds tolerable levels in some areas. Elk almost exclusively occupy privately owned property in some hunt zones, causing significant conflict issues yet may be unavailable for harvest to a majority of general public tagholders. The efficacy of regulated harvest as a management tool in these areas may therefore be reduced due to land access constraints imposed on the general public, among other factors. Chronic, elevated human-elk conflict, elk occupation of predominantly private property, and limited public hunting access has been documented by the Department in the Siskiyou, Northwestern, Mendocino, and Tehachapi Elk Hunt Zones. Modifying regulations within an existing framework, Section 555 Cooperative Elk Hunting Areas, will provide increased hunting opportunities for qualifying landowners and serve to help reduce human-elk conflict.

Consistency and Compatibility with Existing Regulations:

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. Section 20, Article IV, of the state Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to adopt regulations governing landowner tags (California Fish and Game Code Section 1575). No other state agency has the authority to adopt regulations governing landowner tags. The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the CCR for any regulations regarding the adoption of landowner tag regulations; therefore, the Commission has concluded that the proposed regulations are neither inconsistent nor incompatible with existing state regulations.

UPDATE

Section 555.1: added an alternative option to 555.1(a) that removes the Siskiyou hunt zone from the definition of conflict zone. 555.1(a) Option 2 is edited to read: "Definition and Scope: A conflict zone cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A), in which landowners experience chronic, elevated levels of human-elk conflict, as determined by the department. The conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size."

Revised Proposed Regulatory Language

Section 555.1, Title 14 CCR, is added as follows:

§ 555.1. Conflict Zone Cooperative Elk Hunting Areas.

Option 1:

(a) Definition and Scope. A conflict zone cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(1)(A), 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A), in which landowners experience chronic, elevated levels of human-elk conflict, as determined by the department. The conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size.

(b) Within the conflict zones open to public elk hunting, the number of conflict zone cooperative elk hunting license general methods antlerless tags issued shall be up to 100 percent of the number of public license general methods antlerless tags issued annually for the corresponding public hunt (i.e., a 1 to 1 public license antlerless tag to landowner antlerless tag ratio). The corresponding public hunt is comprised of the annual sum of general methods license tags issued across sections 364 and 364.1. Within a conflict zone cooperative elk hunting area, the remaining tag designations (i.e., spike bull, bull, or either-sex) shall be issued consistent with subsection 555(a). Any elk zones described in Section 364 excluded from this subsection shall conform to all criteria described in Section 555.

(c) An elk license tag issued pursuant to the provisions of this subsection is valid commensurate with the first day of the general methods elk season in which the conflict zone cooperative elk hunting area occurs, as described under Section 364, through November 30 annually. All provisions described under Section 555, including 555(b) shall apply to this subsection.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67 and 1575, Fish and Game Code.

Option 2:

(a) Definition and Scope. A conflict zone cooperative elk hunting area is an area of private land located within the boundary of an area open to public elk hunting as identified in subsections 364(a)(2)(A), 364(b)(2)(A), and 364(c)(1)(A), in which landowners experience chronic, elevated levels of human-elk conflict, as determined by the department. The conflict zone cooperative elk hunting area shall be contiguous parcels of at least 60 acres in size.

(b) Within the conflict zones open to public elk hunting, the number of conflict zone cooperative elk hunting license general methods antlerless tags issued shall be up to 100 percent of the number of public license general methods antlerless tags issued annually for the corresponding public hunt (i.e., a 1 to 1 public license antlerless tag to landowner antlerless tag ratio). The corresponding public hunt is comprised of the annual sum of general methods license tags issued across sections 364 and 364.1. Within a conflict zone cooperative elk hunting area, the remaining tag designations (i.e., spike bull, bull, or either-sex) shall be issued consistent with subsection 555(a). Any elk zones described in Section 364 excluded from this subsection shall conform to all criteria described in Section 555.

(c) An elk license tag issued pursuant to the provisions of this subsection is valid commensurate with the first day of the general methods elk season in which the conflict zone cooperative elk hunting area occurs, as described under Section 364, through November 30 annually. All provisions described under Section 555, including 555(b) shall apply to this subsection.

NOTE: Authority cited: Section 1575, Fish and Game Code.
Reference: Sections 67 and 1575, Fish and Game Code.

State of California
Fish and Game Commission
Initial Statement of Reasons for Regulatory Action

Amend Sections 708.14
Title 14, California Code of Regulations
Re: Big Game License Tag Drawing System

I. Date of Initial Statement of Reasons: November 15, 2023

II. Dates and Locations of Scheduled Hearings

(a) Notice Hearing:

Date: December 13, 2023 Location: San Diego, CA

(b) Discussion Hearing:

Date: February 15, 2024 Location: Sacramento, CA

(c) Adoption Hearing:

Date: April 18, 2024 Location: San Jose, CA

III. Description of Regulatory Action

(a) Statement of Specific Purpose of Regulatory Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

BACKGROUND

The Fish and Game Commission (Commission) periodically considers recommendations from the Department of Fish and Wildlife (Department) in establishing big game mammal hunting regulations. Specifically, the Department manages deer, bighorn sheep, pronghorn antelope and elk resources in California. Deer hunting tags, elk hunting tags, bighorn sheep hunting tags, and pronghorn antelope hunting tags are required to hunt these species in California.

CURRENT REGULATIONS

Regulations describing hunting zones and seasons for deer are described in sections 360 and 361, bighorn sheep in Section 362, pronghorn antelope in Section 363, and elk in Section 364. The Department distributes hunting tags for deer, elk, bighorn sheep, and pronghorn antelope annually via a big game drawing for a specific area and season. Some deer tags for certain hunt zones include both an early archery-only season and a subsequent “general” season by firearm and archery.

Public demand for certain deer tags and all bighorn sheep, pronghorn antelope, and elk hunting tags exceeds the available opportunities; therefore, a modified preference point system (subsection 708.14(a)) provides preference to hunters who have applied for, but not drawn, tags in past drawings. Before the start of the hunting license year (which runs from

July 1 through June 30), a hunter may apply through the Automated License Data System (ALDS) between April 15 and June 2 for a deer, bighorn sheep, pronghorn antelope, or elk hunting tag. If the hunter is not drawn, the hunter receives a preference point which gives that hunter preference in future drawings for that game species. A portion of the tags for each species are issued randomly to allow some opportunity for new hunters or hunters that do not have enough preference points to draw through the preference point portion of the drawing.

Many big game hunts require years of accumulated preference points to even have the opportunity. Others require the maximum number of preference points, and are "once in a lifetime" draws. For deer, hunters may make up to three hunt choices. Applicants can indicate their preferred first tag choice, which is considered along with the number of accumulated preference points. All remaining unsuccessful applications are then sorted by second tag choice, in random number order (starting with the lowest random number to the highest random number). A second round of drawings is then conducted for any zones and hunts with tags remaining without consideration of accumulated points.

Deer tags are classified pursuant to subsection 708.1(a)(2)(A) by three types:

- Premium, which include those tags where the tag quota filled on or before the first business day after July 1 in the immediately preceding license year;
- Restricted, which include all non-Premium tags where the tag quota filled on or before on or before the first business day after August 1 in the immediately preceding license year; and
- Unrestricted, which include those tags where the tag quota did not fill on or before the first business day after August 1 in the immediately preceding license year.

Existing regulations in subsections 708.14(j) and 708.14(k) outline the process for returning a big game tag if a hunter was unable to hunt under their first choice. That process requires the hunter to submit to the Department a written request to retain their existing preference point total and earn one preference point for that year. Request for refunds for bighorn sheep, pronghorn, and elk tag fees also exists under subsection 708.14(k). The Department may consider the request if the tag is returned to the Department's License and Revenue Branch before the season starts for which the tag is valid. Tags are offered to the first alternate, and so on. If a hunt area is inaccessible for sixty-six percent (66%) or more of a hunt season due to a public land closure caused by wildfire, customers may return their tags for preference points reinstatement and, if applicable, tag refund.

This regulatory proposal would affect hunters who were drawn for deer hunts in zones defined in Title 14 Section 708.1 and described as Premium Deer Hunt Tags, bighorn sheep hunts in zones defined in Title 14, Section 362, pronghorn antelope hunts in zones defined in Title 14, Section 363, and elk hunts in zones defined in Title 14, Section 364.

PROPOSED REGULATORY CHANGES

The proposed changes focus on preference point reinstatement for members of a party and for apprentice hunters. The last time these regulations were subject to major amendment was April 18, 2022. The proposed amendments here represent the results of the

Department's internal discussions, input from Petition 2021-17, and public comment. The proposed changes are necessary to make hunting opportunities more equitable.

1. The party preference point rule needs to be changed regarding how tags may be returned. Propose that individual party members may return tags only if their points are less than or equal to the party points average. For party members who have more points than the party's point average, all members of the party must return their tags for point reinstatement.
2. Require a completed harvest report for postseason tag returns. Change wording to explicitly state that the entire tag needs to be returned (including carcass portion) – otherwise the carcass portion could be used illegitimately.
3. Apprentice hunters must return all premium first-choice tags to be eligible for preference points reinstatement since they can apply twice in the lottery and both tags carry full point value.
4. Non-substantive editing and renumbering to improve the clarity and consistency of the regulatory language has been made in this section.

Amend Subsection 708.14(j): Process for requesting preference point reinstatements and tag refunds for deer.

For the phrase "unfilled tag", amend to "entire unfilled tag (including carcass portion)"

Subsection 708.14(j)(1) - For the phrase "unfilled tag", amend to "entire unfilled tag (including carcass portion)"

The party preference point rule currently has a loophole that allows hunters with few preference points to repeatedly leverage the preference points of other hunters who have many preference points, because the hunters with many preference points can return their tag for point reinstatement year after year. At the end of the paragraph, add: "If returning tags as member of a party, individual party members may return tags only if their points are less than or equal to the party's point average. For party members who have more points than the party's point average to have their points reinstated, all members of the party must return their tags for point reinstatement." This clarification is necessary because hunters with few preference points can unduly benefit from hunters with many preference points to repeatedly get drawn for premium hunts by leveraging the party preference point system as currently written.

Subsection 708.14(j)(2)(A) - Remove entirely as it is obsolete as the timing of the 2021 hunting license year has already passed.

Subsection 708.14(j)(2)(B) - is now re-numbered as subsection 708.14(j)(2)

Amend Subsection 708.14(k): Process for requesting preference point reinstatements and tag refunds for elk, antelope, or bighorn sheep tag in the big game drawing.

For the phrase "unfilled tag", amend to "entire unfilled tag (including carcass portion)" - This change is necessary to eliminate the possibility for illegitimate use of the carcass portion of the tag.

Subsection 708.14(k)(1) - For the phrase "unfilled tag", amend to "entire unfilled tag (including carcass portion)" - This change is necessary to eliminate the possibility for illegitimate use of the carcass portion of the tag.

Subsection 708.14(k)(2)(A) - Remove entirely as it is obsolete as the timing of the 2021 hunting license year has already passed.

Subsection 708.14(k)(2)(B) - is now re-numbered as subsection 708.14(k)(2)

Add Subsection 708.14(l): Preference point reinstatement for apprentice hunters.

Subsection 708.14(l): Add "Apprentice hunters must return all premium first-choice tags to be eligible for preference points reinstatement. All returned tags must meet eligibility requirements for point reinstatement. Tagholders must submit written request along with entire unfilled tags (including carcass portion) for preference point reinstatement." This change is necessary because under current regulations, junior license hunters may apply and be drawn for multiple premium tags. The addition of the apprentice tag rule is to prevent abuse of gaining preference points while simultaneously keeping a premium tag.

Non substantive changes

Non substantive changes are made throughout Section 708.14 to correct for spelling, punctuation, and gender neutrality.

(b) Goals and Benefits of the Regulation

The goal of the proposed regulation is to remove a loophole in the tag return rules, thus improving equity of hunting opportunity. All other changes further improve equity of hunter opportunity and/or facilitate administration.

(c) Authority and Reference Sections from Fish and Game Code for Regulation

Authority: Sections 200, 203, 219, 265, 270, 275, 331, 332, 1050, 1572, 4302 and 10502, Fish and Game Code.

Reference: Sections 110, 200, 201, 203, 203.1, 219, 255, 265, 270, 275, 331, 332, 713, 1050, 1570, 1571, 1572, 3950, 3951, 4302, 4330, 4331, 4332, 4333, 4336, 4340, 4341, 4902, 10500 and 10502, Fish and Game Code

(d) Specific Technology or Equipment Required by Regulatory Change

None

(e) Identification of Reports or Documents Supporting Regulation Change

None

(f) Public Discussions of Proposed Regulations Prior to Notice Publication

- The Wildlife Resources Committee discussed the proposed regulations at its January 13, 2022, January 11, 2023, and September 19, 2023 meetings.

IV. Description of Reasonable Alternatives to Regulatory Action

(a) Alternatives to Regulation Change

The no-change alternative was considered and rejected because it would not attain project objectives of providing for equitable hunting opportunities.

(b) No Change Alternative

Without the proposed changes, the outstanding issues concerning the regulations currently governing preference points would remain unaddressed.

V. Mitigation Measures Required by Regulatory Action

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed amendments are economically neutral to business.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment

The Commission anticipates no impact on the creation or elimination of jobs within the state, no impact on the creation of new business, the elimination of existing businesses or the expansion of businesses in California as minor variations in hunting regulations are, by themselves, unlikely to provide a substantial economic stimulus to the state.

(c) Cost Impacts on a Representative Private Person or Business

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None

(e) Nondiscretionary Costs/Savings to Local Agencies:

None

(f) Programs Mandated on Local Agencies or School Districts:

None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None

(h) Effect on Housing Costs:

None

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State:

No impacts to the creation or elimination of jobs are anticipated from this regulatory amendment.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State

No impacts to the creation of new businesses or the elimination of existing businesses within the State are anticipated from this regulatory amendment.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State

No impacts to the expansion of businesses currently doing business within the State are anticipated.

(d) Benefits of the Regulation to the Health and Welfare of California Residents

The Commission does not anticipate impacts on the health and welfare of California residents.

(e) Benefits of the Regulation to Worker Safety

No impacts to worker safety are anticipated.

(f) Benefits of the Regulation to the State's Environment

The proposed changes should have no environmental effect.

(g) Other Benefits of the Regulation

Increased equity of hunting opportunities.

Informative Digest/Policy Statement Overview

Unless otherwise specified, all section references in this document are to Title 14 of the California Code of Regulations (CCR).

The California Department of Fish and Wildlife (Department) manages deer, bighorn sheep, pronghorn antelope, and elk resources in California. Deer hunting tags, bighorn sheep hunting tags, pronghorn antelope hunting tags, and elk hunting tags are required to hunt these species in California. The Department distributes hunting tags for certain deer, bighorn sheep, pronghorn antelope, and elk annually via the big game drawing. Public demand for deer, bighorn sheep, pronghorn antelope, and elk hunting tags exceeds the available opportunities; therefore, a modified preference point system (Section 708.14) provides preference to hunters who have applied for, but not received, tags in past drawings. Each year a hunter applies for a deer, bighorn sheep, pronghorn antelope, or elk hunting tag and is not drawn, that hunter receives a preference point which gives that hunter preference in future drawings for that species. A portion of the tag quota for deer, bighorn sheep, pronghorn antelope, and elk tags are allocated by preference point drawing each year. A portion of tags are issued randomly to allow some opportunity for new hunters and hunters that do not have enough preference points to draw through the preference point portion of the drawing.

Proposed changes to subsection 708.14(j) would remedy a loophole issue in that hunters with few preference points can unduly benefit from hunters with many preference points to repeatedly get drawn for premium hunts by leveraging the party preference point system as currently written.

Under current regulations, junior license hunters may apply and be drawn for multiple premium tags. The addition of the apprentice tag rule is to prevent abuse of gaining preference points while simultaneously keeping a premium tag.

Currently the regulation language does not explicitly state that the entire tag including the carcass portion must be returned for point reinstatement. We propose to make this explicit. Finally, it is proposed that apprentice hunters must return both drawing tags in order to receive preference point reinstatement since they are allowed to enter the drawing twice.

The proposed changes are as follows:

1. The party preference point rule needs to be changed regarding how tags may be returned. Propose that for pre-season tag returns, individual party members may return tags only if their points are less than or equal to the party points average. For party members who have more points than the party’s point average, all members of the party must return their tags for point reinstatement.
2. Require a completed harvest report for postseason tag returns. Change wording to explicitly state that the entire tag needs to be returned (including carcass section) – otherwise the carcass section could be used illegitimately.
3. Apprentice hunters must return all premium first-choice tags to be eligible for preference points reinstatement since they can apply twice in the lottery and both tags carry full point value.
4. Non-substantive editing and renumbering to improve the clarity and consistency of the regulatory language has been made in this section.

Benefit of the Regulations:

The proposed regulation changes will make hunting opportunities more equitable and close loopholes that allow leveraging of the system.

Consistency and Compatibility with Existing Regulations:

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. Section 20, Article IV, of the state Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to adopt regulations governing big game hunting (California Fish and Game Code Section 200). No other state agency has the authority to adopt regulations governing big game hunting. The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the CCR for any regulations regarding the adoption of big game hunting regulations; therefore, the Commission has concluded that the proposed regulations are neither inconsistent nor incompatible with existing state regulations.

§ 708.14. Big Game License Tag Drawing System.

(a) General Conditions

(1) Except as otherwise provided, the department shall award license tags for premium deer, bighorn sheep, elk and pronghorn antelope hunts, as described in sections 360(b) and (c), 361, 362, 364 and 363, using a Modified-Preference Point drawing system.

(2) Except as otherwise provided, the Modified-Preference Point drawing system shall award proportions of hunt tag quotas, as specified for each species, using the following drawing methods:

(A) Preference Point Drawings. Tags are awarded based on the following order of priority: an applicant's hunt choice (first choice only for deer), accumulated point totals by species (highest to lowest), and computer-generated random number (lowest to highest).

(B) Draw-By-Choice Drawings. Tags are awarded according to an applicant's hunt choice and computer-generated random number (lowest to highest), without consideration of accumulated points.

(3) Except as otherwise provided, applicants unsuccessful in receiving a tag for premium deer (based on first choice selection), bighorn sheep, elk or pronghorn antelope hunts shall earn one (1) preference point for use in future Big Game Drawings.

(4) To earn and accumulate a point for any species, a person shall comply with all application requirements for that species as specified in sections 708.1, 708.9, 708.10 and 708.11 including the following conditions:

(A) Applicants for premium deer license tags, pronghorn antelope license tags, or elk license tags shall be at least 12 years of age on or before July 1 of the license year for which they are applying.

(B) Applicants for Nelson ~~big horn~~ bighorn sheep license tags shall be at least 16 years of age on or before July 1 of the license year for which they are applying.

(C) Applicants shall possess a valid annual California hunting license valid for the hunting season requested.

(D) Applications for bighorn sheep, pronghorn antelope and elk hunts shall include the appropriate nonrefundable processing fees as specified in Section 702.

(E) ~~Any applicant~~ Applicants shall apply for a premium deer license tag, bighorn sheep license tag, pronghorn antelope license tag and elk license tag through the department's Automated License Data System terminals at any department license agent or department license sales office by June 2 each year.

(F) Each applicant who submits a premium license tag, as noted in (E) above, through the department's Automated License Data System terminals at department license agents and department license sales offices shall receive a "big game drawing receipt" printed from the terminal. The receipt shall contain the customer's name and permanent identification number, proof of entry into the big game drawing for the license year, hunt choices for each species, accumulated preference points for each species, and Party Identification Number.

(G) Except for apprentice deer hunt applicants, applicants shall not submit more than one drawing application for each species during the same license year.

(b) Party Applications, Residency

(1) No more than six persons shall apply together as a party for premium deer license tags. Applicants for premium deer license tags may be residents or nonresidents.

(2) No more than two residents shall apply together as a party for elk license tags. Nonresidents shall not apply as a party for elk license tags.

(3) No more than two residents shall apply together as a party for pronghorn antelope license tags. Nonresidents shall not apply as a party for pronghorn antelope license tags.

(4) Applicants shall not apply as a party for bighorn sheep license tags.

(5) Each year upon application, each applicant shall specify if the applicant is applying as an individual, a party leader or joining an existing party.

(6) Applicants applying as an individual or as a party leader shall be assigned a Party Identification Number from the department's Automated License Data System terminal at the time of application each year. Applicants shall be assigned a Party Identification Number for each species.

(7) To apply as a party, the party leader shall apply first and provide ~~his/her~~ their assigned Party Identification Number to the other party members.

(8) Applicants joining an existing party shall provide the Party Identification Number of the party leader when ~~he/she applies~~ they apply to join the party.

(9) Applicants joining a party shall be assigned the same tag choices in the same order of preference as the party leader.

(10) All party members shall be awarded tags according to the choices selected by the party leader.

(c) No applicant shall earn more than one (1) preference point per species, per drawing, for use in future drawings. Preference points are accumulated by species and shall not be transferred to another species or another person. Preference points are not zone or hunt specific.

(d) Except as otherwise provided, successful applicants receiving tags for their first choice premium deer, bighorn sheep, elk or pronghorn antelope hunts shall lose all preference points for that species.

(e) For party applications, the department shall use the average preference point value of all party members (total preference points for the party divided by number of party members) as the basis for consideration in the drawing for that species. Point averages shall not be rounded.

(f) Except as otherwise provided, persons who do not wish to apply for an antelope, elk, bighorn sheep or premium deer tags, may earn one (1) preference point for any or all of these species, by submitting the appropriate application(s), as specified in sections 708.1, 708.9, 708.10 and 708.11, and selecting the point code number for that species, as defined by the department, as the hunt choice (first choice only for deer) through the department's Automated License Data System terminals at any department license agent or department license sales office. Persons applying for a preference point in this manner shall be subject to the same application requirements as regular drawing applicants as specified in subsection 708.14.

(g) The department shall maintain records of preference points earned by individual applicants based on the identification number assigned to each customer by the department's Automated License Data System. The customer's identification number, Get Outdoors ID (GO ID), will be printed on each drawing receipt issued by the Automated License Data System. Applicants shall notify the department's License and Revenue Branch in Sacramento, in writing, of any changes or corrections regarding name, mailing address, or date of birth.

(h) Persons not applying for premium deer, bighorn sheep, elk, or pronghorn antelope hunts through the department's Big Game Drawings for five (5) consecutive years shall have their preference points for that species reduced to zero (0). For the purposes of this subsection, persons whose applications are disqualified from drawing shall be considered the same as persons not applying. Applying for preference points as described in (f) above, will keep an applicant's file active.

(i) Any person may appeal incomplete, late and ineligible applications or applications submitted without the appropriate processing fee that were not included in the department's big game drawing and the hunter did not earn a preference point. The appeal shall be in writing and describe the basis for the appeal. The appeal shall be received by the department's License and Revenue Branch in Sacramento, or if mailed, postmarked on or before May 31 of the following year. The department, upon consideration of the appeal, may grant the appeal and award one preference point to the appellant. If the department grants the appeal for a preference point, the appellant shall pay all the applicable fees. The department shall not award a preference point unless the appellant pays all the applicable fees.

(j) Any applicant who was drawn for the applicant's first deer tag choice in the big game drawing (becoming a tag holder) and cannot hunt for any reason may return their entire unfilled tag (including carcass portion) and submit a written request to retain their accumulated preference point total and earn one preference point for deer for that license year. If the request is granted, the tag holder shall retain the preference point total the tag holder accumulated prior to the big game drawing and earn one preference point for deer for that license year. The department shall not refund the fees paid for a resident deer tag. To be eligible for preference point reinstatement, tag holders must meet one of the criteria below:

(1) Before a season starts. The tag holder must return the entire unfilled tag (including carcass portion) with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to the earliest date the tag is valid for hunting. For tags that are valid for both an archery season, and a general season pursuant to sections 360 and 361 of these regulations, the written request must be postmarked prior to the opening date of the earliest season. The department may refund the difference between the fee paid for a nonresident deer tag and a resident deer tag for any nonresident. Party members may return their deer tags only if their points are less than or equal to the

party's point average. For party members who have more points than the party's point average to have their points reinstated, all members of the party must return their tags for point reinstatement.

(2) After a season starts.

~~(A) For the 2021 hunting license year, a tag holder whose hunt zone was inaccessible for sixty-six percent (66%) or more of a hunt season (pursuant to sections 360 and 361 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement. For tags that are valid for both an archery season and a general season, only the general season shall be considered for the calculation of the percentage of hunt season lost. The tag holder must return their unfilled deer tag with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to May 1, 2022. Requests postmarked on or after May 1, 2022 shall not be considered.~~

~~(B)~~Commencing with the 2022 hunting license year beginning July 1, 2022, a tag holder whose hunt zone was inaccessible for sixty-six percent (66%) or more of a hunt season (pursuant to sections 360 and 361 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement. For tags that are valid for both an archery season and a general season, only the general season shall be considered for the calculation of the percentage of hunt season lost. The tag holder must return their entire unfilled deer tag (including carcass portion) with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244– 2090, postmarked on or prior to February 28 of the current license year. Requests postmarked after this date shall not be considered.

(k) Any applicant who was awarded an elk, antelope, or bighorn sheep tag in the big game drawing (becoming a tag holder) and cannot hunt for any reason may return their entire unfilled tag (including carcass portion) and submit a written request to retain their accumulated preference point total, earn one preference point for elk, antelope or bighorn sheep for that license year, and seek refund of the tag fee. The tag holder shall pay the nonrefundable processing fee specified in Section 702 with the request. If the request is granted, the tag holder shall retain the preference point total the tag holder accumulated prior to the big game drawing and earn one preference point for elk, antelope, or bighorn sheep. The department may refund the tag fee. To be eligible for preference point reinstatement and/or tag refund, tag holders must meet one of the criteria below:

(1) Before a season starts. The tag holder must return ~~the~~ their entire unfilled tag (including carcass portion) with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to the opening date of the season for which the tag is valid.

(2) After a season starts.

~~(A) For the 2021 hunting license year, a tag holder whose hunt area was inaccessible for sixty-six percent (66%) or more of the hunt season (pursuant to sections 362, 363 and 364 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement and/or tag refund. The tag~~

~~holder must return their unfilled tag with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to May 1, 2022. Requests postmarked on or after May 1, 2022 shall not be considered.~~

~~(B)~~Commencing with the 2022 hunting license year beginning July 1, 2022, a tag holder whose hunt zone was inaccessible for sixty-six percent (66%) or more of the hunt season (pursuant to sections 362, 363, and 364 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement and/or tag refund. The tag holder must return their entire unfilled tag (including carcass portion) with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked on or prior to February 28 of the current license year. Requests postmarked after this date shall not be considered.

(l): Apprentice hunters must return all premium first-choice tags to be eligible for preference points reinstatement. All returned tags must meet eligibility requirements for point reinstatement. Tagholders must submit written request along with entire unfilled tags (including carcass portion) for preference point reinstatement.

NOTE: Authority cited: Sections 200, 203, 219, 265, 270, 275, 331, 332, 1050, 1572, 4302 and 10502, Fish and Game Code.
Reference: Sections 110, 200, 201, 203, 203.1, 219, 255, 265, 270, 275, 331, 332, 713, 1050, 1570, 1571, 1572, 3950, 3951, 4302, 4330, 4331, 4332, 4333, 4336, 4340, 4341, 4902, 10500 and 10502, Fish and Game Code.

§ 708.14. Big Game License Tag Drawing System.

(a) General Conditions

(1) Except as otherwise provided, the department shall award license tags for premium deer, bighorn sheep, elk and pronghorn antelope hunts, as described in sections 360(b) and (c), 361, 362, 364 and 363, using a Modified-Preference Point drawing system.

(2) Except as otherwise provided, the Modified-Preference Point drawing system shall award proportions of hunt tag quotas, as specified for each species, using the following drawing methods:

(A) Preference Point Drawings. Tags are awarded based on the following order of priority: an applicant's hunt choice (first choice only for deer), accumulated point totals by species (highest to lowest), and computer-generated random number (lowest to highest).

(B) Draw-By-Choice Drawings. Tags are awarded according to an applicant's hunt choice and computer-generated random number (lowest to highest), without consideration of accumulated points.

(3) Except as otherwise provided, applicants unsuccessful in receiving a tag for premium deer (based on first choice selection), bighorn sheep, elk or pronghorn antelope hunts shall earn one (1) preference point for use in future Big Game Drawings.

(4) To earn and accumulate a point for any species, a person shall comply with all application requirements for that species as specified in sections 708.1, 708.9, 708.10 and 708.11 including the following conditions:

(A) Applicants for premium deer license tags, pronghorn antelope license tags, or elk license tags shall be at least 12 years of age on or before July 1 of the license year for which they are applying.

(B) Applicants for Nelson ~~big horn~~ bighorn sheep license tags shall be at least 16 years of age on or before July 1 of the license year for which they are applying.

(C) Applicants shall possess a valid annual California hunting license valid for the hunting season requested.

(D) Applications for bighorn sheep, pronghorn antelope and elk hunts shall include the appropriate nonrefundable processing fees as specified in Section 702.

(E) ~~Any applicant~~ Applicants shall apply for a premium deer license tag, bighorn sheep license tag, pronghorn antelope license tag and elk license tag through the department's Automated License Data System terminals at any department license agent or department license sales office by June 2 each year.

(F) Each applicant who submits a premium license tag, as noted in (E) above, through the department's Automated License Data System terminals at department license agents and department license sales offices shall receive a "big game drawing receipt" printed from the terminal. The receipt shall contain the customer's name and permanent identification number, proof of entry into the big game drawing for the license year, hunt choices for each species, accumulated preference points for each species, and Party Identification Number.

(G) Except for apprentice deer hunt applicants, applicants shall not submit more than one drawing application for each species during the same license year.

(b) Party Applications, Residency

(1) No more than six persons shall apply together as a party for premium deer license tags. Applicants for premium deer license tags may be residents or nonresidents.

(2) No more than two residents shall apply together as a party for elk license tags. Nonresidents shall not apply as a party for elk license tags.

(3) No more than two residents shall apply together as a party for pronghorn antelope license tags. Nonresidents shall not apply as a party for pronghorn antelope license tags.

(4) Applicants shall not apply as a party for bighorn sheep license tags.

(5) Each year upon application, each applicant shall specify if the applicant is applying as an individual, a party leader or joining an existing party.

(6) Applicants applying as an individual or as a party leader shall be assigned a Party Identification Number from the department's Automated License Data System terminal at the time of application each year. Applicants shall be assigned a Party Identification Number for each species.

(7) To apply as a party, the party leader shall apply first and provide ~~his/her~~ their assigned Party Identification Number to the other party members.

(8) Applicants joining an existing party shall provide the Party Identification Number of the party leader when ~~he/she applies~~ they apply to join the party.

(9) Applicants joining a party shall be assigned the same tag choices in the same order of preference as the party leader.

(10) All party members shall be awarded tags according to the choices selected by the party leader.

(c) No applicant shall earn more than one (1) preference point per species, per drawing, for use in future drawings. Preference points are accumulated by species and shall not be transferred to another species or another person. Preference points are not zone or hunt specific.

(d) Except as otherwise provided, successful applicants receiving tags for their first choice premium deer, bighorn sheep, elk or pronghorn antelope hunts shall lose all preference points for that species.

(e) For party applications, the department shall use the average preference point value of all party members (total preference points for the party divided by number of party members) as the basis for consideration in the drawing for that species. Point averages shall not be rounded.

(f) Except as otherwise provided, persons who do not wish to apply for an antelope, elk, bighorn sheep or premium deer tags, may earn one (1) preference point for any or all of these species, by submitting the appropriate application(s), as specified in sections 708.1, 708.9, 708.10 and 708.11, and selecting the point code number for that species, as defined by the department, as the hunt choice (first choice only for deer) through the department's Automated License Data System terminals at any department license agent or department license sales office. Persons applying for a preference point in this manner shall be subject to the same application requirements as regular drawing applicants as specified in subsection 708.14.

(g) The department shall maintain records of preference points earned by individual applicants based on the identification number assigned to each customer by the department's Automated License Data System. The customer's identification number, Get Outdoors ID (GO ID), will be printed on each drawing receipt issued by the Automated License Data System. Applicants shall notify the department's License and Revenue Branch in Sacramento, in writing, of any changes or corrections regarding name, mailing address, or date of birth.

(h) Persons not applying for premium deer, bighorn sheep, elk, or pronghorn antelope hunts through the department's Big Game Drawings for five (5) consecutive years shall have their preference points for that species reduced to zero (0). For the purposes of this subsection, persons whose applications are disqualified from drawing shall be considered the same as persons not applying. Applying for preference points as described in (f) above, will keep an applicant's file active.

(i) Any person may appeal incomplete, late and ineligible applications or applications submitted without the appropriate processing fee that were not included in the department's big game drawing and the hunter did not earn a preference point. The appeal shall be in writing and describe the basis for the appeal. The appeal shall be received by the department's License and Revenue Branch in Sacramento, or if mailed, postmarked on or before May 31 of the following year. The department, upon consideration of the appeal, may grant the appeal and award one preference point to the appellant. If the department grants the appeal for a preference point, the appellant shall pay all the applicable fees. The department shall not award a preference point unless the appellant pays all the applicable fees.

(j) Any applicant who was drawn for the applicant's first deer tag choice in the big game drawing (becoming a tag holder) and cannot hunt for any reason may return their <u>entire</u> unfilled tag <u>(including carcass portion)</u> and submit a written request to retain their accumulated preference point total and earn one preference point for deer for that license year. If the request is granted, the tag holder shall retain the preference point total the tag holder accumulated prior to the big game drawing and earn one preference point for deer for that license year. The department shall not refund the fees paid for a resident deer tag. To be eligible for preference point reinstatement, tag holders must meet one of the criteria below:

(1) Before a season starts. The tag holder must return the <u>entire</u> unfilled tag <u>(including carcass portion)</u> with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to the earliest date the tag is valid for hunting. For tags that are valid for both an archery season, and a general season pursuant to sections 360 and 361 of these regulations, the written request must be postmarked prior to the opening date of the earliest season. The department may refund the difference between the fee paid for a nonresident deer tag and a resident deer tag for any nonresident. <u>Party members may return their deer tags only if their points are less than or equal to the</u>

party's point average. For party members who have more points than the party's point average to have their points reinstated, all members of the party must return their tags for point reinstatement.

(2) After a season starts.

~~(A) For the 2021 hunting license year, a tag holder whose hunt zone was inaccessible for sixty-six percent (66%) or more of a hunt season (pursuant to sections 360 and 361 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement. For tags that are valid for both an archery season and a general season, only the general season shall be considered for the calculation of the percentage of hunt season lost. The tag holder must return their unfilled deer tag with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to May 1, 2022. Requests postmarked on or after May 1, 2022 shall not be considered.~~

~~(B)~~Commencing with the 2022 hunting license year beginning July 1, 2022, a tag holder whose hunt zone was inaccessible for sixty-six percent (66%) or more of a hunt season (pursuant to sections 360 and 361 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement. For tags that are valid for both an archery season and a general season, only the general season shall be considered for the calculation of the percentage of hunt season lost. The tag holder must return their entire unfilled deer tag (including carcass portion) with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244– 2090, postmarked on or prior to February 28 of the current license year. Requests postmarked after this date shall not be considered.

(k) Any applicant who was awarded an elk, antelope, or bighorn sheep tag in the big game drawing (becoming a tag holder) and cannot hunt for any reason may return their entire unfilled tag (including carcass portion) and submit a written request to retain their accumulated preference point total, earn one preference point for elk, antelope or bighorn sheep for that license year, and seek refund of the tag fee. The tag holder shall pay the nonrefundable processing fee specified in Section 702 with the request. If the request is granted, the tag holder shall retain the preference point total the tag holder accumulated prior to the big game drawing and earn one preference point for elk, antelope, or bighorn sheep. The department may refund the tag fee. To be eligible for preference point reinstatement and/or tag refund, tag holders must meet one of the criteria below:

(1) Before a season starts. The tag holder must return ~~the~~ their entire unfilled tag (including carcass portion) with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to the opening date of the season for which the tag is valid.

(2) After a season starts.

~~(A) For the 2021 hunting license year, a tag holder whose hunt area was inaccessible for sixty-six percent (66%) or more of the hunt season (pursuant to sections 362, 363 and 364 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement and/or tag refund. The tag~~

~~holder must return their unfilled tag with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked prior to May 1, 2022. Requests postmarked on or after May 1, 2022 shall not be considered.~~

~~(B)~~Commencing with the 2022 hunting license year beginning July 1, 2022, a tag holder whose hunt zone was inaccessible for sixty-six percent (66%) or more of the hunt season (pursuant to sections 362, 363, and 364 of these regulations) due to a public land closure caused by wildfire may return their unfilled tag with their written request for preference point reinstatement and/or tag refund. The tag holder must return their entire unfilled tag (including carcass portion) with their written request to the department's License and Revenue Branch, P.O. Box 944209, Sacramento, CA 94244–2090, postmarked on or prior to February 28 of the current license year. Requests postmarked after this date shall not be considered.

(l): Apprentice hunters must return all premium first-choice tags to be eligible for preference points reinstatement. All returned tags must meet eligibility requirements for point reinstatement. Tagholders must submit written request along with entire unfilled tags (including carcass portion) for preference point reinstatement.

Signed Original on File
Received April 11, 2024

Memorandum

Date: April 10, 2024

To: Melissa Miller-Henson
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: Agenda Item for the April 17-18, 2024, Fish and Game Commission Meeting
Re: Preference Points Reinstatement – Pre- Adoption Memo

The Department of Fish and Wildlife (Department) has prepared this Memorandum to summarize and provide responses to public comments received by the Fish and Game Commission (Commission) on the proposed amendments to Section 708.14, Title 14, California Code of Regulations, regarding proposing changes to the process by which preference points are reinstated. The Department is not recommending any further amendments to the regulatory text because there were no public comments received regarding this proposal.

The Department recommends the Commission adopt the proposed rulemaking for preference points reinstatement.

If you have any questions on this item, please contact Scott Gardner, Wildlife Branch Chief, via phone at (916) 801-6257.

MAMMAL HUNTING

2024 Regulations Proposals

Presentation Overview

- Regulations proposals:
  - Bighorn sheep - 362
  - Pronghorn - 363
  - Elk – 364, 555
- Regulations without changes or public comment:
  - Deer – 554
  - Preference points – 708.14

DESERT BIGHORN SHEEP

Regulations Proposal

Section 362 Bighorn Tag Quota Adjustments

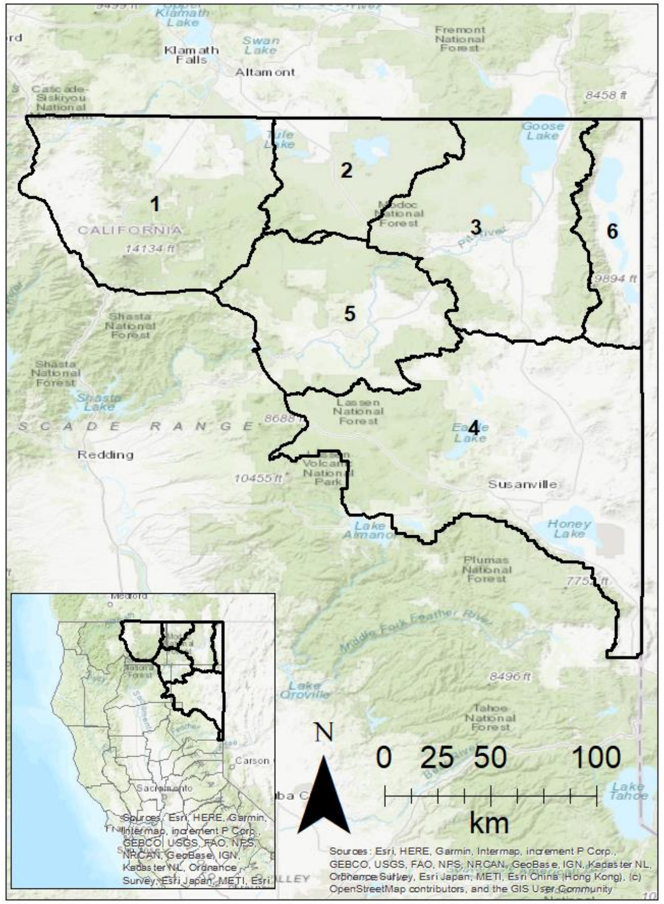
Nelson Bighorn Sheep Hunt Zones	23/24 Tag Allocation	Proposed for 24/25
Zone 1 – Marble/Clipper Mountains	1	1
Zone 2 – Kelso Peak/Old Dad Mountains	1	2
Zone 3 – Clark/Kingston Mountain Ranges	4	3
Zone 4 – Orocopia Mountains	1	1
Zone 5 – San Gorgonio Wilderness	0	0
Zone 6 – Sheep Hole Mountains	0	1
Zone 7 – White Mountains	6	4
Zone 8 – South Bristol Mountains	2	1
Zone 9 – Cady Mountains	2	2
Zone 10 – Newberry, Rodman, Ord Mountains	6	6
Open Zone Fundraising Tag	1	1
Marble/Clipper/South Bristol Fundraising Tag	1	0
Cady Mountains Fundraising Tag	1	1
Total:	26	23

PRONGHORN

Regulations Proposals

Section 363 Pronghorn Tag Quota Adjustments

- Poor productivity and recent harsh winter conditions
- Declines in hunter harvest success and age-at-harvest in Likely Tables (Zone 3) and Big Valley (Zone 5) over last 5 years
- Recent winter surveys indicated lower populations in all zones, most pronounced in Zone 3 and 5
- Ranges needed to be adjusted, we re-noticed quota ranges on 04/05/2024 for 15 days in advance of FGC meeting
  - Period 1 Buck initial range of 15-25 amended to 0-25
  - Period 2 Buck initial range of 10-25 amended to 0-25
- Recommend reducing tags in Zones 2, 3, and 5



Section 363 Pronghorn Tag Quota Adjustments

Hunt Code	Hunt Zone	Description	2023 (approved)	2024 (proposed)	Net change
710	Zone 1 - Mount Dome	General - Buck	2	2	0

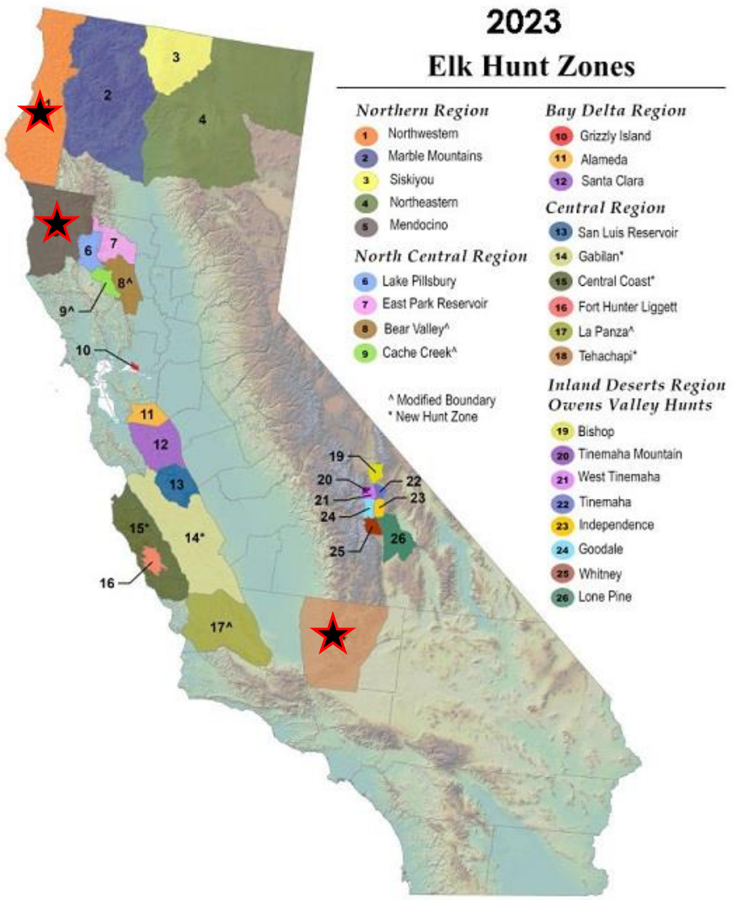
13	4	0	0	4	0	3	0	0	+3
FRT	0	0	1	0	0	1	0	0	0
Total	16	10	7	16	10	12	0	0	+5

Section 555 Cooperative Elk Area Landowner Tags

- Several elk hunt zones with chronic, elevated human-elk conflict where elk almost exclusively occupy private property include:
  - Northwestern
  - Mendocino
  - Tehachapi

- Original proposal included Siskiyou (Zone 3)
  - Department and Commission received letter in February from Siskiyou County Board of Supervisors, the letter recommended that Zone 3 not be designated as a conflict zone. Upon meeting with County, Department supports removing Siskiyou from proposed conflict zones.



★ Proposed "Conflict Zone"

RE: Feb. 15, 2024: Agenda item #21, Mammal hunting 364 (and 364.1)

FGC Commisisoners
CA Fish and Game Commission
(fgc@fgc.ca.gov)

Dear Commissioners,

This email is sent to your attention to object to the Department of Fish and Wildlife's (DFW) revised proposal for hunting tags in the Northwestern zone for the Roosevelt elk in the SHARE program. In the first draft, it appeared that the DFW's hunting quotas were somewhat based on research. However, the DFW's revised proposal to increase the SHARE hunting quotas for bulls, from 34 to 40 bulls; as well as, for anterless elk, from 34 to 60 anterless elk does not seem to be based on any "scientific data". Instead, it looks to me that the DFW guessed! As you may realize, this is unacceptable.

The DFW states that there is an "intolerable" level of Roosevelt elk and human conflict. I would like to remind the FGC that the DFW's definition of the SHARE properties are that they are private properties that are open to the public hunting. Please keep in mind, that the DFW makes tremendous profits from the SHARE hunts.

I object to any hunting quotas submitted by the DFW to the FGC without being supported by actual herd locations and the population of elk in each herd. I think that the DFW has a responsibility to the public by providing the actual Roosevelt elk population for the general hunt and SHARE hunt quotas. According to my research, of the herds of Roosevelt elk in Del Norte County (DNC) ; there is only one herd in DNC that has over 100 members.

In addition, the Roosevelt elk are literally in a life and death survival situation with the treponemes associated hoof disease (TAHD) which is spreading. In the hunting quotas that the DFW presents, the DFW does not present to the FGC the number of deaths (euthanasia) that the DFW is responsible for in Del Norte County. I believe that the lack of any mention of TAHD deaths is a lack of transparency by the DFW to the public. The public in Del Norte County are very concerned about the population and health of the Roosevelt elk.Your consideration will be appreciated.

Sincerely, Phoebe Lenhart [redacted]

Comments Re: California Department of Fish and Wildlife Submission of documents for the December 2023 Fish and Game Commission: Regulatory Action to Amend sections 362, 363, 364, 364.1, 554, 555, and 708.14, and add 555.1 Title 14, California Code of Regulations RE: Mammal hunting, November 28, 2023

The Siskiyou County Fish and Game Commission (SCFGC) would like to make the following recommendations to the California Department of Fish and Wildlife (Department) proposals as described above. All of our recommendations apply specifically to the Siskiyou Elk Management Unit (EMU).

Regarding the proposal to "Add Subsection 555.1, Describe and classify four "conflict zones"

555.1 – "Within Conflict Areas" the Department has identified opportunities to modify the rules and regulations within the current 555 program under 555.1 to help reduce elk conflict and provide increased hunting opportunities for qualifying landowners. "Chronic, elevated human-elk conflict, elk occupation of predominantly private property, and limited public hunting access has been documented by the Department in the Siskiyou, Northwestern, Mendocino, and Tehachapi Elk Hunt Zones." We do NOT support the Department's classification of the Siskiyou EMU as a "conflict zone" (or any of the subsections) and would object to it being designated as a conflict zone. We propose that the Siskiyou EMU continued to be managed under the current 555 program rules and regulations.

Regarding the proposal to Alter Public Hunting (364), Sections 364 and 364.1

Amendment to Siskiyou SHARE Roosevelt Elk Section 364.1 (i)(1) – The SCFGC is supportive of the SHARE program and would like to see it grow beyond the 2 existing private landowners currently enrolled in the SHARE program within the Siskiyou Elk Management Unit.

Section 364.1 (a) – The SCFGC is supportive of giving SHARE participants/the Department options to set the specific seasons on SHARE hunts within the August 15 through January 31 timelines in order to meet the Department's management objectives. We question if the proposed regulation should read (a) Season: the overall season *shall* open on August 15 and continue through January 31. Should that read the overall season *may* open to give the Department the opportunity to move the seasons earlier or later to meet the objectives of the area?

The SCFGC has concerns that some SHARE properties enrolled in the program could be of smaller acres. The current minimum acres necessary to participate in the 555 program is 640 acres. We support setting a minimum acreage of 640 acres to participate in the SHARE program unless there are special circumstances. Rather than reducing the size of individual SHARE (or 555 program) acreages required to participate in the program we recommend the ability to combine adjacent properties to increase the size of the property enrolled in the program. Establishing a minimum acreage necessary to enroll in the SHARE or 555 program would help to reduce safety concerns, hunter ethic issues, game retrieval issues, and regulation enforcement difficulties.

Available Data

On May 10, 2022 the Siskiyou County Fish and Game Commission hosted a meeting at which the California Department of Fish and Wildlife presented information on the current available data on elk within the Siskiyou EMU.

A number of management recommendations and changes to hunting tags to be issued were presented at that meeting, however, the Department stated the proposals were beyond the Department's ability to implement given the available data and the limited management actions that had been assessed in the 2010 Final Environmental Document, Elk Hunting.

The current Department proposals calls for up to a 100% increase to the number of bull tags issued and a roughly 400% increase in cow tags issued within the Siskiyou unit. We would like to meet with the Department to review the data that allows for an increase in tag numbers to this level. If additional elk tags can be issued, the SCFGC recommends that a new Environmental Document be prepared and that available tags be distributed more evenly to the General Public Hunts (364), the SHARE program, and the Cooperative Hunting Area program (555).

Thank you for the opportunity to provide comments.

Mike Ford
Siskiyou County Fish and Game Commission Chair

Public Comments - Elk Hunting

Submitted via email to FGC@fgc.ca.gov

Fish and Game Commission
P.O. Box 944209
Sacramento, CA 94244-2090

Dear Sir or Madam:

I am submitting these comments on behalf of Barbara Page, who owns Elk Meadow Cabins near Orick, California. Given the nature of her business, which relies heavily on elk tourism, Mrs. Page has a direct interest in the health and stability of the elk population in Humboldt County.

ISSUE: The Commission should reject the adoption of 14 CCR § 555.1 and decline to increase the number of Roosevelt elk SHARE tags under 14 CCR § 364.1.

ARGUMENT: For the reasons outline below, we oppose the addition of Section 555.1 and the changes proposed to Section 364.1, both of which would allow increased hunting of Roosevelt elk at a time when the stability of the population is already threatened.

As you know, Roosevelt elk—the largest species of elk in the world by body mass, and the largest free-ranging megafauna remaining in California—were once hunted nearly to extinction.[1] Although their numbers have increased in recent years, they are nowhere near historic levels.[2] In fact, the Department of Fish & Wildlife lacks a clear picture of how many elk are present in the region. The agency did not begin conducting systematic elk surveys in the North Coast Elk Management Unit until to 2016, and monitoring elk populations is notoriously difficult in Northern California.[3] While recent efforts to track Roosevelt elk in Humboldt and Del Norte counties are commendable, the scale of the capture and collar program remains small. Given these challenges in population monitoring—and the threats mentioned below—it is prudent to adopt a conservative approach to the management of elk in this area.

Roosevelt elk currently face a variety of threats, ranging from habitat loss to predation to disease. As you are aware, the population is presently suffering from an outbreak of treponeme-associated hoof disease (TAHD). Few studies have been completed on TAHD, which can eliminate large numbers of the herd very suddenly and yet remains poorly understood even amongst wildlife experts. Until more is known about this dangerous disease and how it may affect elk populations, the Commission should refrain from allowing increased hunting of Roosevelt elk. Conversely, a larger population buffer will ensure elk survival during a potential

[1] *See* National Park Service *Elk in the Redwoods* Fact Sheet, *available at* https://www.nps.gov/redw/planyourvisit/upload/Elk-site-bulletin-508.pdf (last visited April 1, 2024) (noting that the population in California dropped to as few as 15 in 1925).
[2] *See* 2018 California Department of Fish & Wildlife Elk Management Plan at 15 (explaining that 500,000 is a "reasonable estimate" of the tule elk population prior to European settlement).
[3] *See* Management Plan at 88 (noting that "aerial surveys were not effective for surveying elk in the densely canopied forests along the north coast").

widespread outbreak. Habitat loss—fueled by factors such as increased development, wildfires, and climate change—only exacerbates the impact on the elk population.

As noted above, we oppose the addition of Section 555.1 to Title 14. This new provision represents a drastic change in current policy and may threaten the stability of the elk population in Northern California. Section 555.1, which essentially carves out an exception to the standard requirements for Cooperative Elk Hunting "Landowner" tags, would make elk hunting much easier in what the agency describes as the four "conflict zones." These include the Siskiyou, Mendocino, Tehachapi, and Northwestern hunt zones (the latter, of course, encompasses Humboldt County, where Mrs. Page operates her lodge). It would do this by: (1) reducing qualifying landowner criteria in these areas; (2) increasing antlerless tag distribution relative to public tags; and (3) extending the hunt season each year. We believe these changes could have a significant and negative impact on the Roosevelt elk population in these areas.

We also oppose the Commission's proposed increase in hunting tags administered under the SHARE program under Title 14 Section 364.1. Significant increases in Roosevelt elk tags are proposed in the Siskiyou, Northwestern, and Mendocino hunt zones. In the area surrounding Mrs. Page's lodge, the proposed regulations would increase Roosevelt elk SHARE tags from a total of 68 to a total of 100; in the other two hunt zones, these numbers could increase by a factor of ten or more. For the reasons discussed above, we believe it is a mistake to allow increased hunting of Roosevelt elk at this time.

Instead of increased hunting, we urge the Commission to focus its efforts on alternatives that will allow the Department to balance the competing interests among stakeholders. For example, translocating elk may be used not only to alleviate conflict but also contribute to genetic diversity and herd viability. The Department has already demonstrated that this is a safe and effective method for helping to reestablish herds in other locations. We also encourage the use of elk exclusion fences to limit or prevent elk from accessing private property where damage may occur. Although there may be a high cost associated with installing and maintaining physical barriers, the Department itself has recognized that—if done properly—this can be an effective, long-term solution for providing relief from elk damage.[4] These are just a few alternatives we urge the Commission to consider in managing human-elk conflict while balancing the agency's competing objectives for managing this indispensable wildlife resource.

<u>RECOMMENDATION</u>: For the reasons outlined above, we urge the Commission to reject the adoption of Section 555.1 and decline to increase the number of Roosevelt elk SHARE tags under Section 364.1.

We appreciate your consideration of these very important issues.

Sincerely,

Marie Kyle

Notice of Petition: Southern California Steelhead (*Oncorhynchus mykiss*)

Commissioners,

California Trout ("CalTrout") is pleased to submit the following petition to list the Southern California steelhead (*Oncorhynchus mykiss*) as an Endangered Species under the California Endangered Species Act (CESA, FGC § 2050 et seq). This petition demonstrates warranted listing under CESA based on the factors specified in the statute.

CalTrout has been a statewide leader on trout, salmon, and steelhead conservation since its founding 50 years ago. It is CalTrout's belief that abundant wild fish indicate healthy waters and that healthy waters benefit all Californians. With more than sixty large-scale, "boots on-the-ground" conservation projects underway, in tandem with public policy efforts in Sacramento, CalTrout's six regional offices work tirelessly to advance our cause through a three-pillared approach to conservation.

Southern California steelhead ("Southern steelhead") is an iconic species on the South Coast of California. Southern steelhead are culturally important and serve as an indicator species to gauge the broader health of the entire watershed. The species is currently experiencing an alarming rate of habitat loss, compounded by climate crisis impacts. According to the California Department of Fish and Wildlife's Steelhead Restoration and Management Plan for California (1996), "southern steelhead are the most jeopardized of all of California's steelhead populations." This petition utilizes the best available science to fully establish that Southern California steelhead face the threat of certain extinction.

Twenty-five years ago, CalTrout was recognized in the forward of the state's Steelhead Restoration and Management Plan as being a leader in this cause. Today we again see a clear need for action by the Fish and Game Commission, and we request that the Fish and Game Commission list Southern California Steelhead as endangered.

We appreciate your consideration and look forward to working with the Commission on this critical listing. Please do not hesitate to reach out if you have any questions or would like to further discuss the petition.

Sincerely,

Curtis Knight
Executive Director
California Trout

CALIFORNIA TROUT
FISH · WATER · PEOPLE

California Fish and Game Commission
P.O. Box 944209
Sacramento, CA 94244-2090

June 7th, 2021

The California Department of Fish and Wildlife (CDFW) published their Steelhead Restoration and Management Plan for California twenty-five years ago (McEwan and Jackson, 1996). This plan laid out the blueprint for restoring this important and valued state resource by restoring degraded habitat and re-establishing access to historic habitat that is currently blocked. This plan reaffirmed the state's mandate framed in The Salmon, Steelhead Trout, and Anadromous Fisheries Act of 1988 (SB 2261) to significantly increase natural production of salmon and steelhead by the year 2000. As stated in the Plan, severe anadromous fish population declines, the potential for species listings under the Endangered Species Act (ESA), fulfillment of legislative mandates, and the state's Public Trust obligations called for immediate implementation of CDFW's Steelhead Management Plan.

Since its publication in 1996, agencies and concerned organizations have made consistent efforts to reverse the course of population decline for Southern California Steelhead (*Oncorhynchus mykiss*). It is now 2021, and Southern steelhead have seen little demonstrable improvement in population numbers and long-term persistence (National Marine Fisheries Services (NMFS) 5-Year Update, 2016) since the species' federal ESA listing in 1997. We respectfully submit this petition to list Southern California Steelhead as an endangered species under the California Endangered Species Act (CESA F&GC § 2050 et seq.).

Southern steelhead is an iconic species on the South Coast of California. Southern steelhead are culturally important and serve as an indicator species to gauge the broader health of the entire watershed. The species is experiencing an alarming rate of habitat loss, compounded by climate crisis impacts. Yet it is still not listed as endangered by the State of California.

The State of the Salmonids: Status of California's Emblematic Fishes (2017) used an exhaustive literature review and a standardized protocol (Moyle et al. 2015) to determine that Southern steelhead are of "Critical Concern," with the population in danger of extinction with the next 25–50 years due to anthropogenic and environmental conditions. Going further, it states, "Since their listing as an Endangered Species in 1997, Southern steelhead abundance remains precariously low." This statement only reinforces how dire the situation has become. CDFW, in their own management plan, stated that "Southern steelhead are the most jeopardized of all of California's steelhead populations."

Preventing the extinction of Southern steelhead will have long-term implications for all steelhead populations on the West Coast (Boughton et al. 2007b, 2006, NMFS 2016). Over millennia, steelhead have evolved an ability to use a variety of shifting habitats. Southern steelhead took advantage of this plasticity and honed it in the naturally dynamic environment of Southern California and Northern Mexico (NMFS 2016). The mechanisms underlying anadromy for Southern steelhead, which is an important component of their life history variation, are not completely understood. However, research and *in situ* studies point to both environmental and genetic components having significant influence on their life-history pathway.

Extirpation of Southern steelhead would initiate a process of irreversible, cumulative extinctions of other native *O. mykiss* populations through three main pathways. First, irreversible loss of heritable genetic loci responsible for anadromy will prevent their transmission to future progeny. Second, *O. mykiss* in Southern California tolerate higher water temperatures and more variable dissolved oxygen levels, and can therefore contribute these adaptive traits to steelhead in northern regions as they experience warming of coastal waters. Third, fish passage barriers that completely block access to freshwater spawning grounds prevents genetic mixing on a regional scale, and thus the few remaining Southern steelhead or the freshwater resident native rainbow trout that maintain anadromous genetic characteristics, are substantially reproductively isolated (Hoelzer et al. 2008). This isolation by habitat fragmentation represents an important uncoupling in the evolutionary legacy of the species and a direct threat to its continued existence.

Paraphrasing Fish and Game Code 2062, an endangered species under CESA is a native species or subspecies which is in serious danger of becoming extinct throughout all, or at least a significant portion of its range due to one or more causes—including loss of habitat, change in habitat, overexploitation, predation, competition, or disease. Southern steelhead are in danger of becoming extinct throughout their entire range primarily through modification, degradation, and simplification of required habitat for full life-history, and loss of access to historical habitat to maintain genetic diversity. Southern steelhead's continued existence is threatened by predation and competition from non-native aquatic species in their currently accessible habitat and in historical habitat once access is restored. The requirements to list Southern California steelhead as endangered under CESA F&GC § 2050 et seq. are met and exceed over its entire range and distribution.

This petition utilizes the best available science to fully establish that Southern steelhead face the immediate threat of certain extinction due to the loss, fragmentation, and simplification of their habitat and provides clear evidence that the State of California must exercise its mandate to protect native salmonids and steelhead by listing Southern steelhead as endangered.

California Trout, Inc was recognized in the foreword of the state's Steelhead management plan as being a leader in this cause. Today we again see a clear need for leadership and action by the Fish and Game Commission. We request that the Fish and Game Commission list Southern California Steelhead as endangered.

Scientific Information Required for Listing Petition:

Population trend (A)

The Southern steelhead population has decreased substantially from the estimated historic population size (Boughton et al. 2005, Boughton and Goslin 2006, Boughton et al. 2006). The Southern California Coast Steelhead distinct population segment (DPS) has been estimated to have annual runs of between 32,000 and 46,000 returning adults. Today, the annual run is estimated to be less than 500 total returning adults in any given year (Busby et al. 1996, Williams et al. 2011, Good et al. 2005, Helmbrecht and Boughton 2005, Boughton and Fish 2003). The four watersheds historically exhibiting the largest annual anadromous runs—Santa Ynez River, Ventura River, Santa Clara River, and Malibu Creek—have experienced declines in run size of greater than 90 percent (Boughton et al. 2005, Good et al. 2005, Helmbrecht and Boughton 2005, Busby et al. 1996). Simply put, Southern steelhead remain in danger of extinction (Williams et al. 2011, Moyle 2017).

A comprehensive status review of steelhead was conducted by Busby et al. (1996), who characterized Evolutionarily Significant Units (ESUs) using the conceptual framework of Waples (1991), and then assessed extinction risk of each ESU. The Southern California Coast Steelhead DPS, based on the ESU definition, was subsequently listed as endangered by NMFS under the U.S. Endangered Species Act in 1997. The original listing characterized the southern range limit as the eastern end of the Santa Monica Mountains. In 2002, the ESA listing area was extended further south to the Tijuana River system at the U.S. border with Mexico. The listing was further modified in 2006 to include only the anadromous component of the ESU, which is composed of both anadromous and freshwater-resident forms of O. mykiss which can co-exist within watersheds. Good et al. (2005) updated the status of Pacific coast steelhead populations and another update was conducted in 2010 (Williams et al. 2011). None of these updates or reviews led to changes in the status of the species' listing. It has remained endangered under ESA.

Following the significant rise in Southern California's human population after World War II and the associated land and water development within coastal drainages, the Southern steelhead's population rapidly declined. This led eventually to the extirpation of populations in many watersheds, leaving only remnant or sporadic populations (Boughton et al. 2005, Good et al. 2005, Helmbrecht and Boughton 2005, Busby et al. 1996). A central tenet of the NMFS Recovery Plan (2012) is that a viable DPS will consist of a sufficient number of viable discrete populations that may be spatially dispersed but nevertheless adequately connected to achieve the long-term persistence and evolutionary potential of the species. The goal of status-review updates is to assess whether viability metrics for the DPS are moving toward or away from the viability criteria. The consensus of publications is that the status of the Southern California Coast steelhead DPS has not changed appreciably since the federal listing in 1997 (NMFS 1996, Busby et al. 1996, NMFS 2016). The most recent publication which compiled adult steelhead abundance through existing monitoring programs of various types and anecdotal observations within this DPS documented only 177 adult steelhead observations in the past 25 years (Dagit et al. 2020).

Range (B) and Detailed Distribution Map (L)

NMFS identifies the Southern California steelhead DPS as being comprised of the coastal watersheds extending from the Santa Maria River system south to the U.S. border with Mexico (Titus et al. 2010, NMFS 2012). Historically, *O. mykiss* occurred at least as far south as Rio del Presidio in Mexico (Behnke 1992, Burgner et al. 1992).

The range of watersheds within the DPS are generally classified in two basic types depending on their geomorphology; short coastal streams that are part of the coastal ranges, and larger river systems that extend inland through the coastal ranges. The smaller coastal systems are typified by the character of the Santa Monica and Santa Ana Mountain watersheds. The larger watershed class includes the Santa Maria, Santa Ynez, Ventura, Santa Clara, San Gabriel, Santa Ana, Santa Margarita, San Luis Rey, and San Diego

Rivers. These systems were further classified by predominate environmental and climate processes into five biogeographic population groups (BPGs). The entire range covers approximately 12,700 mi^2 with 25,700 mi. of streams (NMFS 2012). The established range of Southern steelhead contains several large human population centers with almost 22 million people. This figure, and level of landscape development and resource use implicit in it, is central to the current degraded condition of Southern steelhead

The range of the Southern steelhead is generally accepted as stated above, but not all stream miles within this range are equally habitable. NMFS used an Intrinsic Potential model to characterize and prioritize habitat suitability for species recovery. These models used an established set of factors to predict the potential for unimpaired over-summering habitat to be present at any given location in the DPS (Boughton 2006, NMFS 2012).

In general, Intrinsic Potential modeling is based on the idea that natural processes will tend to generate suitable habitat in reaches where discharge, gradient and topography meet certain criteria (Burnett et al. 2003). The parameters to model potential over-summering habitat for Southern steelhead included mean annual air temperature, mean discharge of streams during August and September, mean August air temperature and limiting access gradient in addition to stream gradient, discharge, and topography (Boughton et al 2006).

This work developed the ranked prioritization of watersheds within the DPS based on their environmental capacity to support a Southern steelhead population. This led to the designation of Category 1, identified to have the highest priority for recovery, followed by Category 2 then Category 3 populations within each of the five BPGs. This works assists in prioritizing restoration activities for target watersheds. However, the NMFS Recovery Plan describes the scientific basis for population-level and DPS-level recovery criteria whereby multiple populations within each BPG must have self-sustaining populations (NMFS 2012, NMFS 2016)

The delineation of the physical boundaries of Southern steelhead's range has been supported by genetic analysis and the observed variances among different *O. mykiss* populations. Early allozyme analysis of mitochondrial DNA performed before the ESA listing demonstrated a high degree of interpopulation differentiation within California (Nielsen 1994). Comparison of DNA samples among watersheds within the DPS to populations north of the DPS showed large differences in genetic markers. Samples collected from river system between the Santa Ynez River and Malibu Creek indicate the presence of mitochondrial DNA that is rare in steelhead populations north of the Southern steelhead DPS. (Busby et al. 1996). More recent genetic analyses of *O. mykiss* populations at the southern end of their range, using high-resolution genotyping of microsatellite loci and single nucleotide polymorphism (SNP) loci, indicate that the southern boundary of Southern steelhead range extends to northern Baja California, south of the U.S. border with Mexico (Abadia-Cardoso et al, 2015; Abadia-Cardoso et al, 2016).

Distribution (C)

The spatial structure of Southern steelhead is influenced by fish passage barriers. The majority of watersheds historically occupied by Southern steelhead experienced extirpation due to anthropogenic barriers (Boughton et al 2005). The current distribution of Southern steelhead is defined as all anadromous waters below total natural barriers or man-made structural barriers (NMFS 1997). Anadromous adult Southern steelhead have been extirpated from approximately 60% of their historical range due to habitat fragmentation (NMFS 2012).

Southern steelhead have a complex life history that is central to their historical and current distribution. As covered in more detail in the Life History and Required Habitat sections, Southern steelhead predominantly express two forms: full anadromy and resident-freshwater. The anadromous and the resident-freshwater form co-exist throughout the DPS (Boughton et al 2006, Pearse et al. 2014).

The interplay of their life-history, their required habitat types, and distribution --both historical and current -- is complex (Boughton 2006). The freshwater resident form, or rainbow trout, are an integral part of the steelhead population, because anadromous adults can be the offspring of freshwater resident parents (Courter et al. 2013, Kendall et al. 2015, Abadia-Cardoso et al. 2016). It is likely that a combination of environmental and genetic factors determines anadromous or resident phenotype, which may be regulated by epigenetic factors (Baerwald et al, 2016). Genetic sampling above and below impassable dams within the established DPS for Southern steelhead indicates that they tend to be each other's closest relative (Clemento et al 2009.)

A number of barrier removal and habitat restoration projects have been implemented over two decades to address threats throughout the DPS (NMFS 2016). However, a number of large, complex fish passage barriers remain in place or not fully functional, even though significant investment over the years has supported advanced engineering design. The state ESA listing is anticipated to help move these projects forward into construction to realize their potential in species recovery. Environmental impacts from high intensity wildfires, floods, and extended drought have further reduced the number of small, isolated, remnant freshwater resident populations found in the upper tributaries (NMFS 2012). The Thomas Fire (2017) impacted many drainages throughout Santa Barbara and Ventura Counties; the Whittier Fire (2017) impacted the Santa Ynez watershed in Santa Barbara County, the Woolsey Fire (2018) impacted all creeks in the Santa Monica Mountains except Topanga Creek. The Holy Fire (2018) burned through Coldwater Canyon Creek in Riverside County which contains one of two known native rainbow trout populations descended from steelhead at the most southern extent of their range in California. Subsequent fire related floods and debris flows following these catastrophic events can cause local extirpation if emergency translocations are not performed in time.

Abundance (D)

Steelhead abundance numbers are naturally subject to high variability. Due to the character of the river systems in the DPS, monitoring of run sizes is difficult to quantify. Estimates of the historical (pre-1960s) abundance are available for several rivers in the DPS. The Santa Ynez River before 1950 is estimated to have had an annual run of 20,000-30,000 adult Southern steelhead. The Ventura River, pre-1960, had estimated annual runs of 4,000-6,000 returning adults. The Santa Clara River, pre-1960, was 7,000-9,000 returning adults and Malibu Creek, pre-1960, 1,000 adult returns. (NMFS 2012).

A review of the data from life-cycle monitoring stations at Vern Freeman Diversion Fish Ladder, Robles Diversion Fish Passage Facility, from migrant trapping by Cachuma Operation and Maintenance Board and the CDFW's Coastal Monitoring Program (CMP) support the finding that little to no change has been observed in total abundance or spatial structure of Southern steelhead since the initial federal listing (Williams et al 2011, NMFS 2012, NMFS 2016). The most productive systems support single digit runs of returning adults on any given year (Busby 1996, Williams et al. 2011, Dagit et al. 2020). Contemporary literature reviews of monitoring data support the conclusion that the total population estimate is dangerously low. This is further illustrated by the recent compilation of all monitoring program data and independent observations within the federal ESA listing area between 1998-2018. This work documented only 177 positive identifications of returning adult Southern steelhead in the past 25 years (Dagit et al. 2020).

Fish that express the resident freshwater life-history strategy play a central role to the continued existence of Southern steelhead. If the current course of modification and loss of available habitat for anadromous Southern steelhead is not corrected, there will be a greater need for resident freshwater rainbow trout to produce the vast majority of smolts that express anadromy and enter the Pacific Ocean. Smolt production is the product of both resident freshwater and anadromous life-history strategies (NMFS 2012). Due to shrinking suitable habitat below natural or man-made barriers to migration; rainbow trout will be a key component to ensure we maintain and re-establish the expression of anadromy and that any smolts produced by freshwater residents have access to required habitat over the entire course of their journey to the ocean and upon their return.

Recent studies have shown the resident freshwater populations still possess the alleles associated with anadromy (Pearse et al. 2009; Abadia-Cardosa et al. 2016). These results indicate that adoption of the freshwater resident life-history pattern does not necessarily result in the loss of the genetic potential for anadromy. The genetic potential of resident *O. mykiss* to express anadromy remains (Nielsen 1999; Courter et al. 2013; Phillis et al. 2016; Apgar et al. 2017) and, given the opportunity through restoration activity, could support re-establishing viable anadromous populations.

It is important to note that these freshwater resident populations are at risk from watershed-scale adverse anthropogenic impacts, quickening climate stress and other population level threats to their continued success. Catastrophic wildland fire, long term drought and continued human alteration of headwater habitat all put additional pressure on resident freshwater rainbow trout populations (NMFS 2012). Excessive loss of local freshwater resident populations can lead to lower genetic variability and fitness (Pearse et al. 2014; Abadia-Cardoso et al. 2016; Leitwein et al. 2017). Indeed, genetic analysis of rainbow trout at the southernmost extent of their range in the United States indicate that these populations have low allelic diversity (Clemento et al. 2009; Pearse et al. 2009; Jacobson et al. 2014; Abadia-Cardosa et al. 2016; Apgar et al. 2017), potentially leading to decreased retention of the genetic markers that support anadromy and overall fitness

The movement of adult steelhead between watersheds is an important factor as well. Anadromous adults are known to stray from their natal systems and could be important for re-establishing viable populations in formerly occupied watersheds (Bell et al. 2011). This could serve as a pathway to re-introduce genetic material across separate sub-populations (Garza et al. 2014). The inter-play of resident freshwater and anadromous life-histories is a critical component of Southern steelhead's current and future abundance and must be considered for recovery of the species.

Life history (E)

Steelhead are a highly migratory and adaptive species utilizing multiple habitat types over their complete life-history. The life cycle of Southern steelhead generally includes a freshwater period in coastal river systems followed by a migration to a marine environment to reach sexual maturity. Southern steelhead can express a great amount of variation in the timing and duration of each life-history stage in comparison to other species within the genus (Hayes et al. 2011, Quinn 2005, Hendry et al. 2004) This flexibility and malleability of life-history trajectories unique to Southern steelhead (Sloat and Reeves 2014, Kendall et al. 2015) is the evolutionary manifestation of the variability in environmental conditions that is characteristic of Southern California. This is particularly evident in the high number of sand-berm built estuaries in the DPS that must breach due to sufficient streamflow following winter rains to allow steelhead migratory access to a particular watershed.

Southern steelhead will spend one to four years maturing in the Pacific Ocean (Jacobs et al. 2011, Borg 2010, Haro et al. 2009, Leder et al. 2006, Quinn 2005, Davies 1991, Groot and Margolis 1995, Northcote 1958). Anadromous adults grow substantially larger than freshwater residents, leading to higher fecundity of returning anadromous females (NOAA 2012). After reaching maturity, Southern steelhead typically return to their natal river system to spawn, although strays do occur and may be an important vector to maintain genetic variability and connection across basins (Garza et al. 2014) Spawners typically return between January and May, but year-to-year variation in environmental conditions across diverse geographic settings have allowed Southern steelhead variability in spawning period. Variability in access to any river system is compounded by the sporadic nature of hydrologic connectivity common to river systems in Southern California.

Following sand-berm breaching, whereby a lagoon becomes an estuary that connects a freshwater stream to the ocean, steelhead will move into coastal river systems. Upon entering the river system, Southern steelhead can migrate several to hundreds of miles to reach suitable spawning habitat. Upon finding suitable gravel, females excavate a redd and deposit their eggs. Males then fertilize the eggs, after which the eggs are covered with gravel by the female. The embryos' incubation time may vary from three weeks to two months depending on environmental conditions. Newly hatched *O. mykiss* or alevins will then remain in the gravel for an additional two to six weeks. Unlike salmon, adult steelhead do not typically die following their spawning trip, and have been observed to return to the ocean and then come back to freshwater to spawn again. The frequency and nature of repeat spawning by Southern steelhead as a species, is poorly understood, but this iteroparous life-history strategy can occur (Moyle et al 2008, Moyle 2002).

Juvenile Southern steelhead or parr will rear and forage in a variety of freshwater habitat types depending on their maturation rate before beginning their migration to the ocean. Southern steelhead parr will spend between one to three years in freshwater before migrating to the ocean (Shapovalov and Taft 1954, Moore 1980, Quinn 2005). The timing of out-migration is influenced by a variety of environmental cues including streamflow, temperature, and breaching of the sand berm at the river's mouth. Out-migration to the ocean usually occurs in the late winter and spring . Smolts will spend a short time in the estuary. Here the mixing of fresh and saltwater habitats allows for the morphological changes that smolts need to undergo to prepare themselves for the ocean environment. In some watersheds, smolts may rear in a lagoon or estuary for several weeks or months prior to entering the ocean.

In contrast to Central California lagoons where juveniles grow substantially faster and larger than their riverine reared counterparts (Smith 1990, Bond et al. 2008, Hayes et al. 2008, Atkinson 2010), Southern steelhead are less frequently observed in estuaries. This may be attributed to low population numbers, adaptation for rapid outmigration, and/or poor lagoon habitat. Studies from more northern estuaries support the idea that larger juveniles have a higher survival advantage after outmigration into coastal marine waters and, as a result, have a greater opportunity to return to their natal streams as adults for spawning (Bond et al. 2008, Hayes et al. 2008, and Atkinson 2010). Therefore, if conditions permit, increased juvenile steelhead estuarine rearing prior to emigration could be a critical contributor to enhance the viability of steelhead populations.

The cycle described above is referred to as their fluvial-anadromous life-history strategy. Southern steelhead can also express two additional life-history trajectories: a freshwater-resident pathway and a lagoon-anadromous pathway. The freshwater-resident pathway describes *O. mykiss* that complete their entire life cycle in freshwater. Fish that follow this life-history trajectory are commonly known as rainbow trout. Rainbow trout will incubate, hatch, rear, mature, reproduce, and die in freshwater. A lagoon-anadromous pathway describes a hybrid option. Southern steelhead smolts out-migrate, but can remain in the lagoon or estuary for a year before returning upstream to freshwater habitat to spawn.

These descriptions only cover the predominant life-history pathways for *O. mykiss*. It does not, however, capture the full complexity of the life-history permutations that can be exhibited by *O. mykiss*. Plasticity of life-history should be considered the central characteristic for Southern steelhead in understanding their life cycle (Kendall et al. 2015). An interplay between environmental conditions and adaptive behavior likely causes shifts between resident and migratory life-history behavior expressed by a Southern steelhead (Kendall et al. 2015, Pearse et al. 2014, Pearse 2016, Satterthwaite 2012; Beakes 2010). The seasonality of the hydrologic cycle impacts the predominant life-history trajectory expressed in particular watersheds. Southern steelhead's long-term viability is dependent on this life-history plasticity, and on their ability to migrate to new habitat.

Kind of habitat necessary for survival (F)

Habitat characteristics at any one location may change significantly from year to year in the Southern California Mediterranean climate. A Mediterranean climate is distinguished by warm, wet winters under prevailing westerly winds and calm, hot, dry summers, as is characteristic of the Mediterranean region and parts of California, Chile, South Africa, and southwestern Australia. As water warms and preferred habitat alters seasonally, hydrological connectivity between habitat types becomes important, and influences the ability of *O. mykiss* to move throughout the river system to seek refuge areas if needed. Their multiple life-history trajectories rely on a network of habitat types to build in the critical redundancy. This allows any individual to complete their life cycle by exploiting the best available habitat for that stage of development at any given time. A simple example is that juvenile Southern steelhead can find the necessary thermal refugia to over-summer in a tributary that flows year-round or in the river's estuary. The interplay of habitat type, habitat condition, and the connectivity between habitats over time is paramount in their development and survival.

Southern steelhead require cool, clean water, and complex, connected habitat. Each habitat type must provide sufficient nutrients and foraging opportunities to allow for the growth and development required for their current life-history stage (NMFS 2012). Ocean-going adult steelhead require sufficient water quality, depth, cover, and marine vegetation. Estuary and lagoon habitats must provide uncontaminated water and substrates with connected wetlands for juveniles. Effective mobility for juvenile and adult Southern steelhead requires mainstem river migration corridors that are free of obstruction. They must also minimize excessive risk of predation and provide enough water quantity to allow for cover, shelter, and holding areas.

The geological character of their geographic range is young, highly erodible sedimentary rock. Excessive sedimentation and turbidity are critical water quality components in all habitat types and impacts how Southern steelhead utilize each habitat type. Freshwater spawning sites must provide sufficient water quantity as well as good water quality. Southern steelhead gravel sizes must fall within a range that supports spawning and incubation. Freshwater rearing habitat must provide sufficient water quantity and quality with lateral connectivity to the floodplain. These characteristics are essential for rearing and foraging as it provides refugia and habitat complexity.

Within each of these habitat types, Southern steelhead realize changes in their availability depending on the habitat conditions or quality. The preferred biotic conditions of any habitat type are subject to the immense variability common in Southern California. Documented habitat tolerances and ranges are important, but Southern steelhead's ability to move into microenvironments in response to changing conditions is a critical component of their required habitat types and conditions (Moyle et al. 2017). Their required habitat conditions align with habitat types suited to their life-history development stage.

The primary habitat conditions that influence Southern steelhead development are temperature, dissolved oxygen, water depth, and velocity. Of these, water temperature is the best studied and can change significantly diurnally and seasonally. Southern steelhead tolerate warmer water temperatures than more northern salmonids, as they have adapted to a wider range of environmental conditions characteristic of a highly variable climate. The upper temperature threshold of 25°C has been observed to coincide with cessation of feeding and retreat to thermal refugia in Southern steelhead (Boughton et al. 2015, Sloat and Osterback 2013, Spina 2007).

Juvenile Southern steelhead regularly persist in conditions outside of the ideal range. Juvenile steelhead prefer water temperature in the range of 10–17 ° C, but have been observed in the Ventura River with water temperature that peaked at 28°C (Carpanzano 1996). The relatively warm water of the Ventura River has been observed to result in more rapid growth of juvenile steelhead than has been observed in more northerly populations (Moore 1980, McEwan and Jackson 1996).

While temperature is a principle biotic condition impacting overall survival of Southern steelhead, dissolved oxygen, water depth, and water velocity during their freshwater development stages are important factors as well. Dissolved oxygen levels, as influenced by water temperature, above 5mg/L is considered adequate for survival. In contrast, 3 mg/L is considered to be the lethal lower limit for unimpaired growth (EPA 1986) , but is dependent on duration, magnitude, frequency, and accessibility of refugia (McLaughlin et al. 2009, Matsubu et al. 2017, Huber and Carlson 2020).

For returning adult Southern steelhead, 7 inches is considered the minimal water depth needed for successful migration. Water velocities over 10 ft/sec are considered sub-optimal for migration upstream (Bovee 1978, Thompson 1972, Barnhartt 1986). Water velocities that hinder the swimming of adult returners have a greater impact on effective migration than depth (Barnhartt 1986). Southern steelhead fry prefers water depths that are from 2–14 inches with juveniles occupying similar depths with observed preference for 10–20 inches (Bovee 1978).

Factors affecting the ability to survive and reproduce (G)

Destruction, modification, and fragmentation of native habitat are recognized as the primary causes for the decline of the Southern steelhead (NMFS 2012). This has occurred due to the development of water infrastructure, agriculture, urbanization, and climate change-induced events including catastrophic wildland fire and drought. Water storage, withdrawal, diversions, flood control, and hydropower have greatly reduced, disconnected, simplified, or eliminated Southern steelhead habitat. These actions have modified natural flow and sediment regimes, which in turn have resulted in degraded water quality, changes in aquatic species communities, depletion of necessary flows for life-history development, and disrupted habitat maintenance processes (NMFS 2012). The Conservation Action Planning (CAP) Workbooks (Hunt, 2008) prepared for NMFS informed the federal recovery plan and hold true today. The CAP Workbooks resulted from reviewing existing information on steelhead habitat conditions and assessing the magnitude and extent of threats to steelhead and their habitats. These workbooks were used to develop recovery planning actions across the DPS.

Large dams in the Ventura River, Santa Clara River, Santa Ynez River, Malibu Creek, and other impassable barriers created by water diversions, flood control channels and certain bridges have had the most profound effect on blocking Southern steelhead migration between the ocean and upstream freshwater spawning, rearing, and foraging areas. These barriers disconnect the longitudinal and lateral ecosystem processes of the headwaters from lower sections and restrict floodplain access. This not only blocks migration to upstream spawning, rearing and foraging habitat but also restricts and impedes the effective out-migration of smolts (Stoecker and Kelley 2005). In some cases, migration through and access to critical habitat is blocked as is the case for 100-ft tall Rindge Dam in the lower three miles of Malibu Creek in the Santa Monica Mountains BPG (U.S. Army Corps of Engineers, 2020). Land development, whether for agriculture or urban development, leads to reduction in habitat complexity, alteration of flow and sediment transport, and degrades water quality (Moyle et al. 2017). Both agriculture and urbanization increase water demand. Even though almost 80% of water in Southern California is imported, over-reliance on surface diversion and groundwater pumping has resulted in depletion of instream flows and groundwater aquifers.

The rate of change in climate conditions brought on by climate crisis is a significant challenge to the continued existence of Southern steelhead. Climate change models for Southern California that evaluate conservative atmospheric forcing projections predict warmer atmospheric temperatures, sea level rise, ocean acidification, increased surface water temperatures, and changes in frequency, severity, duration, and intensity of drought and precipitation (Wade et al. 2013). Climate crises will exacerbate the problems associated with anthropogenic degradation of riverine, estuarine, and marine habitats already present (Williams et al. 2015). Floods and persistent drought conditions have periodically reduced already limited spawning, rearing, foraging habitats, and migration corridors.

Impacts to Southern steelhead from climate crisis impacts include direct effects from temperature such as mortality from heat stress, changes in growth and development rates, expanded parasite range and disease susceptibility. Changes in the flow regime also affect survival and behavior. Southern steelhead mortality and growth rates are also expected to suffer from the indirect effects that result from changes in the freshwater habitat structure and the invertebrate and vertebrate community, which govern food supply and predation risk (Crozier et al. 2008, Petersen and Kitchell 2001). Expected behavioral responses include shifts in seasonal timing of important life-history events, such as adult migration, spawning, fry emergence, and juvenile migration (Hayes et al. 2011, Boughton et al. 2009).

Direct threats to survival and reproduction include the presence of non-native vegetation and aquatic species that outcompete Southern steelhead for limited resources. Poor water quality and inconsistent water flow are hallmarks of unsuitable habitat for Southern steelhead, which can be exacerbated by competition or predation from non-native species.

As the impacts of climate change become more pervasive, catastrophic events such as fire and extended drought will lead to sudden extirpation of already fragmented populations. These reproductively isolated populations become more inbred through time, and as their genetic diversity decreases, their resilience to environmental threats may also decrease. All of these interactingand negative feedback loops have earned Southern steelhead a rating of “critically vulnerable” to the impacts of climate change, with a forecast of being likely to go extinct by 2100 without strong conservation measures (Moyle et al 2013).

Degree and immediacy of threat (H)

Southern steelhead are facing the highest degree of concern and an immediacy of threat to the continued persistence of this species over the next 50 years. Anadromous *O. mykiss* in southern California face significant threats from water and land management practices that have degraded or curtailed freshwater and estuarine habitats. This has severely reduced the capability of the species to sustain viable populations within most watersheds (Moyle et al. 2011, 2008). Given the current status of the species and the degraded condition of many freshwater and estuarine ecosystems, the continued existence of the species may be further threatened by shifts in climatic and oceanographic conditions (NMFS 2012).

Recent assessments of Southern steelhead forecast that they are in danger of extinction within the next 25–50 years due to the degradation of habitat associated with human development and the widespread impacts of climate crisis (Moyle et al 2017). This assessment is the result of a standardized protocol scoring for seven metrics: area occupied (anadromous and resident freshwater), estimated adult abundance, dependence on human intervention for persistence, environmental tolerance under natural conditions, genetic risks, vulnerability to climate change and anthropogenic threats. Scoring of the metrics was based on literature reviews, expert knowledge, and interviews with species experts (Moyle et al 2017).

Impact of existing management efforts (I)

Federal

The principal management strategy for Southern steelhead lies at the federal level for regulatory and recovery planning within the DPS boundaries. The listing of the Southern steelhead in 1997 under the Endangered Species Act (62 FR 43937) covered steelhead in anadromous water below natural and man-made fish passage barriers within the Southern California Coastal Steelhead DPS, which followed the geographic boundaries of the Southern steelhead ESU. The original listing was bounded by the Santa Maria River at the northern end, to Malibu Creek in the Santa Monica Mountains at the southern end. After documentation of steelhead in San Mateo Creek in San Diego County by CDFW biologists in 1999-2001, and genetic analysis by NOAA showing native steelhead ancestry, the ESA listing was extended south to the U.S.-Mexico border in 2002 (67 FR 21586). As such, the federal ESA listing established requirements for steelhead consultation under NMFS jurisdiction for this amended area, and the Southern California Steelhead Recovery Plan was produced by NMFS pursuant to that listing.

Four U.S. National Forests within the DPS (Angeles, Cleveland, Los Padres, San Bernardino) all have land management practices in place that require protection and conservation decisions to account for listed species. The federal government's oversight of the Clean Water Act (CWA) Section 404/401 Program requires that any project undergo consultation with NMFS when in the listing area for Southern steelhead. Additionally, the federal governments oversight and certification of the Flood Insurance Program through the Federal Emergency Management Agency (FEMA) strongly influences development of floodplains.

Even with these tools at the federal government's disposal, their impact on the long-term survivability of Southern steelhead has been challenging. No discernable change in total population size has been detected since the species was listed by the federal government in 1997. NMFS oversight and management of the species to date has been a key component directing the work of recovering the species. This has been supplemented by project funding from multiple federal agencies to implement NMFS Recovery Plan across the DPS. As stated above, many steelhead migration barriers have been remediated since the federal ESA listing. However, a number of large fish passage barriers remain in place or not fully functional. Significant investment over the years has supported advanced engineering design for remediation of these barriers, but implementation has been problematic.

The lack of legal basis to enforce recalcitrant landowners, entities, and agencies that are responsible for providing protections under ESA has presented problems. The rapid translation of scientific advances in understanding watershed and population dynamics, the ambiguity in the criteria established by NMFS during their oversight of passage barrier remediation has hindered implemented needed restoration actions. Without the species listed under CA Endangered Species Act, NMFS is, in most cases, the only government agency with direct oversight over the condition of the species and its required habitat. This has resulted in protracted legal battles and little option for enforcement.

The impact from the loss of habitat, exploitation of natural resources and the threat from aquatic invasive species has remained unchanged in successive status reviews by NMFS (Williams et al 2011, NMFS 2016). Major milestones of the federal recovery plan remain unachieved. Obsolete dams in the Ventura River and Malibu Creek system still stand. The Vern Freeman Diversion, long recognized as an ineffective partial passage barrier on the main stem of the Santa Clara River, a Core 1 population, has not been remediated over two decades and two lawsuits. Flow releases from Bradbury Dam to support Southern steelhead development in the Santa Ynez, a Bureau of Reclamation project, were secured after a lengthy regulatory process, but Bradbury Dam provides no opportunity for passage to two-thirds of Southern steelhead native headwater habitat in this system. Additional legal protection is imperative to move forward these projects essential to the species' survival.

Another impact of the federal listing is the ability to conduct scientific analysis on the species itself. It is not for lack of interest or want that the most fundamental research to establish the genetic uniqueness of the species pre-dates the federal listing. Federal guidelines and policies on the handling of the species for research purposes are a deterrent to continued research even though there has been significant innovation and advancement in DNA and gene sequencing technology.

State of California

The State of California has several published plans that provide for the management and conservation of Southern steelhead. The Steelhead Restoration and Management Plan for California (1996) written by California Department of Fish and Wildlife is foremost among these. This management plan identified the "impending extinction" of Southern steelhead within twenty-five years. Southern steelhead were given the highest priority for department management conservation action. The State of California's application of the Public Trust Doctrine is a second tool that provides the state a broad-based legal precedent to address threats to Southern steelhead survival. Fish and Game Code Sections 1600–1603 and 5935–5937 are additional mechanisms for State oversight in the management of Southern steelhead. The California State Water Resources Control Board (SWRCB) administers the water rights permitting system. They control utilization of waters for beneficial uses throughout the state (Grantham and Moyle 2014).

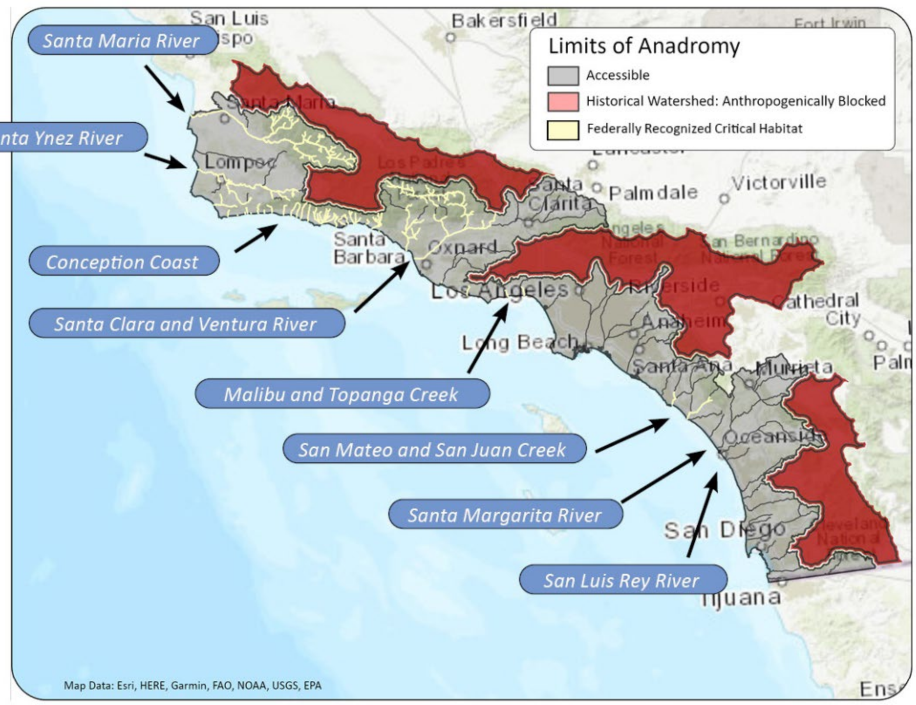
However, the system does not provide an adequate regulatory mechanism to implement the requirements of CDFG Code Sections 5935–5937 for the owner of any dam to protect fish populations below impoundments. Additionally, SWRCB generally lacks the effective oversight and regulatory authority over groundwater development comparable to surface water developments for out-of-stream beneficial uses.

Section 1600 Lake or Streambed Alteration Agreements program is the principal mechanism through which the CDFW provides protection of riparian and aquatic habitats. However, increased protection through this mechanism is needed to protect riparian and aquatic habitats important to migrating, spawning, and rearing steelhead.

Finally, monitoring of stocks (particularly annual run-sizes) is essential to assess the current and future status of individual populations and the DPS, as well as to develop basic ecological information on the Southern steelhead populations of the Recovery Planning Area. However, the Coastal Monitoring Plan remains unfinished for the Southern California region, and long-term funding for its implementation has not been identified and secured.

Suggestions for future management (J)

CalTrout recommends that the Fish and Game Commission list the species as endangered under CESA accepting the current limits of anadromy as established by the ESA listing for this species (NMFS 2002, 2012). The federal ESA listing covers *O. mykiss* downstream of total manmade or natural barriers in anadromous waters, and these fish are under jurisdiction of NMFS. O. mykiss upstream of total barriers are not covered under the federal ESA listing, and are under jurisdiction of the U.S. Fish & Wildlife Service.



We need to recognize Southern steelhead as endangered at the state level to augment the protection provided by the federal listing.

This recommendation is put forth because no demonstrable increase in Southern steelhead abundance has occurred since the initial ESA listing and the threat of extinction is immediate (NMFS 2011, NMFS 2016, Moyle et al. 2017).

CalTrout wants to ensure that all state agencies have the clear mandate to prioritize for Southern steelhead protection and conservation in strategic planning, funding appropriations, and resource management plans. The listing of Southern Steelhead as endangered will provide full acknowledgement to Californians of the fundamental importance this species has to the state and the ecosystem.

Listing of the species as endangered will allow the state and its citizens to realize the value of funds invested to date in Southern steelhead recovery. Many of these Southern steelhead conservation projects are large scale efforts with multiple stakeholders, and have required significant funds for planning, design, and implementation. As more projects are planned and move into construction, the state listing will be important for successful implementation and effectiveness monitoring of these projects.

Specifically, when the commission lists the Southern steelhead as endangered, CDFW will have direct authority to oversee projects proposed within the current limits of anadromy. This will provide CDFW the ability to establish species-specific mitigation measures that must be met for take coverage to be authorized.

CalTrout supports following the federal ESA listing coverage for below barrier steelhead, while keeping the above-barrier resident rainbow trout outside the ESA listing coverage. Above-barrier native rainbow trout are precious genetic resources for Southern steelhead recovery, but also are part of a robust sport fishery in the mountains of Southern California. Excluding these rainbow trout from CESA coverage also allows for emergency translocation after wildland fire without regulatory delays, and allows for conservation brood stock development and research to be performed to increase the genetic and geographic diversity of native rainbow trout of steelhead ancestry.

Our recommendation of adopting the federal ESA listing structure is intended to conserve key ecologic and evolutionary processes to preserve species diversity, while incorporating ESU-defining features of reproductive isolation and adaptation (Waples 1991). The anadromous component of the ESU covers a precariously small steelhead population expressing the anadromy trait in a discontinuous spatial context trending towards extinction. It therefore meets the four Viable Salmonid Population criteria (abundance, trends, spatial structure, diversity) used to guide ESA risk assessments (McElhany et al 2000), as well meeting the discrete and significant criteria for listing under CESA. The resident component of the ESU covers a large number of native rainbow trout that are geographically dispersed, but are genetically demonstrable remnant populations of Southern steelhead (Abadia-Cardoso et al 2016). These trout have been reproductively isolated behind barriers for decades, and have undergone localized adaptation.

Following the existing paradigm of quantitative genetics, most phenotypes are controlled by many genes of small effect (Waples, 2018). The interplay of neutral and adaptive loci enabling rainbow trout to survive in diverse above-barrier habitats, as well as the extent to which anadromy-associated genes are subject to selective pressure in resident trout, is not clearly understood. This is particularly evident in the case of chromosomal inversions (e.g., *Omy5* locus)(Pearse et al 2014) and transcriptional regulators (e.g., Greb1L)(Hess et al 2016, Prince et al 2017, Mohammed et al 2013). These have been shown to be important in triggering anadromy and/or run timing, in which a small number of genes produce a large impact on phenotypes. In this regulatory hierarchy, one or more master regulator proteins and/or epigenetic conditions can regulate hundreds of genes of varying penetrance, and thereby produce ecological/evolutionary diversity.

Native rainbow trout that have undergone adaptive evolution are still at risk from environmental threats such as drought, fire, flood in addition to anthropogenic threats. The proposed CESA management framework allows for emergency translocation of these above-barrier fish before sudden extirpation. It also allows for research to increase understanding of physiological tolerances unique to Southern steelhead and applicable to salmonids statewide. This ESA listing framework also provides for continued recreational fishing in the mountains of Southern California where native rainbow trout persist above major barriers. This in itself is a significant consideration for the state and its people. This is further impetus for the state, considering the diverse threats to steelhead and resident rainbow trout, to remove barriers and provide access to historical habitat in high priority watersheds, as identified through Intrinsic Potential modeling and designated in the NMFS Recovery Plan, to promote genetic interbreeding to the extent possible as soon as possible.

Additionally, CalTrout recommends that:

a) special restrictions of catch-and-release, barbless lures only regulations apply to native trout in areas demonstrated to have steelhead lineage (Abadia-Cardoso et al 2016),
b) signs be posted and fishing survey boxes be installed at key access points in the DPS for fishers that clearly state the role of these native rainbow trout in Southern steelhead recovery and what information is being collected,
c) only triploid (non-reproducing) rainbow trout be stocked in streams within the DPS, and
d) that stocked reservoirs and still-water bodies have adequate barriers to escape of hatchery trout into high priority Southern steelhead recovery rivers throughout the DPS.

CalTrout recommends the adopting of the current ESA listing area not only to preserve the organizing principles that currently directs recovery actions, but also to establish a state-level endangered species redundancy. For a species that is endemic and iconic to the coast of Southern California, redundancy in the species' protection at the state level will lay the groundwork for redundancy in Southern steelhead populations within the DPS.

Availability and sources of information (K)

The National Marine Fisheries Service as a part of the National Oceanic and Atmospheric Administration generated the majority of the information presented here through the NMFS Southern California steelhead Recovery Plan and 5-year status reviews, other technical documents, scientific publications, and biological opinions. CDFW and other state agencies have published Southern steelhead planning, recovery, and assessment documents which have also served to draft this petition. CDFW's Steelhead Restoration and Management Plan for California and NMFS's Southern California Steelhead Recovery Plan are cited throughout. Extensive research on *O. mykiss* physiological tolerances and behavior, particularly on resident rainbow trout, is provided by reference herein, as well as the most recent assessment of adult steelhead population abundance (Dagit et al. 2020).

The scoring of the potential for extinction of Southern steelhead is a product of the comprehensive overview of salmonid species in California conducted most recently by Moyle and co-authors in 2017.

CESA Listing Factors

CESA regulates that a species should be listed as endangered or threatened if the Fish and Game Commission determines that its continued existence is in serious danger by one or any combination of the following factors:

Present or Threatened Modification or destruction of habitat

Southern steelhead have declined in large part because of the degradation, simplification, fragmentation, and total loss of habitat (Hunt & Associates 2008). The destruction of habitat is the result of human land use, agriculture, and flood control management decisions. Water withdrawal, storage, conveyance, and diversions have greatly reduced or eliminated historically accessible Southern steelhead habitat.

Modification of natural flow regimes by water infrastructure development has resulted in increased water temperatures and depleted the flow necessary for migration, spawning, rearing, and forging. This has also resulted in the disruption of habitat forming and ecosystem maintenance processes. While previous loss of habitat was strictly the result of more tangible, direct anthropogenic activity, climate crisis is amplifying these impacts at an accelerating pace.

This assessment of the Present or Threatened Modification or Destruction of habitat is the result of a comprehensive analysis outlined in the Conservation Action Planning Workbooks. This process used available information in a consistent, transparent, and reproducible fashion to assess aquatic habitat quality and anthropogenic threats to that habitat (The Nature Conservancy 2010, Kier Associates and NMFS 2008, Hunt & Associates 2008). This process was applied to all 45 watersheds that comprise the Southern steelhead DPS. The assessment published in 2012 concluded that the general DPS-wide condition of all major watershed was “Fair” to “Poor” with only 4 of the 45 watersheds were assessed to score a ”Good” rating (NMFS 2012).

The DPS-wide threat of habitat modification and destruction remains a concern (NMFS 2011, NMFS 2016). While a number of smaller restoration actions have created landscape level habitat improvements, the practices over the past century including large dam construction, mainstem channel straightening and floodplain disconnection, remain in place and their legacy of alteration continues to ripple through time to this day.

Overexploitation

Southern steelhead populations historically supported an important recreational fishery throughout their range. Reporting on recreational angling for Southern steelhead on the Santa Ynez indicated a vibrant fishery with substantial angling opportunities prior to development of the Bradbury Dam/Lake Cachuma Facilities. Similar accounts are true for the Ventura, Santa Clara, and other river systems such as San Juan Creek and San Mateo Creek in the DPS (NMFS 2012). Recreational angling for Southern steelhead increased the mortality of returning and freshwater-resident adults, but is not considered the principal cause for the decline of the species (NMFS 2012).

Predation

Introductions of non-native aquatic invasive species (AIS) resulted in increased predator populations in numerous river systems in the DPS. Once established, these introduced species increase the level of predation experienced by native salmonids (NMFS 1996, Busby et al. 1996). AIS in the Southern steelhead DPS are pervasive and deleterious. These species are known to prey on rearing juvenile Southern steelhead (Cucherousset and Olden 2011).

NMFS concluded that the information available on these impacts to steelhead did not suggest that the DPS was in danger of extinction, or likely to become so in the foreseeable future because of predation. (NMFS 2012). It is recognized that small, isolated populations of Southern steelhead can be more vulnerable to extinction through the combination of multiple secondary threats, and the role predation plays may be heightened under the current degraded condition of their native habitat.

Competition

In addition to the increase of predation on Southern steelhead by AIS, Southern steelhead are also in direct competition for critical aquatic habitat and resources with AIS (Marks et al. 2010, Scott and Gill 2008, Fritts and Pearson 2006, Bonar et al. 2005, Dill and Cordone 1997) including fishes and amphibians such as largemouth bass, redeye bass, bullhead, sunfish species, and bullfrogs. All these species thrive in warmer slow-moving water. They can also withstand lower water quality conditions than Southern steelhead. The combination of a Mediterranean climate and decades of habitat loss led to habitat conditions suitable for uncontrolled AIS population growth. This uncontrolled population growth of AIS is evident in Sespe Creek, a tributary of the Santa Clara River. Designated as critical habitat by NMFS and a State identified Wild and Scenic River, it is teeming with AIS in the slow-moving pool habitat. However, in the smaller tributaries in this system with cool water temperatures and greater slope, there are healthy juvenile Southern steelhead population numbers (Stillwater 2019).

The presence of invasive species in San Mateo Creek in northern San Diego County is another example where invasive species threaten the recovery of Southern steelhead. In recent years, the San Diego Regional Water Quality Control Board has sought to combat this problem using a novel approach by preparing a 303d listing for invasive aquatic species in San Mateo Creek as a non-point source pollutant. This proposal has received preliminary approval by the Regional Water Board for incorporation into the San Diego Regional Basin Plan. A formal 303d listing would open up significant funding to remove invasive aquatic species from San Mateo Creek. The last purported Southern steelhead observed in 2017 in lower San Mateo Creek was likely lost due to predation by invasive species.

Disease

The combination of disease, AIS infestation and predation are likely to play a major role in the population size of Southern steelhead. Many diseases are known to influence the development and survival of steelhead (Noga 2000, Wood 1979, Rucker et al 1953), although limited data or information exists to explicitly link infection levels and rate of mortality (NMFS 2012). With the increased environmental stress on resident rainbow trout populations that are experiencing impacts due to climate crisis, they will likely encounter new parasites that have expanded range which may lead to sudden extirpations of the few remaining coastal steelhead populations.

Other Natural Occurrences or human related activities

Southern steelhead are on the front line for climate crisis impacts. The DPS covers the southern edge of the species' total range on the West Coast. The DPS is projected to experience the greatest overall increase of air and water temperatures. Persistent drought has increased surface air temperatures and altered natural precipitation patterns (Williams et al. 2015, NMFS 2016). This has accelerated the loss of habitat needed for all life-history stages for an already stressed population. Climate change will have a significant impact on their continued existence (Wade et al 2013). Climate crisis impacts on salmonid species are increasing over time. Building resiliency into the remaining populations of Southern steelhead is essential to their survival (Williams et al. 2016) and to the survival of salmonids further north along the coast. Even given their inherent plasticity, the impacts of climate crisis will outpace their ability to utilize this flexibility. The most recent NMFS 5-year status review completed in 2016 concluded that the ongoing drought and ocean conditions in the years preceding its publication likely reduced the survival of Southern steelhead across the DPS.

Conclusion

Southern steelhead are an iconic California species that deserve the highest level of state protection. State and federal entities have had decades to address the precipitous and continuing decline in Southern steelhead populations through all manner of guidance, policy, and mandate. Yet this species remains on the brink of extinction throughout its range. The principal condition for protection under CESA is met.

Southern steelhead have an irreplaceable impact on Southern California watersheds and communities. The total loss of this species will have irreversible consequences.

For this reason and all of those presented in this petition, CalTrout requests that the California Fish and Game Commission use the powers that it has vested to list this species as endangered under the California Endangered Species Act. We must ensure that future Californians have the ability to enjoy this amazing species.

Sincerely,

Curtis Knight
Executive Director
California Trout

Subject: Status Review Report for Southern California Steelhead (*Oncorhynchus mykiss*)

The California Department of Fish and Wildlife (Department) has prepared the attached status review report for southern California steelhead (*Oncorhynchus mykiss*) for the California Fish and Game Commission (Commission) pursuant to the California Endangered Species Act, Fish and Game Code section 2050 et seq. The Commission published the Notice of Candidacy Findings on May 11, 2022, directing the Department to prepare a status review report. On October 12, 2022, the Commission approved a Department request for a 6-month extension to further analyze the petition and complete its status review report in accordance with Fish and Game Code section 2074.6.

The Department completed the attached status review report as required by Fish and Game Code section 2074.6. The status review report contains the Department's review of the best scientific information available to the Department on the status of southern California steelhead and serves as the basis for the Department's recommendation to the Commission that the petitioned action to list southern California steelhead as endangered is warranted. The Department finds that southern California steelhead is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease.

If you have any questions or need additional information, please contact Jay Rowan, Branch Chief, Fisheries Branch at (916) 212-3164 or by email at Jay.Rowan@wildlife.ca.gov.

EXECUTIVE SUMMARY

This status review of southern California steelhead (*Oncorhynchus mykiss*) (Status Review) has been prepared by the California Department of Fish and Wildlife (Department) for the California Fish and Game Commission (Commission) pursuant to the requirements of the California Endangered Species Act (CESA; Fish & G. Code, § 2050 et seq.). This Status Review is based on the best scientific information currently available to the Department regarding each of the components listed under Section 2072.3 of the Fish and Game Code and Section 670.1 of Title 14 of the California Code of Regulations. In addition, this Status Review includes a preliminary identification of habitat that may be essential to the continued existence of the species, the Department's recommendations for management activities, and other recommendations for the recovery of the species (Fish & G. Code, § 2074.6). This Status Review has been independently reviewed by scientific peers pursuant to Fish and Game Code Section 2074.6.

In this Status Review, southern California steelhead are defined as "all *O. mykiss* below manmade and natural complete barriers to anadromy, including anadromous and resident life histories, from and including the Santa Maria River (San Luis Obispo and Santa Barbara counties) to the U.S.-Mexico Border." This range encompasses five biogeographic population groups of *O. mykiss* (from north to south): Monte Arido Highlands, Conception Coast, Santa Monica Mountains, Mojave Rim, and Santa Catalina Gulf Coast. To capture the life history variability that is included in the scope of the CESA listing unit evaluated in this Status Review, "southern California steelhead rainbow trout" (Southern SH/RT) is used to describe the proposed CESA listing unit.

The Department recommends that the Commission find the petitioned action to list Southern SH/RT as an endangered species under CESA to be warranted. The Department further recommends implementation of the management recommendations and recovery measures described in this Status Review.

The scientific data available to the Department indicates a long-term declining trend of Southern SH/RT and low range-wide abundances. The decline of Southern SH/RT can be attributed to a wide variety of human activities, including, but not limited to, urbanization, agriculture, and water development. These activities have degraded range-wide aquatic habitat conditions and limited the amount of suitable and accessible spawning and rearing habitats. Dams and other impediments obstruct access to a significant portion of historical Southern SH/RT habitats in many rivers within the proposed listing area, some of which have multiple major dams on a single mainstem.

Climate change projections for Southern SH/RT range predict an intensification of typical climate patterns, such as more intense cyclic storms, droughts, and extreme heat. These projections suggest that Southern SH/RT will likely experience more frequent periods of adverse conditions and continued selection pressure against the anadromous life-history form. Impacts of the most recent prolonged period of drought from 2012 – 2017 resulted in significant reductions in all life-history forms and stages of Southern SH/RT, and few populations have rebounded as current abundance estimates remain low relative to pre-drought conditions. The ability of Southern SH/RT to persist will likely depend on the successful recruitment of migrants from resident populations in refugia habitats. However, virtually all refugia populations are currently above impassable barriers. Furthermore, many southern California watersheds do not contain upstream drought refugia. In these instances, recolonization of Southern SH/RT from source populations in other watersheds is likely the only mechanism for these populations to rebound (Boughton et al. 2022a).

1. INTRODUCTION

1.1 Petition History

On June 14, 2021, the California Fish and Game Commission (Commission) received a petition (Petition) from California Trout to list southern California steelhead (*Oncorhynchus mykiss*) as endangered pursuant to the California Endangered Species Act (CESA; Fish & G. Code, § 2050 et seq.).

On June 23, 2021, pursuant to Fish and Game Code Section 2073, the Commission referred the Petition to the California Department of Fish and Wildlife (Department) for evaluation.

On July 16, 2021, pursuant to Fish and Game Code Section 2073.3, the Commission published notice of receipt of the Petition in the California Regulatory Notice Register (Cal. Reg. Notice Register 2021, No. 29-Z, p. 921-922).

On August 18, 2021, pursuant to Fish and Game Code Section 2073.5, the Commission approved the Department's request for a 30-day extension to complete its petition evaluation report.

On October 29, 2021, the Department provided the Commission with a report, "Evaluation of the Petition from California Trout to List Southern California Steelhead (*Oncorhynchus mykiss*) as Endangered under the California Endangered Species Act" (Evaluation). Based upon the information contained in the Petition, the Department concluded, pursuant to Fish and Game Code Section 2073.5, that sufficient information exists to indicate that the petitioned action may be warranted and recommended to the Commission that the Petition be accepted and considered.

On April 21, 2022, at its public meeting pursuant to Fish and Game Code Sections 2074 and 2074.2, the Commission considered the Petition, the Department's Evaluation and recommendation, comments received, and oral testimony. The Commission found that sufficient information exists to indicate the petitioned action may be warranted and accepted the Petition for consideration.

On May 13, 2022, pursuant to Fish and Game Code Section 2074.2, the Commission published its Notice of Findings for southern California steelhead in the California Regulatory Notice Register, designating southern California steelhead as a candidate species (Cal. Reg. Notice Register 2022, No. 19-z, p. 541).

On October 12, 2022, pursuant to Fish and Game Code Section 2074.6, the Commission approved the Department's request for a six-month extension to complete its status review report.

1.2 Status Review Overview

Pursuant to Fish and Game Code Section 2074.6 and the California Code of Regulations, Title 14, Section 670.1, the Department has prepared this status review to indicate whether the petitioned action to list southern California steelhead as endangered under CESA is warranted (Status Review). An endangered species under CESA is "a native species or subspecies . . . which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease" (Fish & G. Code, § 2062). A threatened species under CESA is "a native species or subspecies . . . that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by [CESA]" (*id.* at § 2067). A species' range for CESA purposes is the species' California range (Cal. Forestry Assn. v. Cal. Fish and Game Com. (2007) 156 Cal.App.4th 1535, 1551).

Using the best scientific information available to the Department, this Status Review includes information on each of the following components pursuant to Fish and Game Code Section 2072.3 and Title 14 of the California Code of Regulations Section 670.1: population trend(s), range, distribution, abundance, life history, factors affecting the species' ability to survive and reproduce, the degree and immediacy of threats, the impact of existing management efforts, the availability and sources of information, habitat that may be essential to the continued existence of the species, and the Department's recommendations for future management activities and other recovery measures to conserve, protect, and enhance the species.

Southern California steelhead, as defined in the Petition, means all *O. mykiss*, including anadromous and resident life histories, below manmade and natural complete barriers to anadromy from and including the Santa Maria River (San Luis Obispo and Santa Barbara counties) to the U.S.-Mexico Border (CDFW 2021a Petition Evaluation). The Department accepts the taxonomy as published by Behnke (1992) that identifies southern California *O. mykiss* as being included in the range of Coastal Rainbow Trout (*O. mykiss irideus*), which have a broad distribution extending from Alaska to Baja California (Moyle 2002). The Department has long referred to these fish as "steelhead rainbow trout" (Shapovalov and Taft 1954), which captures the life history variability that is included in the scope of this status review for both anadromous and resident forms of the species. Thus, the Department will refer to the Petitioner's proposed listing unit as southern California steelhead rainbow trout (*O. mykiss*;

Southern SH/RT) throughout the remainder of this Status Review. This naming convention is slightly different than what was used by the Petitioner in the Petition, but the Department asserts the importance of recognizing the full scope of life history diversity included in the listing unit.

This Status Review report is not intended to be an exhaustive review of all published scientific literature relevant to the Southern SH/RT. Rather, it is intended to summarize the best scientific information available relevant to the status of the species, provide that information to the Commission, and serve as the basis for the Department's recommendation to the Commission on whether the petitioned action is warranted. Specifically, this Status Review analyzes whether there is sufficient scientific information to indicate that the continued existence of Southern SH/RT throughout all or a significant portion of its range is in serious danger or is threatened by one or a combination of the following factors: present or threatened modification or destruction of its habitat; overexploitation; predation; competition; disease; or other natural occurrences or human-related activities (Cal. Code Regs., tit. 14, § 670.1, subd. (i)(1)(A)).

1.3 Federal Endangered Species Act Listing History

The federal Endangered Species Act (ESA) defines "species" to include "any subspecies of fish or wildlife or plants, and any distinct population segment of any species of vertebrate fish or wildlife which interbreeds when mature" (16 U.S.C. § 1532). In 1991, the National Marine Fisheries Service (NMFS) adopted its policy on how it would apply the definition of "species" to Pacific salmon stocks for listing under the ESA (ESU Policy). Under the ESU Policy, a salmon stock is considered a distinct population segment (DPS) if it constitutes an evolutionary significant unit (ESU) of the biological species (NMFS 1991). In February 1996, the United States Fish and Wildlife Service (USFWS) and NMFS published a joint DPS policy for the purposes of ESA listings (DPS Policy) (NMFS 1996a). Section 3.1 of this Status Review describes the ESU Policy and DPS Policy in greater detail.

In 1997, NMFS listed the Southern California Steelhead ESU as endangered under the federal ESA. The Southern California Steelhead ESU only included naturally spawned populations of anadromous *O. mykiss* (and their progeny) residing below long-term, natural and manmade impassable barriers in streams from the Santa Maria River, San Luis Obispo County (inclusive) to Malibu Creek, Los Angeles County (inclusive) (NMFS 1997). In 2002, NMFS extended the geographic range of the Southern California Steelhead ESU listed under the federal ESA south to the U.S.-Mexico border (NMFS 2002).

In 2001, the U.S. District Court in Eugene, Oregon, ruled that NMFS improperly excluded certain hatchery stocks from the listing of Oregon Coast Coho Salmon after NMFS had concluded that those hatchery stocks were part of the ESU being considered for listing but not essential for recovery (*Alsea Valley Alliance v. Evans* (D. Or. 2001) 161 F. Supp. 2d 1154, 1162). Based in part on the *Alsea* decision, in 2002 NMFS announced that that it would conduct an updated status review of 27 West Coast salmonid ESUs, including the Southern California Steelhead ESU (NMFS 2006). In 2004, NMFS proposed to continue applying its ESU Policy to the delineation of DPSs of *O. mykiss* and to include resident *O. mykiss* that co-occur with the anadromous form of *O. mykiss* in 10 *O. mykiss* ESUs, including the Southern California Steelhead ESU (NMFS 2006).

In 2005 USFWS wrote to NMFS stating USFWS's "concerns about the factual and legal bases for [NMFS's] proposed listing determinations for 10 *O. mykiss* ESUs, specifying issues of substantial disagreement regarding the relationship between anadromous and resident *O. mykiss*" (NMFS 2006). After discussions with USFWS regarding the relationship between anadromous and non-anadromous *O. mykiss*, in 2006 NMFS decided to depart from their past practice of applying the ESU policy to *O. mykiss* stocks and instead apply the joint DPS Policy (NMFS 2006). Concurrent with that decision, NMFS relisted the Southern California Steelhead ESU as the Southern California Steelhead DPS under the federal ESA (NMFS 2006). As part of its 2006 relisting of southern California steelhead, NMFS concluded that the anadromous life form of *O. mykiss* is markedly separate from the non-anadromous life form of *O. mykiss* within the geographic boundary of the Southern California Steelhead DPS—as well as the geographic boundaries of the other nine *O. mykiss* ESUs that NMFS was relisting as DPSs at that time—due to "physical, physiological, ecological, and behavioral factors" (NMFS 2006). The Southern California Steelhead DPS only includes the anadromous life-history component of *O. mykiss* and is defined as including all naturally spawned anadromous *O. mykiss* (steelhead) populations below natural and manmade impassible barriers in streams from the Santa Maria River, San Luis Obispo County (inclusive) to the U.S.-Mexico border (Table 1) (NMFS 2006).

2. BIOLOGY AND ECOLOGY

2.1 Species Description

The species *O. mykiss* is one of the most widely distributed of Pacific salmonids, occupying nearly all coastal streams from Alaska to southern California and from Russia's Kamachatka Peninsula to South Korea in the western Pacific. Steelhead is the common name for the anadromous form of *O. mykiss*, while Rainbow Trout is the common name applied to the freshwater resident form (Behnke 1993; Moyle 2002). *O. mykiss* possess 10–12 dorsal fin rays, 8–12 anal fin rays, 9–10 pelvic fin rays, 11 – 17 pectoral fin rays, and a slightly forked caudal fin (Moyle 2002). They have 9–13 branchiostegal rays and 16–22 gill rakers on each arch (Moyle 2002). Teeth are present on both upper and lower jaws, the tip and shaft of the vomer, as well as on the tip of the tongue (Fry 1973; Moyle 2002). Between 110–180 small, pored scales make up the first row above the lateral line (Fry 1973; Moyle 2002).

Table 1. Common nomenclature for Oncorhynchus mykiss (adapted from Boughton et al. 2022b).

Term	**Description**
Oncorhynchus mykiss	A species of Pacific salmonid composed of both anadromous and freshwater-resident forms, which all spawn in freshwater rivers and streams.
Steelhead	Individuals: *O. mykiss* that are anadromous (individuals that migrate to and spend one or more seasons in the ocean); here used to mean adult steelhead.
Rainbow Trout	Individuals: *O. mykiss* that are freshwater resident (individuals that complete their life cycle in freshwater), here used to mean adult Rainbow Trout.
Steelhead Rainbow Trout	Population(s): contains both steelhead individuals and Rainbow Trout individuals.
Juvenile *O. mykiss*	Immature fish whose fate as steelhead or Rainbow Trout cannot yet be established.
Anadromous waters	Stream reaches that are accessible to migrating steelhead (those not blocked by complete natural or artificial barriers). It is important to note that *Oncorhynchus mykiss* individuals, occurring in anadromous waters, may or may not express the anadromous life history type (e.g., smoltification).

The steelhead life history form is thought to be named for the sometimes silvery-metallic appearance of its back and head. The steelhead body profile is fusiform, with typically "bullet-shaped" heads and distinct narrowing at the base of a powerful tail, suited for often-demanding and lengthy upstream spawning migrations. In the marine environment, steelhead body coloration includes a blueish-green dorsum (back) and silver or white coloration over the rest of the body (Fry 1973; Moyle 2002). Black spots typically cover the dorsal, adipose, and caudal fins, as well as the head and back (Fry 1973). When adult steelhead return to spawn in freshwater, their silver sheen fades and a pink or red lateral band develops along the sides and on the opercula, while the silvery-blue coloration on the back transitions to an olive green or brown (Barnhart 1986). These characteristics are very similar to those exhibited by resident Rainbow Trout (Fry 1973); thus, it can be difficult to differentiate the anadromous and resident forms based only on outward appearance. Adult steelhead, however, are generally larger than adult Rainbow Trout in a given stream system since they spend time feeding and growing in the ocean (NWF 2020; USFWS 2020).

Juvenile *O. mykiss* have body coloration similar to that of resident adults, while also exhibiting 5–13 oval parr marks along the lateral line on both sides of the body (Moyle 2002). These parr marks are dark bluish-purple in coloration and are widely spaced, with the marks themselves being narrower than the spaces between them (Moyle 2002). A total of 5–10 dark spots also line the back, typically extending from the head to the dorsal fin. There are usually few to no marks on the caudal fin, and the tips of the dorsal and anal fins are white to orange (Moyle 2002).

After a year or more of development, some *O. mykiss* undergo the transitional process of smolting, which is a series of morphological, physiological, and behavioral changes that prepare the fish for entry into brackish estuaries and then ocean environments (Fessler and Wagner 1969; McCormick 2012). Smolting is the primary physiological characteristic that distinguishes the anadromous life history variant from the resident one within the species. Smolts lose their parr marks and develop silver coloration during the downstream migration process. After entering the ocean, young steelhead will reside in the saltwater environment for 1–4 years while feeding and growing quickly (Moyle 2002). Juvenile *O. mykiss* that do not smolt and remain in freshwater generally lose their parr marks as they grow and develop into adult Rainbow Trout.

The sexual maturation process for anadromous steelhead involves the development of secondary sex characteristics such as bright coloration and sexual dimorphism, including the development of a hooked snout, or kype, in males. These secondary sex characteristics are typically reabsorbed once spawning is complete, although jaw shape may never fully revert to the pre-spawn condition (Shapovalov and Taft 1954).

Different populations of *O. mykiss* can exhibit variations in growth rate, size, and body shape depending on their life histories and habitats utilized. For example, Bajjaliya et al. (2014) studied morphometric variation between four California steelhead DPSs and found that coastal steelhead (populations with adults migrating less than 160 km from the ocean to their sample site) were significantly larger in size and had a more robust body type than steelhead found in California’s Central Valley drainages and the Klamath-Trinity basin (populations with adults migrating more than 160 km from the ocean to their sample site). These morphological differences provided the basis for recognizing “coastal type” and “inland type” steelhead in California (Bajjaliya et al. 2014). However, the morphometric variation in populations of steelhead occurring in more southerly DPSs, such as the Southern California Steelhead DPS, may include features of both the large, coastal type as well as smaller, inland-type *O. mykiss* that occur in interior drainages (Bajjaliya et al. 2014).

2.2 Taxonomy and Systematics

Steelhead and Rainbow Trout are members of the bony fish class Osteichthyes, in the order Salmoniformes and family Salmonidae. In 1792, J. J. Walbaum classified Rainbow Trout from populations on the Kamchatka Peninsula in Russia as *Salmo mykiss* (Moyle 2002). During the next century, using J. Richardson's description of Columbia River steelhead as *S. gairdneri* and Gibbons's description of juvenile steelhead from San Leandro Creek as *S. iridea*, both the biology and fishing communities began referring to resident Rainbow Trout and steelhead as *S. irideus* and *S. gairdneri*, respectively. It was ultimately discovered that Rainbow Trout and steelhead are the same species, and North American scientists applied the original species name, *mykiss*, to North American populations (Moyle 2002).

In the 1970s, analyses of polymorphic proteins, or allozymes, were utilized to determine the degree of species relatedness and evolutionary divergence among salmonids (Quinn 2018). These studies indicated that Coho and Chinook salmon (*O. kisutch* and *O. tschawytscha*, respectively) were most closely related to Pink, Chum, and Sockeye salmon, and that Rainbow and Cutthroat trout were most closely related to each other (Quinn 2018). This phylogeny was assumed until researchers analyzed relatedness by looking at differences in mitochondrial DNA, which showed that Coho and Chinook salmon were related more closely to steelhead than they were to the other three genera of salmon (Quinn 2018). Based on this study, Smith and Stearley (1989) reorganized the taxonomy to reflect both the use of the name *mykiss* for North American Rainbow Trout and the inclusion of Rainbow and Cutthroat trouts in the Pacific salmon genus *Oncorhynchus*, but with their own distinct lineages.

Pacific salmonid lineages continue to be studied using a variety of genetic and statistical methods (Quinn 2018). There has been debate over the relationship between Rainbow and Cutthroat trouts with regards to genetics versus morphology and behavior. Stearley and Smith (1993) and Esteve and McLennan (2007) found that the idea of monophyly (a group descending from a most recent common ancestor) of these two trout species is not supported by either morphological or behavioral traits, even though mitochondrial DNA suggests otherwise. Esteve and McLennan (2007) attribute this contradiction to hybridization events that have led to a high rate of genetic introgression between the two species (Chevassus 1979). This introgression can dilute the distinctiveness of these close relatives and convolute phylogenetic reconstruction (Esteve and McLennan 2007). Although some uncertainty remains surrounding these evolutionary relationships, it is now accepted that within the genus *Oncorhynchus*, Coho and Chinook salmon have the closest relationship to each other, with Pink (*O. gorbuscha*), Chum (*O.*

keta), and Sockeye (*O. nerka*) salmon in their own group, and Rainbow (*O. mykiss*) and Cutthroat (*O. clarkii*) trout in another group (Kitano et al. 1997; Crête-Lafrenière et al. 2012; Quinn 2018; Figure 1).

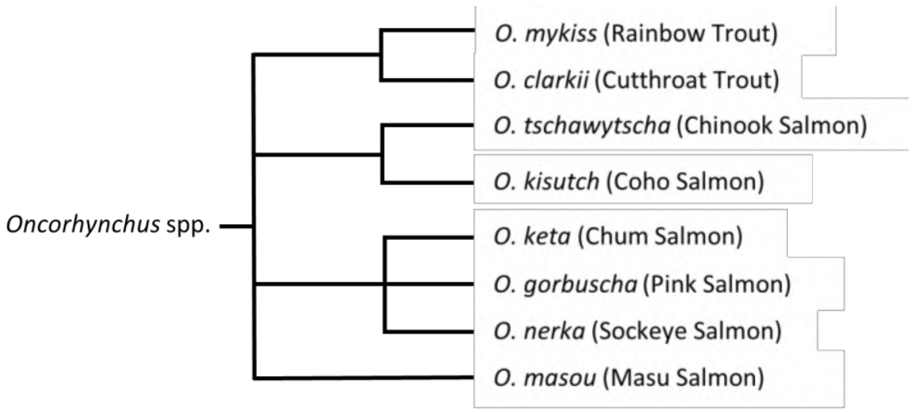

Figure 1. Consensus relationships of Oncorhynchus species from morphological, allozyme, ribosomal RNA, mitochondrial DNA, and short interspersed repetitive elements data across multiple studies. Adapted from Figure 1 in Kitano et al. (1997)

2.3 Range and Distribution

Range is the general geographical area in which an organism occurs. For purposes of CESA and this Status Review, the range is the species' California range (*Cal. Forestry Assn. v. Cal. Fish and Game Com.* (2007) 156 Cal.App.4th 1535, 1551). Distribution describes the actual sites where individuals and populations of the species occur within the species' range.

Oncorhynchus mykiss is native to both coastlines of the Pacific Ocean and spawns in freshwater streams, from the Kuskokwim River in Alaska, south to Baja California along the eastern Pacific, and from Russia's Kamchatka Peninsula in the western Pacific (Moyle 2002). The species is widely distributed throughout the northern Pacific Ocean during its ocean phase. Coastal steelhead within the state historically occupied all perennial coastal streams, from the Oregon/California border to the U.S.-Mexico border (Moyle 2002). Steelhead are also native to the Central Valley, including both the Sacramento and San Joaquin River basins, and have been found as far upstream as the Pit and McCloud rivers (Moyle 2002). It is likely that most suitable streams in the Sacramento and San Joaquin River basins with ocean access have historically supported runs of steelhead (Moyle 2002).

Southern SH/RT currently occupy fluvial habitat from the Santa Maria River at the border of San Luis Obispo and Santa Barbara counties south to the U.S.-Mexico border. This range encompasses five biogeographic population groups (BPGs), collectively described by NMFS as the Southern California steelhead DPS (Boughton et al. 2007; NMFS 2012a). BPGs are steelhead subpopulations within a DPS that occupy contiguous areas that share broadly similar physical geography and hydrology, generally within a single watershed unit. The combinations of these physical characteristics represent the suite of differing natural selective regimes across the watersheds occupied by Southern SH/RT. These varying selective pressures have led to life history and genetic adaptations that enable subpopulations to persist in distinctive and dynamic habitats that have shaped each BPG. The purpose of delineating BPGs for steelhead populations is to ensure the preservation of the range of genetic and natural diversity within each DPS for recovery and conservation purposes (NMFS 2012a). The BPGs that form the Southern SH/RT DPS are (from north to south): Monte Arido Highlands, Conception Coast, Santa Monica Mountains, Mojave Rim, and Santa Catalina Gulf Coast.

While some near-coastal populations of Southern SH/RT are small, there are likely dispersal dynamics that contribute to their stability and persistence (Boughton et al. 2007). The movement of spawning adults between BPGs may be an important mechanism for maintaining the viability of steelhead populations (NMFS 2012a). Dams and other impediments obstruct access to a significant portion of historical Southern SH/RT habitats in many rivers within the proposed listing area, some of which have multiple major dams on a single mainstem. There is evidence that loss of access to upstream habitat has resulted in a northward range contraction of anadromous Southern SH/RT (Boughton et al. 2005), whose study also found a strong correlation between steelhead population extirpations and anadromous barriers, as well as urban and agricultural development.

2.4 Life History

An individual fish's genotype, condition, and a variety of environmental factors influence the expression of anadromy versus stream residency (Sloat et al. 2014; Busby et al. 1996; Pascual et al. 2001; Courter et al. 2013). Juvenile *O. mykiss* prior to the smolting life stage are difficult to distinguish without genetic, morphological, or physiological evaluations (Negus 2003; Beeman et al. 1995; Haner et al. 1995; Pearse et al. 2014). Adult steelhead returning to streams from the ocean are often easier to identify due to their larger size relative to most resident Rainbow Trout adults in the same stream system and their overall steel-gray color (Dagit et al. 2020). While anadromy and residency are the two primary life histories, *O. mykiss* life history expression is notably plastic and can be quite variable (Moyle 2002). For example, individuals may exhibit the lagoon-anadromous life history, spending their first or second summer rearing in seasonal lagoons in the estuaries of streams before outmigrating to the ocean (Boughton et al. 2007).

Unlike other Pacific salmonids, which are semelparous and perish almost immediately after spawning, *O. mykiss* can be iteroparous (Moyle 2002), with the potential to spawn up to four times but typically not more than twice (Shapovalov and Taft 1954). Steelhead that spawn and return to the sea are called “kelts.” These fish can either spawn consecutively, returning the next season after their first spawn, or they may return a year later after spending an extra year at sea (Light et al. 1989). Reportedly, females survive spawning events more frequently than males (Shapovalov and Taft 1954; Ward and Slaney 1988; Busby et al. 1996; Marston et al. 2012), although males can repeat spawn in significant numbers, especially in smaller, near-coastal stream systems (Marston et al. 2012).

Steelhead exhibit two seasonal migratory patterns, or run types: 1) winter, also called “ocean-maturing” or “mature-migrating;” and 2) summer, also called “stream-maturing” or “premature-migrating.” The names of these two runs are reflective of the seasonal timing when adult steelhead reenter estuaries and rivers to reproduce (Busby et al. 1996; Moyle 2002). Only the winter-run form of steelhead occurs in southern California streams, consistent with what is believed to be the historical condition (Moyle 2002). Southern SH/RT typically begin migrating upstream from December through May, with returning adults often reliant upon winter rainstorms to breach sandbars at the mouths of stream estuaries and lagoons, providing seasonal upstream spawning passage (California Trout 2019). Steelhead age-at-maturity is dependent on a number of factors, including time spent in either or both freshwater and marine environments; however, adult returning spawners are usually 3 or 4 years old, having spent 1-3 years in freshwater and 1-2 years at sea (Shapovalov and Taft 1954). Southern SH/RT steelhead spawning runs are dominated by age 3+ fish, with 2 years spent in fresh water and 1 year in the ocean, although many smolt after only 1 year in fresh water (Busby et al. 1996). Shapovalov and Taft (1954) found that the average age of male spawners (about 3.5 years) was lower than that of female spawners (close to 4 years) in Waddell Creek, CA. Non-anadromous Rainbow Trout can mature anywhere between 1 and 5 years but are commonly age 2+ or 3+ years, with a fork length of ≥13 cm (Moyle 2002). Rainbow Trout typically spawn during the spring months, from February through June (Moyle 2002).

Spawning usually occurs in shallow habitats with fast-flowing water and suitable-sized gravel substrates, often found in riffles, faster runs, or near the tail crests of pool habitats. When female *O. mykiss* are ready to spawn, they will select a suitable spawning site and excavate a nest, or redd, in which they deposit their eggs to incubate (Moyle 2002). Adequate stream flow, gravel size, and low substrate embeddedness are crucial for egg survival, as these conditions allow oxygenated water to permeate through sediments to the egg (Coble 1961). During redd construction, the female may be courted by multiple males. Following completion of the redd, the most dominant males fight for position alongside the female, depositing milt while the female deposits her eggs (Quinn 2018). Immediately following fertilization, females cover their eggs with gravel (Barnhart 1986). Females dig multiple smaller pits within the broader redd where they deposit a portion of eggs into each pocket until all the eggs are expelled

(Shapovalov and Taft 1954; Quinn 2018). Adult steelhead are often accompanied by resident male Rainbow Trout during spawning, as they attempt to participate by quickly swimming, or darting, in and out of steelhead redds (Shapovalov and Taft 1954). These fish are sometimes referred to as "egg-eaters," although it is generally accepted that the main purpose of their presence is to contribute to spawning rather than consume newly laid eggs (Shapovalov and Taft 1954). If adult steelhead cannot emigrate back to the ocean after spawning, they require large, deep pools that provide refuge during the hot summer months (Boughton et al. 2015).

Fecundity, among other biological and environmental factors, contributes substantially to reproductive success. Egg production is positively correlated with fish length, although there is wide variation in female steelhead fecundity at a given size (Shapovalov and Taft 1954; Quinn 2018). Larger females tend to produce larger and greater numbers of eggs; however, energy demands for gonad development create a physiological tradeoff between the number and size of eggs produced (Quinn 2018). Thus, females generally produce either many smaller eggs or fewer larger eggs. Quinn (2018), referencing multiple sources of data, showed that female steelhead of average size produce slightly over 5,000 eggs. Moyle (2002) provides a range of eggs per female from 200 to 12,000 and states that steelhead generally produce about 2,000 eggs per kilogram of body weight. Rainbow Trout less than 30 cm in total length usually have under 1,000 eggs per kilogram of body weight (Moyle 2002).

Multiple factors contribute to egg development and incubation time; however, eggs generally incubate in stream gravels for up to several months. Temperature has the greatest effect on the incubation period; colder water slows development, and warmer water increases the rate of development (Quinn 2018). Incubation can take from 19 days at an average temperature of 60°F (15.6°C) to 80 days at an average temperature of 40°F (4.4°C) (Shapovalov and Taft 1954). Dissolved oxygen (DO) levels in surrounding waters also influence life stage development rates in Southern SH/RT and other salmonids. Higher DO levels lead to more rapid egg development, while eggs exposed to low levels of DO during incubation produce much smaller alevins (yolk-sac fry) than those exposed to high DO (Quinn 2018). Fry emerge from the gravel 2-3 weeks after hatching, once the yolk sac is fully or almost entirely absorbed, at which time they form schools along stream banks (Shapovalov and Taft 1954). During their first year of life, *O. mykiss* juveniles develop small territories and defend them against other individuals in their age class (Shapovalov and Taft 1954; Barnhart 1986). Juvenile *O. mykiss* generally feed on many different species of aquatic and terrestrial insects, sometimes cannibalizing newly emerged fry (Barnhart 1986). Further north, feeding generally peaks during the summer months and is depressed during the winter months; however, *O. mykiss* in California typically have higher growth rates in the winter and spring than summer and fall (Hayes et al. 2008; Sogard et al. 2009; Krug et al. 2012). As they grow, juveniles will move into deeper, faster water and are often found in riffle or swift-run habitats (Shapovalov and Taft 1954; Barnhart 1986). Larger juvenile *O. mykiss* can outcompete and displace their smaller counterparts from ideal habitats, such as deep pools or run complexes, leaving smaller individuals to often inhabit suboptimal habitats, such as riffles (Barnhart 1986).

Parr will ultimately begin transitioning into smolts and migrate downstream to estuaries and lagoons, where they complete the process of smolting. Smolt outmigration to the ocean typically occurs from March–May in southern California but can vary depending on factors such as connectivity between the ocean and estuary or lagoon and streamflow (Booth 2020). Compared to other Pacific salmonids, steelhead have the greatest variability in the timing and duration of freshwater inhabitance, ocean entry, time spent at sea, and return to freshwater (Barnhart 1986). Resident Rainbow Trout early life stages mirror those of anadromous steelhead, up until their life history strategies diverge (Moyle 2002). Rather than migrating out to the ocean like steelhead, resident *O. mykiss* will reside in freshwater for the remainder of their lives.

Little is known regarding steelhead stock-specific utilization of and distribution in the ocean environment. While much is known about the status and abundance of commercially important ocean stocks of Pacific salmon, steelhead-specific research on this topic is lacking and hampered by the inability to differentiate individual stocks using standard sampling methods (Barnhart 1986; Light et al. 1989; Moyle 2002). Unlike Pacific salmon species, steelhead are rarely captured in the ocean; therefore, information specific to Southern SH/RT ocean distribution is not available. Limited tag recoveries by North American fisheries research and management agencies showed no differences in the ocean distribution of steelhead by stock (Light et al. 1989). Attempts to distinguish steelhead population units from one another in terms of ocean distribution are confounded by findings that all steelhead apparently congregate in shared ocean feeding grounds, regardless of their origin or run type (Light et al. 1988).

Pacific steelhead smolts quickly migrate offshore after entry into the ocean (Daly et al. 2014) and, once in the open water, generally move in a northwestern trajectory from spring to summer and follow a southeastern pattern from fall to winter (Okazaki 1983; Light et al. 1989). In the winter, steelhead are found in the eastern North Pacific (Myers et al. 2016) and tend to be closer to shore than during other times of the year (Light et al. 1989). California steelhead do not appear to migrate any farther west than the Gulf of Alaska (Light et al. 1989), and, overall, steelhead migration patterns appear to be strongly tied to “thermal avoidance.” Migratory-based thermal avoidance involves fish movement patterns that remain within a narrow range of tolerable sea surface temperatures, suggesting that steelhead ocean migration may be largely influenced by physiological responses to temperature (Hayes et al. 2016). Ocean steelhead are typically found within seven meters of the sea surface, within the epipelagic zone, although they have been found at more than three times that depth (Light et al. 1989).

Studies addressing steelhead ocean behavior, distribution, and movement are limited; however, as with other salmonids, steelhead tend to exhibit strong homing behavior to their natal streams, with some exceptions. Evidence of straying has been documented in central California steelhead populations (Donohoe et al. 2021), while genetic population structure analyses suggest that historical (natural) exchange of genetic information occurred between coastal populations of steelhead (Garza et al. 2014).

2.5 Genetics and Genomics

2.5.1 Role of Genetics and Genomics in Evaluating Steelhead Population Structure

To date, most genetic studies focused on quantifying the population structure of salmonid species have used neutral genetic markers (e.g., microsatellite DNA). Neutral markers are not directly linked with a particular life history trait, and it is assumed that they are not under direct selection. This class of genetic marker continues to be used to investigate and define salmonid listing units and population structure (e.g., Busby et al. 1996) in both California and across the Pacific Northwest. These types of markers have also been successfully used for decades to delineate populations and ESUs based primarily on reproductively isolated lineages. These markers remain valuable, in that they are the standard for determining the genetic structure and relatedness of species and, thus, their evolutionary histories.

More recently, the advent and rapid development of “adaptive” genetic markers have provided fishery managers and geneticists with a new suite of tools. Adaptive genetic markers provide putative associations with specific life history characteristics, and the “genetic type”, or “variant” infers information about a phenotype of interest. Specific genes, or genomic regions, within individuals or subgroups may vary from the overall pattern exhibited by a species. Of particular relevance to Southern SH/RT is the role that adaptive genetic variation plays in migratory behavior. This relationship is still being evaluated, and uncertainties remain regarding the level of influence genetics may have on migration phenotype. See Section 2.6.5 for more information.

2.5.2 Patterns of O. mykiss Genetic Population Structure

Geography and local environmental factors influence the genetic structure of *O. mykiss* populations, a pattern referred to as "isolation by distance". Evidence of isolation by distance is shown in *O. mykiss* populations throughout their range. Studies based on neutral mitochondrial DNA analysis have demonstrated a pattern of isolation by distance in populations spanning the western coast of the United States, including among coastal California steelhead populations (Hatch 1990; Reisenbichler et al. 1992; McCusker et al. 2000). Nielsen (1999) found a pattern of isolation by distance when looking at the microsatellite loci of southern California and northern California steelhead populations. Bjorkstedt et al. (2005) suggested that genetic variation in salmonid populations generally increases with greater distances between watersheds. Pearse et al. (2007) analyzed geographic structure within the Klamath-Trinity River basin and consistently found a positive relationship between geographic distance and genetic relatedness—specifically, that genetic divergence between populations increased as a function of geographic distance.

Garza et al. (2004) evaluated population structure across coastal California populations using microsatellite loci to understand the relationship between genetic distance and the geography of coastal steelhead populations. This study's results included a bootstrap consensus tree showing clustering of geographic locations corresponding to five DPS assignments in coastal California steelhead (Figure 2). The long terminal branches in this consensus tree demonstrate that, while migration is important to the populations in this study, the conflicting evolutionary processes of random genetic drift and local adaptation were likely responsible for the genetic differentiation between the populations. The general isolation-by-distance pattern of genetic diversity is also visually apparent.

Aguilar and Garza (2006) found a significant relationship between geographic distance and genetic distance in coastal *O. mykiss* using both major histocompatibility complex genes, which can be helpful in identifying salmonid population structure, and microsatellite loci. This significant relationship represented isolation through distance. Garza et al. (2014) reaffirmed that genetic variation is associated with isolation by distance using microsatellite loci from samples of coastal California steelhead. Across all coastal California steelhead populations sampled, there was evidence that population structure is dependent on geographic distance. Their phylogeographic trees also suggested that population structure was almost entirely consistent with geographic proximity.

Populations within a watershed, even those disconnected by barriers, have been shown through microsatellite DNA analyses to be more genetically similar than those in adjacent watersheds (Clement et al. 2009; Garza et al. 2014). However, anthropogenic impacts including stocking, barrier construction, and habitat destruction have resulted in weaker relationships between geographic proximity and relatedness in modern *O. mykiss* populations (Pearse et al. 2011).

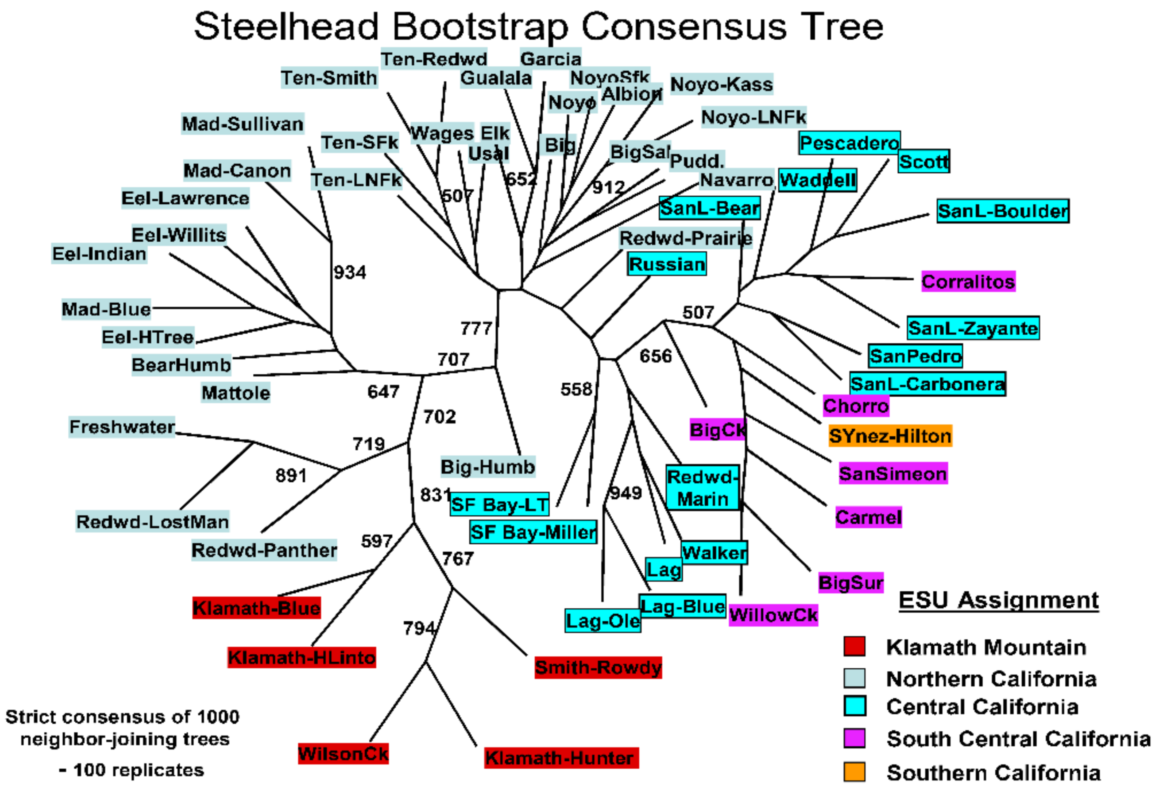

Figure 2. Majority-rule consensus tree, with genetic data bootstrapped 1,000 times, showing chord distances and neighbor-joining trees for 62 coastal California steelhead populations. (from Garza et al. 2004).

2.5.3 Genetics of the Southern California SH/RT

Busby et al. (1996) posited that the extreme environmental conditions found in southern California could result in both substantial local adaptations of and gene flow impediments between *O. mykiss* populations in the region. Nielsen (1999) hypothesized that the substantial interpopulation genetic diversity found in southern California's mostly small and somewhat isolated *O. mykiss* populations could be the result of a transitional ecotone, where two adjacent Pleistocene source populations have met and blended. Allozymes, mitochondrial DNA, and microsatellites have uncovered significant and unique genetic diversity in southern California steelhead, with traits not found in more northern populations. Busby et al. (1996) noted that a mitochondrial DNA type exists in steelhead populations between the Santa Ynez River and Malibu Creek that is rare in populations to the north, and samples from Santa Barbara County were found to be the most genetically unique of any wild coastal steelhead populations analyzed. In general, *O. mykiss* at the extreme southern end of their range have low genetic diversity (Clemento et al. 2009; Pearse et al. 2009; Jacobson et al. 2014; Abadía-Cardoso et al. 2016; Apgar et al. 2017). Loss of genetic diversity is often a consequence of declines in population size (Allendorf et al. 1997), which have been observed in Southern SH/RT populations.

2.5.4 South-Central and Southern California Genetic Relationships

Clemento et al. (2009) conducted a genetic analysis of steelhead populations in California south of Monterey Bay using microsatellite data to elucidate patterns of genetic differentiation and gene flow. In terms of coastwide population structure, the authors found that southern California steelhead populations were grouped with all other steelhead populations south of San Francisco Bay and were well-distanced from populations north of San Francisco Bay. Population genetic structure does not correspond with geographic management boundaries because genetically based population clusters are not separated by current federal-ESA-listed DPS boundaries. Overlap in clustering was detected between populations from nearby watersheds, and genetic differentiation between populations in the South-Central California Coast steelhead DPS and the southern California steelhead DPS could not be detected. Additionally, the construction of phylogeographic trees did not result in the separation of populations from the two DPSs into distinct genetic lineages based on their current ancestry (Figure 3). In populations south of San Francisco Bay, no apparent isolation by distance pattern corresponding with DPS boundaries was detected. This may be a result of metapopulation dynamics occurring between these *O. mykiss* populations. Although a lack of genetic differentiation was observed across these southern DPSs, allozymes, mitochondrial DNA, and microsatellites have uncovered significant and unique genetic diversity in southern California steelhead (see Section 3.2.2 for more information). Further, the Department recognizes other factors that define Southern SH/RT, such as unique regional biogeography, ecology, physiology, and behavior of the population groups (Boughton et al. 2007).

2.5.5 Role of Genetics in Life History Expression

Many *O. mykiss* populations are considered “partially migratory,” meaning they contain both migratory (e.g., anadromous) and non-migratory (e.g., resident) individuals (Chapman et al. 2011). It is widely accepted that migratory behavior and migration-associated traits are heritable in partially migratory populations (Pearse et al. 2014; Hecht et al. 2015; Phillis et al. 2016). In recent years, studies have revealed that important migration-related characteristics in *O. mykiss*, such as maturation, growth, development, and smolting, are linked to specific genomic regions that are under natural selection (Nichols et al. 2008; Martínez et al. 2011; Hecht et al. 2012; Miller et al. 2012; Pearse et al. 2014). Phenotypic expression of anadromy vs. residency has since been found to be strongly associated with a large genomic region on *O. mykiss* chromosome 5 (*Omy5*) (Martínez et al. 2011; Hecht et al. 2012; Pearse et al. 2014; Leitwein et al. 2017; Kelson et al. 2019). This *Omy5* migration-associated region exhibits unique alleles, associated with either anadromy or residency as their phenotypic expression, and these *Omy5* genetic variants are thought to be the result of a chromosomal inversion (Pearse et al. 2014; Leitwein et al. 2017).

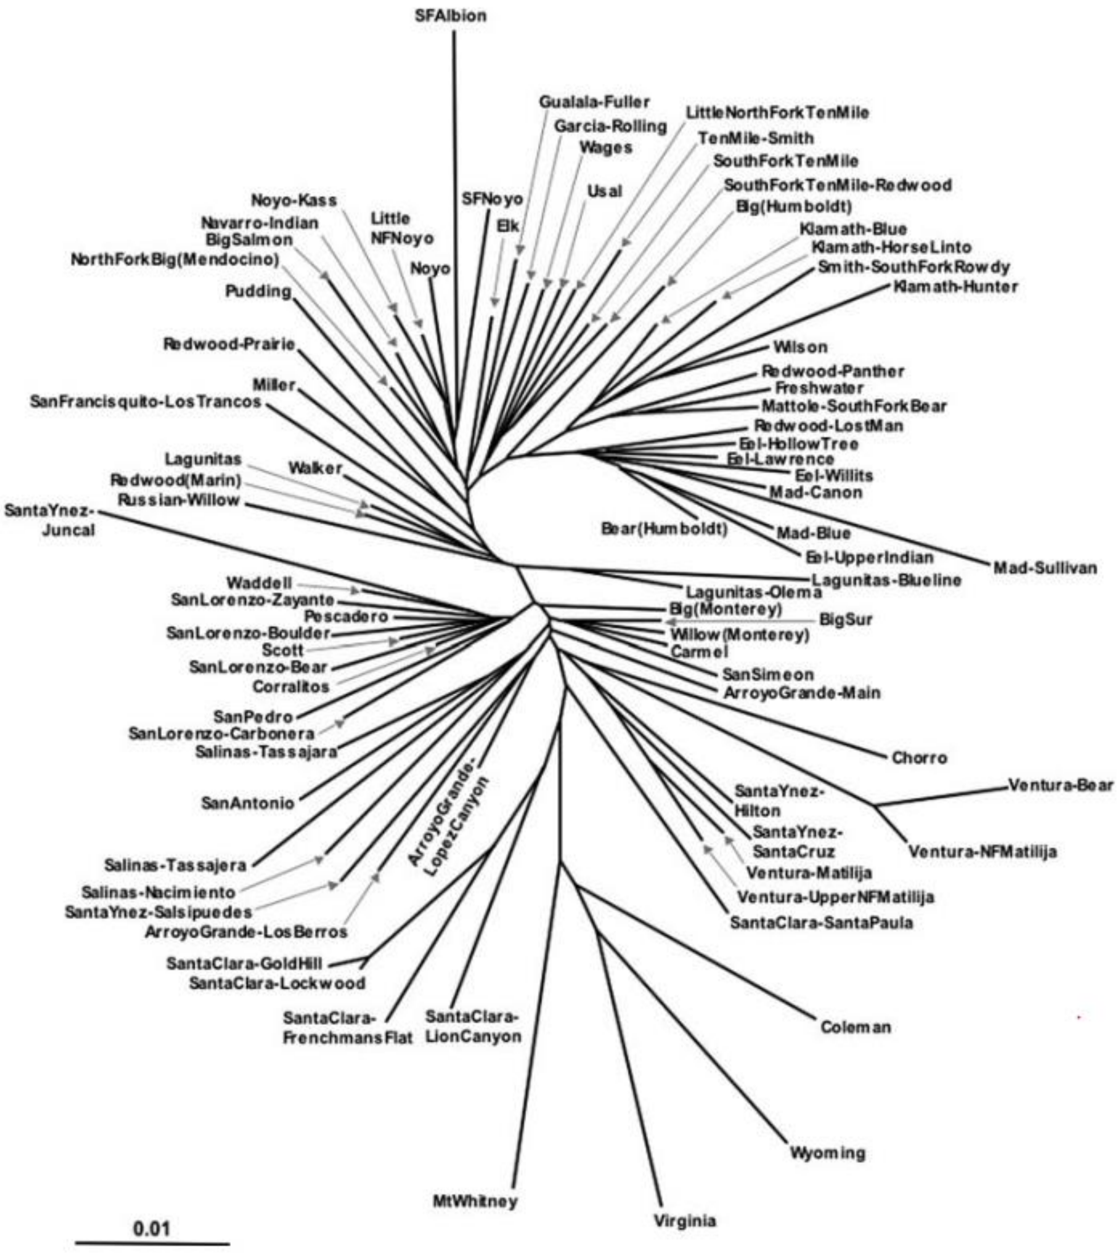

Figure 3. Unrooted neighbor-joining chord distance tree of 84 coastal O. mykiss populations in California (from Clemento et al. 2009).

Chromosome *Omy5* is associated with multiple life history characteristics related to migration vs. residency in *O. mykiss*, explaining morphological and developmental variation between the two life history forms (Nichols et al. 2008; Martínez et al. 2011; Hecht et al. 2012). Nichols et al.

(2008) used quantitative trait loci analysis to locate specific loci associated with smolting and found several genomic regions that were linked with morphological and physiological smolting indicators. The study was the first of its kind in terms of finding connections between specific genomic loci and the migration characteristics of a species of fish. In addition, Martínez et al. (2011) found multiple microsatellite markers on *Omy5* that were correlated with differential selection between anadromous and resident *O. mykiss*, while Hecht et al. (2012) identified associations between *Omy5*, body morphology, and skin reflectance, which are linked to the smolting process and the anadromous phenotype. Pearse et al. (2014) found that specific *Omy5* loci diverged between above-barrier and below-barrier *O. mykiss* populations that had differing frequencies of the anadromous phenotype.

Populations with higher potential to support anadromous or migratory individuals typically have a higher population-wide frequency of the anadromous variant of Omy5 than populations that have a higher frequency of the resident rainbow trout, such as those above manmade and natural barriers (Pearse et al. 2014; Leitwein et al. 2017). This suggests that utilizing comparative anadromous *Omy5* variant frequency data between steelhead populations may indicate which populations have a higher likelihood of producing anadromous offspring, as well as having utility in identifying above-barrier populations with the genetic potential to support or bolster downstream anadromous populations. Results from Kelson et al. (2020) suggest that the *Omy5* genomic region also regulates physiological traits, such as juvenile growth, which will subsequently influence residency vs. anadromy (Figure 4).

Sex determination has also been genetically linked to the migratory phenotype of *O. mykiss* (Rundio et al. 2012). Migratory ecotype composition within a population is typically female-dominated, a phenomenon that has been observed in multiple salmonid species (Jonsson et al. 1998; Páez et al. 2011; Ohms et al. 2014; Kelson et al. 2019) and may be due to a strong correlation between fecundity and body size (Hendry et al. 2004; Quinn 2018). Female steelhead that migrate to the ocean can grow larger in the highly productive marine environment than their counterparts in the less productive freshwater environment and, as a result, produce greater numbers of embryos. Their genetic traits, which control the anadromous ecotype, are therefore predominant in most populations.

Alternate life history ecotypes within a given watershed are typically more closely related to each other than to their life history stage equivalents in other watersheds (Nielsen and Fountain 1999; Docker and Heath 2003; Narum et al. 2004; Olsen et al. 2006; McPhee et al. 2007; Leitwein et al. 2017). These close genetic relationships indicate some degree of gene flow between sympatric life history forms of *O. mykiss* (Olsen et al. 2006; McPhee et al. 2007; Heath et al. 2008), although the level of gene flow is dependent on environmental, physiological, and genetic factors, such as watershed size and degree of reproductive isolation between life history forms (Heath et al. 2008). Regardless, the close genetic relationships between sympatric populations of steelhead and Rainbow Trout suggest that the populations interbreed and that close relatives, including full siblings, may express alternative ecotypes (or other life-history variation, e.g., adfluvial or lagoon migration). Therefore, managing individual fish with different life histories separately is biologically unjustified, and the two life history variants should be considered a single population when found coexisting in streams (McPhee et al. 2007). Additionally, freshwater resident populations can retain alleles associated with anadromy (Nielsen and Fountain 1999; Phillis et al. 2016; Apgar et al. 2017) and can contribute to the viability of anadromous *O. mykiss* populations.

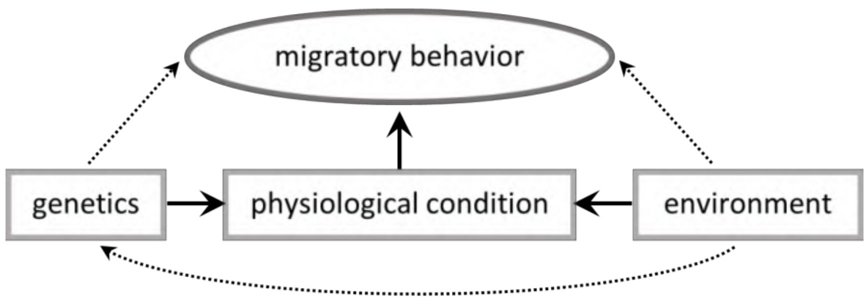

Figure 4. Schematic of indirect genetic control of migratory behavior. Genetic variation and the environment influence physiology, which then impacts migratory behavior (adapted from Kelson et al. 2020).

2.5.6 Above-Barrier vs. Below-Barrier Genetic Relationships

Studies have shown that populations of *O. mykiss,* above and below barriers within the same drainage, are closely related to one another (Heath et al. 2008; Clemento et al. 2009; Pearse et al. 2009; Leitwein et al. 2017; Fraik et al. 2021). Clemento et al. (2009) used microsatellite data to evaluate steelhead population structure above and below barriers in southern California streams and determined that populations separated by barriers are typically more closely related to each other than to populations in adjacent watersheds, consistent with many previous barrier studies. This relationship had strong bootstrap support, especially for natural-origin steelhead populations. For example, populations from the Santa Clara River formed a monophyletic lineage on the unrooted neighbor-joining tree constructed from samples taken in five main southern California watersheds (Figure 5).

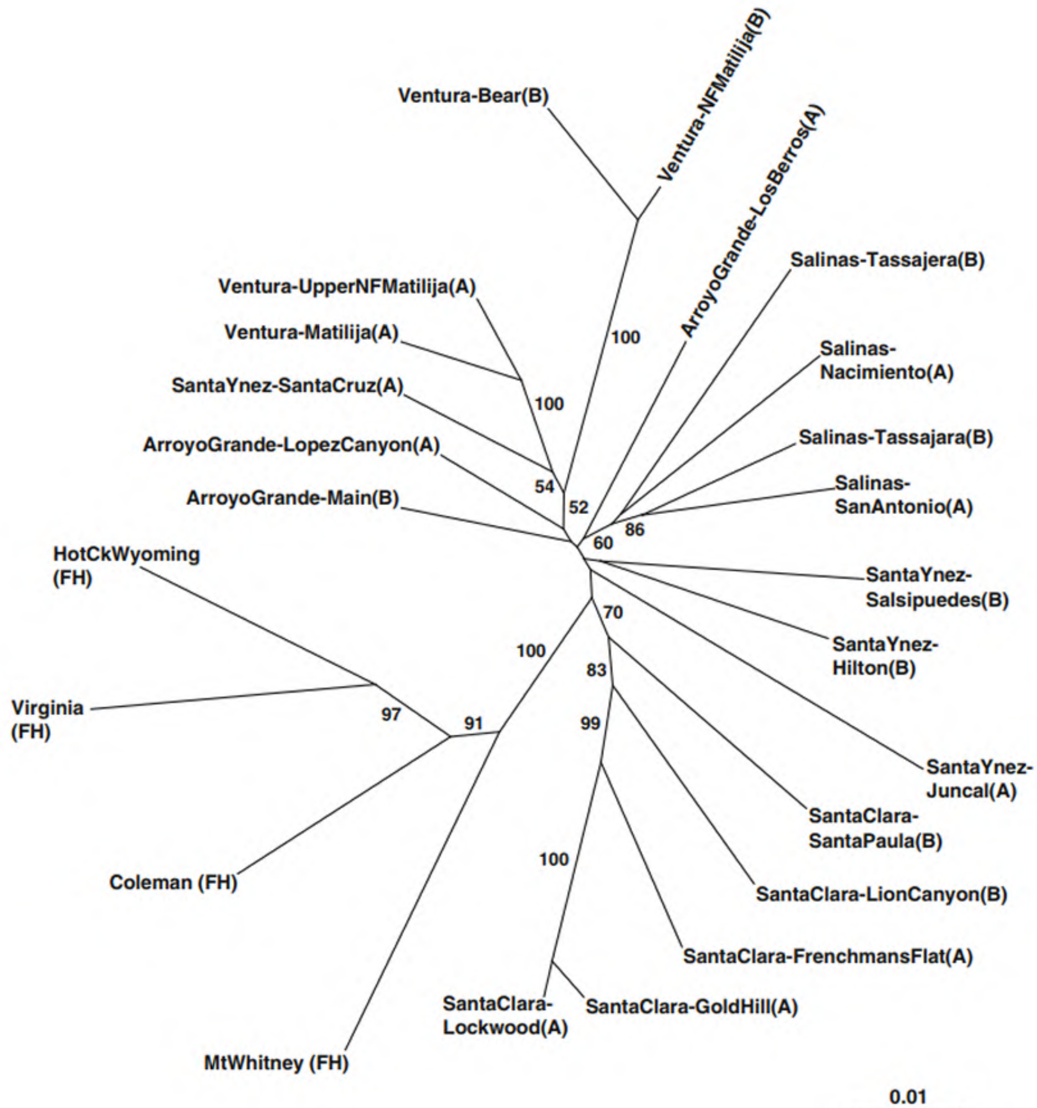

Figure 5. Unrooted neighbor-joining dendogram showing chord distances between 24 sampled naturally spawning populations both above and below barriers, denoted with A and B, respectively. Strains of Rainbow Trout from Fillmore Hatchery used for regional stocking are indicated with FH. Numbers associated with branches indicate percentage >50% of the 10,000 bootstrap replications in which the branch appeared (from Clemento et al. 2009).

Fraik et al. (2021) recently studied patterns of genetic diversity both before and after dam removal on the Elwha River (in Washington state) and determined that populations separated by natural barriers had greater genetic differentiation than those separated by long-standing dams. Following the removal of major artificial dams on the Elwha, they also detected admixture of above- and below-dam lineages and recolonization of upstream areas by steelhead.

While many fish populations separated by barriers within the same watershed have been shown to be closely related (Heath et al. 2008; Clemento et al. 2009; Pearse et al. 2009; Leitwein et al. 2017), major barriers to anadromy, both natural and artificial, have been found to prevent gene flow between populations upstream and downstream of the obstruction (Pearse et al. 2009; Abadía-Cardoso et al. 2019; Fraik et al. 2021). Multiple studies have demonstrated that there is often a discrepancy between life history expression (Nielsen 1999; Pearse et al. 2009) and associated adaptive genetic variation (Leitwein et al. 2017; Phillis et al. 2016; Apgar et al. 2017; Abadía-Cardoso et al. 2019) across major fish passage barriers. In a number of California watersheds, *O. mykiss* populations above major barriers, especially permanent artificial barriers, have shown decreased anadromous allelic frequency when compared with the population below (Leitwein et al. 2017; Phillis et al. 2016; Abadía-Cardoso et al. 2019). Likewise, in San Francisco Bay Area study streams, most above-dam *O. mykiss* populations, have significantly lower frequencies of the anadromous *Omy5* genotype than populations downstream of barriers (Leitwein et al. 2017). Abadía-Cardoso et al. (2019) also found decreased frequencies of anadromous alleles above barrier dams in the American River drainage.

Reduced migratory allelic frequency in fish populations above longstanding natural barriers is the expected condition since the population is fragmented and gene flow is unidirectional. Fish can almost always move, either passively or volitionally, over barriers in the downstream direction, potentially contributing genes to the downstream population. Those that inhabit waters upstream of permanent barriers either assume a resident life history or must migrate downstream, taking migratory alleles with them and further reducing their frequency in the upstream population (Leitwein et al. 2017). It is also important to note that some above-barrier fish populations exhibit less genetic diversity (lower heterozygosity) than their below-barrier counterparts within the same drainage (Martínez et al. 2011). In some cases, however, fish carrying anadromous alleles may not be able to move downstream over barriers, especially large artificial dams and other complete barriers, which may help maintain anadromous *Omy5* variants in some above-dam populations (Leitwein et al. 2017; Pearse et al. 2014). It also appears that some large, above-barrier reservoirs can act as “surrogate oceans” and may assist in the retention of anadromous genotypes and the expression of the adfluvial life history type (Leitwein et al. 2017). However, a reservoir environment imposes different selective pressures than migration to the northern Pacific Ocean, and therefore we would expect the anadromous genotype to be changed over time and eventually lose its ability to express a successful anadromous phenotype.

Apgar et al. (2017) recently investigated the effects of climate, geomorphology, and fish passage barriers on the frequency of migration-associated alleles in *O. mykiss* populations across four California steelhead federal-ESA-listed DPSs (Southern California, South-Central

California Coast, Central California Coast, and Northern California). Long-term natural barriers and artificial dams that provide no fish passage had the most pronounced negative impact on migration-associated allele frequency. Southern California DPS populations had the lowest frequency of *Omy5* haplotypes associated with anadromy of all California DPSs sampled. The Southern California DPS also exists in a number of heavily developed watersheds, with the greatest average number of partial and complete artificial barriers of the DPSs sampled. Removal of these barriers was predicted to substantially increase the frequency of anadromous alleles in southern California watersheds (Apgar et al. 2017).

2.5.7 Genetic Impacts of Historical Stocking

Clemento et al. (2009) conducted a genetic analysis using microsatellite loci to elucidate the genetic population structure of *O. mykiss* in southern California, with an emphasis on above- and below-barrier genetic relationships. Their analysis included an evaluation of genetic influences of long-standing Fillmore Hatchery stocking on naturally spawned populations in the region. In regional population structure analysis, Fillmore Hatchery Rainbow Trout strains clustered separately from all wild populations, both above and below barriers. This dispersal pattern indicates that there was no evidence of hatchery introgression with wild *O. mykiss* within the Southern SH/RT range (Clemento et al. 2009).

Abadía-Cardoso et al. (2016) used microsatellite and SNP loci to elucidate *O. mykiss* ancestry at the extreme southern extent of its range. Most samples collected for this study were from populations above anadromous barriers, which mostly precludes any analysis of Southern SH/RT genetic lineage pertinent to the proposed CESA listing unit, which includes only below barrier *O. mykiss*. The evaluated southern California *O. mykiss* populations had lower genetic diversity than other California steelhead populations and, genetically, most resembled hatchery Rainbow Trout. The most northern of the evaluated populations of the Southern SH/RT exist in the Santa Maria, Santa Ynez, and Santa Clara rivers, all of which exhibit genetics associated with the native coastal steelhead lineage, matching the results of Clemento et al. (2009) and Nielsen et al. (1997). Many of the more southern populations have been almost entirely replaced by hatchery produced Rainbow Trout, and only select populations in the San Luis Rey River, Coldwater Canyon Creek, the Santa Ana River watershed, and the San Gabriel River were found to have significant native coastal steelhead ancestry. Based upon these findings, the authors recommended that conservation planning focus on these populations for the preservation of native coastal lineages. These populations also had shared ancestry with the native coastal *O. m. nelsoni* from Baja California. Secondarily, they identified Bear Creek and Devil's Canyon Creek as high value populations with remnant, detectable levels of native ancestry. Also, in contrast to northern coastal steelhead populations, southern California *O. mykiss* showed low allelic frequency correlated with anadromy at *Omy5* loci, again consistent with extensive introgressive hybridization with hatchery Rainbow Trout and limited opportunities to express the anadromous life history. Low genetic variation, observed in populations with predominantly native ancestry, may not allow them to endure changes in environmental conditions, particularly rapid and dramatic changes like those being driven by escalating climate change impacts to the region. Abadía-Cardosa et al (2016) further recommended a managed translocation strategy between the few remaining southern populations with native ancestry to help slow the erosion of native genetic diversity. They found a high variability in the frequency of alleles associated with anadromy, suggesting that many populations of Southern RT/SH may maintain the capability to express the anadromous phenotype.

Nuetzel et al (2019) examined population genetic structure of *O. mykiss* populations in the Santa Monica Mountains BPG using a set of SNP markers. Specifically, they conducted genetic analyses of *O. mykiss* from Topanga, Malibu and Arroyo Sequit creeks and compared SNP data to the existing data from the Abadía -Cardosa et al (2016) study, including Omy5 genetic marker data. Their results indicate that Malibu Creek trout are almost entirely of native ancestry. The analysis of Topanga Creek trout was more complex, suggesting that Topanga Creek is a predominantly unique native population with some introgressive hybridization with hatchery Rainbow Trout. The authors did not have a sufficient sample size from Arroyo Sequit Creek to draw meaningful inferences about the ancestry of that population. Both Malibu and Topanga creeks were also found to have relatively high frequencies of the anadromous Omy5 alleles. Together, both of these populations can be a valuable genetic resource for recovery of southern California native coastal *O. mykiss*.

3. ASSESSMENT OF PROPOSED CESA LISTING UNIT

The Commission has authority to list species or subspecies as endangered or threatened under CESA (Fish and G. Code, §§ 2062, 2067). The Legislature left to the Department and the Commission, which are responsible for providing the best scientific information and for making listing decisions, respectively, the interpretation of what constitutes a “species or subspecies” under CESA (*Cal. Forestry Assn. v. Cal. Fish and G. Com.* (2007) 156 Cal.App.4th 1535, 1548-49). The Department has recognized that similar populations of a species can be grouped for efficient protection of bio- and genetic diversity (*id.* at 1546-47). Further, genetic structure and biodiversity in California populations are important because they foster enhanced long-term stability (*id*. at p. 1547). Diversity spreads risk and supports redundancy in the case of catastrophes, provides a range of raw materials that allow adaptation and persistence in the face of long-term environmental change, and leads to greater abundance (*ibid*.).

Courts should give a “great deal of deference” to Commission listing determinations supported by Department scientific expertise (*Central Coast Forest Assn. v. Fish & Game Com.* (2018) 18

Cal.App.5th 1191, 1198-99). Courts have held that the term "species or subspecies" includes ESUs (*id*. at 1236, citing *Cal. Forestry Assn.*, 156 Cal.App.4th at pp. 1542 and 1549). The Commission's authority to list necessarily includes discretion to determine what constitutes a species or subspecies (*id.* at p. 1237). The Commission's determination of which populations to list under CESA goes beyond genetics to questions of policy (*ibid.*). The Department and Commission's determinations of what constitutes a species or subspecies under CESA are not subject to the federal ESA, regulations based on the federal ESA, or federal ESA policies adopted by NMFS or USFWS, but those sources may be informative and useful to the Department and Commission in determining what constitutes a species or subspecies under CESA.

The ESU designation has been used for previous Pacific salmon listings under CESA, including the Sacramento River Winter-run Chinook Salmon ESU (Endangered, 1989), the Central Valley Spring-run Chinook Salmon ESU (Threatened, 1999), Southern Oregon-Northern California Coast Coho Salmon ESU (Threatened, 2005), and the Central California Coast Coho Salmon ESU (Endangered, 2005). In 2022, the Commission listed northern California summer steelhead as endangered under CESA. In support of that listing, the Commission determined that the petitioned listing unit qualified as a subspecies under CESA "based on the discreteness (when compared to other ecotypes) and significance of that listing unit within the state of California" (Cal. Fish and G. Com. 2022).

3.1 DPS and ESU Criteria

The federal ESA defines "species" to include "any subspecies of fish or wildlife or plants, and any distinct population segment of any species of vertebrate fish or wildlife which interbreeds when mature" (16 U.S.C. § 1532). In 1991, NMFS adopted its policy on how it would apply the definition of "species" to Pacific salmon stocks for listing under the ESA. Under the NMFS ESU Policy, a salmon stock is considered a DPS if it constitutes an ESU of the biological species. To be considered an ESU, the salmon stock must meet two criteria (NMFS 1991):

1. "It must be substantially reproductively isolated from other conspecific population units; and
2. It must represent an important component in the evolutionary legacy of the species."

Generally, reproductive isolation does not have to be absolute, but it must be strong enough to permit evolutionarily important differences to accrue in different population units (NMFS 1991). The evolutionary legacy of a species refers to whether the population contributes substantially to the ecological and genetic diversity of the species as a whole (NMFS 1991).

In February 1996, USFWS and NMFS published a joint DPS policy for the purposes of ESA listings. Three elements are evaluated in a decision regarding the determination of a possible DPS as endangered or threatened under the ESA. These criteria are (NMFS 1996a):

1. "Discreteness of the population segment in relation to the remainder of the species to which it belongs;
2. The significance of the population segment to the species to which it belongs; and
3. The population segment's conservation status in relation to the [federal ESA's] standards for listing (i.e., is the population segment, when treated as if it were a species, endangered or threatened [under the federal ESA's standards])."

A population segment is discrete if it meets either of two conditions specified in the DPS Policy (NMFS 1996a):

1. "It is markedly separated from other populations of the same taxon as a consequence of physical, physiological, ecological, or behavioral factors. Quantitative measures of genetic or morphological discontinuity may provide evidence of this separation.
2. It is delimited by international governmental boundaries within which differences in control of exploitation, management of habitat, conservation status, or regulatory mechanisms exist that are significant in light of Section 4(a)(1)(D) of the [ESA]."

If a population segment is determined to be discrete based on physical, physiological, ecological, or behavioral factors, its significance and status are then evaluated based on several characteristics specified in the joint DPS Policy. These include, but are not limited to (NMFS 1996a):

1. "Persistence of the discrete population segment in an ecological setting unusual or unique for the taxon.
2. Evidence that loss of the discrete population segment would result in a significant gap in the range of a taxon.
3. Evidence that the discrete population segment represents the only surviving natural occurrence of a taxon that may be more abundant elsewhere as an introduced population outside its historic range.
4. Evidence that the discrete population segment differs markedly from other populations of the species in its genetic characteristics."

Under the DPS Policy, if a population segment is found to be both discrete and significant, its status is then evaluated for listing based on listing factors established by the federal ESA.

3.2 Southern SH/RT Evaluation under the Joint DPS Policy

The proposed listing unit (Southern SH/RT) in the Petition is "all *O. mykiss* below manmade and natural complete barriers to anadromy, including anadromous and resident life histories, from and including the Santa Maria River (San Luis Obispo and Santa Barbara counties) to the U.S.-Mexico Border." Southern SH/RT is a subtaxon of the species *O. mykiss*. The anadromous life history of Southern SH/RT is not markedly separate from the non-anadromous life history of Southern SH/RT below manmade and natural barriers to anadromy. To determine whether Southern SH/RT is a subspecies for the purposes of CESA listing, the Department used the joint DPS Policy to determine whether Southern SH/RT is a DPS. The Department evaluated the proposed listing unit by applying the first (discreteness) and second (significance) criteria of the joint DPS Policy but not the third criterion (the population segment's conservation status in relation to the federal ESA's standards). The Department did not apply the third criterion because after using the discreteness and significance criteria to determine whether Southern SH/RT is a DPS and hence a subspecies for purposes of CESA, the Department will assess the listing unit's status in relation to CESA's standards rather than the federal ESA's standards.

In 2006 NMFS concluded that application of the joint DPS Policy to West Coast *O. mykiss*, including the Southern California Steelhead DPS, was logical, reasonable, and appropriate (NMFS 2006). Further, NMFS concluded that use of the ESU Policy, which was originally intended for Pacific salmon, should not continue to be applied to *O. mykiss*, a type of salmonid with characteristics not typically exhibited by Pacific salmon (NMFS 2006). The Department finds that the application of the discreteness and significance DPS criteria from the DPS Policy is appropriate, logical, and reasonable for identifying whether Southern SH/RT is a subspecies for purposes of CESA because the taxon exhibits characteristics that are not typically exhibited by other Pacific salmonids, for which the ESU policy was developed.

3.2.1 Discreteness

Markedly Separate: Yes. The Department considers Southern SH/RT to be markedly separate from other populations of the taxon along the West Coast of North America based on unique regional biogeography, ecology, physiology, and behavior of Southern SH/RT. Point Conception in southern California is a well-studied biogeographic boundary that separates different physical oceanographic processes and the abundance and distribution of many marine species (Horn and Allen 1978; Horn et al. 2006; Miller 2023). The coastal areas north of Point Conception have cooler water temperatures, stronger upwelling, high nutrient concentrations, and the coastline is generally rocky. Within the southern California Bight, water temperatures are warmer, upwelling is weaker, and the coastline is typically sandy. While intraspecific genetic breaks do not always coincide with biogeographic boundaries near Point Conception (Burton

1998), the Department maintains that the DPS standards for discreteness do not require absolute separation of a DPS from other members of this species, because this can rarely be demonstrated in nature for any population of organisms (NMFS 1996a).

The life history of Southern SH/RT relies more heavily on seasonal precipitation than populations of the same taxon occurring farther north (Busby et al. 1996). Because average precipitation is substantially lower and more variable and erratic in southern California than regions to the north, Southern SH/RT are more frequently exposed to adverse environmental conditions in marginal habitats (i.e., warmer water temperatures, droughts, floods, wildfire) (Busby et al. 1996). Morphologically, anadromous forms of Southern SH/RT are typically longer in length and more streamlined in shape than more northern populations to enable passage through southern California's erratic and low streamflow watersheds (Moyle et al. 2017).

The Department also considers Southern SH/RT to be markedly separate from above-barrier populations of *O. mykiss* in watersheds that are within the geographic scope of the proposed listing unit, because these above-barrier populations do not contribute substantially to the below-barrier populations of Southern SH/RT. Despite several studies showing that above and below barrier *O. mykiss* populations within the same drainage are closely related, major artificial and natural barriers to anadromy prevent migration and gene flow between these populations (Heath et al. 2008; Clemento et al. 2009; Pearse et al. 2009; Abadia-Cardoso et al. 2019; Fraik et al. 2021). Disconnection between populations is further illustrated by the fact that a number of above-barrier *O. mykiss* populations exhibit reduced migratory allelic frequency compared to below-barrier Southern SH/RT. This is particularly true for *O. mykiss* populations in southern California, where long-standing natural and artificial barriers that impede fish passage have led to a lower frequency of migratory alleles associated with anadromy than in populations further north (Apgar et al. 2017).

International Border: No.

3.2.2 Significance

Unique Ecological Setting: Yes. The range of Southern SH/RT represents one of the southernmost regions of the taxon's entire West Coast Range of North America. Within this range, the watersheds that occur south of the Santa Monica Mountains have a semi-arid climate that is characterized by low precipitation, high evaporation rates, and hot and dry summers (CDFW 2021d). This climate type represents a unique ecological setting for Southern SH/RT relative to most *O. mykiss* populations along the West Coast of North America that occur in Mediterranean climates characterized by summer fog.

The ecological setting for Southern SH/RT is characterized by significant urbanization which is unique among many other federally listed steelhead DPSs that occur in coastal regions of California that are not as highly developed or populated. For example, approximately 22 million people reside in the southern California counties of Santa Barbara, Ventura, Los Angeles, Orange, San Bernardino, Imperial, and San Diego, whereas the population in the South-Central coast counties of Santa Cruz, Santa Clara, Monterey, San Benito, and San Luis Obispo is approximately 2.8 million people (NMFS 2012a; NMFS 2013). Furthermore, almost all Southern SH/RT-bearing watersheds contain dams and water diversions that have blocked access to most historic spawning and rearing habitats. Of the four DPSs sampled by Apgar et al. (2017), the Southern California Steelhead DPS contained the highest average number of partial anthropogenic barriers per watershed (n = 4.7) and the highest total number of complete anthropogenic barriers (n = 8). For context, the neighboring, and more northern South-Central Coast DPS contains a significantly lower average number of partial anthropogenic barriers per watershed (n = 1.6) and complete anthropogenic barriers (n = 1). Moreover, nearly all estuary and lagoon ecosystems in southern California have been severely degraded, thereby limiting the ability of juvenile Southern SH/RT to utilize these critical nursery habitats (Moyle et al. 2017). While these anthropogenic threats are not necessarily unique to the southern California coastal area, the region's highly variable and erratic hydrologic cycle and relatively arid climate, combined with the impacts of climate change, make Southern SH/RT increasingly vulnerable to extinction and less resilient to disturbance events and catastrophic events such as major wildfires and floods.

Gap in Range: Yes. The Department maintains that the loss of Southern SH/RT would result in a significant truncation of the southern range of the taxon along the West Coast of North America. The range of Southern SH/RT encompasses approximately 12,700 square miles with 25,700 miles of streams (NMFS 2012a).

Only Surviving Natural Occurrence: No.

Markedly Different Genetic Characteristics: No. Individuals from populations of Southern SH/RT have been shown to not be genetically isolated from populations of *O. mykiss* in the south-central California coast (Clemento et al. 2009). Evidence of straying has been documented in steelhead in central California (Donohue et al. 2021), and genetic population structure analyses suggest that there was historical exchange of genetic information between coastal populations (Garza et al. 2014). Although many steelhead populations can be partially isolated, at least a small amount of exchange between different populations of steelhead is to be expected due to natural straying. This connectivity results in a level of genetic similarity, which is more pronounced between neighboring populations, and prevents most populations from being completely isolated (Bjorkstedt et al. 2005; Garza et al. 2014; Arciniega et al. 2016).

Nonetheless, allozymes, mitochondrial DNA, and microsatellites have uncovered significant and unique genetic diversity in southern California steelhead, including traits not found in more northern populations. Busby et al. (1996) noted that a mitochondrial DNA type exists in *O. mykiss* populations between the Santa Ynez River and Malibu Creek that is rare in populations to the north, while samples from Santa Barbara County were found to be the most genetically unique of any wild coastal steelhead populations analyzed. Conservation of both neutral and adaptive genetic diversity, such genetic variation associated with migratory life history, is crucial in maintaining the ability of *O. mykiss* populations to adapt to altered environments. Given that Southern SH/RT populations have the lowest frequencies of anadromous genotypes, it is critical to preserve this genetic variation and ensure no more of it is lost.

3.2.3 Conclusion

Southern SH/RT satisfies the first (discreteness) and second (significance) criteria of the joint DPS Policy: i.e., Southern SH/RT is markedly separate and biologically significant to the taxon to which it belongs. Accordingly, the Department concludes that Southern SH/RT is a DPS and hence a subspecies for the purposes of CESA listing.

4. POPULATION TRENDS AND ABUNDANCE

4.1 Structure and Function of Viable Salmonid Populations

In this review, we use the definition of “population” from McElhany et al. (2000): “An independent population is a group of fish of the same species that spawns in a particular lake or stream (or portion thereof) at a particular season and which, to a substantial degree, does not interbreed with fish from any other group spawning in a different place, or in the same place at a different season.” In other words, a population as defined by McElhany et al. (2000) is a group of fish that experiences a substantial degree of reproductive isolation.

Steelhead have strong fidelity to their natal stream, which can lead to substantial reproductive isolation and, as a result, create local adaptation within somewhat isolated populations (Waples et al. 2008). Isolation can expose these local populations to varying degrees of genetic drift as well as different environmental pressures that ultimately lead to the development of genetic and phenotypic differences. Although many steelhead populations can be partially isolated, at least a small amount of exchange between different populations of steelhead is to be expected due to natural straying. This connectivity results in a level of genetic similarity, which is more pronounced between neighboring populations, and prevents most populations from being completely isolated (Bjorkstedt et al. 2005; Garza et al. 2014; Arciniega et al. 2016).

The concept of viable salmonid populations was introduced by McElhany et al. (2000). A viable salmonid population is defined as, “an independent population of any Pacific salmonid (genus *Oncorhynchus*) that has negligible risk of extinction due to threats from demographic variation, local environmental variation, and genetic diversity changes over a 100-year time frame,” and an independent population is defined as, “any collection of one or more local breeding groups whose population dynamics or extinction risk over a 100-year time period are not substantially altered by exchanges of individuals with other populations.”

McElhany et al. (2000) introduced four criteria for assessing viability of salmonid populations: abundance, productivity, population spatial structure, and diversity. These parameters form the foundation for evaluating population viability because they serve as reasonable predictors of extinction risk, reflect general processes important to all populations of species, and are measurable. Abundance is a key parameter because smaller populations are at greater risk of extinction than larger populations. Productivity, which is associated with abundance, serves as an indicator of population growth rate either over an entire life cycle or stage-specific life-history stage. Population spatial structure represents the distribution of individuals in habitats they use throughout their life cycle, as well as the processes that generate that distribution. Spatial structure often reflects the amount of suitable habitat available for a population as well as demographic stability and the level of straying among habitats. Diversity represents variation in traits such as anadromy, run-timing, and spawning behavior and timing. Typically, a more diverse population is more likely to contain individuals that will survive and reproduce in the face of environmental variation (McElhany et al. 2000). In this chapter, we evaluate, to the best of our ability, these four criteria for Southern SH/RT populations.

4.2 Sources of Information

We reviewed many sources of information for this Status Review, including primary research and literature review articles, the CESA listing petition, previous federal status reviews, recovery plans, viability assessments, Department reports and documents, annual reports from ongoing Southern SH/RT monitoring efforts, and historical reports. Agency staff with knowledge of watersheds supporting Southern SH/RT were also consulted for information.

Data limitations and uncertainties associated with historical accounts for Southern SH/RT limits our ability to understand their complete historical abundance and distribution in their range. The majority of available historical data are in reports, technical memos, and other documents that have not undergone a formal peer-review process. These types of historical sources are not necessarily at a high level of scientific rigor and have not been subject to peer review, but they represent the best information available at the time of this review regarding the historical distribution and abundance of Southern SH/RT populations.

Multiple data sources were used to evaluate viability metrics of Southern SH/RT populations. These data are mostly derived from monitoring reports from several single-basin annual survey efforts. For example, data for the Santa Ynez River population was sourced from monitoring reports developed by the Cachuma Operations and Maintenance Board (COMB). Data for the Ventura River was sourced from annual monitoring reports produced by Casitas Municipal Water District (CMWD), and data contained in Booth (2016) for the United Water Conservation District (UWCD) was used for the Santa Clara River population (See Appendices A – D for full data sources). Although data from these monitoring reports represent the best available scientific information in many southern California watersheds, the data may be derived from different monitoring approaches and designs, contain detection bias, and vary in the level of monitoring effort through time and geographic areas. These constraints may limit the power of statistical analyses to assess trends in viability criteria. Therefore, the results of the analyses conducted in subsequent portions of this chapter should be interpreted in the context of these limitations.

Dagit et al. (2020) describes the occurrences of adult steelhead from 1994-2018 and was also used as a source of peer-reviewed information to provide insight into the abundance trends of Southern SH/RT, particularly for the basins south of Los Angeles where historically no monitoring of steelhead occurred. Additional information on the data sources used in this chapter can be found in Appendices A - D. and Dagit et al. (2020).

4.3 Historical and Current Distribution

This section discusses the historical and current distribution of Southern SH/RT within their range. The section is structured on the five BPGs, which are a federal delineation based on a suite of environmental conditions (e.g., hydrology, local climate, geography) and watershed characteristics (i.e., large inland or short coastal streams) (NMFS 2012a). Separate watersheds within each BPG are considered to support individual populations of southern SH and RT; therefore, single BPGs encompass multiple watersheds and populations (Figure 6). Additional information on southern SH/RT distribution in watersheds not included in this section can be found in Good et al. (2005), Becker and Reining (2008) and Titus et al. (2010). In general, estimates of historical population abundance are based on sparse data and assumptions that are plausible but have yet to be adequately verified or tested. While the following historical estimates are likely biased either upward or downward, the examination of historical records of adult run size in southern California show consistent patterns of abundance that are at least two or three orders of magnitude greater in size than in recent years.

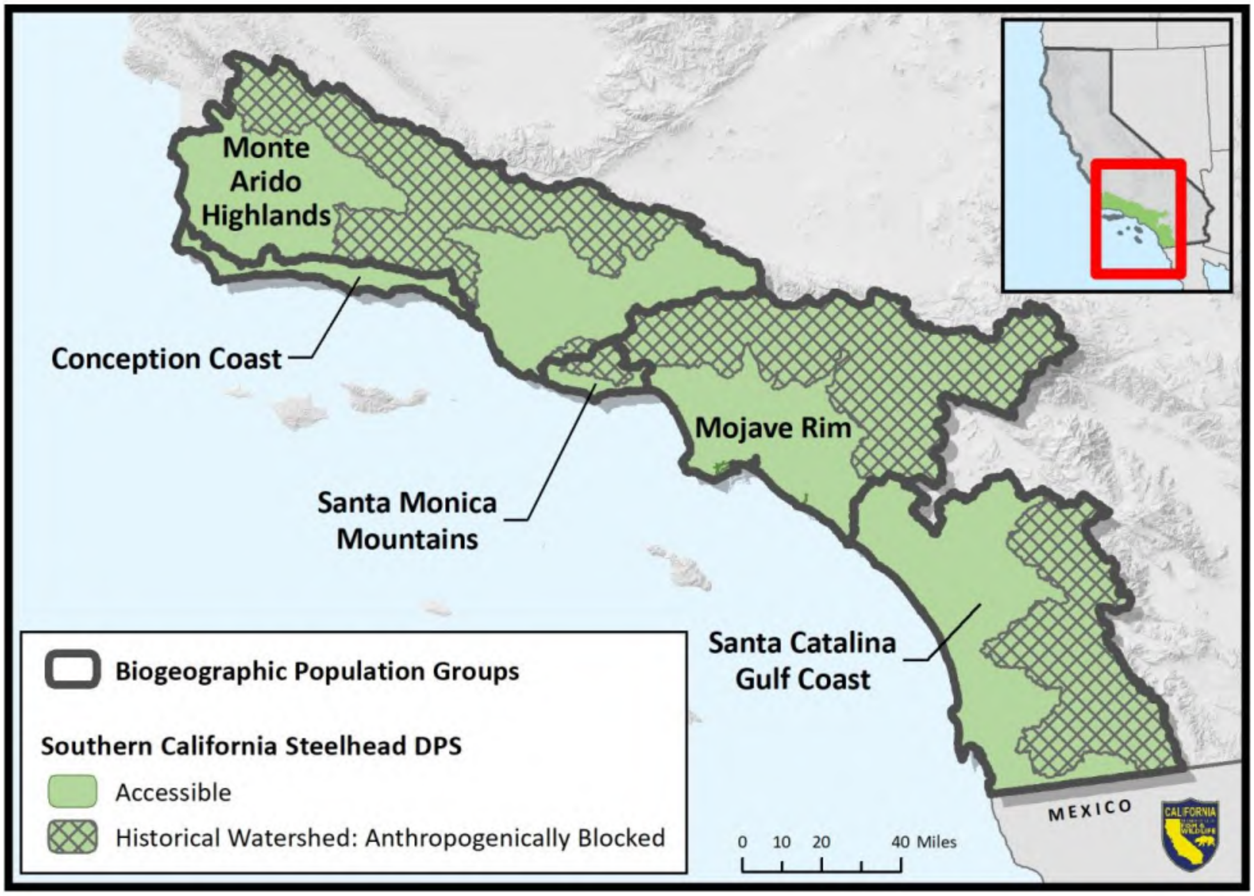

Figure 6. Map of the current and historical distribution of Southern SH/RT. BPGs represented are the Monte Arido Highlands, Conception Coast, Santa Monica Mountains, Mojave Rim, and Santa Catalina Gulf Coast.

4.3.1 Monte Arido Highlands Biogeographic Population Group

The Monte Arido Highlands BPG includes four watersheds spanning San Luis Obispo, Santa Barbara, Ventura, and northern Los Angeles counties draining the west side of the Transverse Range and terminating at the Pacific Ocean (NMFS 2012a; Figure 7). Inland stretches of these watersheds are high in elevation and mountainous, but otherwise the watersheds contain different geographic features. Watersheds in this BPG are susceptible to “flashy” flows with seasonal storms and can also dry during the summer even in mainstem reaches. Perennial flows are mainly found in the upper reaches of tributaries that still retain groundwater connection (NMFS 2012a).

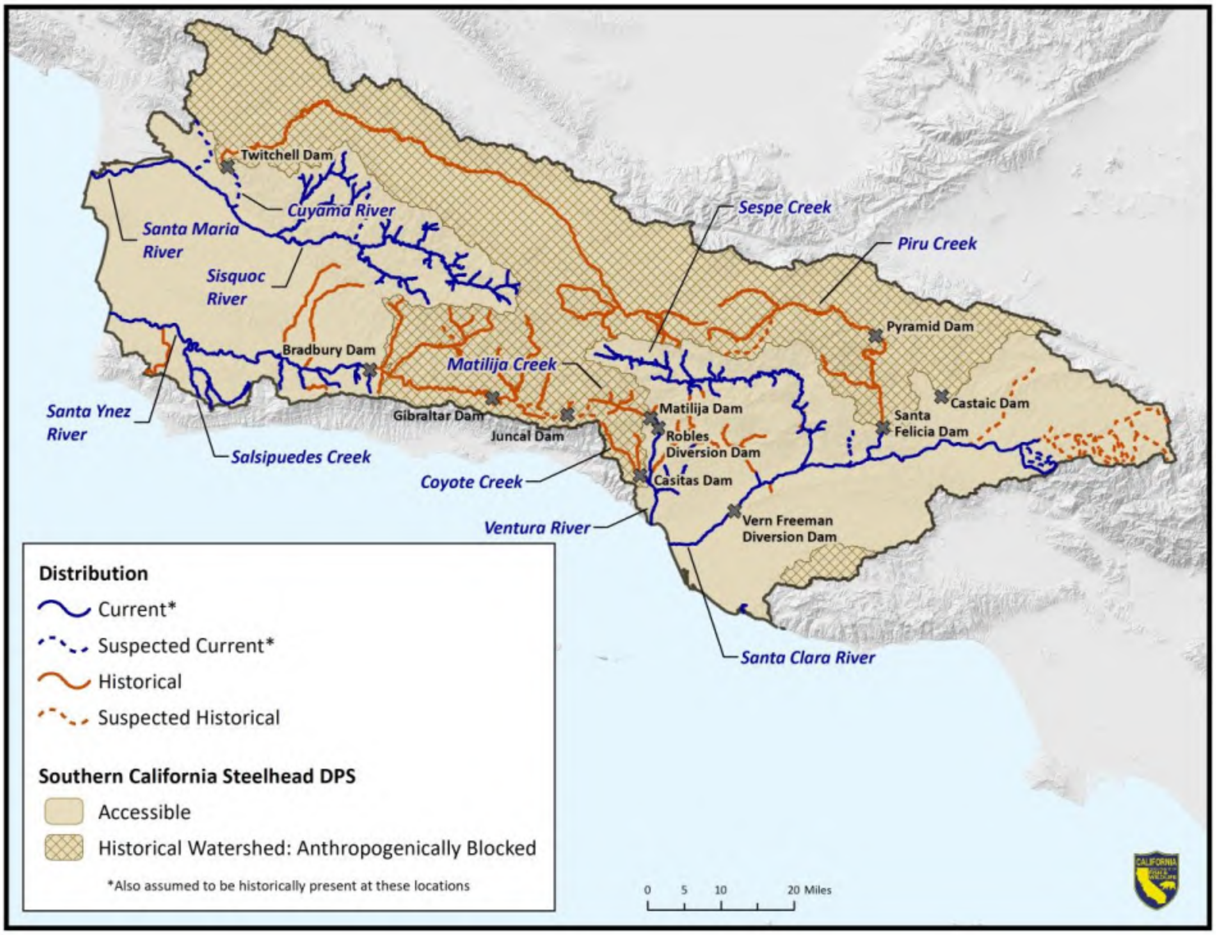

Figure 7. Map of the Monte Arido Highlands BPG depicting known and suspected current and historical distribution.

4.3.1.1 Santa Maria River

The Santa Maria River runs from the confluence of the Cuyama and Sisquoc rivers to the ocean and encompasses 1,790 square miles of watershed (Becker and Reining 2008). Historically, the Santa Maria River served mainly as a corridor for steelhead migrating to and emigrating from the Cuyama and Sisquoc rivers, rather than as habitat for spawning and rearing (Titus et al. 2010).

Hatchery stocking of *O. mykiss* occurred in the early 1930s in the Sisquoc and Cuyama watersheds (Titus et al. 2010). However, local newspaper records from the late 1800's reported abundant harvests of *O. mykiss* in the Sisquoc River watershed well before hatchery stocking occurred (Camm Swift, Emeritus, Section of Fishes, Natural History Museum of Los Angeles County, personal communication). In the early to mid-1940s, juvenile steelhead from the Santa Ynez River were rescued and translocated to the Santa Maria River. Tributaries of the Cuyama

River were stocked with Rainbow Trout in the 1940s to support recreational fishing; however, it is unknown if there was a historical run of anadromous Southern SH/RT in the Cuyama River tributaries (Titus et al. 2010). Starting in 1950, there was essentially no steelhead fishery for at least a decade (Titus et al. 2010).

The Sisquoc River had a robust population of resident *O. mykiss* in 1959 (Becker and Reining 2008) and fish were seen in smaller numbers in 1964 (Titus et al. 2010). Southern SH/RT of multiple age classes were also observed in the upper river during the 1990s (Becker and Reining 2008). In 2005, substantial numbers of young-of-the-year (YOY) *O. mykiss*, as well as some older age classes, were observed in the upper Sisquoc watershed during a population survey (Stoecker 2005).

Other smaller tributaries in the Santa Maria watershed, mostly tributaries of the Sisquoc and Cuyama rivers, have had limited historical and present *O. mykiss* observations from surveys, although some anecdotal sightings have occurred (Becker and Reining 2008). The streams include Deal Canyon Creek, Reyes Creek, Beartrap Creek, Tepusquet Creek, La Brea Creek, North Fork La Brea Creek, Manzana Creek, Davy Brown Creek, Munch Canyon Creek, Sunset Valley Creek, Fish Creek, Abel Canyon Creek, South Fork Sisquoc River, White Ledge Canyon Creek, Rattlesnake Canyon Creek, and Big Pine Canyon Creek. Some of these *O. mykiss* observations were made in tributaries of the Cuyama River post-dam construction (Becker and Reining 2008); however, it is possible that anadromous Southern SH/RT were able to access and inhabit these areas historically. Notably, many of these small tributaries were stocked with thousands of hatchery-raised *O. mykiss* in the mid-1900s for fishery supplementation (Titus et al. 2010).

Twitchell Dam was built on the Cuyama River in the late 1950s, almost 8 miles upstream from the confluence with the Santa Maria River. The dam currently impacts hydrologic function of the Santa Maria system by increasing the frequency of “false positive” migration flows in the Sisquoc River, reducing the frequency of downstream passable migration conditions, increasing the number of days with upstream passable flows that are not followed by additional days of passable flows, and reducing the frequency of long-duration migration flows (Becker and Reining 2008; Stillwater Sciences 2012). Twitchell Dam is a complete barrier to anadromy, and historically, water releases have not been regulated to provide instream flows for upstream and/or downstream steelhead migration in the Santa Maria River during the winter and spring migration periods (Stoecker 2005). Following construction of the dam, the Santa Maria and Cuyama rivers continue to have intermittent flows (Becker and Reining 2008). Currently, the lower mainstem of the Santa Maria River, which serves as a migration corridor for Southern SH/RT, is dry most of the year in most years due to managed aquifer recharge in the Santa Maria Valley (NMFS 2012a). The U.S. Court of Appeals for the Ninth Circuit recently held that under the legislation authorizing construction of Twitchell Dam, the U.S. Bureau of Reclamation and the Santa Maria Water District have discretion to manage and operate Twitchell Dam for the purpose of preventing take of Southern California Steelhead under the federal ESA, which may include adjusting water discharges to support their migration and reproduction (*San Luis Obispo Coastkeeper v. Santa Maria Valley Water Conservation Dist.* (9th Cir. 2022) 49 F.4th 1242, 1244). The case was remanded to the U.S. District Court for the Central District of California (*id.* at 1250), which adopted a pilot project involving supplemental flow releases, to be implemented while consultation under the federal ESA is conducted (*San Luis Obispo Coastkeeper et al. v. Santa Maria Valley Water Conservation Dist. et al.*, Case No. 2:19-CV-08696-AB-JPR, Dkt. No. 167 (October 12, 2023)).

4.3.1.2 Santa Ynez River

The Santa Ynez River is a major watershed spanning approximately 900 square miles and 90 river miles (Becker and Reining 2008). The river is thought to have supported the largest anadromous Southern SH/RT run (Titus et al. 2010). The earliest records of Southern SH/RT in the Santa Ynez occurred in the late 1800s prior to any stocking of the river with hatchery trout (Alagona et al. 2012). Upstream migration of Southern SH/RT past river km 116 was impeded in 1920 resulting from the construction of Gibraltar Dam (Titus et al. 2010). The reservoir supported landlocked steelhead following dam construction and was stocked in the 1930s with hatchery *O. mykiss* as well as steelhead rescued from the Santa Ynez River in 1939, 1940, and 1944 (Titus et al. 2010).

Upstream migration typically occurred from December to March following precipitation events. Southern SH/RT were seen spawning in all tributaries as well as the mainstem below Gibraltar Dam during the spring in the mid-1930s, though flow was observed to limit suitable spawning habitat (Titus et al. 2010). Most spawning in the Santa Ynez River occurred in the upper reaches between Buellton and Gibraltar Dam as well as the tributaries to the mainstem such as Alisal, Santa Cota, Cachuma, Tequepis Canyon, and Santa Cruz creeks. Fish rescues were required during the summer due to intermittent flows and drying of downstream tributary areas as well as the mainstem (DFG 1944).

Tens of thousands of hatchery *O. mykiss* were stocked in Gibraltar Reservoir in the 1930s, and over 100,000 hatchery-reared juvenile steelhead were planted in the Santa Ynez River from 1930-1935. In the 1940s, about 2.5 million juvenile Southern SH/RT were translocated from various areas of the watershed to the lower river (DFG 1944). An approximate run size of at least 13,000 spawners was inferred by a Department staff member based on comparisons with Benbow Dam counts on the South Fork Eel River, California in the 1930s and 1940s (Becker and Reining 2008; Titus et al. 2010). However, it is possible that the Santa Ynez steelhead population may have increased during this period due to ongoing rescue operations that resulted in lower mean mortality rates during the early to mid-1940s (Good et al. 2005). Nonetheless, these estimates may underestimate historical abundance because they were produced 24 years after a significant portion of spawning and rearing habitat had been blocked by Gibraltar Dam.

Construction of Bradbury Dam, originally named Cachuma Dam, downstream of Gibraltar Dam was finished in 1953. Bradbury Dam forms the Lake Cachuma reservoir, blocks Southern SH/RT access to upstream habitat, and alters natural flow regimes and sediment dynamics (Becker and Reining 2008; Titus et al. 2010). Even before the dam was built, the lack of precipitation limited upstream migration due to the sandbar at the mouth of the river remaining intact (Titus et al. 2010). Steelhead run size declined significantly after 1946 and only small numbers were seen in the stream reaches below Bradbury Dam in following decades (Titus et al. 2010). Anadromous Southern SH/RT were effectively extirpated by 1975 due to lack of flows below Bradbury Dam especially during summer months, though steelhead have occasionally been observed over the past few decades (Becker and Reining 2008).

Recently, Reclamation's permit to operate releases from Bradbury Dam was modified to require releases from the dam for purposes of protecting fishery resources in accordance with the 2000 NMFS Biological Opinion during wetter years. This modification also included additional measures to benefit Southern SH/RT, including opportunities to provide fish passage above and below Bradbury Dam, measures to reduce the impacts of predation, and restoration of stream and bankside habitat (SWRCB 2019).

Department staff have monitored steelhead in Salsipuedes Creek, Hilton Creek, and the mainstem Santa Ynez River and have found that most years can support a small steelhead run. However, zero adult steelhead have been found in the Santa Ynez River since 2012 (Boughton et al. 2022a). COMB has conducted uncalibrated, single pass snorkel surveys each year since the 1990s at multiple index sites to determine *O. mykiss* densities in the Santa Ynez River. Until 2012, fish densities were consistent but declined sharply in the following years due to drought conditions (Boughton et al. 2022a). The past few years have seen numbers rebound somewhat in response to wetter conditions. Similar trends were observed in the migrant traps on Hilton and Salsipuedes creeks and the mainstem Santa Ynez River, which have been in operation since 2001 (COMB 2022).

4.3.1.3 Ventura River

The Ventura River watershed encompasses 228 square miles and 16.5 stream miles (Becker and Reining 2008). Matilija Creek and North Fork Matilija Creek intersect to form the headwaters of the Ventura River. Multiple large storage and diversion dams occur in this watershed, altering the natural flow regime and causing negative impacts to Southern SH/RT habitat quantity and quality. About 2 miles downstream of the Ventura River headwaters is the Robles Diversion Dam, which was constructed in 1958 to direct water for storage into Lake Casitas (Becker and Reining 2008; Titus et al. 2010). Both Matilija Dam on Matilija Creek and Casitas Dam on Coyote Creek, are also attributed to population declines of Southern SH/RT on the Ventura River (Titus et al. 2010).

In the 1930s, tens of thousands of juvenile *O. mykiss* were stocked in the Ventura River, as well as thousands of fish that were transplanted from rescues conducted on the Santa Ynez River (Titus et al. 2010). Department staff estimated that the Ventura watershed supported 4,000 to 5,000 steelhead spawners in 1946. In 1973, Department staff estimated a run of between 2,500 and 3,000 steelhead (Becker and Reining 2008). However, the methodologies used to make these estimates were likely based on expert opinion. Similar to the Santa Ynez River, ongoing rescues may have had a small effect on the Ventura River steelhead populations in the 1940s. By the mid-1970s, the steelhead run size was estimated at approximately 100 fish, likely due to limited suitable rearing habitat below Robles Diversion Dam (Becker and Reining 2008).

There are four key tributaries to the Ventura River that historically provided substantial suitable spawning and rearing habitat for *O. mykiss*. These tributaries were Matilija Creek, San Antonio Creek, Coyote Creek, and Santa Ana Creek (Capelli 1974). Coyote Creek likely had a strong run of steelhead with up to 500 adult returns being probable prior to construction of Casitas Dam. Currently, the few returning Southern SH/RT spawners may use the lower reaches of the 13-mile stream for spawning (Becker and Reining 2008; Titus et al. 2010). Matilija Creek, which extends for almost 15 miles from its confluence with the Ventura River, contains ideal spawning and rearing habitat. However, access to the upper reaches of the creek was impeded with the construction of Matilija Dam (Becker and Reining 2008). Before completion of the dam, it is estimated that the creek could have supported runs of 2,000 to 2,500 spawners (Becker and Reining 2008). The removal of Matilija Dam, which is an important element of the Matilija Dam Ecosystem Restoration Project, is currently in the process of environmental review. Tributaries of Matilija Creek contain high quality habitat that continue to support resident *O. mykiss* (Becker and Reining 2008). The removal of Matilija dam will allow access to about 20 miles of stream habitat for Southern SH/RT (MDERP 2022). Historical presence of steelhead in San Antonio Creek is unknown, but the stream is thought to have produced steelhead in the 1980s and 1990s (Titus et al. 2010). Santa Ana Creek was home to *O. mykiss* in the headwater reaches during the 1930s through the 1940s as well as in 1979 (Becker and Reining 2008).

Construction on the Robles Fish Passage Facility, which allows fish passage through the Robles Diversion Dam, was completed in 2006. As a requirement of their federal Biological Opinion, CMWD monitors fish migration through the facility (CMWD 2019). A downstream migrant trap is also operated to evaluate if smolts can pass through the facility without injury (CMWD 2019). A weir trap is then used to evaluate success of smolt migration through the reach downstream of the facility (CMWD 2019). Small numbers of out-migrating smolts have been captured since operation of the weir trap began. However, during the most recent drought (2012-2017), trapping did not occur due to low flow conditions. Since 2017, zero to only a few fish have been observed per year in the vicinity of the passage facility. Presence/absence and redd surveys for *O. mykiss* have also been conducted by CMWD each year and numbers have declined substantially since the beginning of the drought (CMWD 2018).

4.3.1.4 Santa Clara River

The Santa Clara River is a major river that flows into the Pacific Ocean near Ventura, California. The watershed drains an area of approximately 1,600 square miles with 75 stream miles (Becker and Reining 2008). The historical steelhead run was estimated to be around 9,000 fish based on comparisons of habitat suitability metrics produced for the Ventura River (Moore 1980). Numerous instream water diversions have impeded anadromous migration since the 1950s (Becker and Reining 2008; Titus et al. 2010).

In 1991 UWCD built the Vern Freeman Diversion Dam across the Santa Clara River at about 10 river miles from the Pacific Ocean, near the unincorporated community of Saticoy. The Vern Freeman Diversion Dam includes a fish passage facility (Titus et al. 2010), however, in 2019 the U.S. District Court for the Central District of California issued an order that stated, in a factual summary, “the structure and operation of [Vern Freeman Diversion Dam] significantly hampers the migration of steelhead in the Santa Clara River to and from the Pacific Ocean” because it “reduces the availability of water downstream for steelhead migration” and “it is difficult for adult steelhead to successfully pass through the fish ladder” (*Wishtoyo Found., et al. v. United Water Conservation Dist.*, Case No. 2:16-CV-03869-DOC-PLA, Dkt. No. 254 (Mar. 5, 2019); see also NMFS 2012a). Operations of a downstream migrant trap at the Vern Freeman Diversion Dam began in 1993 and typically occur from January to June when flows in the river are sufficient to maintain consistent water levels at the fish trap. A total of 16 adult steelhead and 839 smolts were observed at the Vern Freeman Diversion Dam from 1993-2014 (Booth 2016).

In 2018, the U.S. District Court for the Central District of California issued a judgment in *Wishtoyo Foundation, et al. v. United Water Conservation District* finding that “[UWCD’s] operation and maintenance of Vern Freeman Dam (‘VFD’), including its operation and maintenance of the fish ladder at the VFD, and [UWCD’s] diversion of water from the VFD, constituted ‘take’ of the Distinct Population Segment of Southern California Steelhead . . . in violation of section 9 of the Endangered Species Act” (Case No. 2:16-CV-03869-DOC-PLA, Dkt. No. 248 (December 1, 2018)). In that judgment, the court issued a permanent injunction requiring UWCD to adhere to the water diversion operating rules set forth in a 2008 NMFS Biological Opinion until such time as UWCD obtains incidental take authorization from NMFS for the maintenance and operation of the Vern Freeman Diversion Dam (*ibid.*). The injunction further requires UWCD to design, construct, and obtain certain permits and authorizations for a new fish passage facility at the Vern Freeman Diversion Dam that is reasonably likely to meet NMFS criteria as specified in the judgment (*ibid.*). In September 2023, UWCD issued a Notice of Preparation under CEQA for an environmental impact report that will identify a hardened ramp structure as the preferred alternative for the project (available at https://www.unitedwater.org/wp-content/uploads/2023/09/Notice-of-Prepration-for-EIR_September-2023.pdf). In a joint stipulation filed with the court in July 2023, the plaintiffs and UWCD jointly proposed an order for the court to sign that would require UWCD to submit complete regulatory applications in February 2024 and submit 90% engineered design plans in June 2024 (*Wishtoyo Found., et al. v. United Water Conservation Dist.*, Case No. 2:16-CV-03869-DOC-PLA, Dkt. No. 590 (July 18, 2023).

Tributaries that intersect the Santa Clara River above the Vern Freeman Diversion Dam historically provided most of the suitable Southern SH/RT spawning and rearing habitat in the watershed. Santa Paula Creek, a tributary to the Santa Clara River, contains high quality suitable *O. mykiss* spawning and rearing habitat. The Harvey Diversion Dam is located on the lower reaches of Santa Paula Creek. While this diversion originally provided fish passage, strong flows rendered the facility irreparable in 2005 (Stoecker and Kelley 2005). More recently, the Harvey Diversion Fish Passage Remediation Project has the goal of restoring fish passage at the facility to reestablish connection to the upstream watershed on Santa Paula and Sisar creeks (California Trout 2018).

Sespe and Piru creeks are the largest tributaries of the Santa Clara River and support higher *O. mykiss* numbers than Santa Paula Creek (Stoecker and Kelley 2005). Sespe Creek contains over 198 km of habitat historically accessible to steelhead and sustains the highest relative abundance of wild *O. mykiss*. It is thought that Sespe Creek offers the highest potential for steelhead recovery because it lacks mainstem migration barriers (Stillwater Sciences 2019). However, Sespe Creek is known to dry in years with low precipitation, leading to a loss of connectivity with the Santa Clara River (Puckett and Villa 1985; Stoecker and Kelley 2005). A recent survey found high abundances of aquatic invasive species throughout most reaches of Sespe Creek downstream of its confluence with Howard Creek, which transports high abundances of invasive species from the Rose Valley Lakes (Stillwater Sciences 2019).

The Piru Creek watershed includes the Santa Felicia and Pyramid Dams. Both dams block access to upstream historical habitat on the Santa Clara River. Reservoir and dam operations also lead to unnatural and diminished flow regimes in the watershed (Moore 1980). Prior to the construction of both dams, adult steelhead were reported to migrate up into Buck and Snowy creeks (Stoecker and Kelley 2005). Piru Creek does not provide spawning and rearing habitat to Southern SH/RT (Moore 1980); however, Aqua Blanca and Fish creeks contain suitable habitat and currently support adfluvial *O. mykiss* populations, which could be important in the future for restoring an anadromous run in this tributary (Stoecker and Kelley 2005).

Various Santa Clara tributaries, including those mentioned above, were stocked in the 1930s through 1950s with hatchery *O. mykiss* as well as those rescued from the Santa Ynez River in 1944 (Titus et al. 2010). Some minor tributaries of the Santa Clara River were also stocked but have no historical records of *O. mykiss* presence. These tributaries include Hopper Canyon, Tom, Pole, and Willard creeks (Titus et al. 2010).

4.3.2 Conception Coast Biogeographic Population Group

Many small coastal watersheds that are relatively uniform in geographic features comprise the Conception Coast BPG, which spans about 50 miles of the southern California coast (NMFS 2012a; Figure 8). Streams in this BPG run north to south and have steep slopes in the upper portions of their watersheds where there is perennial flow. Precipitation can be much higher in the upper watersheds and can lead to “flashy” flows due to the steep stream gradients (NMFS 2012a). Both the Carpinteria Creek and Gaviota Creek watersheds have been the focus of habitat restoration in recent years, as both provide high-quality spawning and rearing habitat for Southern SH/RT and have high recovery potential (NMFS 2012a).

4.3.2.1 Gaviota Creek

Gaviota Creek is about six miles in length, connecting with the Pacific Ocean just south of Las Cruces, California. Steelhead were documented in Gaviota Creek in the 1930s in the winter (Becker and Reining 2008) and multiple ages of *O. mykiss* were observed in the 1990s and early 2000s (Becker and Reining 2008). Steelhead runs in Gaviota Creek, which were historically present in most years, were likely small (Becker and Reining 2008). Livestock grazing is responsible for reductions in suitable habitat for Southern SH/RT in the watershed (Becker and Reining 2008). In recent years, periodic bankside observations conducted by the Department have observed a range of zero to a few hundred *O. mykiss* and no adult steelhead in Gaviota Creek (K. Evans, CDFW, unpublished data).

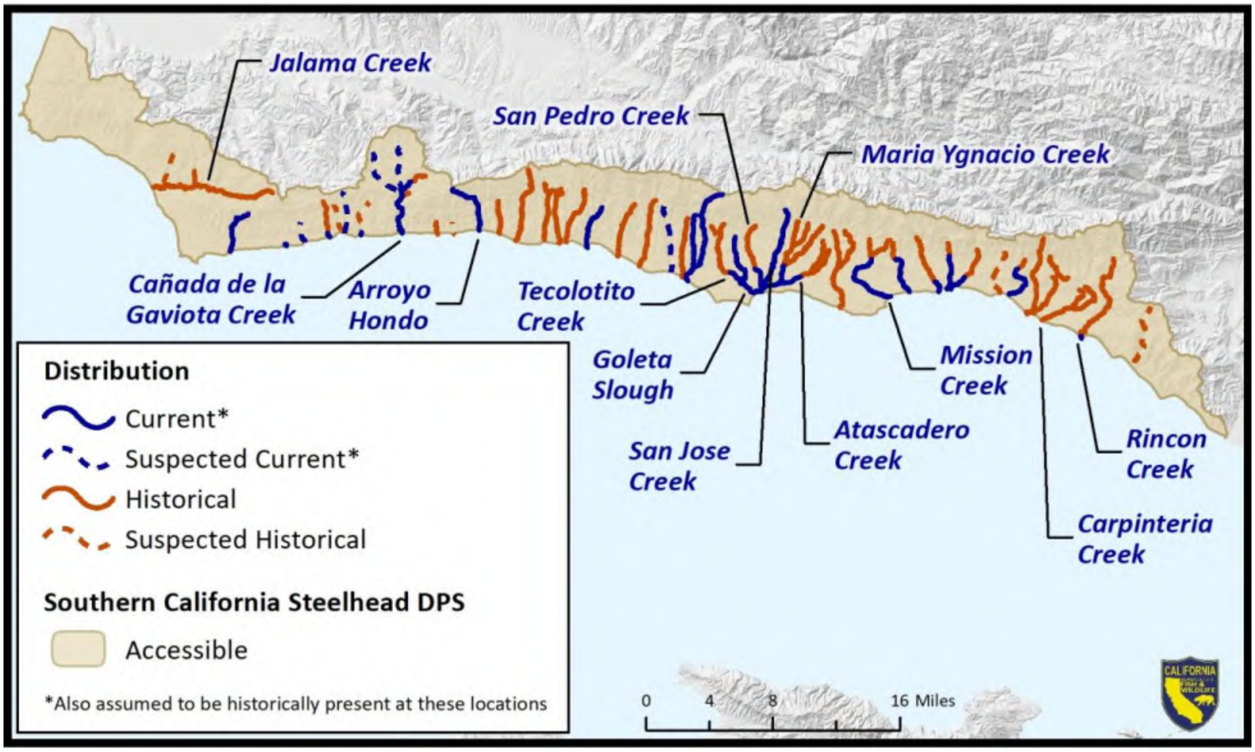

Figure 8. Map of the Conception Coast BPG depicting known and suspected current and historical distribution.

4.3.2.2 Carpinteria Creek

Carpinteria Creek is approximately 6.5 miles long and connects with the Pacific Ocean near Carpinteria, California. Southern SH/RT were observed in the watershed in 1942 (Stoecker et al. 2002) and the stream was understood to have a historical steelhead run (Becker and Reining 2008). Different life stages of *O. mykiss* were seen in the mid-1990s (Becker and Reining 2008), and many were seen in the upper watershed (Becker and Reining 2008) which is known to have suitable habitat (Becker and Reining 2008). A few *O. mykiss* of varying sizes were found in the lower watershed in 2008 (Becker and Reining 2008). In recent years, monitoring conducted by the Department from 2016-2022 have observed few if any individuals of either life-history forms (K. Evans, CDFW, unpublished data).

4.3.2.3 Other Creeks

There are many other creeks flowing into the Pacific Ocean, some of which may have supported Southern SH/RT historically (e.g., Jalama Creek), some where there have been recent observations, and others where *O. mykiss* has not been seen at all. These coastal creeks are typically no longer than 10 stream miles. In addition to Gaviota and Carpinteria creeks, other suitable streams with more recent sightings of Southern SH/RT include Arroyo Hondo Creek and

Rincon Creek (Becker and Reining 2008). Arroyo Hondo Creek contains the least number and severity of threats for Southern SH/RT in the Conception Coast BPG (NMFS 2012a).

4.3.3 Santa Monica Mountains Biogeographic Population Group

There are five watersheds in the Santa Monica Mountains BPG, the majority of which are small with geography resembling that of watersheds in the Conception Coast BPG (NMFS 2012a; Figure 9). Except for Malibu Creek, the headwaters of the streams occur prior to passing through the Santa Monica mountains. Malibu Creek is the largest watershed in the BPG (NMFS 2012a) but is similar to Topanga Creek in stream length (Becker and Reining 2008). There are two substantial anthropogenic migration barriers on Malibu Creek, Rindge Dam and Malibu Lake Dam. Rindge Dam is located a few miles upstream from the mouth and prevents access to nearly all historical Southern SH/RT habitat. The remaining three streams include Big Sycamore Canyon Creek, Arroyo Sequit, and Las Flores Canyon Creek (NMFS 2012a).

4.3.3.1 Malibu Creek

The Malibu Creek watershed encompasses about 105 square miles including 8.5 miles of stream that outflows into the Pacific Ocean at Malibu Lagoon State Beach in Santa Monica Bay (Becker and Reining 2008). Rindge Dam was constructed in 1924 about three miles upstream from the mouth (Becker and Reining 2008; Titus et al. 2010). Before the dam was built, steelhead were able to access spawning habitat in Las Virgenes and Cold creeks (Titus et al. 2010). In 1947, a steelhead run was observed when the sandbar at the mouth was manually opened. In the 1970s, steelhead were observed migrating upstream up to Rindge Dam (Becker and Reining 2008). In 1980, a Department employee counted 61 steelhead immediately downstream of Rindge Dam (Titus et al. 2010). Multiple life stages of *O. mykiss* were observed during a study conducted in the winter and spring of 1986. A total of 158 fish was reported though only one was an adult steelhead. Later in 1986 and in 1987, a handful of adult *O. mykiss* were found below Rindge Dam and a few adult *O. mykiss* were seen just below the dam in 1992 (Titus et al. 2010). The quality of spawning and rearing habitat is the best just below Rindge Dam (Titus et al. 2010), which explains the greater use of that area by juvenile *O. mykiss* (Titus et al. 2010). Stocking of hatchery Rainbow Trout occurred in 1984 at Malibu Creek State Park with additional stockings likely occurring frequently (Titus et al. 2010).

In addition to Rindge Dam and other migration barriers blocking access to historical habitat, the natural flow regime and water quality of Malibu Creek has been modified by operations of the Tapia Water Reclamation Facility (approximately 5 miles upstream from the ocean). Treated water releases from the facility sustain flows in Malibu Creek throughout the year (Titus et al. 2010). Currently, a new recycled wastewater treatment facility is being proposed that would treat effluent from the Tapia Water Reclamation Facility with the purpose of re-distributing the water to the service area rather than releasing it back to Malibu Creek (Las Virgenes-Triunfo Joint Powers Authority 2022). The implementation of this project could lead to less streamflow in Malibu Creek as a result of the repurposing of discharged recycled water that would have previously been released to Malibu Creek.

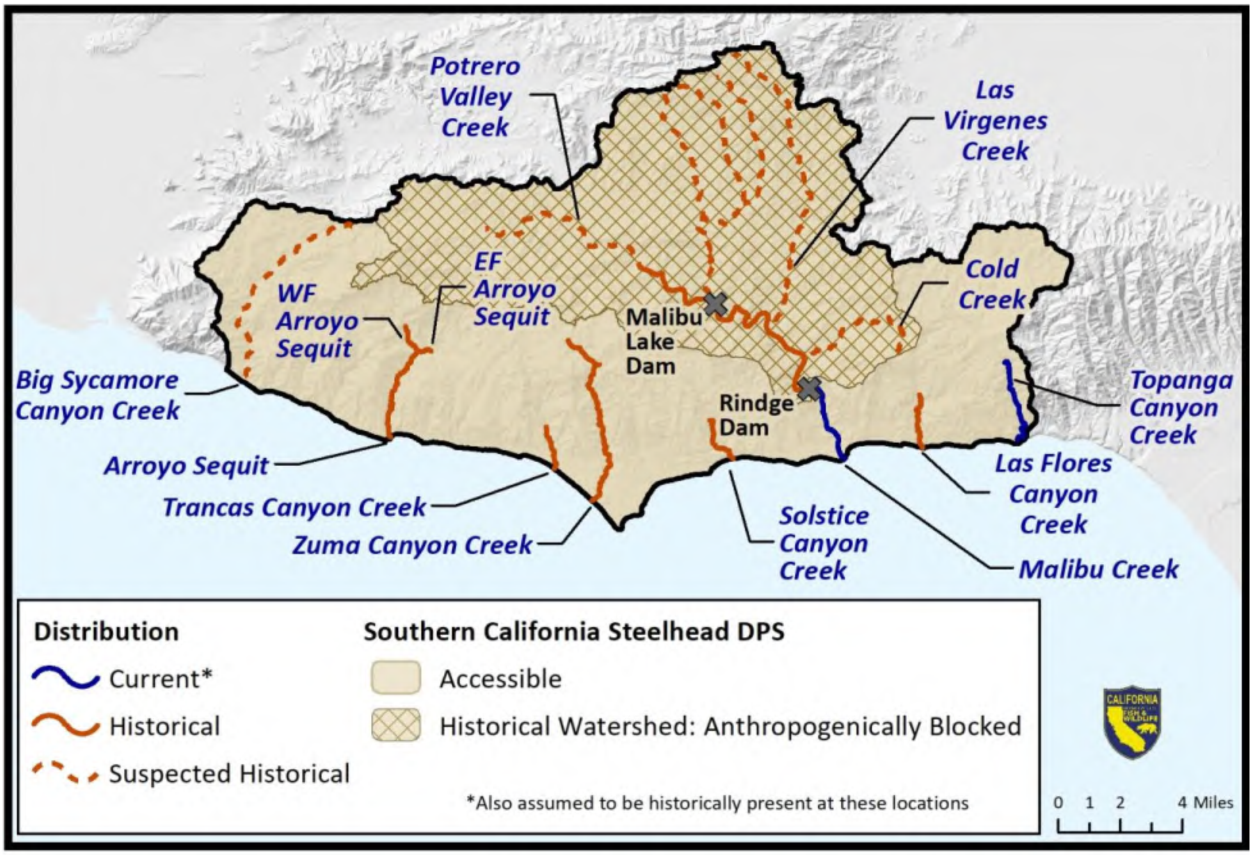

Figure 9. Map of the Santa Monica Mountains BPG depicting known and suspected current and historical distribution. Abbreviations: EF = East Fork, WF = West Fork.

In more recent years, *O. mykiss* have been seen in Malibu Creek below Rindge Dam (Becker and Reining 2008). A die off of about 250 *O. mykiss* occurred in the creek in 2006 after yellowing of the fish was noticed during snorkel surveys (Becker and Reining 2008). Recent drought conditions starting in 2012 have led to reduced abundances of *O. mykiss* in Malibu Creek based on similar observations on Topanga Creek (Dagit et a. 2017)

4.3.3.2 Topanga Creek

Topanga Creek empties into the ocean at Topanga Beach and contains similar stream mileage to Malibu Creek but contains less accessible habitat for Southern SH/RT (Becker and Reining 2008). Some steelhead can access Topanga Creek in years when there is sufficient precipitation (Becker and Reining 2008), and *O. mykiss* of various sizes were observed in the watershed in

1979 (Becker and Reining 2008). Juvenile *O. mykiss* were observed by Department staff in Topanga Creek again in 1982 (Becker and Reining 2008). Unlike in Malibu Creek, the upstream impassable migration barrier for Southern SH/RT is a natural barrier in Topanga Creek (Camm Swift, Emeritus, Section of Fishes, Natural History Museum of Los Angeles County, personal communication).

The Southern SH/RT population in Topanga Creek was recently monitored from 2001-2007, revealing consistent use by spawning steelhead adults and successful smolt production (Becker and Reining 2008). Bell et al. (2011b) characterized the Topanga population as a satellite population that is supported by other populations in the Southern SH/RT range but provides minimal production to other streams. As a satellite population, Topanga Creek *O. mykiss* support the metapopulation in southern California but are more vulnerable to extirpation (Bell et al. 2011b). The effects of the most recent prolonged drought on Southern SH/RT have been severe. Significant reductions for all life-stages were observed from 2012-2016, leading to reductions of the population from 358 individuals in 2008 to less than 50 individuals in 2016 (Dagit et al. 2017).

4.3.3.3 Other Creeks

Big Sycamore Canyon Creek was surveyed in 1989-1990 but no steelhead were observed (Becker and Reining 2008). NMFS (2005) designated the population as extirpated after another survey in 2002.

Arroyo Sequit Creek was reported to have a small historical steelhead run. Steelhead were seen in a 1989-1990 survey of the stream and again in a 1993 survey. From 2000-2007 steelhead were reported utilizing Arroyo Sequit Creek (Becker and Reining 2008).

Overall, from 2005-2019, monitoring in Arroyo Sequit Creek done by the Resource Conservation District of the Santa Monica Mountains (RCDSMM) has observed few *O. mykiss*, primarily due to two instream barriers that were eventually removed in 2016. Two adult observations occurred after the removal of barriers in 2017 (Dagit et al. 2019). There is also limited documentation of steelhead in the West and East forks of Arroyo Sequit Creek (Becker and Reining 2008). Las Flores Canyon Creek is reported to have suitable steelhead habitat but there is no evidence of historical or present use by steelhead (Becker and Reining 2008; Titus et al. 2010).

4.3.4 Mojave Rim Biogeographic Population Group

There are three relatively large watersheds that make up the Mojave Rim BPG (NMFS 2012a; Figure 10). These watersheds include the San Gabriel, Santa Ana, and Los Angeles rivers. The headwaters of these streams are in the San Gabriel and San Bernardino mountains, which experience greater seasonal precipitation than is seen in the neighboring BPGs. Lower watershed areas span the flat coastal plain of the Los Angeles River, which historically contained widespread springs and marshes (Mendenhall 1907). Over time the mouths of these rivers have drifted to different areas along the coast. Currently, the river mouths are each less than 20 miles apart (NMFS 2012a).

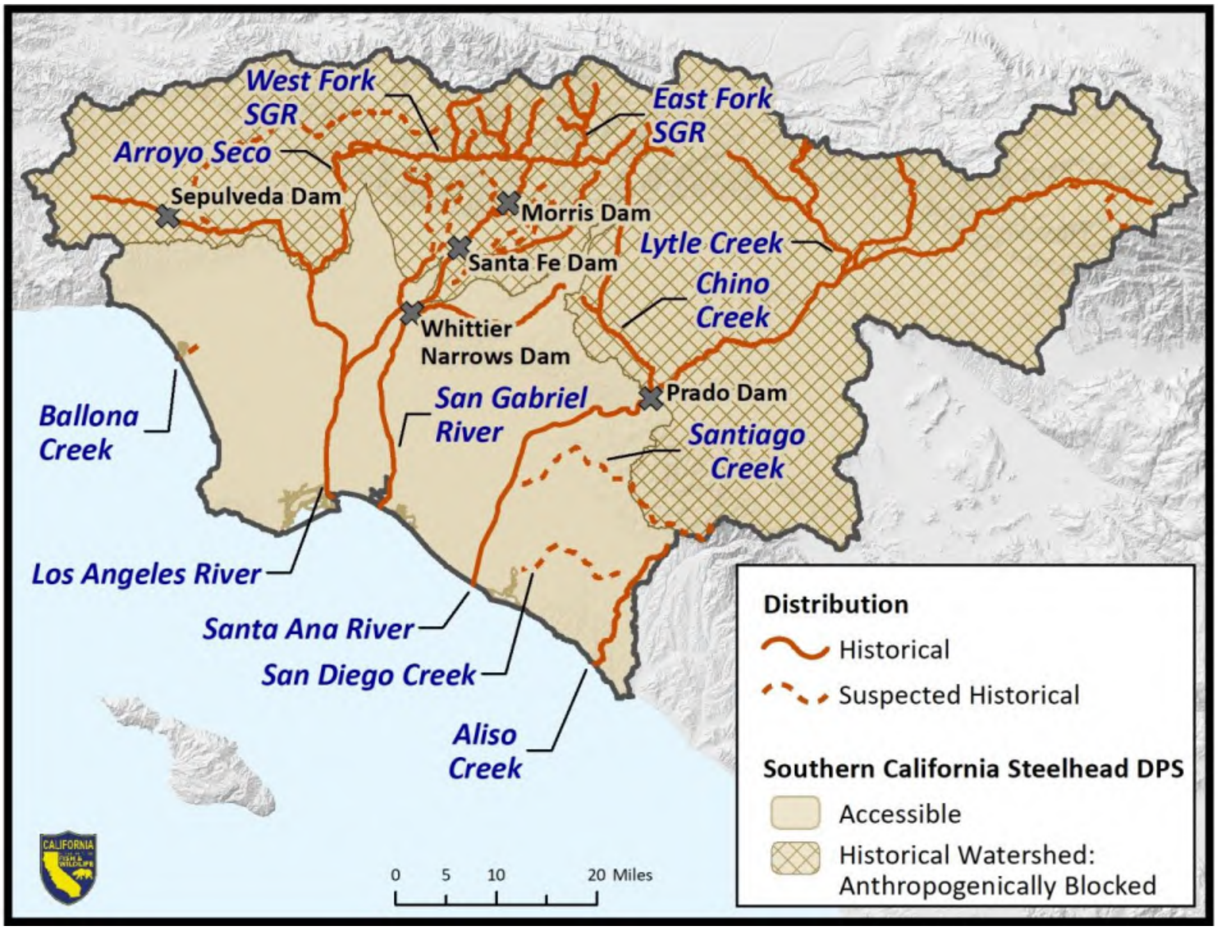

Figure 10. Map of the Mojave Rim BPG depicting known and suspected current and historical distribution. Abbreviations: SGR= San Gabriel River.

4.3.4.1 San Gabriel River

The San Gabriel River encompasses more than 58 stream miles but about half of it is channelized below Santa Fe Dam. Morris Dam and Santa Fe Dam were both constructed in the 1930s (Becker and Reining 2008) and are considered complete barriers to fish migration. Rainbow trout were seen by Department staff in the 1930s, but the river was also stocked during that time (Becker and Reining 2008). Stocking below Morris Dam also occurred on Little Dalton Creek in 1945 (Titus et al. 2010). Rainbow Trout fishing was good from the late 1930s to late 1940s according to various Department stream surveys and in 1951, Department staff noted that natural production was average (Becker and Reining 2008). Fish Canyon Creek and Robert's Canyon Creek, which are mainstem tributaries downstream of Morris Dam, were observed by Department surveyors to have *O. mykiss* in the 1940s, 1950s, and 1973 (Titus et al. 2010).

Southern SH/RT historically occurred in a few tributaries of the San Gabriel River such as San Jose Creek. Many tributaries to the San Gabriel River have been channelized and contain fish passage barriers. Most were stocked for recreational angling in the 1930s and 1940s (Becker and Reining 2008). Southern SH/RT remain in tributaries above the two barrier dams and are known to presently inhabit the East Fork. The ancestry of these fish is unclear and may have genetic influence from stocking *O. mykiss* from other watersheds (Nielsen 1999). There is also a remnant historical population of Rainbow Trout just below Morris Dam that appears to self-propagate (Becker and Reining 2008).

4.3.4.2 Santa Ana River

The Santa Ana River is the largest river within southern California at almost 100 miles long (Becker and Reining 2008). Prado Dam, which is located approximately 30 miles upstream of the river outlet, was constructed in 1941 (O.C. Public Works, n.d.). The lower 24 miles of channelized river below the dam outflows to the Pacific Ocean in Huntington Beach (Becker and Reining 2008). Rainbow Trout were first observed and captured in the upper Santa Ana River drainage in the 1850s (Boughton et al. 2006). Rainbow Trout were also observed in the mountainous upper watershed during the 1930s, coinciding with when stocking occurred (Becker and Reining 2008). A steelhead run was historically present in the lower river (Becker and Reining 2008); however, in 1951 and 1955, no *O. mykiss* were observed in any stream reaches below Prado Dam during Department surveys (Titus et al. 2010). Various water uses have highly altered flows in the Santa Ana River and low numbers of fish in the lower river are attributed to limited water releases from Prado Dam (Titus et al. 2010). Southern SH/RT are thought to be extirpated from the Santa Ana River (Nehlsen et al. 1991), but resident *O. mykiss* remain in the upper watershed above natural and manmade impassable barriers (Boughton et al. 2005).

Southern SH/RT were historically present in Santiago Creek below Prado Dam. Many tributaries upstream of where the dam was built were stocked with *O. mykiss* in the 1930s and fish have been observed reproducing naturally in the decades that followed (Becker and Reining 2008).

4.3.4.3 Los Angeles River

The Los Angeles River is approximately 52 miles long and flows to the Pacific Ocean in Long Beach. Like the San Gabriel River, the Los Angeles River is completely channelized with much of the lower mainstem channel paved with concrete for flood control purposes (Becker and Reining 2008; Titus et al. 2010). Southern SH/RT are assumed to have been present in the watershed but there have been no actual observations to confirm this assumption (Titus et al. 2010). Major tributaries to the Los Angeles River were stocked in the 1930s or 1940s (Becker and Reining 2008; Titus et al. 2010) but some of these tributaries were later channelized and no longer support *O. mykiss*. Due to the highly modified nature of the river basin, Southern SH/RT cannot utilize the mainstem Los Angeles River for spawning or rearing (Titus et al. 2010) and are considered extirpated (Nehlsen et al. 1991). However, resident *O. mykiss* have been observed in the major tributaries of the Los Angeles River, including Arroyo Seco and Big Tujunga Creeks (Becker and Reining 2008). Fish passage by native Southern SH/RT on Arroyo Seco is obstructed by Devil's Gate Dam. Recently, Department-led fish rescues have transplanted Southern SH/RT from the West Fork San Gabriel River and Bear Creek to Arroyo Seco as a result of the Bobcat Fire (Pareti 2020).

4.3.5 Santa Catalina Gulf Coast Biogeographic Population Group

Multiple medium sized watersheds comprise the Santa Catalina Gulf Coast BPG (Figure 11). Most have their headwaters in the Santa Ana or Peninsular Mountain ranges and flow south over coastal terraces (NMFS 2012a). Many watersheds in the BPG have intermittent flow and are seasonally dry due to limited precipitation and groundwater depletion (D. Boughton, NOAA, personal communication). Some smaller drainages within the BPG might occasionally support steelhead. Streams in this BPG have substantial tributary mileage in the upper watershed areas due to the fragmented landscape in the region (NMFS 2012a).

4.3.5.1 San Juan Creek

San Juan Creek is 22-mile stream located in Orange and Riverside Counties. Arroyo Trabuco Creek is a major tributary to San Juan Creek with approximately the same stream length (Becker and Reining 2008). Steelhead were observed in the creek in 1939 (Swift et al. 1993) and in the 1940s as well as in 1968 and 1974 (Becker and Reining 2008). Trout stocking to support fishing in San Juan Creek occurred year-round in 1981 (Becker and Reining 2008) and possibly in other years. San Juan Creek contains suitable habitat for *O. mykiss*, which have been observed in some but not all years in recent decades (Becker and Reining 2008).

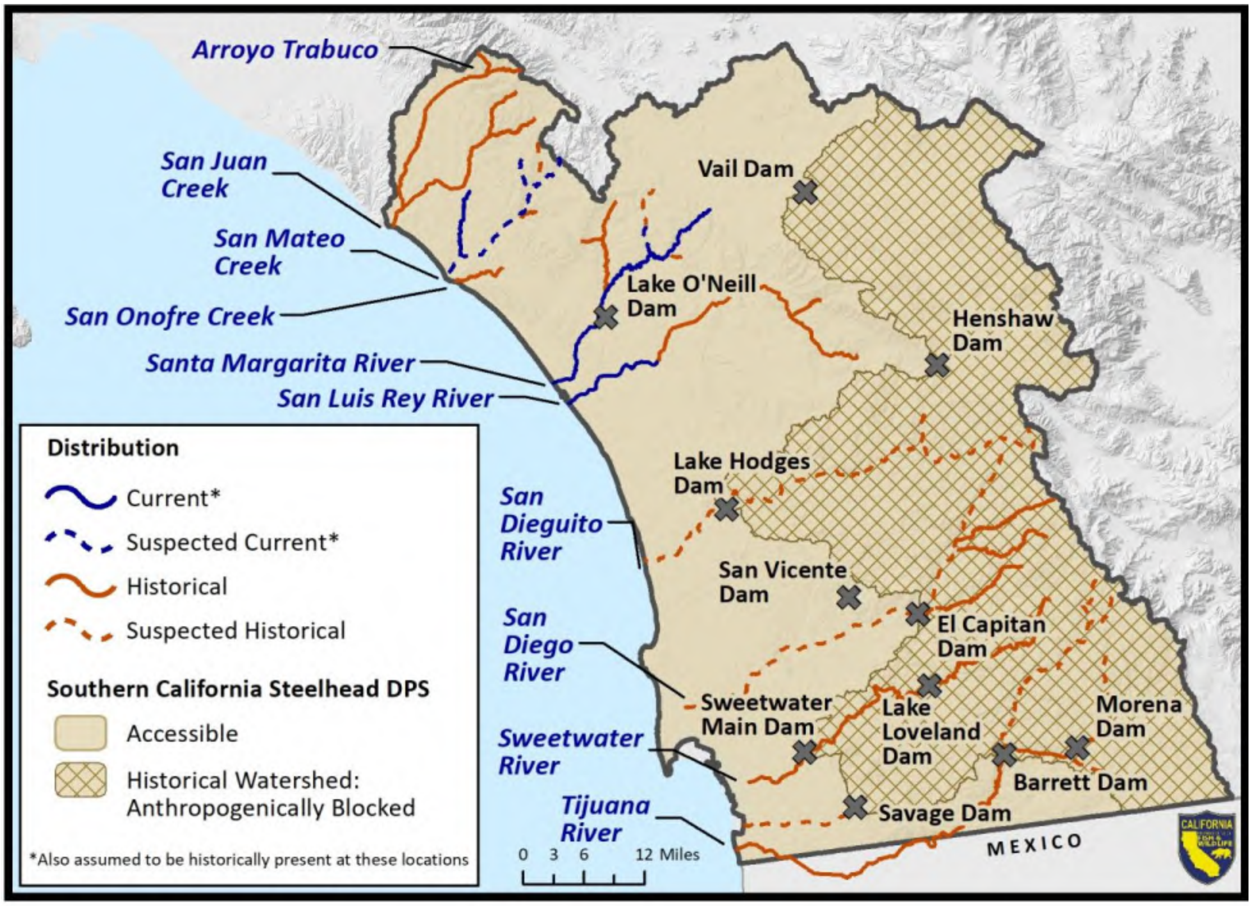

Figure 11. Map of the Santa Catalina Gulf Coast BPG depicting known and suspected current and historical distribution.

Arroyo Trabuco was a historical Southern SH/RT stream; however, there is now a complete barrier to fish migration about 2.4 miles from the confluence with San Juan Creek. Regardless, the stream still appears to contain suitable habitat and steelhead were still thought to be present in 2004 below the barrier (Becker and Reining 2008). Recently, efforts to remediate fish passage at two total barriers to migration on Trabuco Creek are in progress. Completion of this project would provide access to 15 miles of upstream spawning and rearing habitat.

4.3.5.2 San Mateo Creek

San Mateo Creek, which has a similar stream length as San Juan creek, supported a historical steelhead run (Titus et al. 2010). In the early 1900s, anglers were successful in catching Southern SH/RT of greater sizes than in other regional watersheds (Titus et al. 2010). In 1939, juvenile Southern SH/RT were observed and rescued in the thousands from isolated reaches and transferred to the estuary lagoon (Titus et al. 2010). Stocking of the creek began in 1945 (Becker and Reining 2008). Anadromous and resident Southern SH/RT were thought to persist in 1950 (Becker and Reining 2008), though after that year, Southern SH/RT encounters declined (Titus et al. 2010). In 1999, *O. mykiss* sampled by the Department were surmised to be offspring from anadromous Southern SH/RT because of the lack of a resident population (Becker and Reining 2008). Habitat quality in the watershed has been degraded by anthropogenic activities and intermittent streamflow has posed migration issues for Southern SH/RT (Titus et al. 2010). Steelhead were thought to be extirpated from San Mateo Creek (Nehlsen et al. 1991) until more recent monitoring by Hovey (2004) documented a small resident *O. mykiss* population in Devil Canyon Creek, a major tributary to San Mateo Creek. Currently, the San Diego Regional Water Quality Control Board is considered using a draft invasive species Total Maximum Daily Load (TMDL) and plan to certify that actions of other entities will correct impairments to the creek caused by invasive species (Loflen 2022).

4.3.5.3 San Onofre Creek

San Onofre Creek consists of 13 miles of stream in Orange County. Personal observations of annual steelhead runs in the creek prior to 1946 suggest it was a historical Southern SH/RT stream (Becker and Reining 2008). Fletcher Creek, a tributary to San Onofre Creek, was considered a steelhead rearing area in 1950 and *O. mykiss* were observed by Department staff during a survey in 1979 (Titus et al. 2010). By the 2000s, San Onofre Creek was observed to be dry (Boughton et al. 2005), though reaches in the upper watershed may still offer suitable *O. mykiss* habitat (Becker and Reining 2008).

4.3.5.4 Santa Margarita River

The Santa Margarita River is almost 30 miles long, but a diversion weir located approximately ten miles upstream within the boundaries of Camp Pendleton likely acts as a complete barrier to upstream fish migration (Becker and Reining 2008; Titus et al. 2010). This diversion eliminates surface flow during most of the year (Titus et al. 2010). Adult and juvenile steelhead were observed in the river in the 1930s and 1940s and steelhead were thought to migrate upstream to the town of Fallbrook when flows allowed (Becker and Reining 2008). DeLuz Creek, a tributary to the Santa Margarita River, also historically supported steelhead (Becker and Reining 2008). Stocking of *O. mykiss* in the Santa Margarita watershed began in 1941 (Becker and Reining 2008) and occurred most recently in 1984 (Titus et al. 2010). Currently, the reaches downstream of O’Neill Lake do not support Southern SH/RT spawning (Titus et al. 2010) and they are thought to be extirpated (Nehlsen et al. 1991). As part of the Santa Margarita River Conjunctive Use Project, the existing O’Neill weir diversion will be replaced with an inflatable structure that will allow fish passage during most flow events (FPUD 2016). Further upstream, efforts are also underway to replace a fish passage barrier at the Sandia Creek Drive bridge to provide passage to 12 miles of upstream rearing and spawning habitat (Dudek 2021)

4.3.5.5 San Luis Rey River

The San Luis Rey River is a large river in northern San Diego County that runs approximately 69 stream miles from its river mouth near Oceanside, California. Lake Henshaw Dam, which was built in 1924, reduces the downstream flow of the river and blocks steelhead access to the uppermost portion of the drainage (Becker and Reining 2008; Titus et al. 2010). According to Native Americans and other observers of *O. mykiss* in the late 1800s, there was a historical run of steelhead that was able to reach areas above where the dam was constructed (Becker and Reining 2008). Stocking of Rainbow Trout occurred sometime prior to 1946 (Becker and Reining 2008). Although resident Rainbow Trout remain in tributaries of the upper watershed like Pauma Creek and the West Fork San Luis Rey River (Becker and Reining 2008), native Southern SH/RT are extirpated from the lower reaches of the San Luis Rey River (Nehlsen et al. 1991; Becker and Reining 2008).

4.3.5.6 San Dieguito River

The San Dieguito River is a large river in San Diego County that runs for 23 stream miles before entering into the Pacific Ocean north of the City of San Diego. Hodges Dam, which was constructed 12 miles upstream from the mouth in 1918, serves as a complete barrier to anadromy (Becker and Reining 2008). A journal article by Hubbs (1946) mentioned anglers catching possible steelhead in the estuary (Titus et al. 2010). Rainbow trout have been stocked below the dam (Titus et al. 2010); however, those downstream reaches no longer support *O. mykiss* (Becker and Reining 2008). Prior to the construction of the Sutherland Lake dam on Santa Ysabel Creek, a major tributary of the San Dieguito River, Department staff saw *O. mykiss* in a creek upstream of the eventual dam site, though there had been stocking efforts in that creek (Becker and Reining 2008). Black Canyon Creek, another smaller tributary to the San Dieguito River, was also stocked for rainbow trout fishing (Becker and Reining 2008).

4.3.5.7 San Diego River

The San Diego River has a stream length of 52 miles but El Capitan Dam, built in 1934, blocks about 22 miles of historical Southern SH/RT habitat (Becker and Reining 2008). Additionally, channelization of downstream reaches has eliminated suitable habitat below the dam (Titus et al. 2010). Anglers may have caught steelhead historically (Titus et al. 2010) but the population is now thought to be extinct (Nehlsen et al. 1991). Upper watershed tributaries above the dam were stocked in the 1930s and earlier and may still support *O. mykiss* (Becker and Reining 2008; Titus et al. 2010).

4.3.5.8 Sweetwater River

The Sweetwater River is a large river in San Diego County that runs for 55 miles before emptying into San Diego Bay southeast of the City of San Diego. The Sweetwater Reservoir, formed by the construction of the Sweetwater Dam in 1888, serves as a total barrier to anadromy (Becker and Reining 2008; Titus et al. 2010). Although *O. mykiss* were present historically and may still be found in the upper watershed, there are no mentions of a historical anadromous steelhead run in the Sweetwater River (Becker and Reining 2008; Titus et al. 2010). In years leading up to 1946, Cold Stream, a small tributary to Sweetwater River, was stocked with Rainbow Trout and these fish may have continued to naturally reproduce for some time (Becker and Reining 2008).

4.3.5.9 Otay River

The Otay River enters the south end of San Diego Bay near the U.S.-Mexico Border. There are no known historical or current records of Southern SH/RT existing in the Otay River. Fish passage is obstructed by the dam that forms Lower Otay Lake, though there may be *O. mykiss* residing in upper reaches above the reservoir (Titus et al. 2010).

4.3.5.10 Tijuana River

The Tijuana River is the southernmost stream within the Southern SH/RT range and extends for 26 miles from the intersection of Cottonwood Creek (Becker and Reining 2008). Other than one account of a few steelhead seen in 1927 by Department law enforcement, there has been no other documentation of historical use of the mainstem river (Titus et al. 2010). Steelhead were present in Cottonwood Creek in the mid-1930s, which was stocked with *O. mykiss* at that time, but Southern SH/RT are no longer able to pass multiple dams within the creek (Titus et al. 2010). If a steelhead run did exist in the Tijuana watershed, it is now assumed to be extirpated (Titus et al. 2010).

4.4 Abundance and Trends

To provide the best scientific information in our evaluation of Southern SH/RT as required by Fish and Game Code Section 2074.6, we analyzed its status and trends with annual abundance data compiled from a variety of sources (see Section 4.2 for Sources of Information).

Southern SH/RT, as defined in the Petition, include both anadromous and resident forms below complete migration barriers. To account for both life-history forms in our review, our analyses in Sections 4.4-4.8 examine data on anadromous adult Southern SH/RT (Adult SH) separately from data on *O. mykiss* not identified as anadromous adult Southern SH/RT (Other *O. mykiss*), as most existing monitoring efforts produce datasets that use these two categories. This is because it is possible to distinguish anadromous adult Southern SH/RT in rivers and streams due to their larger size (fork length >400m), greater girth, and steel-gray appearance, but it is otherwise difficult to conclude which life history an individual *O. mykiss* that does not have the identifying characteristics of an adult fish has expressed or will express. (Dagit et al. 2020; Moyle et al. 2017).

The analysis presented below is structured on the five BPGs with an emphasis on Core 1 and Core 2 populations within each BPG (NMFS 2012a; Boughton et al. 2007). The BPGs are a federal delineation based on a suite of environmental conditions (e.g., hydrology, local climate, geography) and watershed characteristics (i.e., large inland or short coastal streams). Core 1 and 2 populations occupy watersheds that exhibit the physical and hydrological conditions necessary to sustain self-sufficient viable populations of Southern SH/RT (NMFS 2012a). Datasets were reviewed to ensure that they were collected from monitoring conducted below the upper limit to anadromy in each watershed to remain consistent with the geographic scope of the listing unit proposed in the Petition. Where sufficient data were available for a given population, we present and discuss abundance and long-term population trend estimates for each BPG. The Department was unable to analyze core watersheds in the Mojave Rim and Santa Catalina Gulf Coast BPGs in detail due to data limitations. In these instances, as well as in other cases where data was limiting or unavailable, we provide a qualitative discussion, such as a viability assessment, based on the sources identified in Section 4.2 (Boughton et al. 2022a).

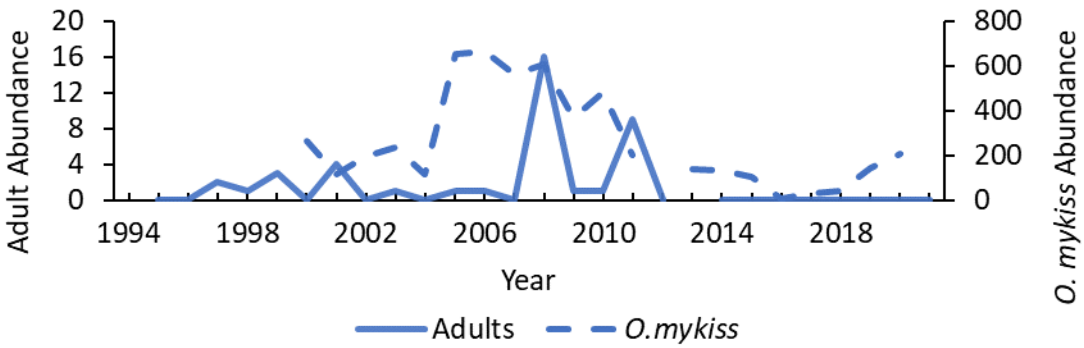
4.4.1 Time Series of Abundance

Southern SH/RT populations in the Monte Arido Highlands BGP have the longest running time-series dating back to the 1990s for the Santa Ynez and Santa Clara rivers (COMB 2022; Booth 2016) and the early 2000s for the Ventura River (CMWD 2005-2021; Dagit et al. 2020) (Figure 12). However, no organized monitoring efforts have been conducted on the Santa Maria River since steelhead were federally listed in 1997. Therefore, no further analysis of the Santa Maria Southern SH/RT populations are conducted in this chapter.

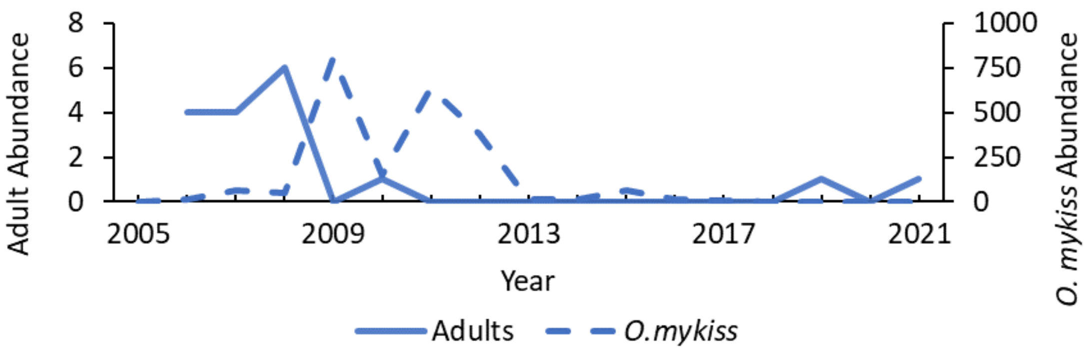
More recently, monitoring has been intermittently conducted on Carpinteria, Mission, and Arroyo Hondo in the Conception Coast BPG by the Department (Boughton et. al 2022a). Malibu, Topanga, and Arroyo Sequit creeks in the Santa Monica Mountains BPG have been actively monitored since the early 2000s (Dagit et al. 2019) (Figure 13). No recent or historical monitoring has been conducted in either the Mojave Rim or Santa Catalina Gulf Coast BPGs.

4.4.1.1 Monte Arido Highlands BPG

A. Santa Ynez River



B. Ventura River



C. Santa Clara River

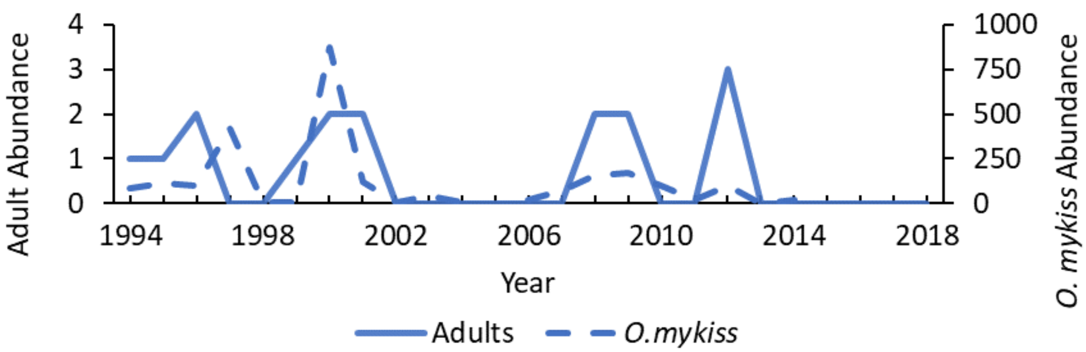


Figure 12. Adult steelhead (Adults) and other O. mykiss (O. mykiss) abundances for the Monte Arido Highlands BPG. A) Santa Ynez River; no data 2013. Biological Opinion Incidental Take provisions have been required since 2014. B) Ventura River. C) Santa Clara River. Adult abundance is on the left -axis with the solid blue line and O. mykiss abundance is on the right axis with the dashed blue line. Note different scales on the Y-axis.

4.4.1.2 Conception Coast BPG

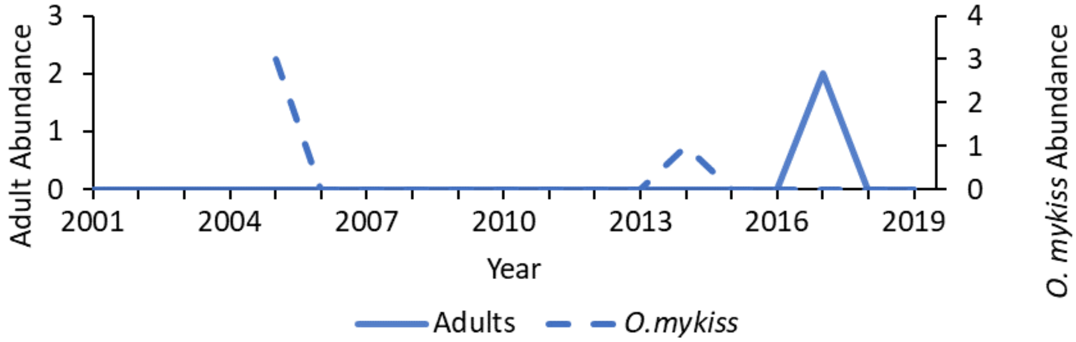
Very few monitoring activities have occurred throughout the Conception Coast BPG, and most of the work that has occurred in more recent years was conducted by the Department. We were unable to develop a full-time series of Southern SH/RT abundance for Conception Coast populations.

Although past monitoring is limited in this BPG, Dagit et. al (2020) documented a total of 42 adult steelhead opportunistic observations from 2000-2018. Two adults were observed in Arroyo Hondo Creek in 2017 and 10 adults were documented in the Goleta Slough Complex with the most recent observation occurring in 2017. For the entirety of Conception Coast BPG, 64% (n=27) of all adult observations occurred in Mission Creek, primarily from 1998-2008. However, from 2018-2022, Department redd and snorkel surveys documented zero adult steelhead in Mission Creek (K. Evans, CDFW, unpublished data). Three adults were observed opportunistically in Carpinteria Creek in 2008 (Dagit et al. 2020); however, from 2008-2019, zero adult steelhead were observed based on recent monitoring conducted by the Department (Boughton et al. 2022a).

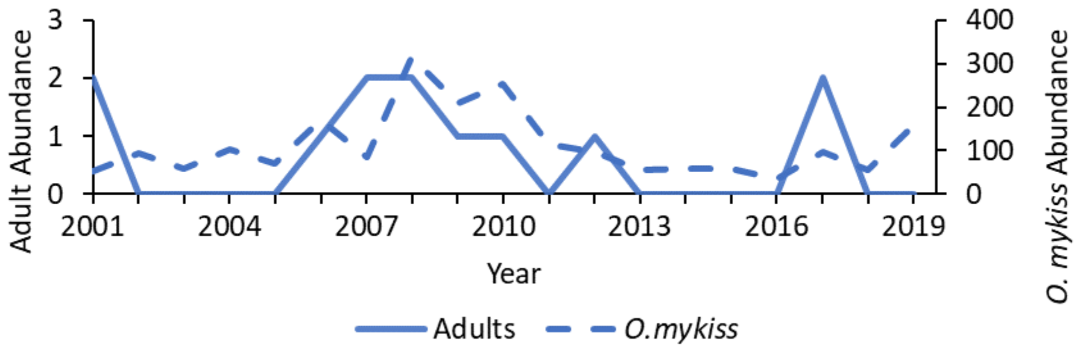
There is also limited data for *O. mykiss* in the Conception Coast BPG. No *O. mykiss* have been documented in Carpinteria Creek since 2016. In Mission Creek, no *O. mykiss* were observed from bankside surveys during the 2018-2019 spawning season (Carmody et al. 2019). In recent years, the largest number of *O. mykiss* observations in this BPG have occurred on Arroyo Hondo Creek, indicating that despite being a small watershed, the creek contains suitable habitat that is relatively undisturbed due to its inclusion in a natural reserve system (NMFS 2012a). Snorkel surveys have documented a total of 2,363 *O. mykiss* in Arroyo Hondo Creek from 2017-2019 (Carmody et al. 2019), while bankside *O. mykiss* observations have documented a total of 12,090 *O. mykiss* from 2015-2022 (K. Evans, CDFW, unpublished data).

4.4.1.3 Santa Monica Mountains BPG

A. Arroyo Sequit Creek



B. Topanga Creek



C. Malibu Creek

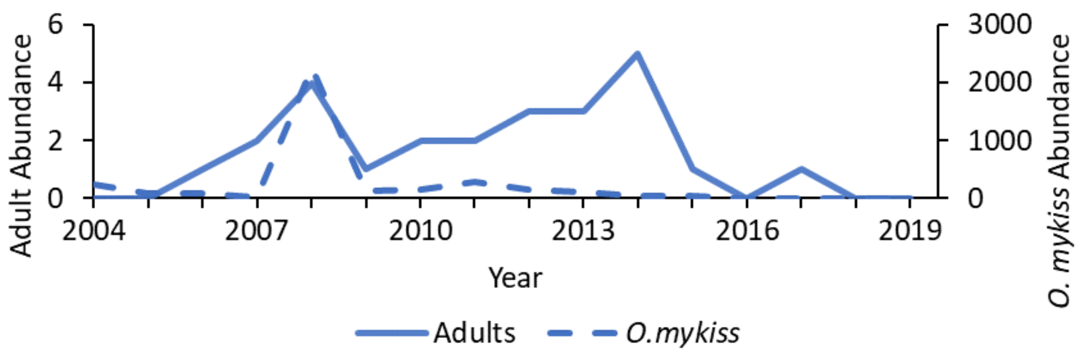


Figure 13. Adult steelhead (Adults) and other O. mykiss (O. mykiss) abundances for the Santa Monica Mountains BPG. A) Arroyo Sequit Creek. B) Topanga Creek. C) Malibu Creek. Adult abundance is indicated on the left -axis and delineated by the solid blue line and O. mykiss abundance is indicated on the right axis and delineated by the dashed blue line. Note different scales on the Y-axis.

4.4.1.4 Mojave Rim BPG

Abundance data is generally not available for this BPG; therefore, we were unable to create a full-time series of Southern SH/RT abundances for the San Gabriel River, Santa Ana River, and Los Angeles River watersheds.

A total of 3 adult steelhead were observed opportunistically in the Mojave Rim BPG from 2000-2018. Two observations occurred on Ballona Creek in 2007, and one observation occurred on the San Gabriel River in 2016 (Dagit et al. 2020). It is generally accepted that all over-summering, rearing, and spawning habitat occurring upstream is no longer accessible to Southern SH/RT due to the presence of extensive physical and velocity related passage barriers located within the lower reaches of each of the three major rivers; therefore, steelhead are not expected to be present in the lower reaches of these watersheds (NMFS 2012a).

4.4.1.5 Santa Catalina Gulf Coast BPG

We were unable to construct a full-time series of Southern SH/RT abundance for these populations because no data series were available to analyze the Santa Catalina Gulf Coast BPG. A total of 15 adult steelhead have been observed in the Santa Catalina Gulf Coast BPG from 2001-2018. Ten of these steelhead observations occurred on either San Juan or San Mateo creeks, and the remainder of observations were distributed throughout the Santa Margarita and San Luis Rey rivers and Los Penasquitos Creek (Dagit et al. 2020).

4.4.2 Geometric Mean Abundance

We calculated the geometric mean of abundance for Southern SH/RT populations (Na) with at least 3-4 generations of data for three time periods. The long-term calculation represents the total available time series. The medium-term calculation represents 12 years or three generations of data, while the short-term calculation is for the most recent 5 years of data. Missing data are noted in the following tables and there was no effort to interpolate or otherwise fill in missing data. Furthermore, we did not substitute values for years in which zero individuals were observed; instead, these values were omitted from the calculation in order to obtain an informative result.

The geometric mean is a useful metric for evaluating species' status because it calculates the central tendency of abundance while minimizing the effect of outliers in the data. Furthermore, the geometric mean is thought to more effectively characterize time series data of abundance based on counts than the arithmetic mean (Good et al. 2005; Spence et al. 2008). We did not calculate arithmetic mean because of its tendency to be overly sensitive to outlier data to a few large counts and can result in the incorrect depiction of central tendency. A range of minimum and maximum abundances were also calculated to provide scale.

Using methods from Spence et al. (2008), we defined the geometric mean of Southern SH/RT abundance as:

$$Na\ (geom) = \left(\prod Na(i)\right)^{1/n}$$

where $Na(i)$ is the total number of adult steelhead in year *i*, and *n* is the number of years of data available.

4.4.2.1 Monte Arido Highlands BPG

Maximum abundance of adult steelhead in the Monte Arido Highlands BPG has remained consistently low since the mid-1990s and early 2000s (Table 2a-2c). For each population examined, maximum counts from the most recent 5-year period are less than either the medium or long-term time frames. For all three watersheds, years in which zero adults were observed have occurred more frequently than years in which at least one fish was observed.

The highest average abundance in this BPG was during the 12-year time frame (2010-2021) on the Santa Ynez River. Both the Santa Clara and Santa Ynez rivers have higher 12-year averages compared to the long-term average. Overall, all three populations have lower 5-year averages when compared to the long-term average and geometric mean abundances remain low across all time frames (Table 3).

Table 2a. Minimum and maximum adult steelhead abundance for the Santa Ynez River over three-time frames: 1995 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year). No data for 2013. Biological Opinion Incidental Take provisions have been required since 2014.

Abundance	Minimum	Maximum
Long-term	0	16
12-year	0	9
5-year	0	0

Table 2b. Minimum and maximum adult steelhead abundance for the Ventura River over three-time frames: 2006 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year).

Abundance	Minimum	Maximum
Long-term	0	6
12-year	0	1
5-year	0	1

Table 2c. Minimum and maximum adult steelhead abundance for the Santa Clara River over three-time frames: 1994 to 2018 (long-term), 2007 to 2018 (12-year), and 2014 to 2018 (5-year).

Abundance	Minimum	Maximum
Long-term	0	3
12-year	0	3
5-year	0	0

Table 3. Long-term, medium-term, and short-term geometric mean abundance of adult steelhead in the Monte Arido Highlands BPG.

Population	Years	Long-term Mean	Years	12-year mean	Years	5-year mean
Santa Ynez River[1]	1995-2021	2.1	2010-2021	3.0	2017-2021	0.0
Ventura River	2006-2021	2.1	2010-2021	1.0	2017-2021	1.0
Santa Clara River	1994-2018	1.7	2007-2018	2.3	2014-2018	0

[1] No data long-term 2013; Biological Opinion Incidental Take provisions have been required since 2014.

Maximum abundances of *O. mykiss* for all populations in the Monte Arido BPG are considerably less when comparing the 5-year time frame to the long-term time frame (Table 4a-4c). On the Ventura River, a maximum of 807 *O. mykiss* were observed during the long-term time frame compared to just nine individuals being observed during the most recent 5-year time frame. Minimum abundances range from zero to five *O. mykiss* for all three time-periods and populations. All three *O. mykiss* populations have lower 5-year averages compared to the 12-year and long-term time frames (Table 5). The Santa Ynez River has the highest average abundance of the three populations for each time frame. Overall, mean abundances of *O. mykiss* in this BPG have declined to low numbers, especially in the last five years.

Table 4a. Minimum and maximum O. mykiss (Other O. mykiss) abundance for the Santa Ynez River over three-time frames: 2001 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year). No data for 2013. Biological Opinion Incidental Take provisions have been required since 2014.

Abundance	Minimum	Maximum
Long-term	5	665
12-year	5	484
5-year	5	205

Table 4b. Minimum and maximum O. mykiss abundance (Other O. mykiss) for the Ventura River over three-time frames: 2005 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year).

Abundance	Minimum	Maximum
Long-term	0	807

Table 4c. Minimum and maximum other O. mykiss abundance for the Santa Clara River over three-time frames: 1994 to 2014 (long-term), 2003 to 2014 (12-year), and 2010 to 2014 (5-year). No data for 2005.

Abundance	Minimum	Maximum
Long-term	1	876
12-year	1	170
5-year	1	100

Table 5. Long-term, medium-term, and short-term geometric mean abundance of O. mykiss (Other O. mykiss) in the Monte Arido Highlands BPG.

Population	Years	Long-term Mean	Years	12-year mean	Years	5-year mean
Santa Ynez River[1]	2001-2021	166.4	2010-2021	100.5	2017-2021	43.7
Ventura River	2005-2021	44.7	2010-2021	34.5	2017-2021	3.0
Santa Clara River[2]	1994-2014	39.5	2003-2014	30.5	2010-2014	21

[1] No data long-term 2013; Biological Opinion Incidental Take provisions have been required since 2014.
[2] No data long-term 2005

4.4.2.2 Conception Coast BPG

We were unable to calculate geometric mean abundance estimates for the Conception Coast BPG aside from the Arroyo Hondo Creek *O. mykiss* population due to the lack of long-term data. Based on bankside *O. mykiss* observations as part of spawner redd surveys, the geometric mean abundance was 581 individuals from 2015-2022, the maximum abundance of 8,614 individuals was observed in 2021, and the minimum abundance of zero individuals was observed in 2022 (K. Evans, CDFW, unpublished data).

4.4.2.3 Santa Monica Mountains BPG

Maximum abundance counts of adult steelhead in the Santa Monica Mountains BPG have remained consistently low since the early 2000s (Table 6a-6c). A total of two adult steelhead were observed in Arroyo Sequit Creek in 2017, coinciding with the removal of all instream barriers on the creek below the Mulholland culvert in 2016; however, no adult steelhead have been observed in this creek since 2017. The maximum abundance of adult steelhead in Topanga and Malibu creeks has not been greater than five individuals for any given year during all time periods. For adult steelhead populations in both Topanga and Malibu creeks, the 5-year average is lower than the long-term average (Table 7). Overall, average abundances of adult steelhead for all three populations remain low across all time frames.

Table 6a. Minimum and maximum adult steelhead abundance for Arroyo Sequit Creek over three-time frames: 2005 to 2018 (long-term), 2007 to 2018 (12-year), and 2014 to 2018 (5-year).

Abundance	**Minimum**	**Maximum**
Long-term	0	2
12-year	0	2
5-year	0	2

Table 6b. Minimum and maximum adult steelhead abundance for Malibu Creek over three-time frames: 2004 to 2019 (long-term), 2008 to 2019 (12-year), and 2015 to 2019 (5-year).

Abundance	**Minimum**	**Maximum**
Long-term	0	5
12-year	0	5

Table 6c. Minimum and maximum adult steelhead abundance for Topanga Creek over three-time frames: 2001 to 2019 (long-term), 2008 to 2019 (12-year), and 2015 to 2019 (5-year).

Abundance	**Minimum**	**Maximum**
Long-term	0	2
12-year	0	2
5-year	0	2

Table 7. Long-term, medium-term, and short-term geometric mean abundance of adult steelhead in the Santa Monica Mountains BPG.

Population	Years	Long-term mean	Years	12-year mean	Years	5-year mean
Arroyo Sequit Creek[1]	2005-2019	NA	2008-2019	NA	2015-2019	NA
Topanga Creek	2001-2019	1.4	2008-2019	1.3	2015-2019	1
Malibu Creek	2004-2019	1.9	2008-2019	2.1	2015-2019	1

[1] Insufficient data to produce meaningful results.

For all populations in this BPG, maximum abundances of *O. mykiss* for the 5-year time frame are considerably lower compared to the long-term time frame (Table 8a-8c). Since 2005, a total of four *O. mykiss* were observed in Arroyo Sequit Creek with most years recording zero observations (Table 8a). For the Malibu Creek population, a maximum abundance of 2,245 *O. mykiss* was observed from 2004-2019 compared to just 32 individuals during the 5-year time frame (Table 8b). Topanga Creek appears to support a small but consistent population of *O. mykiss* with a long-term maximum and minimum abundance of 316 and 34 individuals, respectively (Table 8c). Topanga Creek *O. mykiss* have also declined in abundance over the three time periods, but this difference is less pronounced than the decline observed for the Malibu Creek population (Table 9).

Table 8a. Minimum and maximum O. mykiss (Other O. mykiss) abundance for Arroyo Sequit Creek over three-time frames: 2005 to 2019 (long-term), 2008 to 2019 (12-year), and 2015 to 2019 (5-year).

Abundance	Minimum	Maximum

[1] Insufficient data to produce meaningful results.

4.4.2.4 Mojave Rim and Santa Catalina Gulf Coast BPG

We were unable to calculate geometric mean abundance estimates for either the Mojave Rim or Santa Catalina Gulf Coast BPG due to the lack of long-term data. See Sections 4.3.4, 4.4.1.4, 3.3.5 and 3.4.1.5 for more information on adult steelhead and *O. mykiss* distribution and abundances in these two BPG.

4.4.3 Trend Analysis

Trends were calculated as the slope (β_1) of the regression of log-transformed abundance against years. A value of one was added to the number of Southern SH/RT before the log-transformation to address any zero values if they were present in the dataset [i.e., $ln\ (\bar{N}_a + 1)$]. Using methods from Good et al. (2005), the linear regression can be expressed as:

$$ln\ (\bar{N}_a + 1) = \beta_0 + \beta_1 X + \in$$

Where $\bar{N}_a$ is annual adult steelhead abundance, β_0 is the intercept, β_1 is the slope of the equation, and $\in$ represents the random error term. Population trend, *T*, for the specified time series was expressed as the exponentiated slope from the regression above:

$$\exp(\beta_1)$$

with 95% confidence intervals calculated as:

$$\exp(\beta_1) \pm t_{0.05(2),df} s_{b_1}$$

where b_1 is the estimate of the true slope, β_1, $t_{0.05(2),df}$ is the two-sided t-value for a confidence level of 0.95, *df* is equal to *n*-2, *n* is the number of data points in the time series, and s_{b_1} is the standard error of the estimate of the slope, b_1 (Good et al. 2005). We converted the slope to percent annual change (Busby et al. 1996), calculated as:

$$100 * (\exp(\beta_1) - 1)$$

Negative trend values indicate declining abundances over time, whereas positive values indicate growth of the population. Slopes significantly different from zero (P<.05) were noted.

4.4.3.1 Monte Arido Highlands BPG

We calculated adult steelhead and *O. mykiss* population trends for the Santa Ynez, Ventura, and Santa Clara rivers; however, due to lack of monitoring data we were unable to calculate trends for the Santa Maria River adult steelhead and *O. mykiss* populations (Tables 10 and 11). All three adult steelhead populations have declining trends in abundance for their respective data series and the decline in the Ventura River population is statistically significant (p=0.03). Our trend estimates are consistent with other recently reported trend estimates for the Monte Arido Highlands BPG (Boughton et al. 2022a). Similarly, all three *O. mykiss* populations have declining trends in abundance with significant declines observed on the Santa Ynez (p=0.03) and Ventura (p=0.05) rivers (Table 11).

Table 10. Trends in adult steelhead abundance using slope of ln-transformed time series counts for three Monte Arido Highland BPG populations. Missing years of data were eliminated and not interpolated in any way. Bolded trend values were found to be significant (p<0.05).

Population	Years	Trend (%/year)[1]	Lower 95% CI	Upper 95% CI
Santa Ynez River[1]	1995-2021	-2.24	-6.12	1.59
Ventura River	2006-2021	**-7.54**	-13.77	-0.86
Santa Clara River	1994-2018	-2.29	-4.99	0.49

[1] No data 2013, Biological Opinion Incidental Take provisions have been required since 2014.

Table 11. Trends in O. mykiss (Other O. mykiss) abundance using slope of ln-transformed time series counts for three Monte Arido Highland BPG populations. Missing years of data were eliminated and not interpolated in any way. Bolded trend values were found to be significant (p<0.05).

Population	Years	Trend (%/year)[1]	Lower 95% CI	Upper 95% CI
Santa Ynez River[1]	1995-2021	**-8.81**	-15.98	-1.03
Ventura River	2006-2021	**-19.39**	-34.89	-0.20
Santa Clara River[2]	1994-2018	-6.09	-18.03	7.58

[2] No data 2005

4.4.3.2 Santa Monica Mountains BPG

Both Topanga and Malibu Creek populations have a declining but non-significant trend in adult abundance (Table 12). The trend estimates reported here are consistent with recently reported trend estimates for Topanga and Malibu creeks (Boughton et al. 2022a).

The Malibu Creek *O. mykiss* population has experienced a statistically significant (p=0.002) average declining trend in abundance of approximately 26% per year from 2004-2019 (Table 13). The average trend in adult *O. mykiss* abundance for the Topanga Creek population also suggests a decline from 2001-2019; however, the trend is not statistically significant.

Table 12. Trends in adult steelhead abundance using slope of ln-transformed time series counts for the Santa Monica Mountains BPG populations. Missing years of data were not included. Bolded trend values were found to be significant (p<0.05).

Population	Years	Trend (%/year)	Lower 95% CI	Upper 95% CI
Arroyo Sequit[1]	2001-2019	NA	NA	NA
Topanga Creek	2001-2019	-1.70	-5.76	2.54
Malibu Creek	2004-2019	-1.41	-8.49	6.22

[1] Insufficient data to produce meaningful results.

Table 13. Trends in O. mykiss (Other O. mykiss) abundance using slope of ln-transformed time series counts for the Santa Monica Mountains BPG populations. Missing years of data were not included. Bolded trend values were found to be significant (p<0.05).

Population	Years	Trend (%/year)	Lower 95% CI	Upper 95% CI
Arroyo Sequit [1]	2005-2019	NA	NA	NA
Malibu Creek	2004-2019	**-25.56**	-37.19	-11.79
Topanga Creek	2001-2019	-1.24	-6.44	4.25

[1] Insufficient data to produce meaningful results.

4.4.3.3 Conception Coast, Mojave Rim, and Santa Catalina Gulf Coast BPGs

We were unable to calculate trends for populations of Southern SH/RT in the Conception Coast, Mojave Rim, and Santa Catalina Gulf Coast BPGs due to lack of available data, with the exception of Arroyo Hondo Creek *O. mykiss*. The analysis of the Arroyo Hondo Creek *O. mykiss* population counts from seven years of bankside observations conducted during winter redd surveys indicate a declining trend in *O. mykiss* abundance, but the trend is not statistically significant (p=0.71).

Many watersheds in the Mojave Rim and Santa Catalina Gulf Coast BPGs likely supported intermittent Southern SH/RT populations characterized by repeated local extinctions and recolonization events in dry and wet years, respectively (NMFS 2012a). The sporadic and intermittent nature of these populations preclude the ability to effectively analyze trends in abundance. Furthermore, many adult steelhead populations occurring south of the Santa Monica Mountains are considered severely reduced and, in many instances, extirpated (Boughton et al. 2005).

4.5 Productivity

Productivity or population growth rate provides important information on how well a population is "performing" in the habitat it occupies throughout its life cycle. Productivity is a key indicator of a population's viability in terms of its long-term trends in abundance and the ability for it to recover after short-term disturbances (Boughton et al. 2022b). Productivity and abundance are closely linked metrics as a population's growth rate should be sufficient to maintain its abundance above viable levels (McElhany et al. 2000).

A population's cohort replacement rate (CRR) is defined as the rate at which each subsequent cohort or generation replaces the previous one (NOAA 2006). Data for adult steelhead in southern California contain too many years of zero observations to effectively calculate a CRR; therefore, we did not attempt to estimate this ratio. We calculated the CRR for *O. mykiss* populations in the Santa Ynez, Ventura, and Santa Clara rivers, as well as Malibu and Topanga creeks to account for the possibility of some individuals from these populations contributing to the anadromous life-history form. These watersheds were also selected because there was sufficient data (i.e., years with nonzero data) to produce CRR estimates.

The CRR is defined as:

$$CRR = \ln\left(N_{t+4}/N_t\right)$$

Natural log transformed CRRs greater than zero indicate that the cohort increased in size that year in relation to the brood year three years earlier, whereas a CRR less than zero indicates that the cohort decreased in size. This analysis assumes a generation time of four years, which has been determined to be reasonable based off our best understanding of the Pacific steelhead fluvial-anadromous life-history (NMFS 2012a; Shapovalov and Taft 1954). However, it is important to note that not all Southern SH/RT will return and spawn at age 4, and there is likely considerable variation in age structure (1-4 years) within individual populations (Boughton et al. 2022b).

Over the entire time series, CRR values for the Santa Ynez, Ventura, and Santa Clara River *O. mykiss* populations were more negative than positive (Figure 13). Negative CRRs most frequently occurred from 2013-2018, which coincide with the most recent extreme drought period and associated drought-related low flow conditions. The Santa Ynez River population may be rebounding, as indicated by a high CRR in 2021. Topanga Creek had more positive CRRs than negative, however, 89% of the years with positive values occurred prior to 2012. The CRRs on Topanga Creek are consistent with a recent study that found a significant decline of the abundance of all life stages of *O. mykiss* due to the 2012-2017 drought (Dagit et al. 2017). Population growth rates on Malibu Creek appear to be declining as CRR values have been negative since 2012.

4.6 Population Spatial Structure

Population spatial structure refers to the spatial distribution of individuals in the population and the processes that generate that distribution. Population spatial structure is a function of habitat quality, spatial configuration, and dispersal rates of individuals within different habitat types. Spatial structure reflects the extent to which a population’s abundance is distributed among available or potentially available habitats at any life stage. All else being equal, a population with low abundance is likely to be less evenly distributed within and among watersheds and is more likely to experience extinction from catastrophic events. Furthermore, populations with low abundance have a reduced potential to recolonize extirpated populations.

Numerous discrete and spatially dispersed but connected populations are required to achieve long-term persistence of Southern SH/RT (NMFS 2012a). Though we cannot specifically classify the spatial structure necessary to maintain Southern SH/RT viability with certainty, examining similarities and differences between their historical and current spatial distribution can provide a better understanding of their present extinction risk. Southern SH/RT historically occupied at least 46 watersheds in southern California, but currently, only 37-43% of these watersheds are thought to still be occupied (NMFS 2012a). This finding not only highlights the severe contraction of the distribution and abundance of Southern SH/RT in their range, but also indicates that they are prone to range-wide extinction due to several factors such as low population growth rate, loss of genetic diversity, and the limited number of sparsely distributed individuals that may be necessary to recolonize extirpated neighboring populations.

The truncated Southern SH/RT spatial structure observed today can be attributed to the presence of numerous dams, artificial barriers, other instream structures, and groundwater extraction that have long impeded migration and access to high quality upstream habitat throughout southern California (NMFS 2012a). Dams and other barriers not only restrict access to upstream spawning and rearing habitat, but also prevent important ecological and genetic interactions with *O. mykiss* from occurring both upstream and downstream of the total barrier. Isolated *O. mykiss* populations containing ancestry of native Southern SH/RT continue to persist above barriers in approximately 77% of watersheds where the anadromous component has been lost below the barrier (Nielsen et al. 1997; Boughton et al. 2005; Clemento et al. 2009). The impact of dams and other artificial barriers is especially notable on the large rivers and small coastal streams in the northern portion of Southern SH/RT's range. For example, Cachuma, Gibraltar, and Juncal dams on the Santa Ynez River block access to at least 70% of historical spawning and rearing habitat within the watershed. Matilija and Casitas dams located on Matilija and Coyote creeks, respectively, restrict access to 90% of the available spawning habitat in Ventura River watershed. Similarly, Santa Felicia and Pyramid dams on Piru Creek block access to all upstream spawning habitat on this major tributary of the Santa Clara River. On Malibu Creek, the Rindge Dam and Malibu Lake dam blocks access to over 90% of historical anadromous spawning and rearing habitat within the watershed (NMFS 2012a).

Historically, the lower and middle reaches of streams in southern California were used as both migration corridors to higher quality upstream habitat and juvenile rearing habitat in stream reaches that maintained perennial surface flows (Moore 1980). Today, these reaches are the only remaining accessible spawning habitat for Southern SH/RT and are characterized by high urban densities, channelization, impaired stream flows, instream diversions, groundwater extraction, and habitat that generally favors non-native fishes (NMFS 2012a). Furthermore, habitat loss and fragmentation has led to the loss of habitat diversity (i.e., riparian cover, instream habitat structure), which has prevented fish from utilizing these once connected and intact habitats.

The current distribution of Southern SH/RT across its range is inadequate for their long-term persistence and viability (NMFS 2012a). The majority of watersheds in southern California contain dams and artificial barriers that restrict access to high quality upstream spawning and rearing habitat. Barriers to migration isolate and prevent ecological interactions with upstream native *O. mykiss* that would otherwise have the potential to be anadromous. Population level impacts include increased susceptibility to local extirpation due to natural demographic and environmental variation and the loss of genetic and life-history diversity (NMFS 2012a). Range-wide, the historically widespread Southern SH/RT are now sparsely distributed across the landscape with significant reductions in abundance. The degraded spatial structure of Southern SH/RT threatens the viability of the population because extinction rates of individual sub-basin populations are likely much higher than the rate of the formation of new populations from recolonization (McElhany et al. 2000). This is especially relevant for populations occurring in watersheds south of the Santa Monica Mountains; originally, these watersheds supported infrequent Southern SH/RT populations that were likely characterized by repeated local extinction and recolonization events by either neighboring watersheds or from resident populations in upstream drought refugia in dry and wet cycles.

4.7 Diversity

Diversity refers to the phenotypic (e.g., life-history diversity) and genetic characteristics of a population. Life-history diversity allows populations to utilize a wide array of habitats and confers resilience against short-term spatial-temporal variation in the environment. Genetic diversity affects a population's ability to persist during long-term changes in the environment due to both natural and anthropogenic influences. The variation in the life history characteristics in any given population are typically the result of its genetic diversity interacting with environmental conditions. Populations lacking genetic diversity may not have as many genetic "options" to generate new or modified life history types in the face of changing environmental conditions, since natural selection may favor new or different genetic variants. As such, a genetically depauperate population that may be well adapted to the current steady state could be maladapted to new environmental conditions. The combination of both diversity types in a natural environment provides populations with the ability to adapt to long-term changes and be more resilient to these changes over both short- and long-term time scales (McElhany et al. 2000).

Our analysis in Section 4.4 demonstrates declines in *O. mykiss* populations across much of its southern California coast range and preserving Southern SH/RT life-history strategies and adaptations is a critical component for the recovery of the Southern California Steelhead DPS (NMFS 2012a). Ideally, all three Southern SH/RT life-history types (i.e., fluvial-anadromous, freshwater-resident, lagoon-anadromous) would be expressed within a single population, or the population would harbor the underlying genetic variation to express those life-history types when environmental conditions allow. The freshwater-resident life-history type is still present in many populations of Southern SH/RT; however, this form frequently occurs in the isolated upper reaches of the watershed where opportunities for gene flow with anadromous fish are prevented by barriers to migration. Bond (2006) demonstrated accelerated growth rates of juvenile *O. mykiss* expressing the lagoon-anadromous life-history form. Larger size at ocean entry is thought to enhance marine survival and improve adult returns (Bond 2006); however, it is unlikely that this life-history form is currently viable, because approximately 75% of estuarine habitat in southern California has been lost, and the remaining intact habitats are constrained by agricultural and urban development, highways, and railroads, and threatened by sea level rise and invasive species (NMFS 2012a). The artificial breaching of lagoons also poses a significant threat to the lagoon-anadromous life-history form as a recent study observed considerable mortality of Southern SH/RT directly after artificial breaching (Swift et al. 2018). As presented in Section 4.4, the anadromous form of Southern SH/RT still occurs in very low abundances in a limited portion of their historical range. The preservation of this life-history component will require substantial habitat restoration and modifications or removal of the numerous artificial barriers that currently restrict access to upstream high-quality spawning habitat (NMFS 2012a).

Several recent studies highlight the important role that genetic factors have in determining the life-history expression of coastal steelhead. Pearse et al. (2014) identified two Omy5 haplotypes linked to the anadromous ("A") and resident ("R") life-history forms whereby "AA" and "AR" genotype are more likely to be anadromous than the "RR" genotype (Pearse et al. 2019). Rundio et al. (2021) found that age 1+ juveniles with "RR" and "AR" genotypes experienced higher growth rates than fish with the "AA" genotype, and that overall condition was slightly higher in future resident fish than in future smolts, particularly among resident males. The divergence of the "A" and "R" haplotypes in Southern SH/RT populations is influenced by the presence of numerous artificial barriers in southern California, which act as a strong selection pressure against the "A" haplotype in above-barrier populations. For example, on the Santa Clara River, the Vern Freeman Diversion Dam and other instream diversions have limited upstream fish passage to spawning and rearing habitat on its tributaries, Sespe and Santa Paula creeks (NMFS 2012a). Populations of *O. mykiss* from both tributaries were found to display moderately high frequencies of the "R" haplotype (Pearse et al. 2019). Relative frequencies of the "R" and "A" haplotypes can also be altered in populations that have become introgressed with other strains of Rainbow Trout that may have much different haplotype frequencies.

The recognition of the "A" and "R" haplotypes provide insight on the genetic integrity and viability of Southern SH/RT. The frequency of the anadromous haplotype may substantially decline during periods of adverse conditions due to the low predicted survival of migrating smolts (i.e., “AA” and “AR” individuals). Likewise, “RR” and “AR” residents may be favored during adverse conditions, which could eventually lead to declines of the “A” haplotype over time and the gradual loss of the “AA” genotype from the population. Without considerable restoration of habitat connectivity through the removal of artificial barriers, the “A” haplotype in “AR” individuals in isolated populations above barriers is expected to be slowly lost over time (Apgar et al. 2017). While “AR” smolts may produce “AA” individuals when favorable migration conditions continue and retain the “A” haplotype in resident populations, it is unclear that the resident component can reliably produce anadromous fish after prolonged periods of unfavorable conditions in the long term (Boughton et al. 2022a). Furthermore, climate change projections for Southern SH/RT range predict an intensification of typical climate patterns such as more intense cyclic storms, drought, and extreme heat (NMFS 2012a). These projections suggest that Southern SH/RT will likely experience more frequent periods of adverse conditions and continued selection pressure against the anadromous life-history form.

4.8 Conclusions

This section summarizes the abundance, trends, and productivity analyses. Because quantitative analyses were not conducted for population spatial structure and diversity, we do not provide conclusions for these metrics as the qualitative discussions in Sections 4.6 and 4.7 provide sufficient detail and information.

4.8.1 Abundance and Trends

The data evaluated indicate an overall long-term declining trend of Southern SH/RT with critically low range-wide abundances. In the past decade, adult abundance counts have not been greater than ten for any watershed examined, and most streams have observed no adult returns during this time period. For the Monte Arido Highlands BPG, which is thought to be a potential source population for smaller coastal watersheds such as the Conception Coast BPG, only a single adult has been observed returning in the past five years. For each of the three populations analyzed, the data for this BPG shows a long-term declining trend in adult abundance. The steepest decline occurred in the Ventura River population, for which a statistically significant -7.54% per year was observed.

The data evaluated for the Santa Monica Mountains BPG indicate that these watersheds support small but consistent runs of adult steelhead ranging from zero to five individuals per year. However, like other salmonid-supporting streams in the Southern SH/RT range, few adults have been observed in the past five years, and it is unlikely that these streams historically supported large runs of Southern SH/RT due to their small size. The data also show declining but not statistically significant trends in adult abundance for Malibu and Topanga creeks. The Department's South Coast Region staff have not observed any *O. mykiss* in Malibu Creek since before the Woosley fire in 2018, which suggests that Southern SH/RT have been effectively extirpated below Rindge Dam (D. St. George, CDFW, personal communication). A combined total of five adults have been observed for the Conception Coast, Mojave Rim, and Santa Catalina Gulf Coast BPGs since 2017 (Dagit et al. 2020). Our finding of generally declining trends in the abundance of adult steelhead is consistent with the results of a recent viability assessment for the southern California Coast Domain produced by Boughton et al. (2022a).

O. mykiss trends also demonstrate measurable declines in overall abundance. Maximum abundance and long-term averages of *O. mykiss* have declined in all three Monte Arido Highland populations. Similarly, all populations in this BPG show declining trends in O. *mykiss* abundance with statistically significant declines of -8.81% and -19.39% per year on the Santa Ynez and Ventura rivers, and a non-statistically significant decline of -6.09% on the Santa Clara River. Within the Santa Monica Mountains BPG, both Malibu and Topanga creek *O. mykiss* populations have experienced a long-term decline. The *O. mykiss* population in Topanga Creek appears to be more viable than Malibu Creek as our results indicate only a small long-term decline. Our results indicate a trend of -25.56% per year on Malibu Creek, which is the steepest average annual decline for any of the Southern SH/RT populations that we analyzed.

The most recent prolonged drought from 2012-2017 correlates with significant reductions of all life-history forms and stages of Southern SH/RT. Drought conditions are associated with the loss of suitable spawning and rearing habitat, insufficient instream flows required for migration, diminished water quality, reductions in available food supply, and increases in direct mortality due to predation and stranding (Dagit et al. 2017). Our analyses show a relatively consistent range-wide pattern of higher abundances prior to 2012, followed by consecutive years of lower abundances starting at the onset of the drought. It appears that few populations have rebounded from the drought as current abundance estimates remain low relative to pre-drought conditions. The recovery of Southern SH/RT will likely depend on the successful recruitment of downstream migrants from upstream resident populations in refugia habitats. However, virtually all refugia populations are currently above impassable barriers. Furthermore, many southern California watersheds do not contain upstream drought refugia. In these instances, recolonization from source populations in other watersheds is likely the only mechanism for these populations to rebound (Boughton et al. 2022a).

Boughton et al. (2007) established a precautionary run size criteria for the southern California Coast Domain of 4,150 spawners per year to provide a 95% chance of persistence of the watershed's population over the next 100 years. While this goal may not be feasible for many of the smaller coastal watersheds in southern California, NMFS (2012) speculated that this target may be more feasible for the larger watersheds (i.e., Monte Arido Highland BPG). Even if we applied a lower criterion of 834 spawners (Boughton et al. 2022a), the results of our analyses demonstrate that no population is near the criteria necessary to provide resilience from extinction.

It is important to highlight limitations of our analyses. First, our analysis may underestimate the true abundance of adult steelhead because data analyzed for this effort are usually collected during periods of high stream flows and turbidity, making monitoring difficult to conduct (Dagit et al. 2020). Second, the data used in this effort are derived from various single-basin monitoring efforts, each of which utilize different survey designs and approaches. Thus, we were required to interpret the data as reported, while recognizing the potential limitations in making inter-watershed comparisons in instances where the data were from various monitoring efforts that did not necessarily meet standards established by the Department's California Coastal Monitoring Program (CMP). Third, the lack of any monitoring of most watersheds occurring south of the Santa Monica Mountains inhibited our ability to make definitive and comprehensive range wide conclusions on Southern SH/RT abundance and trends. However, it is likely that abundance estimates for many watersheds in the southern portion of the range are so low that obtaining accurate estimates would remain difficult even with increased monitoring.

4.8.2 Productivity

The results of our CRR analysis for *O. mykiss* on the Santa Ynez, Ventura, and Santa Clara rivers show more years of negative than positive CRR values. Negative CRR values were observed during the 2012-2017 drought period for all populations. However, the most recent 2021 estimate for the Santa Ynez population was positive, which may suggest a rebounding population. CRR values for Topanga Creek were more positive than negative; however, most positive values occurred prior to the onset of 2012 drought conditions. In recent years, Malibu Creek CRR values have been negative, particularly during the 2012-2017 drought period.

While the CRR values for *O. mykiss* do not necessarily reflect true spawner to spawner ratios due to the high likelihood that many observed fish were not actually part of the spawning cohort during that year, our results demonstrate that *O. mykiss* populations occurring below the barrier to anadromy in these watersheds do not appear to be viable because abundances are too low to sustain positive population growth rate on a yearly basis. This result is especially concerning given that the long-term resilience of the anadromous component of Southern SH/RT likely depends on the production of anadromous juveniles from the freshwater-resident life-history form.

5. HABITAT THAT MAY BE ESSENTIAL TO THE CONTINUED EXISTENCE OF SOUTHERN SH/RT

5.1 Migration

Southern SH/RT migration into freshwater is linked with seasonal winter and spring high flows that establish connectivity between the ocean and freshwater spawning areas (NMFS 2012a). Adult steelhead require water depths of at least 18 cm depth for upstream movement; however, 21 cm is considered to be more suitable for upstream passage of all possible sizes of individual fish, because it allows sufficient clearance so that contact with the streambed is minimized (Bjornn and Reiser 1991; SWRCB 2014). Low dissolved oxygen (<5 mg/L) and high turbidity can deter migrating salmonids such as steelhead (Bjornn and Reiser 1991). Delayed migration may also occur when stream temperatures are too high or low (Bjornn and Reiser 1991). Disease outbreaks can occur as a result of extreme high temperatures (Bjornn and Reiser 1991; Spence et al. 1996). Salmonids usually migrate when water temperatures are below 14°C (Spence et al. 1996); however, salmonids can adapt to higher thermal limits when slowly exposed to increased water temperatures over time (Threader and Houston 1983).

Instream structure, like waterfalls, sandbars, and debris jams can act as impediments to upstream fish migration. Steelhead are able to jump a maximum of 3.4 m (Spence et al. 1996) and typically, pool depth must be at least 25% greater than barrier height to achieve the required swimming velocity to pass the barrier (Spence et al. 1996). Pool shape can also influence if a barrier is passable by steelhead. For example, water flow over a steep waterfall into a plunge pool may increase jump height capacity due to upward thrust created by the hydrodynamics within the pool (Bjornn and Reiser 1991). Physical structures such as large woody debris and boulders within streams can offer flow and temperature refuge for resting fish during migration to upstream spawning areas (Spence et al. 1996). Wood structures, overhanging banks, and riparian flora can provide cover to steelhead for protection from terrestrial and avian predators. Deep pools provide important holding habitats for migrating adult salmonids (Chubb 1997).

5.2 Spawning

Habitat attributes necessary for successful spawning include cover, appropriate substrate, cool stream temperatures, and adequate streamflow (Reiser and Bjornn 1979). Salmonids select spawning sites in pool-riffle transitional areas where downwelling or upwelling currents occur that create loose gravel with minimal sediment and litter (Bjornn and Reiser 1991). Rainbow Trout can spawn in a relatively wide range of temperatures, from 2 – 22°C, but may respond to abrupt temperature declines with decreased spawning activity and production (Reiser and Bjornn 1979). Steelhead and Rainbow Trout require gravel substrate of 0.5 – 10.2 cm in diameter to construct their redds and a high proportion of the redd substrate must be comprised of smaller-sized gravel within this range (Reiser and Bjornn 1979). Cover habitat, which offers protection from predation, can include overhanging banks, riparian or aquatic vegetation, large and small woody debris, rocks, boulders, and other instream features. Having access to cover close to a redd is advantageous for Southern SH/RT and may influence spawning site selection (Reiser and Bjornn 1979). Minimum water depth must be sufficient to cover the spawning fish and, depending on individual fish size, is likely to range from 6-35cm (Bjornn and Reiser 1991).

Steelhead and Rainbow Trout have been documented to spawn in water velocities ranging from 21-117 cm/s (Reiser and Bjornn 1979; Bovee and Milhous 1978). Under moderate water velocities, increasing streamflow leads to a greater amount of covered gravel substrate for spawning; however, if water velocities and associated stream flows are too high, the additional suitable spawning habitat becomes unusable for salmonids and stream spawning capacity declines (Reiser and Bjornn 1979; Bjornn and Reiser 1991). Total suitable spawning area within a stream is dependent on the density and size of spawning fish, water depth and velocity, and amount of appropriately sized gravel substrate available (Bjornn and Reiser 1991). These factors combined drive habitat suitability for steelhead and other salmonids (Bjornn and Reiser 1991).

5.3 Instream Residency

Temperature, dissolved oxygen, salinity, water flow, and water depth are all factors that determine stream habitat suitability for *O. mykiss*. Water temperature is especially critical for survival in southern California, as stream temperature can vary drastically within the span of a single day, sometimes peaking at over 30°C during summer months (Sloat and Osterback 2013). For Southern SH/RT, changes in behavior occur above 25°C, such as decreased feeding or movement into refugia (Ebersole et al. 2001; Sloat and Osterback 2013) and the estimated mortality threshold is 31.5°C (Sloat and Osterback 2013), which is marginally higher than that of more northern steelhead populations (Rodnick et al. 2004; Werner et al. 2005). This increased temperature tolerance indicates that Southern SH/RT may have acclimated to higher temperature conditions; however, it does not necessarily suggest that they have undergone local adaptation with genetic underpinnings (Sloat and Osterback 2013). Dissolved oxygen levels should generally be at or above 5 mg/L for Southern SH/RT survival (Reiser and Bjornn 1979; Bjornn and Reiser 1991; Moyle et al. 2017) but concentrations greater than 7 mg/L are ideal (Moyle et al. 2017). In cooler temperatures, Rainbow Trout can survive in minimal dissolved oxygen levels of 1.5-2.0 mg/L (Moyle 2002).

Adult Rainbow Trout preferentially select habitat in deeper water and can be found in runs or pools close to swift water (Moyle 2002). In such habitats, fish can move into fast water habitat for feeding and then return to hold and rest in slower water (Moyle 2002). Tobias (2006) found that Southern SH/RT in Topanga Creek exhibited a preference for pools over other habitat types. Trench pools were strongly favored and mid-channel pools and step pools were also selected; however, fish avoided plunge pools, corner pools, and lateral scour pools as well as riffles and cascades. Glides and step runs were neither avoided nor strongly selected.

Resident Rainbow Trout prey on aquatic and terrestrial invertebrates that drift by, both in the water column or on the surface, as well as benthic invertebrates and sometimes smaller fishes (Moyle 2002). Larger stream-dwelling salmonids (>270 mm) often exhibit an ontogenetic niche shift, moving away from consuming invertebrates and depending more on piscivory to achieve efficient growth (Keeley and Grant 2001). Size of invertebrate and fish prey increased with body length (Keeley and Grant 2001). Stomach contents of *O. mykiss* in Topanga Creek revealed that aquatic and terrestrial insects, other invertebrates, and fish comprised most of their diet during fall and spring. Consumption of introduced Arroyo Chub (*Gila orcutti*) by Topanga Creek *O. mykiss* suggests that chub may be an important component of their diet in this stream, particularly during the late fall when aquatic macroinvertebrates may be less available (Krug et al. 2012; Swift et al. 1993).

5.4 Egg and Larval Development and Fry Emergence

Many environmental factors influence salmonid embryo incubation success, including dissolved oxygen, temperature, substrate size and porosity, and extra-gravel and inter-gravel hydrodynamics (Bjornn and Reiser 1991). Inter-gravel dissolved oxygen is particularly important to egg development and insufficient oxygen can lead to high mortality. Dissolved oxygen requirements increase as embryos grow and peaks just prior to hatching (Quinn 2018). Intra-gravel oxygen allows for embryo respiration, and oxygen concentrations of 8 mg/l or more contribute to high survival of steelhead embryos (Reiser and Bjornn 1979).

Water velocity is correlated with the amount of dissolved oxygen available to incubating eggs, and lower water velocity leads to higher embryo mortality (Bjornn and Reiser 1991). Reduced flows can also cause redd dewatering, which may result in egg mortality if there is no subsurface flow (Reiser and White 1983). The settling of fine sediment within gravels used to construct redds can prevent the interstitial flow of water and oxygen, and thus smother and kill embryos and post-hatch alevins (Bjornn and Reiser 1991). Finer sediment particles such as ash from wildfires or dust, are most effective at filling interstitial spaces within the redd substrate and can be a contributor to egg asphyxiation and recruitment failure (Beschta and Jackson 1979; Chapman 1988; Bjornn and Reiser 1991).

In addition to negative impacts from sediment deposition, unsuitable temperatures can have negative effects on embryonic development and survival (Bjornn and Reiser 1991). Higher temperatures are correlated with faster embryonic growth and development (Kwain 1975; Bjornn and Reiser 1991); however, if temperatures exceed upper suitability thresholds, mortality increases (Kwain 1975; Rombough 1988; Melendez and Mueller 2021). The ideal temperature range for incubation is 7-10°C (Kwain 1975) and incubation temperatures surpassing 15°C can result in considerable embryo mortality (Kwain 1975; Rombough 1988). Faster development and early hatching resulting from elevated temperatures can manifest in substantial reductions in body mass and length of newly hatched alevin (Melendez and Mueller 2021). These environmentally driven developmental changes could have negative implications for predation response and survival (Hale 1996; Porter and Bailey 2007). Alternatively, extremely cold water can induce mortality (Reiser and Bjornn 1979), although water temperatures that are below steelhead tolerances are likely a rare occurrence in southern California streams. Fry emerge in late spring or early summer and incubation time is dependent on water temperature (Moyle et al. 2017; Quinn 2018). Cold water temperatures, or those above 21.1°C, can decrease survival of emerging fry by restricting their ability to obtain oxygen from the water (McEwan and Jackson 1996).

5.5 Rearing and Emigration

Suitable rearing habitats for juvenile *O. mykiss* require adequate water temperature, flow velocity, water depth, dissolved oxygen concentrations, and availability of prey items. Juveniles generally occupy cool, clear, higher velocity riffles which provide cover from predators (Moyle 2002). Rearing juveniles require habitat with sufficient food production such as riffles with gravel substrate (Reiser and Bjornn 1979). Juvenile *O. mykiss* in southern California have been found to rear in both perennial and intermittent streams (Boughton et al. 2009). Intermittent streams are common in the southern California region and can in some cases benefit native fishes and other aquatic organisms that have evolved within these conditions. By seasonally fragmenting watersheds and disconnecting populations of introduced warm-water tolerant species, intermittent stream desiccation can reduce potential predation and competition from invasives. However, these same conditions can also negatively affect steelhead survival through loss of wetted habitat or degraded water quality conditions, prevent adult spawning migrations or juvenile/smolt emigration, and otherwise isolate subpopulations (Boughton et al. 2009).

Preferred water temperatures for juvenile *O. mykiss* range between 15 and 18°C (Moyle 2002), although they can tolerate temperatures up to 29°C if dissolved oxygen concentrations are high and there is an abundant food supply (Dressler et al. 2023; Sloat and Osterback 2013). Southern SH/RT have been observed functioning in stream temperatures outside of the preferred range up to the mid to high twenties (Dressler et al. 2023; Moyle et al. 2017; SYRTAC 2000). For example, the Santa Ynez River was determined to be thermally suitable, albeit thermally stressful, for Southern SH/RT in both normal and warm years, with thermal suitability characterized as a maximum daily temperature below 29°C and a mean daily temperature below 25°C (Boughton et al. 2015). Temporary or intermittent exposure to temperatures above the upper tolerance limit for salmonids can be tolerated in some populations (Dressler et al. 2023; Johnstone and Rahel 2003), whereas chronic or long-term exposure to high temperatures is typically lethal (Dickerson and Vinyard 1999; Johnstone and Rahel 2003). Additionally, feeding behavior and activity level are generally reduced when fish are temporarily exposed to warmer temperatures that cause thermal stress (Johnstone and Rahel 2003). However, Spina (2007) found that in Topanga Creek, there were no available daytime thermal refugia available for juvenile *O. mykiss,* yet they were able to tolerate temperatures up to 24.5°C without changes in behavior or activity level. These findings may indicate that Southern SH/RT are acclimated to higher daily stream temperatures than more northern *O. mykiss* populations. Juvenile salmonids acclimated to higher water temperatures, such as those in many Southern SH/RT streams, can sustain higher maximum thermal tolerances than those acclimated at lower temperatures (Lohr et al. 1996).

Metabolic demand increases with higher environmental temperatures. Warmer waters can result in faster growth rates where the forage base is abundant or may slow if food is scarce (Noakes et al 1983.; Brett 1971). Thus, freshwater growth is strongly dependent on primary productivity and food accessibility within the stream (NMFS 2012a). In Topanga Creek, juvenile Southern SH/RT had high growth rates during the summer despite temperatures that frequently surpassed known high temperature tolerances (Bell et al. 2011a).

Thermal refugia are especially important for summer rearing, when Southern SH/RT juveniles must find stream reaches that are sufficiently cool (NMFS 2012a). In southern California streams, higher altitude can provide thermal refuge as well as near-coastal areas that benefit from the ocean acting as a temperature sink (NMFS 2012a). Riparian cover is also important for moderating stream temperatures, as exposed or non-shaded streams are generally warmer than those shaded by riparian canopy (Li et al. 1994). These types of shaded, cool-water stream habitats are most frequently found in headwater reaches within the range of Southern SH/RT (NMFS 2012a).

In Sespe Creek, juvenile Southern SH/RT were observed to occupy the coolest areas of pools during daytime hours in summer months (Matthews and Berg 1997). Fish were consistently found congregating in a seep area that provided cool groundwater during the hottest times of day. The juvenile Southern SH/RT appeared to experience a trade-off between dissolved oxygen and water temperature but chose cooler temperatures, deeper within the temperature stratified pools, over higher levels of dissolved oxygen which were closer to the stream surface. In the spring, *O. mykiss* have been found to emigrate downstream into lower mainstem areas when tributaries may become warmer and/or drier (Spina et al. 2005). As flows increase in the fall and winter, fish may move upstream into tributary habitat to overwinter (Bramblett et al. 2002); however, this behavior has not been confirmed for Southern SH/RT (Spina et al. 2005).

Cover is also an important habitat component for juvenile Southern SH/RT survival, particularly during the winter months. Riparian cover, such as canopy and undercut banks, as well as instream cover like large woody debris (LWD) and deep pools, are important in providing shelter to rearing salmonids (Bjornn and Reiser 1991). Cover quality and availability have been correlated with local instream fish abundance for multiple salmonid species (Bjornn and Reiser 1991). In the mainstem Ventura River, juvenile Southern SH/RT densities were found to be positively correlated with velocity and cover (Allen 2015 p. 133). In western Oregon and Washington streams, juvenile steelhead were found in higher densities in reaches treated with LWD during the winter (Roni and Quinn 2001). Pool formation and enhancement can result from presence of live hardwood or LWD in a stream (Thompson et al. 2008). Instream tree roots can produce scour in high flow conditions leading to long-lasting pools. Trees in the stream channel can also anchor dead LWD and create wood jams. Jams constructed around standing trees are more durable and will last longer in watersheds dominated by hardwood species (Thompson et al. 2008).

Certain substrate types can also provide cover habitat for rearing salmonids. Larger substrate offers interstitial spaces for fish to avoid visual detection from predators. Boulders may be particularly important features in southern California streams, due to the paucity of LWD in these watersheds (Boughton et al. 2009; Tsai 2015). Boulders can assist in the formation of pools and create habitat complexity, which increases habitat suitability for Southern SH/RT (Roni et al. 2006; Tsai 2015). The presence of boulders in streams can also have a significant positive effect on *O. mykiss* survival and abundance due to their role in providing hiding areas and refuge from winter storms and associated flows (Tsai 2015). In contrast, areas with increased stream substrate embeddedness (more compacted stream bottoms) have been associated with lower juvenile salmonid densities (Bjornn and Reiser 1991).

Some Southern SH/RT will remain in freshwater through their life cycle, while those expressing the anadromous life history strategy will begin migrating downstream towards the ocean after two to three years of rearing in freshwater (NMFS 2012a). It is common in southern California for seasonal lagoons to be formed during the summer due to decreased stream flows and the natural accumulation of a sand berm at the point where the stream meets the ocean. Some juveniles take advantage of rearing in the warmer lagoon environment to achieve greater size prior to entering the ocean, which allows them a greater chance of survival (Bond et al. 2008; Hayes et al. 2008).

In Scott Creek (central California), during years when a seasonal lagoon formed, growth rates were 2-6 times greater for steelhead rearing in the estuary-lagoon than those in the cooler, less productive upstream habitat (Hayes et al. 2008). Juvenile *O. mykiss* in central California streams have been observed to exhibit a lagoon-anadromous, or “smolting” twice, life history strategy. These life history variants travel downstream to the closed estuary to rear during the summer, then migrate back upstream into more suitable conditions when the estuary starts to become less hospitable (Hayes et al. 2011; Huber and Carlson 2020). Juvenile *O. mykiss* also preferentially seek out areas with higher water quality when confined within a seasonally closed estuary (Matsubu et al. 2017). However, estuaries in poor condition, including lagoons with poor water quality, may lead to mortality of rearing juveniles if they do not have access to suitable habitat upstream. Seasonal lagoons in southern California typically do not reconnect to the ocean until the first rainfall occurs in the fall or winter (Booth 2020). Juvenile *O. mykiss* benefit from pulse flows initiated by storms and successful emigration is largely dependent on storm flow events matching the timing of *O. mykiss* smolt outmigration (Booth 2020). Smolts in southern California streams, such as the Santa Clara River are largely unable to take advantage of lagoon rearing and its associated benefits due to poor water quality in the estuary and dry reaches upstream (Booth 2020).

5.6 Ocean Growth

Little information exists specific to ocean growth of anadromous Southern SH/RT, but data from other west coast steelhead populations can provide some insight into habitat requirements of this life stage. Steelhead exhibit early ocean migratory behavior that is thought to maximize bioenergetic efficiency (Atcheson et al. 2012). In contrast to other Pacific salmon species, which typically remain relatively close to shore and feed in coastal waters along the continental shelf during their first summer at sea, steelhead quickly leave these productive coastal habitats for the open ocean (Atcheson et al. 2012; Daly et al. 2014). Many California steelhead juveniles spend only a few months feeding in the California Current Ecosystem (CCE) before they migrate northwest to cooler waters offshore (Daly et al. 2014). In the open ocean, steelhead maximize their energy intake by consuming high-energy prey items like fish and squid at moderate rates rather than consuming lower-energy food resources at high rates (Atcheson et al. 2012). Fish and squid make up a substantial portion of the juvenile steelhead diet for those rearing in the Gulf of Alaska, which serves as an important rearing location for west coast steelhead (Atcheson et al. 2012).

While feeding and growing in the ocean, steelhead typically occupy waters within the temperature range of 6-14°C (Hayes et al. 2016; Quinn 2018). Steelhead exhibit strong thermal avoidance, remaining within a narrow range of suitable sea surface temperatures (SSTs) during their ocean foraging and migrations, generally within 20 meters of the surface (Burgner et al.

1992 in Atcheson et al. 2012; Nielsen et al. 2010). Deviations outside of their thermal tolerance have negative consequences for growth and survival in the ocean (Atcheson et al. 2012) and generally poor ocean conditions can negatively affect survival especially during early ocean residence (Kendall et al. 2017). For example, warm SSTs were associated with lower post-smolt survival of Keogh River steelhead off the coast of Alaska (Friedland et al. 2014). In recent years, the CCE experienced a severe marine heatwave (Di Lorenzo and Mantua 2016), which impacted species abundance and distribution at multiple trophic levels, including the prey base for Pacific salmon (Daly et al. 2017; Peterson et al. 2017). During years with anomalously warm ocean conditions, young Chinook Salmon were observed to be much thinner, and their survival rates were depressed compared to years with cooler ocean temperatures, likely resulting from this shift in availability of prey species (Daly and Brodeur 2015; Daly et al. 2017).

Steelhead average a travel distance in the ocean of 2,013 km but have been tracked traveling up to 5,106 km (Quinn 2018). Steelhead are not typically captured in commercial fisheries possibly resulting from their swift movement offshore, and most catches of steelhead in research trawls are in the upper 30 meters of the water column (Moyle et al. 2017; Quinn 2018).

6. FACTORS AFFECTING THE ABILITY TO SURVIVE AND REPRODUCE

6.1 Changes in Ocean Conditions

The long-term relationship between ocean conditions, food web structure, and Southern SH/RT productivity is not well understood; however, these relationships have been examined for steelhead populations in the Pacific Northwest. While the Pacific Northwest coastal rivers are distant from the coastal rivers of southern California in terms of both geography and ecology, these findings still improve our understanding of the relationship between ocean temperatures and the dietary composition and morphology of west coast steelhead populations. Comparisons may also offer insights into similar mechanisms that may potentially influence Southern SH/RT ocean diet compositions. Thalmann et al. (2020) detected significant differences in the prey items consumed by juvenile steelhead during warm ocean years compared to average or cold ocean years. They also found significant interannual variability in stomach fullness, with significantly lower than average stomach fullness associated with warm ocean years. Steelhead sampled during warmer years were thinner, on average, than those sampled during cooler years. In 2015 and 2016, when ocean conditions were anomalously warm, there was limited availability of cold-water prey species with higher energetic and lipid content. Although some level of plasticity was demonstrated in the juvenile steelhead diet, consumption of lower-quality prey items likely led to reduced growth and poorer body condition during those years (Thalmann et al. 2020).

In the North Pacific, the 2013–2020 period was characterized by exceptionally high sea surface temperatures coupled with widespread declines and low abundances for many west coast salmon and steelhead populations (Boughton et al. 2022a). For example, the abundance of southern Chinook salmon and steelhead populations reached very low counts between 2014 and 2019, leading to the designation of many stocks as overfished (PFMC 2020). Increased sea temperatures and associated impacts have resulted in a significant biological response at all trophic levels, from primary producers to marine mammals and birds.

6.2 Effects of Climate Change

The climate of the United States is strongly connected to the changing global climate (USGCRP 2017), and temperatures are projected to continue to rise another 2°F (1.11°C) to 4°F (2.22°C) in most areas of the United States over the next few decades (Melillo et al. 2014). The waters of the United States are projected to lose between 4 and 20% of their capacity to support cold water-dependent fish by the year 2030 and as much as 60% by 2100 due to climate change and its impacts (Eaton and Scheller 1996). The greatest loss of this important aquatic habitat capacity is projected for California, owing to its naturally warm and dry summer climate (O'Neal 2002; Preston 2006; Mote et al. 2018). The recent multidecadal (2000–2021) "megadrought" in the southwestern U.S., including California, has been the driest 22-year period over the past 1,000 years in this region (OEHHA 2022). Severe drought was documented across much of the southwest during this period, with record-breaking low soil moisture, extended heat waves, reduced precipitation, and intensifying weather extremes (Garfin et al. 2013; OEHHA 2022; Williams et al. 2022). These conditions are expected to continue or increase in the region (Gershunov et al. 2013), with predicted outcomes dependent upon the level and extent of human efforts to address and offset CO_2-driven climate change impacts, both within the United States and across the globe (Overpeck et al. 2013; NMFS 2016; USGCRP 2017; OEHHA 2022).

Since 1895, California has warmed more than both the North American and global temperature averages (NOAA 2021; OEHHA 2022). As such, the state is considered one of the most "climate-challenged" areas in North America (Bedsworth et al. 2018), facing increasingly extreme weather patterns and comparatively rapid shifts in regional climate- and local weather-based averages and trends (e.g., Overpeck et al. 2013; Pierce et al. 2018). California's temperatures have paralleled global trends in terms of increasing at an even faster rate since the 1980s (Figure 15; OEHHA 2022). The past decade has been especially warm; eight of the ten warmest years on record for California occurred between 2012 and 2022 (OEHHA 2022). In general, the portions of California with lower latitudes and elevations will be subject to the greatest increase in duration and intensity of higher air and water temperatures due to climate change (Wade et al. 2013). Thus, the southwestern part of California, which includes the range of Southern SH/RT, will likely face disproportionate climate change-related impacts when compared to other regions of the state. Southern SH/RT are, therefore, likely to face more severe and challenging conditions than their northern salmonid relatives.

The broad-scale climatic factors that appear to primarily shape the habitat suitability and population distribution of Southern SH/RT are summer air temperatures, annual precipitation, and severity of winter storms (NMFS 2012a). These factors and their influences on the landscape are predicted to intensify under long-term, synergistically driven conditions brought about by climate change. They are also expected to exacerbate existing stressors for Southern SH/RT and other cold water-dependent native aquatic organisms in stream and river systems in southern California (NMFS 2012b). In a comprehensive rating of California native fish species, Moyle et al. (2013) determined southern California steelhead to be "critically vulnerable" to climate change and likely to go extinct by 2100 without strong conservation measures. This was reaffirmed by an analysis conducted by Moyle et al. (2017).

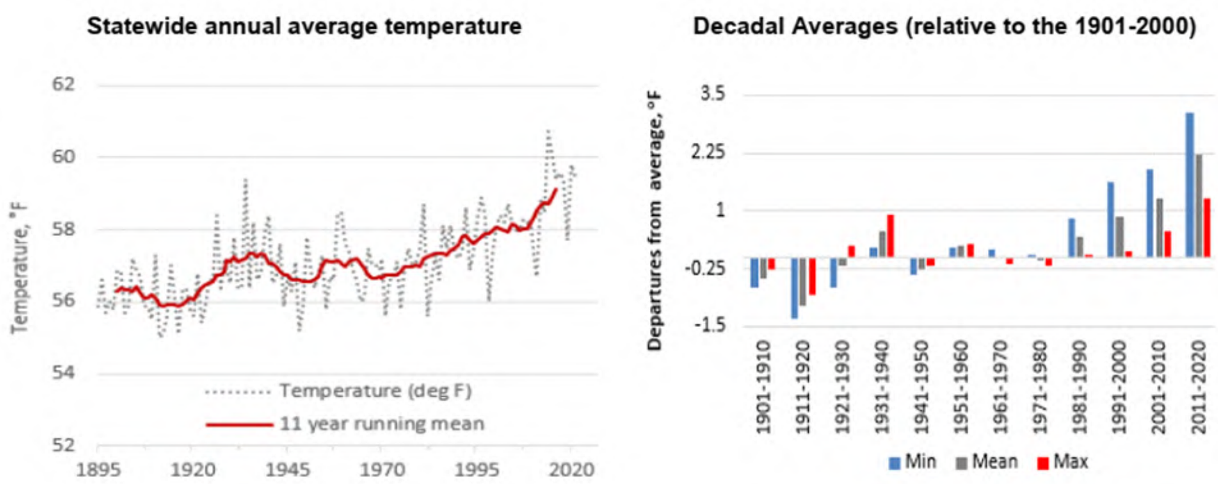

Figure 15. Temperature trend (left) and departure from average (right) graphs for California, from about 1900-2020 (source: OEHHA 2022).

6.2.1 Rising Temperatures

Extreme heat events in California have become more frequent, dating back to the 1950s; however, they have become especially pronounced in the past decade (OEHHA 2022). Heat waves, defined as two or more consecutive heat events (which are characterized by temperatures at or above the highest 5% of historical values), have also become more frequent during this period (OEHHA 2022). For context, over the past 70 years, extreme heat events increased at a rate of about 1 to 3 events per decade at 10 of a set of 14 statewide long-term monitoring sites across California (OEHHA 2022). Further, at several monitoring sites, daytime heat waves increased to as many as 6 events per year, and nighttime heat waves similarly increased to as many as 10 events per year (OEHHA 2022). Long-term regional climate observations for southern California also follow this pattern of long-term, steady temperature increases. Based on analyses of California South Coast National Oceanic and Atmospheric Administration (NOAA) Climate Division temperature records from 1896–2015, He and Gautam (2016) found significant upward trends in annual average, maximum, and minimum temperatures, with an increase of about 0.29°F (0.16°C) per decade. Likewise, every month of the year has experienced significant positive trends in monthly average, maximum, and minimum temperatures, across the same 100-year period (Hall et al. 2018).

Importantly, nighttime temperatures in California, which are reflected as minimum daily temperatures, have increased by almost three times more than daytime temperatures since 2012 (OEHHA 2022). Gershunov et al. (2009) showed that heat waves over California and Nevada are increasing in frequency and intensity while simultaneously changing in character and becoming more humid. This shift toward humid heat waves in the southwestern U.S. is primarily expressed through disproportionate increases in nighttime air temperatures (Garfin et al. 2013). These changes started in the 1980s and appear to have accelerated since the early 2000s (Garfin et al. 2013). Nighttime warming has been more pronounced in the summer and fall, increasing by about 3.5°F (1.94°C) over the last century, and southern California has warmed faster than Northern California (OEHHA 2022). These long-term regional changes will have disproportionate impacts on aquatic habitats due to elevated atmospheric humidity levels and diminished nighttime cooling effects on southern California waterways (Garfin et al. 2013).

In fact, water temperatures in many streams across California have risen for some time and are continuing to do so (Kaushal et al. 2010). Stream temperatures across the state have increased by an average of approximately 0.9–1.8°F (0.5–1.0°C) in the past 20+ years (e.g., Bartholow 2005 in Moyle et al. 2013). While such increases may seem small, they can push already marginal waters over thresholds for supporting cold water-dependent fishes (Moyle et al. 2015; Sloat and Osterback 2013). Summer water temperatures already frequently exceed 68°F (20°C) in many California streams and are expected to keep increasing under all climate change scenarios (Hayhoe et al. 2004; Cayan et al. 2008 in Moyle et al. 2015). Organisms that are adapted to California's traditional nighttime cooling influence on their habitats, including Southern SH/RT, are less prone to recover from extreme and extended periods of excessive daytime heat, particularly when humidity and temperatures remain high at night (Garfin et al. 2013; OEHHA 2022).

6.2.2 Drought

Overall, California has been getting warmer and drier since 1895; as part of this long-term climatic shift, droughts are becoming more frequent, extended, and severe in their impacts (OEHHA 2022). As noted, 2000–2021 was the driest 22-year period in the last millennium in the southwestern United States, including California (Williams et al. 2022). The 2012–2016 drought was one of the warmest and driest on record in California, negatively affecting both aquatic and terrestrial environments across the state (Figure 16; CDFW 2018a). Notable statewide aquatic habitat impacts from this and other prolonged droughts include seasonal shifts in stream hydrographs to earlier peaks with extended summer and fall low flow periods, contraction and desiccation of typically perennial aquatic habitats (Figure 18), poor water quality, elevated water temperatures, changes in migratory cues, spawn timing, and other fish behaviors, stranding, and both direct and indirect mortality of fish, along with estuary and lagoon habitat degradation, among other ecological impacts (CDFW 2018a; Bedsworth et al. 2018).

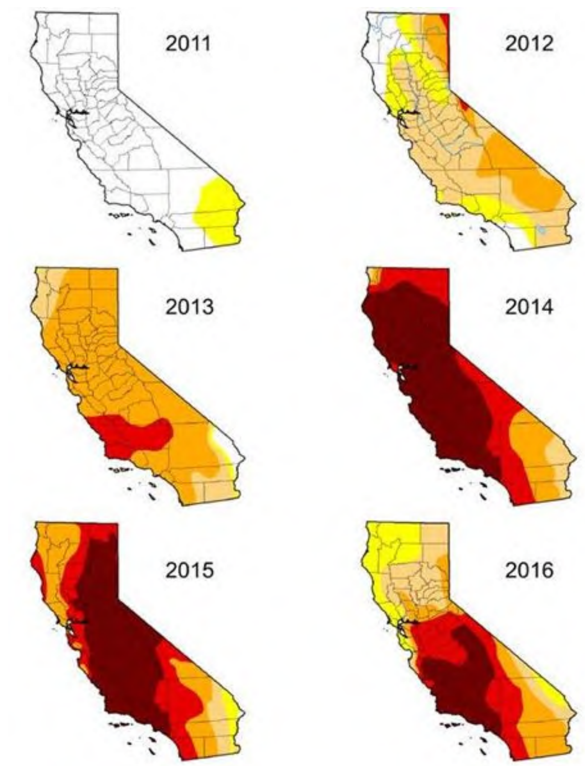

Figure 16. The distribution and progression of drought conditions in California from 2011 to 2016, depicting the level of drought at the beginning of each Water Year (October 1). White indicates no drought conditions, whereas yellow to dark red indicates increasing drought conditions, including duration and intensity (CDFW 2018a, based on U.S. Drought Monitor).

No part of the state has been more impacted by drought than southern California, with significant reductions in precipitation compared to long-term averages, along with record high temperatures, exceptionally dry soils, and low regional snowpack in surrounding mountain ranges in the past decade (Hall et al. 2018). Southern California is naturally arid and already prone to periods of extremely dry conditions (MacDonald 2007; Woodhouse et al. 2010), so increasing drought conditions have amplified many existing ecological stressors while also creating new ones. As an example, during normal water years, many streams in California's south-coastal region maintain perennial flows in their headwaters but become intermittent or dry in lower portions of their watersheds, especially in areas of concentrated urbanization or agriculture. The 2012–2016 drought dramatically exacerbated these conditions, leading to widespread stream drying in this region, even outside of areas that typically experience annual desiccation (Figure 17; CDFW 2018a). Not surprisingly, CDFW (2018a) noted that the two most common causes of fish kills in southern California during the 2012–2016 drought were stream drying and reduced dissolved oxygen levels (impaired water quality).

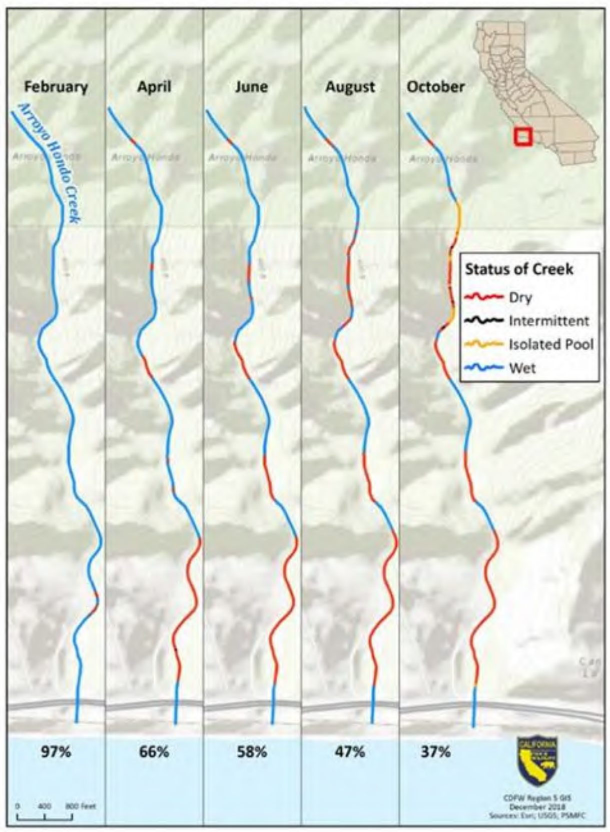

Figure 17. Example southern California stream (Arroyo Hondo Creek, Santa Barbara County), showing seasonal desiccation across 60% of its study area wetted length during February-October 2015 (source: CDFW 2018a). 2015 was a notably bad drought year in California, but the large extent of stream drying in this creek may be an indicator of future climate change-driven conditions in this and other southern California regional streams.

Further desiccation of Southern SH/RT habitats is expected due to climate change, leading to reduced natural spawning, rearing, and migratory habitats for already small and fragmented Southern SH/RT populations. This undesirable future state includes the increasing probability that low-precipitation years continue to align and coincide with warm years, further amplifying the risk of future severe droughts and low snowpack in California, especially in southern latitudes (Difenbaugh et al. 2015; Berg and Hall 2017; Williams et al. 2015).

In their five-year status reviews, NMFS (2016; 2023) concluded that ongoing “hot drought” conditions, among other negative factors, likely reduced salmonid survival across DPSs and ESUs for listed steelhead and salmon in California, including Southern SH/RT. It is likely that these same Southern SH/RT populations, already impacted and diminished in abundance and distribution, will face more frequent and severe drought periods in the future, along with more intense and destructive (albeit less frequent) winter storms, under all predicted scenarios. Both stressors, in combination, will further negatively affect the remaining suitable habitats for Southern SH/RT in California.

6.2.3 Reduced Snowpack

As air temperatures have warmed, more precipitation has been falling as rain instead of snow at high elevations in the western United States, where widespread snowpack declines of 15-30% have been documented since the 1950s (Mote et al. 2018; Siirla-Woodburn et al. 2021). Since 1950, California’s statewide snow-water content has been highly variable, ranging from more than 200% of the average in 1952, 1969, and 1983 to 5% in 2015 in the midst of the 2012–2016 drought (OEHHA 2022). The past decade included years that were among the lowest (2013, 2014, 2015, and 2022) and the highest (2011, 2017, 2019) on record for snowpack (OEHHA 2022). These patterns demonstrate increasing variability in the amount of overall precipitation the state receives, the frequency and intensity of storm systems, and the amount of precipitation received as rainfall versus snowfall. Annual snowpack in the Peninsular Ranges of southern California (e.g., Santa Ana Mountains, San Jacinto Mountains, and Laguna Mountains) is expected to continue to diminish, so future stream flows in the range of Southern SH/RT will be increasingly driven by rainfall events (Mote et al. 2018).

Snowmelt attenuates stream flows in basins that usually receive annual snowpack at higher elevations. An increase in the ratio of rain to snow and rain-on-snow events will result in more peak flows during winter and early spring, along with an increasing frequency of high flow events and damaging flooding. With earlier seasonal peak hydrographs, many southern California streams will experience diminished spring pulses and protracted periods of low flows through the summer and fall seasons (Moyle et al. 2015). These conditions will translate into warmer water temperatures at most elevations, reflecting both increases in air temperatures and reduced base flows (Moyle et al. 2017). Future shifts from snow to rain may also negatively impact overwintering rearing habitat for juvenile Southern SH/RT and reduce the availability of cold-water holding habitats as refuges in rivers and streams during the summer and fall months (Williams et al. 2016). Such abiotic shifts will affect the physical habitat availability and suitability for Southern SH/RT and are also anticipated to change species interactions, generally favoring introduced species with broader environmental tolerances (Moyle et al. 2013).

6.2.4 Increasing Hydrologic Variability – Reduced Stream Flows to Catastrophic Flooding

Climate change is likely to increase the impacts of El Niño and La Niña events, which are predicted to become more frequent and intense by the end of the century (OEHHA 2022). Increasingly dramatic swings between extreme dry years (or series of years) and extreme wet years are already occurring in California and are expected to escalate under various climate change scenarios (Swain et al. 2018; Hall et al. 2018). California's recent rapid shifts from drought periods (2012-2016, 2020-2022) to heavy precipitation and flooding (winter 2016-2017, winter 2022-23) exemplify "precipitation whiplash" and its potential for widespread natural habitat and human infrastructure damage and destruction (OEHHA 2022). California's river and stream systems will bear the brunt of these impacts since they are the natural conduits for water conveyance on the state's landscape.

Such precipitation variability and intensity in California is now increasingly influenced by "atmospheric rivers," or long, narrow bands of precipitation originating over ocean bodies from the tropics to the poles that transport large amounts of water vapor (USGCRP 2017; Hall et al. 2018). During the winter months, heavy precipitation associated with landfalling atmospheric rivers can produce widespread flooding in most of the southwestern U.S. states (Garfin et al. 2013). California is especially vulnerable to this source of destructive flooding because of its proximity to the Pacific Ocean, where atmospheric rivers are generated (USGCRP 2017). As a result of these changes, southern California stream flows will almost certainly become more variable and "flashy" on an annual basis. Predictions include likely extreme fluctuations in precipitation, with intermittent heavy winters producing high stream flows, coastal impacts, and extensive flooding during otherwise prolonged periods of drought, with low to no flows in many streams. Changes in seasonal flow regimes (especially flooding and low flow events) may also affect salmonid behavior. Expected behavioral responses include shifts in the seasonal timing of important life history events such as adult migration, spawning, fry emergence, and juvenile migration (NMFS 2016). The outmigration of juvenile steelhead from headwater tributaries to mainstem rivers and their estuaries may be disrupted by changes in the seasonality or extremity of stream hydrographs (NMFS 2016; Figure 18). Flood events can also disrupt incubation and rearing habitats due to increased bed mobility (Fahey 2006). Conversely, low flow periods with elevated water temperatures and impaired water quality can cause direct mortality to steelhead across wide portions of southern California's mountain desert streams (CDFW 2018a). Stream drying can also further isolate and restrict subpopulations, potentially leading to genetic drift, interfering with gene flow and genetic mixing at the larger population/ESU level, and potentially further reducing overall fitness.

6.2.5 Sea Level Rise

Along California's coast, mean sea levels have increased over the past century by about 8 inches (203 mm) at monitoring sites in San Francisco and La Jolla (OEHHA 2022). For the southern California coast, roughly 1-2 feet (0.3 m – 0.6 m) of sea level rise is projected by the mid-century, and the most extreme projections indicate 8–10 feet (2.4 m – 3.0 m) of sea level rise by the end of the century (Hall et al. 2018). Sea level rise is predicted to further alter the ecological functions and dynamics of estuaries and near-shore environments. Rising sea levels may impact estuary hydrodynamics with increased saltwater intrusion, potentially increasing salinity levels in estuaries and shifting the saltwater/freshwater interface upstream (Glick et al. 2007). Loss or degradation of already scarce estuary habitats in southern California's coastal areas due to sea level rise may negatively affect Southern SH/RT survival and productivity, since estuaries and lagoons serve as important nursery habitats for juvenile steelhead (Moyle et al. 2017). Alternatively, sea level rise may potentially increase the amount of available estuary habitat by inundating previously dry areas or creating additional brackish, tidal marsh, or lagoon habitats, which serve as important rearing habitats for juvenile salmonids (NMFS 2016). Overall, however, predictions indicate substantial reductions in southern California's coastal lagoon and estuary habitats, which may reduce steelhead smolt survival and numbers of outmigrants to the ocean, further constraining populations of Southern SH/RT (Moyle et al. 2017).

6.2.6 Ocean Acidification

Ocean acidification occurs when excess carbon dioxide (CO2) is absorbed from the atmosphere, acidifying or lowering the pH of sea water (CDFW 2021b). Ocean acidification is becoming evident along California's central coast, where increases in CO2 and acidity levels in seawater have been measured since 2010 (OEHHA 2022). Coupled with warming ocean waters and reduced dissolved oxygen levels, ocean acidification poses a serious threat to global marine ecosystems (OEHHA 2022). If left unchecked, ocean acidification could dramatically alter the Pacific Ocean's marine food webs and reduce the forage base for California's salmonids. Forage fish, which are a primary prey source for steelhead in the ocean (LeBrasseur 1966; Quinn 2018), may suffer declines in abundance due to reduced biomass of copepods and other small crustaceans resulting from ocean acidification (Busch et al. 2014). Ocean acidification makes it harder for the shells of ecologically and economically important species, including krill, oysters, mussels, and crabs, to form and potentially causes them to dissolve. Reduced seawater pH has also been shown to adversely affect olfactory discrimination in marine fish (Munday et al. 2009), which could result in impaired homing of Southern SH/RT to their natal streams.

6.2.7 Wildfires

Wildfires are a natural and fundamental part of California's ecological history in many parts of the state. Wildfires are an essential ecological process for the periodic renewal of chaparral vegetation communities (Sugihara et al. 2006), which dominate much of the south-coastal part of California. Historical fires were, therefore, important episodic ecological events with generally lower intensity impacts, at smaller geographic scales, and generally positive long-term outcomes for fish habitats (Boughton et al. 2007).

Euro-American influences and activities on the western landscapes of the U.S., coupled with climate change, have made modern western fires more frequent, severe, and catastrophic in nature (e.g., Gresswell 1999; Noss et al. 2006; and Moyle et al. 2017). Future frequency and size of wildfires in the range of Southern SH/RT is expected to increase, driven by rising atmospheric temperatures and prolonged droughts associated with climate change (NMFS 2012a, OEHHA 2022). Potter (2017) examined satellite data for the 20 largest fires that have burned since 1984 in the central and southern coastal portions of California and found that climate and weather conditions at times of ignition were significant controllers of the size and complexity of high-burn severity fire areas. Since 1950, half of California's largest wildfires (10 of 20) occurred between 2020 and 2021 (OEHHA 2022). One study predicted a nearly 70% increase in the area burned in southern California by the mid-21st century, due to warmer and drier climatic conditions (Jin et al. 2015). This study also evaluated southern California's wildfires in terms of their impacts in the presence or absence of regionally prominent Santa Ana winds. This research found that non-Santa Ana fires which occur mostly in June through August affected higher-elevation forests, while Santa Ana-driven fires which occur mostly from September through December spread three times faster and occurred closer to urban areas (Jin et al. 2015). Recent examples of devastating Santa Ana wind-driven fires include the destructive Thomas Fire (approximately 282,000 acres) in Ventura and Santa Barbara counties (December 2017) and the Woolsey Fire (approximately 97,000 acres) in Los Angeles and Ventura counties (November 2018), both of which were also influenced by preceding record-breaking heatwaves and extremely dry fall conditions (Hulley et al. 2020).

Projected increases in precipitation extremes will lead to increased potential for floods, mudslides, and debris flows (Hall et al. 2018). Wildfires and subsequent debris torrents in southern California were demonstrated to have destroyed Southern SH/RT habitats in 2004, 2006, and 2008 (Moyle et al. 2015). More recent events, including mass wasting and debris flows, such as those in Santa Barbara County in early 2018, resulted from heavy rains preceded by wildfires (Livingston et al. 2018). High-intensity wildfires can accelerate the delivery of sediments to streams (Boughton et al. 2007) by stripping the land of vegetative cover and eliminating stabilizing root structure, thereby degrading spawning habitats for salmonids and other fishes. Increased soil friability greatly increases rates of fine soil mobilization, erosion, transport, and deposition into watercourses affected by fire due to the elimination of vegetation, the input of large amounts of dry ash and charcoal, the lack of soil shading, and the associated increased solar warming and drying of soils (NMFS 2012a). These fine materials often become so dry after a fire that they become hydrophobic, making it much easier for runoff water to mobilize and transport. Fine sediments delivered to streams in large amounts have been shown to cover and smother coarser-grained spawning gravels, which are required for salmonid spawning success (Moyle et al. 2015). Largescale sediment mobilization events can also change the channel characteristics of streams, destroy instream and riparian vegetation, and possibly cause direct or indirect mortality to multiple life history stages of Southern SH/RT, while also facilitating the rapid spread of non-native plant and animal species. High flows and floods in fire scars can also scour redds, depending on their seasonal timing, possibly nearly eliminating a Southern SH/RT subpopulation's cohort post-spawn if gravels are mobilized and eggs or juveniles are washed downstream.

6.3 Disease

Numerous diseases caused by bacteria, protozoa, viruses, and parasitic organisms can infect Southern SH/RT in both juvenile and adult life stages. These diseases include bacterial kidney disease (BKD), *Ceratomyxosis*, *Columnaris*, *Furunculosis*, infectious hematopoietic necrosis virus, redmouth and black spot disease, Erythrocytic Inclusion Body Syndrome, and whirling disease (NMFS 2012a). Water quality and chemistry, along with warm stream temperatures, influence infection rates. As water temperatures rise and fish become thermally stressed, lower host resistance aligns with higher pathogen growth rates due to shorter generation times and can lead to a sharp increase in infection rates and associated mortality (Belchik et al. 2004; Stocking and Bartholomew 2004; Crozier et al. 2008). There is little current information available to evaluate the potential impacts of these kinds of infections on Southern SH/RT populations.

6.4 Hatcheries

Extensive stocking of hatchery-origin *O. mykiss* has occurred throughout the southern California region to support recreational fisheries, but no efforts have specifically targeted the conservation and supplementation of Southern SH/RT. Historical stocking records dating back to the 1930s occasionally reference the stocking of "steelhead"; however, it appears that these references represent nomenclature being used interchangeably rather than identification of fish from native migratory populations. Hatchery-origin *O. mykiss* were stocked widely for recreational fisheries up until the late 1990s. Stocking was ceased in the anadromous waters of southern California as a protective conservation measure starting in 1999 (J. O'Brien, CDFW, personal communication).

While restricted stocking of *O. mykiss* has continued in the region above barriers to anadromy, potential remains for the inadvertent introduction of hatchery stocks into anadromous waters due to downstream movement or during reservoir spill events. To mitigate the risk of hatchery-origin fish interbreeding with wild fish, the Department shifted to stocking only triploid hatchery-origin *O. mykiss* in waters above anadromous barriers following the adoption of the Hatchery and Stocking Program Environmental Impact Report (EIR) in 2010 (Jones and Stokes 2010). Triploid *O. mykiss* have been used across the western United States to reduce the risks of introgression and hybridization associated with stocking programs that support recreational fisheries. The application of heat- or pressure-induced "triploiding" on salmonid eggs, including *O. mykiss*, has a proven 91-100% sterilization rate, often at the upper end of that range (Kozfkay et al. 2011). Using triploid hatchery-origin *O. mykiss* for recreational fisheries has mitigated some of the inherent risk of potential hybridization and introgression with native and wild stocks, although some risks to Southern SH/RT may still exist. Competition and predation from hatchery stocks remain of concern since the degree to which triploid *O. mykiss* may compete with or prey upon native *O. mykiss* is not well understood.

Hatchery-origin *O. mykiss* have been tagged prior to stocking into select regional reservoirs to attempt to evaluate if and the extent to which they may be escaping these impoundments and entering anadromous waters below dams. No reservoir spills have occurred across the region since tagging began due to the predominance of drought conditions, except for during the winter and spring of 2023. To date, downstream monitoring has not been conducted since the inception of the tagging study (J. O'Brien, CDFW, personal communication). Due to climate change impacts and the decreased frequency with which many southern California reservoirs are filling or overspilling, it is expected that threats from interactions between hatchery-stocked *O. mykiss* and remaining native stocks of Southern SH/RT will be considerably reduced in the future. However, the large number of atmospheric rivers that impacted much of California during the recent winter of 2022–2023, causing some southern California reservoirs to fill and overspill, is a reminder that such events remain possible.

While exclusively triploid hatchery-origin *O. mykiss* are stocked above barriers to anadromy in southern California, historical regional stocking practices of non-triploid fish have led to introgression, or hybridization with hatchery stocks, in some Southern SH/RT populations. Levels of introgression appear to vary across the landscape, differing between populations and watersheds. Some populations retain high levels of native southern California steelhead ancestry, while others are highly introgressed and exhibit high levels of hatchery-origin genetics (primarily Central Valley *O. mykiss* genetics), while some are in between, with genetic signatures from both native and hatchery origins (Clemento et al. 2008; NMFS 2016; Jacobson et al. 2014). See Section 6.7 in this Status Review for more information.

6.5 Predation

6.5.1 Predation in Freshwater Environments

California's salmonids have evolved under selective pressure from a variety of natural predators, including many species of fish, birds, and mammals; however, a growing number of non-native aquatic species have also become established within the range of Southern SH/RT (Busby et al. 1996; NMFS 2016; Stillwater Sciences 2019; Dagit et al. 2019; COMB 2022). Established populations of non-native fishes, amphibians, and invertebrates, combined with anthropogenic habitat alterations that often favor non-native species, have led to increased impacts from predation, competition, and other stressors on Southern SH/RT across much of its range (NMFS 1996b). Stream habitat alteration can also directly affect predation rates by reducing available cover for prey species, creating flow and velocity regimes that favor non-native predators, and creating obstructions to passage that can lead to migration delays and increased exposure to predators (Moyle et al. 2013; Dagit et al. 2017). Further, stream habitat alterations can influence water temperatures, often increasing them, which may then lead to higher metabolic rates for piscivorous fishes and increased predation pressure (Michel et al. 2020). In addition to physical habitat alterations, chemical habitat alterations in the form of contaminants known to alter fish behavior and reduce avoidance or cover-seeking activities are also likely to increase predation rates, particularly from avian predators (Grossman 2016).

Established populations of non-native catfish and centrarchids occur in the lower reaches of many watersheds throughout the range of Southern SH/RT, leading to widespread predation risk (NMFS 2016; Stillwater Sciences 2019; Dagit et al. 2019; COMB 2022). Grossman (2016) found that non-native Channel Catfish (*Ictalurus punctatus*) may be a primary predator of Central Valley steelhead in the San Joaquin River, suggesting they may pose the same level of risk to Southern SH/RT. Non-native centrarchids have been demonstrated to negatively impact salmonid populations through direct predation on rearing juveniles and resident adult *O. mykiss* (Dill and Cordone 1997; Marks et al. 2010; NMFS 2012a; Bonar et al. 2005).

Abundant populations of non-native fish have been documented in many southern California coastal watersheds, including Malibu Creek, lower Arroyo Trabuco, Santa Margarita, and San Luis Rey rivers. These species include largemouth and redeye bass, green sunfish, mosquito fish, and black bullhead (C. Swift, Emeritus, Section of Fishes, Natural History Museum of Los Angeles County, personal communication; O'Brien et al. 2022).

In addition to piscivorous fishes, non-native invertebrates and amphibians have also been introduced and spread across the Southern SH/RT range. American bullfrogs (*Lithobates catesbeianus*) have become widely established and can prey upon rearing juvenile steelhead (COMB 2022; Cucherousset and Olden 2011; Dagit et al. 2019; Stillwater Sciences 2019). Non-native Red Swamp Crayfish (*Procambarus clarkia*) populations have also increased in some Southern SH/RT waters (Garcia et al. 2015; Dagit et al. 2019). Direct observations of YOY Southern SH/RT being attacked by crayfish in shallow riffle-run habitat suggest that predation poses a threat to the survival of juvenile steelhead (Dagit et al. 2019).

6.5.2 Predation in Marine Environments

Marine predation influences on Southern SH/RT are not well documented or understood. Primary predators of salmonids in the marine environment are pinnipeds, such as harbor seals (*Phoca vitulina*) and California sea lions (*Zalophus californianus*) (Cooper and Johnson 1992; Spence et al. 1996). Although fish are a major dietary component of marine pinnipeds, their predation on Southern SH/RT may be minimal at present, given the very low relative abundances of Southern SH/RT.

6.6 Competition

Competition is the interaction between individuals of the same or different species that compete for a limited supply of a common resource (Holomuzki et al. 2010). The extent to which competition impacts the distribution, abundance, and productivity of Southern SH/RT populations is not well understood. Pacific steelhead typically compete with other salmonid species like Coho and Chinook salmon in freshwater; however, unlike northern populations of steelhead that typically co-occur with other salmonid species, Southern SH/RT are the only salmonids that occur in their range. While inter-specific competition with other salmonids is unlikely to occur, intraspecific competition among Southern SH/RT may be prevalent in southern California watersheds, especially those that are highly degraded. Poor and degrading habitat conditions can contribute to increased competition, which, in turn, can adversely affect fish during the juvenile life-history stage and lead to reduced recruitment and reproductive performance over the entire life cycle (Chilcote et al. 2011; Tatara et al. 2012). Limited habitat space, coupled with high juvenile densities, is associated with reduced growth, premature emigration, increased competition for food, decreased feeding territory sizes, and increased mortality (Kostow 2009).

Juvenile steelhead are habitat generalists, occupying a variety of microhabitat types in streams depending on the size and age of individuals (Spina et al. 2005). Non-native fish species can competitively restrict the spatial distribution of juvenile steelhead to suboptimal habitats such as shallower, higher-velocity rifles, where the energetic cost to forage is higher (Rosenfeld and

Boss 2001). Non-native fish species may also exclude juvenile steelhead from areas of suitable habitat. For example, recent watershed-wide surveys in Sespe Creek, a large and unregulated tributary to the Santa Clara River, documented the absence of Southern SH/RT in several stream reaches with suitable steelhead habitat (i.e., cool water with deep pools) that were dominated by multiple species of non-native juvenile fishes (Stillwater Sciences 2019). According to Krug et al. (2012), Arroyo Chub may also compete with Southern SH/RT juveniles for food resources. Like juvenile steelhead, Arroyo Chub are opportunistic feeders and consume benthic and drift invertebrates, sometimes switching preferences depending on food abundance. Southern SH/RT and Arroyo Chub are frequently part of the same native southern California fish assemblages and generally habitat partition, with juvenile steelhead mostly feeding on drift invertebrates while chub have a more benthic diet. However, periods of diet overlap may lead to strong interspecific competition between the two species. While other native fishes may impose some level of competitive threat to Southern SH/RT, it remains likely that non-native competitors pose the greater threat, especially with these species continued expansion and proliferation (O'Brien and Barabe 2022).

6.7 Genetic Diversity

West coast steelhead have considerable genetic diversity, both within and across populations, including variation in traits linked to anadromy, morphology, fecundity, spawning, and run timing, as well as age at smolting and maturation (McElhany et al. 2000). While some traits are entirely genetically based, the expression of most traits usually varies, due to a combination of both genetic and environmental factors. Species with high genetic diversity typically occupy a wider range of habitats than those with lower diversity and are more resilient to both short-and long-term spatial-temporal fluctuations in the environment such as ecological disturbances (i.e., wildfires, floods, and landslides) and human-caused impacts. Generally, populations need to be large enough to maintain long-term genetic diversity and avoid genetic problems, such as loss of variation, inbreeding depression, bottlenecks, and the accumulation of deleterious mutations, all of which occur more frequently in smaller populations.

A range-wide genetic analysis demonstrated that populations in the southernmost portions of the Southern SH/RT range are dominated by hatchery ancestry, indicating genetic introgression of native lineages with hatchery strains (Jacobson et al. 2014; Abadia-Cardoso et al. 2016). Most of these hybridized wild populations occur above barriers in the upper reaches of the Los Angeles, San Gabriel, Santa Ana, San Juan, San Diego, and Sweetwater rivers. It is unclear whether introgression will decrease the viability of these southern populations, since the introduction of small amounts of novel genetic material, even from hatchery stocks, can lead to increased diversity and the phenomenon known as "hybrid vigor," conferring adaptive resilience to changing environments and the negative impacts of inbreeding. This study also confirmed that the northernmost populations of Southern SH/RT, including all watersheds in the Monte Arido Highlands BPG, contain native steelhead ancestry and generally higher genetic diversity than more southern populations (Clemento et al. 2009; Abadia-Cardoso et al. 2016).

As with other salmonids, natural straying and the resultant gene flow between populations maintain the genetic diversity of Southern SH/RT. A recent study, which examined the otoliths of seven adult steelhead from a small basin on the Big Sur coast of California, revealed that all adults were strays, coming from at least six different source populations, including neighboring ones on the Big Sur coast as well as distant populations such as the Klamath River (Donohoe et al. 2021). As is the case for many coastal steelhead populations, the genetic diversity of Southern SH/RT has been compromised by human impacts on their habitats, such as the blocking of migration corridors by artificial dams and widespread reductions in streamflow, at least partially due to locally and regionally intensive water diversions for municipal, agricultural, and other human consumptive uses (NMFS 2012a).

Measures of genetic diversity, such as heterozygosity and allelic richness, indicate that Southern SH/RT populations have lower diversity than northern coastal populations. Within the range of Southern SH/RT, the northernmost populations in the Santa Maria, Santa Ynez, Ventura, and Santa Clara rivers have higher genetic diversity than the southernmost populations (Abadia-Cardoso et al. 2016). Previous genetic studies have revealed that populations occurring downstream of modern artificial barriers are genetically more similar to above-barrier populations in the same basin than they are to populations below barriers in neighboring basins (Clemento et al. 2009). While above- and below-barrier populations within the same drainage are usually each other's closest relatives, they appear divergent in respect to the frequencies of the anadromous (A) and resident (R) haplotypes found in each subpopulation (see Section 4.7). The A haplotype is more common below dams, while the R haplotype is found more frequently above dams. This evidence of selection against the anadromous genotype is likely a product of artificial dams or other barriers blocking anadromous adults from returning to these upstream areas to reproduce and provide A haplotype genetic influx to the above-barrier population (Pearse et al. 2014; Pearse et al. 2019). Apgar et al. (2017) found that the frequency of the A haplotype is strongly associated with several factors, including the extent of migration barriers present, barrier type (complete, partial, artificial, or natural), barrier age (recent or longstanding), and migration distance. Genetic diversity in above-barrier populations is an important repository of genetic material, serving a similar function as conservation hatcheries do in other parts of the Southern SH/RT range (D. Boughton, NOAA, personal communication; NMFS 2012a)

Because migratory phenotypes are primarily genetically based, variation in the reproductive success of anadromous and resident individuals can influence the tendency of populations to produce anadromous offspring, corresponding to changes in the frequency of the A haplotype. Moreover, environmental factors, such as intra-and inter-annual climate variation, food availability, and water temperature, also influence the expression of anadromy in Southern SH/RT populations (Satterthwaite et al. 2009; Ohms et al. 2014; Kendall et al. 2015). Furthermore, climate change projections for Southern SH/RT range predict an intensification of climate patterns, such as more intense cyclic storms, droughts, and extreme heat (NMFS 2012a). These projections suggest that Southern SH/RT will likely experience more frequent periods of adverse conditions and continued selection pressure against the anadromous life-history form.

6.8 Habitat Conditions

The decline of Southern SH/RT can be attributed to a wide variety of human activities, including, but not limited to, urbanization, agriculture, and water development. These activities have degraded range-wide aquatic habitat conditions, particularly in the lower and middle reaches of most watersheds in the Southern SH/RT range (NMFS 2012a). Southern California is home to over 20 million people and 1.8 million acres of metropolitan, urban, and suburban areas (DWR 2021) which has resulted in highly urbanized watersheds that are impacted by surface and groundwater diversions and associated agricultural, residential, and industrial uses. Major rim dams, instream diversion dams, and other water conveyance infrastructure have significantly reduced or eliminated access to the majority of historical upstream rearing and spawning habitat for southern steelhead. While some of these human activities have been reduced, eliminated, or mitigated, the cumulative impacts of these activities remain throughout most of the Southern SH/RT range, particularly in larger systems such as the Santa Maria, Santa Ynez, Ventura, Santa Clara, Los Angeles, San Gabriel, Santa Ana, and Santa Margarita watersheds, as well as in smaller coastal systems such as Malibu Creek.

6.8.1 Roads

High human population densities in southern California have led to the development of an extensive network of transportation corridors throughout the range of Southern SH/RT. The extensive road and highway networks across much of the Southern SH/RT range, especially in areas proximate to rivers and streams, are attributed to increases in a number of negative habitat impacts. Among these are: non-point pollution (e.g., oil, grease, and copper from braking systems); sedimentation; channel incision due to bankside erosion; substrate embeddedness; floodplain encroachment and loss of floodplain connectivity; loss of channel heterogeneity (e.g., filling of pool habitats); and higher frequencies of flood flows (NMFS 2012a). Additionally, extensive road and highway networks require many road crossings (e.g., culverts and bridges) that are often improperly designed for the volitional passage of aquatic organisms (CalTrans 2007; NMFS 2012a).

NMFS (2012) assessed the impacts of roads and transportation corridors on Southern SH/RT using roads per square mile of watershed and the density of roads within 300 feet of streams per square mile of watershed as metrics. The results of their analysis demonstrated that roads and associated passage barriers have the highest impact on rivers and streams in the Santa Monica Mountains and Conception Coast BPG regions: 60% of watersheds in the Conception Coast BPG ranked “very high” or “high” in severity for roads as a stressor, while 100% of the watersheds that drain the Santa Monica Mountains received the same ranking. Highway 101 and the Union Pacific Railroad cross the mainstem of each watershed along the Conception Coast BPG region (as well as the Monte Arido Highlands BPG region) near their river mouths. At each major transportation crossing, culverts were constructed to allow stream flows to pass through to the Pacific Ocean, but they were not necessarily engineered to allow upstream fish passage. For example, the Highway 101 culvert on Rincon Creek serves as a total barrier to upstream migration, preventing Southern SH/RT from reaching any of its historical habitats upstream of the barrier. Road development, bridges, and other transportation corridors are also partly responsible for the significant (70-90%) reduction of estuarine habitat across all BPGs (Hunt and Associates 2008).

The Mojave Rim and Santa Catalina Gulf Coast BPG regions are home to the highest urban densities across the Southern SH/RT range, and both BPGs are impacted by high road densities. For example, in the Santa Catalina Gulf Coast BPG region, the Rancho Viejo Bridge, Interstate-5 Bridge array, and the Metrolink drop structure are all recognized as total fish passage barriers on Arroyo Trabuco Creek, a tributary to San Juan Creek. On the Santa Margarita River, an outdated box culvert at the Sandia Creek Bridge serves as a significant fish passage barrier on the river (Dudek 2001). Recently, efforts have been undertaken to repair and modify these barriers to provide upstream steelhead passage and again allow access to many miles of historical habitat in these watersheds (see Chapter 6: Influence of Existing Management Efforts).

6.8.2 Dams, Diversions, and Artificial Barriers

A number of anthropogenic impacts, including water diversions, dams, and other artificial barriers, influence stream flows in most Southern SH/RT-supporting watersheds. Municipal and agricultural beneficial uses comprise the majority of water demand in the South Coast region (Mount and Hanak 2019). Surface water diversions can lead to reduced downstream flows, as well as changes to the natural flow regime (e.g., magnitude, timing, and duration of flow events), stream hydrodynamics (e.g., velocity, water depth), and degradation of both habitat quality and quantity needed to support Southern SH/RT (NMFS 2012a; Yarnell et al. 2015). Changes to the natural flow regime can result in elevated downstream water temperatures, reduced water quality, shifts in fish community composition and structure, increased travel times for migrating fish, increased susceptibility of native aquatic organisms to predation, and reduced gravel recruitment from upstream areas of watersheds to the lower reaches of rivers (NMFS 1996b; Axness and Clarkin 2013; Kondolf 1997). Dams physically separate fish populations into upstream and downstream components, leading to population and habitat fragmentation, along with potential changes to population spatial and genetic structure over time (NMFS 2012a). Large dams often trap upstream sediments, which naturally would be transported downstream and deposited, augmenting substrates and improving spawning habitats for salmonids and other fish. It is common for rivers and streams with large dams to exhibit more scouring and streambed degradation downstream of the impoundment (Kondolf 1997; Yarnell et al. 2015). Stream flow reductions also interfere with the downstream transport and influx of freshwater to estuaries. The consequences of reduced inflows to estuaries include wetland and edge habitat loss, changes to the amount and location(s) of suitable habitat for aquatic organisms and accelerated coastal erosion (Nixon et al. 2004).

Many types of artificial stream barriers exist throughout the range of Southern SH/RT, including dams, concrete channels for flood control, gravel and borrow pits, roads and utility crossings, fish passage facilities, and other non-structural features such as velocity barriers. In the South Coast hydrologic region, a total of 164 known total migration barriers were identified as part of a larger effort to inventory fish passage barriers across California's coastal watersheds (California Coastal Conservancy 2004). Of the 164 total barriers, 11 were identified as requiring modification or removal to improve fish passage. Dams were identified as the most numerous barrier type, followed by stream crossings and non-structural barriers. The Santa Maria River, San Antonio Creek, Cuyama River, Santa Ynez River, and Santa Barbara coastal watersheds, which all belong to the Central Coast hydrologic region, also contain hundreds of known barriers scattered throughout the area, with the highest number found along the Santa Barbara coastal area (California Coastal Conservancy 2004).

Artificial barriers act as physical impediments but may also contribute to, or enhance, non-structural barriers to steelhead spawning migrations. For example, the three major watersheds of the Los Angeles basin have channelized concrete aqueducts in their lower reaches, with some extending from their mouths upstream for miles. As a result, adult Southern SH/RT can no longer access the lower reaches of these three major regional rivers (Titus et al. 2010). Furthermore, if Southern SH/RT were to successfully enter into the channelized reaches of these rivers, migration success would be limited because individuals would encounter non-structural velocity barriers that would require greater swimming speeds than could be sustained (Castro-Santos 2004). Other non-structural barriers may exist in the form of low flows, disconnected wetted habitat, and poor or lethal water quality in these largely metropolitan lower river aqueduct reaches.

Most of the large rivers in the Monte Arido Highlands BPG region contain multiple large, impassable dams. Twitchell Dam on the Cuyama River is primarily managed for groundwater recharge in the Santa Maria Valley. Operations of Twitchell Dam limit downstream surface flows into the mainstem Santa Maria River (NMFS 2012a). Cachuma, Gibraltar, and Juncal dams on the mainstem Santa Ynez River prevent upstream migratory access to approximately 70% of historical spawning and rearing habitat in the watershed (NMFS 2012a). In the Ventura River watershed, Matilija and Casitas dams on Matilija Creek and Coyote Creek, respectively, block access to 90% of historical Southern SH/RT spawning and rearing habitat. However, the recent Matilija Dam Ecosystem Restoration Project is aimed at restoring over 20 miles of perennial Southern SH/RT habitat in the Matilija Creek watershed through the removal of Matilija Dam. Santa Felicia Dam and Pyramid Dam on Piru Creek, as well as Castaic Dam on Castaic Creek, block access to historical habitat in the tributaries of the mainstream Santa Clara River. Several of these large dams are operated along with smaller downstream diversion dams: primarily the Robles Diversion Dam on the Ventura River and the Vern Freeman Diversion Dam on the Santa Clara River. The Robles Diversion Dam diverts water from the upper Ventura River into storage at Lake Casitas, while the Vern Freeman Diversion diverts water for groundwater recharge purposes in the Santa Clara Valley.

Two major dams impair habitat connectivity and hydrologic function in the Malibu Creek watershed: Rindge Dam and Malibu Lake Dam. Both dams have created favorable habitat conditions for non-native species, including crayfish, snails, fish, and bullfrogs. As a result, invasive aquatic species have been documented in high abundance in Malibu Creek (NMFS 2012a). Rindge Dam is located only 2 miles upstream of the mouth and is no longer functional, so it is targeted for future removal. The removal of this dam alone would allow Southern SH/RT access to 18 miles of high-quality spawning and rearing habitat in the Malibu Creek watershed.

Dams are ranked “high” or “very high” as a threat in 88% of the component watersheds that comprise the Mojave Rim BPG region (NMFS 2012a). There are also at least 20 jurisdictional-sized dams (i.e., a dam under the regulatory powers of the State of California) within each of the three major watersheds of the Los Angeles basin, owned by federal, state, local, and/or private entities and operated for multiple purposes, including: irrigation, flood control, storm water management, and recreation. The principal impoundments in the San Gabriel River watershed are Whittier Narrows, Santa Fe, Morris, San Gabriel, and Cogswell dams. Sepulveda Dam on the Los Angeles River is operated as a flood control structure approximately 8 miles downstream from the river’s source. Big Tujunga Dam on Big Tujunga Creek, a tributary to the Los Angeles River, is also operated as a flood control structure. Prado Dam on the Santa Ana

River is also primarily operated as a flood risk management project. These dams alter the physical, hydrological, and habitat characteristics of the lower and middle reaches of the mainstem rivers in this BPG. They also create favorable habitat for non-native species such as crayfish, largemouth bass, and bullfrogs, which have all been documented in the Los Angeles, San Gabriel, and Santa Ana rivers. Periodic removal of sediments accumulated behind dams on the San Gabriel River also degrades downstream riparian and instream habitat conditions (Hunt and Associates 2008).

In the Santa Catalina Gulf Coast BPG, dams also ranked “high” or “very high” as a threat in 90% of constituent watersheds. At least 20 major dams and diversions without fish passage facilities occur throughout the BPG’s distribution. Prominent dams in this BPG include Agua Tibia, Henshaw, and Eagles Nest dams in the San Luis Rey watershed; and the O’Neill Diversion and Vail dams in the Santa Margarita River watershed. Dams in this BPG are generally not operated with fish passage as a consideration in flow release schedules, and many of these facilities lack fish passage provisions (NMFS 2012a).

Groundwater extraction for agricultural, industrial, municipal, and private use from coastal aquifers has increased with population growth in southern California since the mid-1850s (Hanson et al. 2009). Currently, around 1.57 million acre-feet of groundwater are used on an annual basis in southern California to meet both urban and agricultural water demands (DWR 2021). Groundwater is an important input for surface flows during the summer low flow period in many southern California watersheds (Hanson et al. 2009). Groundwater contributions can help sustain suitable over-summering Southern SH/RT juvenile rearing habitat in both mainstem and tributary habitats (Tobias 2006). Unsustainable groundwater water diversions have led to the depletion of several large aquifers in the region (NMFS 2012a). Offsite pumping can impact the surface-water to groundwater interactions by intercepting water that would have otherwise discharged to a stream or by lowering the water table, causing a reduction of baseflow derived from groundwater during the summer low flow period. While some riparian species can tolerate reduced groundwater contributions to streams, for many other species, such as Southern SH/RT, adequate surface water depth, velocity, and water quality characteristics must be maintained in order to survive (Tobias 2006). The combination of surface water diversions and groundwater extractions can lead to the complete drying of streams, which can lead to the stranding of Southern SH/RT in isolated pools and direct mortality. On average, 57% of watersheds across the five BPGs ranked “high” or “very high” for groundwater extraction as a threat (NMFS 2012a).

Recently, the Sustainable Groundwater Management Act priority process identified several groundwater basins across the South Coast hydrologic region as either critically over drafted (i.e., Santa Clara River Valley, Cuyama River Valley, and Pleasant Valley) or medium-to-high priority basins for water conservation (e.g., the Coastal Plain of Orange County) based on several metrics such as population growth rates, the total number of wells, and the number of irrigated acres (DWR 2020). Groundwater sustainability agencies overseeing critically overdrafted and medium-to-high priority basins are responsible for developing and realizing groundwater sustainability plans (GSPs) to achieve basin sustainability within a 20-year implementation horizon. However, the benefits provided by SGMA for Southern SH/RT and their habitats are uncertain, as the most commonly cited goal for GSPs thus far has been to increase groundwater storage and not the restoration of interconnected surface water flows (Ulibarri et al. 2021).

6.8.3 Estuarine Habitat

The estuaries of many coastal watersheds in southern California form freshwater lagoons that are seasonally closed to the ocean. Lagoons form when low summer baseflows are unable to displace sand deposition at the mouth of the estuary, which results in the formation of a sandbar that blocks connectivity with the ocean. This closure creates an environment characterized by warmer and slower-moving (i.e., longer residence times) freshwater that is relatively deep (Bond et al. 2008). These habitat characteristics provide important, high-quality nursery conditions for rearing juveniles and transition areas for smolts acclimating to the ocean environment. Adult steelhead also acclimate in these areas prior to upstream migration during the winter months when the estuary is fully open (NMFS 2012a). The importance of such habitats was demonstrated by the observed doubling of growth in juvenile *O. mykiss,* which reared throughout the summer in a typical northern California coastal watershed (Bond et al. 2008). The same study examined scales from returning adult steelhead and found that estuary-reared individuals dominated adult returns, despite comprising only a small part of the annual outmigrating population. Another study conducted in the same watershed also reported higher growth rates for estuary-reared juvenile steelhead than for their cohorts reared in the upper watershed (Hayes et al. 2011). Hayes et al. (2011) also found that the lagoon environment provided warmer water temperatures and a diverse abundance of invertebrate prey resources for rearing juvenile *O. mykiss* to consume. Trade-offs between accelerated growth and survival likely exist in lagoon habitats because they represent a relatively high-risk yet high-reward environment in which accelerated growth may come at the cost of increased metabolic demand and potentially increased predation risk, exposure to poor water quality, and episodic artificial breaching (Osterback et al. 2013; Satterthwaite et al. 2012; Swift et al. 2018).

The southern California Bight, which encompasses the entire southern California coastline, from Point Conception to San Diego, historically supported around 20,000 hectares of estuary habitat (Stein et al. 2014). Over half of all historical estuaries were found in San Diego County (e.g., Mission Bay and San Diego Bay), while Los Angeles and Orange counties contained about 15%

each of the total estimated historical area. Estimates of the amount of estuarine habitat loss from historical levels, based on wetland acreage, range from 48-75% (Brophy et al. 2019; NMFS 2012a; Stein et al. 2014). The magnitude of the loss varies depending on the watershed. For example, the estuaries of the Santa Maria and Santa Ynez rivers in the northern portion of the Southern SH/RT range remain almost entirely intact, while the estuaries of the Los Angeles, San Gabriel, and Santa Ana rivers have been reduced to 0-2% of their historical extent (NMFS 2012a). Overall, estuary habitat loss in southern California is likely underestimated because early landscape modifications (e.g., housing and transportation development and associated filling of wetlands with sediment) had substantially altered the landscape before attempts were made to quantify the extent of historical habitat (Brophy et al. 2019).

The primary cause of estuarine loss in southern California is the conversion of habitat to other land use practices such as agriculture, grazing, and urban development activities, which require the construction of infrastructure and the subsequent filling, diking, and draining of coastal wetlands (NMFS 2012a). Currently, estuary habitats in the range of Southern SH/RT remain highly degraded and prone to further degradation by urban impacts such as point and nonpoint source pollution, coastal development, and dams. These environmental stressors can cause declines in water quality and the proliferation of harmful algal blooms that can lead to the rapid die-off of both aquatic and terrestrial organisms (Lewitus et al. 2012; Smith et al. 2020). Artificial breaching of estuaries also poses a mortality risk to Southern SH/RT. Seven moribund juvenile steelhead were observed in the lagoon at the mouth of the Santa Clara River shortly after the sandbar was artificially breached in 2010 (Swift et al. 2018). The authors of this study noted that the Santa Clara River, upstream of the lagoon, was dry during this time and that the observed fish were relatively large and in robust condition, indicating that favorable rearing conditions existed prior to the artificial breaching.

6.8.4 Water Quality and Temperature

Contaminants and pollutants are well-documented to alter water quality parameters that affect the growth and survival of Pacific salmonids in both freshwater and estuarine environments (Arkoosh et al. 1998; Baldwin et al. 2009; Laetz et al. 2008; Sommer et al. 2007; Sullivan et al. 2000). Both are generally introduced into southern California rivers and streams by urban runoff, agricultural and industrial discharges, wastewater treatment effluent, and other anthropogenic activities. Recent monitoring conducted by the USGS measured between 20 and 22 current-use pesticides in samples collected from urban sites at Salt Creek and the Sweetwater River in Orange and San Diego counties (Sanders et al. 2018). Diminished water quality conditions, including contaminants and associated toxicity, elevated nutrients, low dissolved oxygen, increased temperature, and increased turbidity, can all adversely affect Southern SH/RT as well as other native fish and aquatic organisms. The effects of individual pollutants and combinations thereof can impact populations by altering growth, reproduction, and mortality rates of individual fish (Sommer et al. 2007). These impacts can ultimately manifest in direct mortality due to acute and long-term physiological stress or may act through indirect pathways such as changes to food webs, ecosystem dynamics, increased susceptibility to disease and predation, and more frequent occurrences of harmful algal blooms. Aquatic stressors that impair water quality can also interact with each other in an additive or synergistic fashion, such that they are generally interdependent and can greatly amplify negative impacts on aquatic ecosystems (Sommer et al. 2007). Dissolved oxygen concentrations, turbidity, and water temperatures are all parameters directly influenced by flow management. Lower flows can lead to warmer water temperatures that hold less dissolved oxygen than cold water. Higher water temperatures also increase the metabolic and oxygen consumption rates of aquatic organisms, making these conditions particularly stressful for aquatic life (Myrick and Cech 2000). See Section 6.2.1 in this Status Review for a full description of air and water temperature influences and trends.

Many watersheds that support Southern SH/RT are listed under Section 303(d) of the federal Clean Water Act (CWA). Section 303(d) requires states to maintain a list of waters that do not meet prescribed water quality standards. For waters on this list, states are required to develop TMDLs that account for all sources (i.e., point and non-point sources) of the pollutants that caused the water to be listed as impaired under the CWA. In southern California, there are many impaired water bodies and pollutant combinations listed under Section 303(d). While contaminant and discharge sources have changed over the years and there have been significant improvements in controlling many of these sources, many 303(d)-listed waters do not yet have approved TMDLs (SWRCB 2020). All four of the major rivers in the Monte Arido Highlands BPG region are listed as 303(d)-impaired, and each system contains over five sources of pollutants. Seven Southern SH/RT-supporting watersheds in the Conception Coast BPG region and three in the Santa Monica Mountains BPG region are 303 (d) listed, including Jalama, Gaviota, Mission, Carpinteria, Rincon, Big Sycamore Canyon, Malibu, and Topanga creeks. All three of the major watersheds in the Mojave Rim BPG region, as well as eight out of ten in the Santa Catalina Gulf Coast BPG region, are 303(d)-listed, including the Los Angeles, San Gabriel, Santa Ana, Santa Margarita, San Diego, and Sweetwater rivers and the San Juan, San Mateo, San Luis Rey, and San Dieguito creeks. Essentially, all rivers and streams supporting Southern SH/RT that are 303(d)-listed are impaired by multiple pollutants, including water temperature, benthic community effects, indicator bacteria, trash, toxicity, and invasive species. Furthermore, southern California's coastal and bay shorelines, estuary environments, and tidal wetlands are also frequently 303(d)-listed as impaired. As examples, the estuaries of Malibu, Aliso, San Juan, and Los Penasquitos creeks; the entirety of Santa Monica Bay; and the estuaries of the Los Angeles, Santa Clara, Santa Margarita, and Tijuana rivers are all listed as 303(d)-impaired waterbodies.

6.8.5 Agricultural Impacts

The impacts of agricultural development have lessened over time as farm and pasturelands continue to be converted to urban development in southern California (NMFS 2012a). Historically, the loss of riparian and floodplain habitat was due first to conversion by livestock ranching, followed by irrigated row-crop agriculture, and then urban development. For example, interior portions of the Santa Clara River floodplain were originally converted to agriculture but are now dominated by urban growth and major human population centers, such as the cities of Santa Paula and Fillmore. Today, the South Coast hydrologic region supports approximately 159,000 acres of agricultural land, with avocados, citrus, truck crops, and strawberries comprising the highest agricultural production by acreage (DWR 2021). Approximately 530,000 acre-feet of groundwater are annually pumped from underlying basins to support agricultural production in southern California (DWR 2021). Agricultural activities produce wastewater effluent containing nutrients that can either directly or indirectly be introduced into the rivers, streams, and estuaries that support Southern SH/RT, particularly when agricultural best management practices and water quality objectives have not been established. Agricultural production is prevalent in several watersheds, including the lower Santa Maria and Santa Ynez rivers; many of the smaller coastal watersheds along the Santa Barbara coast, such as the Goleta Slough complex and Rincon Creek; the upper Ventura River and the Ojai basin; and portions of the San Mateo Creek, San Luis Rey, and San Dieguito River tributaries in the southernmost portion of the range. Statewide, the counties of Ventura, Santa Barbara, and San Diego are each ranked in the top fifteen for total value of agricultural production (CDFA 2021).

While the impacts of agricultural development on Southern SH/RT and their habitats have decreased over time due to land use conversion, both activities have resulted in considerable cumulative regional habitat loss and degradation. These changes have led to greatly reduced habitat complexity and connectivity in the lower and middle reaches of many southern California watersheds. Currently, agricultural impacts on Southern SH/RT are most evident during the summer dry season, when agricultural and residential water demands are the highest. This period coincides with the juvenile *O. mykiss* rearing life-history stage, which is dependent on adequate summer base flows to maintain suitable habitat conditions for growth and survival (Grantham et al. 2012). Agricultural groundwater diversions can lead to rapid stream drying by depleting aquifer groundwater that contributes to stream base flows, which limits the extent of summer rearing habitat for fish (Moyle et al. 2017). Naturally occurring surface waters supported only by groundwater recharge can be rapidly dewatered due to excessive groundwater pumping or diversions. These areas have been shown to provide adequate depth, surface area, and habitat for steelhead in streams lacking cold-water refuges (Tobias 2006).

The cultivation, manufacturing, and distribution of cannabis products have increased since recreational use became legal in California in 2016 (Butsic et al. 2018). Threats and stressors on aquatic ecosystems associated with the cultivation of cannabis include stream flow and bank modifications, water pollution, habitat degradation, and species invasions (CDFW 2018b). Cannabis is a water-and nutrient-intensive crop that requires an average of up to 6 gallons of water per day, per plant, during the growing season, which usually spans a total of 150 days from June to October (Zheng et al. 2021). Water diversions can lead to changes in flow regimes, the creation of fish passage barriers, the loss of suitable spawning and foraging habitat, and the rerouting and dewatering of streams, especially during drought years or during the dry season (CDFW 2018b; see Section 6.8.2).

6.8.6 Invasive Species

Invasive and non-native species are abundant and widely distributed in many watersheds that support Southern SH/RT. Non-native species frequently occur in both anadromous and non-anadromous waters that have been extensively stocked by a variety of public and private entities (NMFS 2012a). Most reservoirs contain non-native species, such as largemouth and smallmouth bass, carp, sunfish, bullfrogs, and bullhead catfish, that can all establish reproducing populations in the river and stream reaches above and below the dams. Range-wide habitat alteration has also facilitated the widespread distribution and increased abundance of non-native fish species, which typically favor slower-moving, warmer-water habitats with lower dissolved oxygen concentrations and higher sediment loads (Moyle et al. 2017). While the introduction of non-native game species has historically been viewed as a fishery enhancement, these species can have negative impacts on Southern SH/RT due to predation, competition, disease, habitat displacement and alteration, as well as behavior modifications (Cucherousset and Olden 2011).

Non-native species have recently been documented in high densities in Sespe Creek, an unregulated tributary to the Santa Clara River and a Department-designated Wild Trout Water (Stillwater Sciences 2019). High abundances of invasive species are due to the historic and ongoing stocking of non-native fish in the Rose Valley Lakes on Howard Creek, a tributary to Sespe Creek. In both Malibu and Topanga creeks, red swamp crayfish abundances have increased with recent warmer stream temperatures and lower flow conditions despite regular removal efforts (Dagit et al. 2019). High densities of crayfish likely have a direct (predation) and indirect (competition) effect on Southern SH/RT in both creeks. A variety of warm-water, non-native fish species are frequently observed in the lower Santa Ynez River, including multiple species of sunfish and catfish, carp, and largemouth bass, all of which are known predators of Southern SH/RT early life stages. In the lower Ventura River, annual monitoring efforts have consistently detected higher numbers of non-native fish species than Southern SH/RT in recent years (CMWD 2021).

Non-native plant and amphibian species also occur in several watersheds that support Southern SH/RT. Invasive plants such as giant reed and tamarisk have displaced extensive areas of native riparian vegetation in major drainages, such as the Santa Clara and San Luis Rey rivers (NMFS 2012a). These water-intensive plant species both reduce instream flows through groundwater uptake and severely reduce the extent of riparian cover and shading. These habitat changes often affect stream flow and thermal regimes, potentially increasing susceptibility of Southern SH/RT to predation, disease, and competitive exclusion. Other non-native plant species, such as water primrose and hyacinth, both of which form dense, sprawling mats on the water's surface, can alter the structure and function of aquatic ecosystems by outcompeting native aquatic plants, reducing the amount of open water habitat, altering the composition of invertebrate communities, physically blocking fish movement, and inducing anoxic conditions detrimental to fish (Khanna et al. 2018). In the Santa Clara River watershed, bullfrogs and African clawed frogs are abundant and widespread throughout the mainstem reaches, from the estuary upstream to Fillmore, including tributaries such as Santa Paula Creek and Hopper Canyon Creek (NMFS 2012a). Both species represent a threat to native aquatic communities because they opportunistically consume a variety of native prey, and eradication of either species is unlikely (Wishtoyo Foundation 2008).

6.9 Fishing and Illegal Harvest

Southern SH/RT traditionally supported important recreational fisheries for both winter adults and summer juveniles in coastal streams and lagoons (NMFS 2012a, Swift et al. 1993). Angling-related mortality may have contributed to the decline of some small populations but is generally not considered a leading cause of the decline of the Southern California Steelhead DPS as a whole (Good et al. 2005; Busby et al. 1996; NMFS 1996b). After the southern California steelhead DPS was federally listed as endangered in 1997, Department fishing regulation modifications led to the closure of recreational fisheries for Southern SH/RT in marine and anadromous waters with few exceptions. That closure continues, and there is currently no legal recreational fishery for Southern SH/RT (CDFW 2023).

Southern SH/RT take is primarily from poaching rather than legal commercial and recreational fishing. While illegal harvest rates appear to be very low, the removal of even a few individuals in some years could be a threat to the population because of such low adult abundance in most populations (Moyle et al. 2017). Southern SH/RT are especially vulnerable to poaching due to their high visibility in shallow streams. Estimates of fishing effort from self-report cards for 1993–2014 suggest extremely low levels of angling effort for Southern SH/RT, primarily due to the statewide prohibition of angling in anadromous waters starting in 1998 (NMFS 2016; Jackson 2007). Historic commercial driftnet fisheries may have contributed slightly to localized declines; however, Southern SH/RT are targeted in commercial fisheries, and reports of incidental catch are rare. Commercial fisheries are not thought to be a leading cause of the widespread declines of Southern SH/RT over the past several decades (NMFS 2012a).

7. INFLUENCE OF EXISTING MANAGEMENT EFFORTS

7.1 Federal and State Laws and Regulations

Several state and federal environmental laws apply to activities undertaken in California that provide some level of protection for Southern SH/RT and their habitat. There are also restoration, recovery, and management plans, along with management measures specific to habitat restoration, recreational fishing, research, and monitoring that may benefit Southern SH/RT. The following list of existing management measures is not exhaustive.

7.1.1 National Environmental Policy Act and California Environmental Quality Act

The National Environmental Policy Act (NEPA) was enacted in 1970 to evaluate the environmental impacts of proposed federal actions. The NEPA process begins when a federal agency proposes a major federal action. The process involves three levels of analysis: 1) Categorical Exclusion determination (CATEX); 2) Environmental Assessment (EA) or Finding of No Significant Impact (FONSI); and 3) Environmental Impact Statement (EIS). A CATEX applies when the proposed federal action is categorically excluded from an environmental analysis because it is not deemed to have a significant impact on the environment. If a CATEX does not apply, the lead federal agency for the proposed action will prepare an EA, which concludes whether the action will result in significant environmental impacts. A lead agency will issue a FONSI document if significant impacts are not expected. Alternatively, if the action is determined to have a potentially significant effect on the environment, an EIS containing an explanation of the purpose and need for the proposed action, a reasonable range of alternatives that can achieve the same purpose and need, a description of the affected environment, and a discussion of environmental consequences of the proposed action is required (EPA 2017). The United States Environmental Protection Agency is responsible for reviewing all EIS documents from other federal agencies and must provide NEPA documentation for its own proposed actions. Because the Southern California DPS is listed as endangered under the federal ESA, proposed actions that may impact this population are evaluated as biological resources in the project area concurrently and interdependently with the federal ESA Section 7 consultation process.

The California Environmental Quality Act (CEQA) is similar to NEPA in that it requires environmental review of discretionary projects proposed by state and local public agencies unless an exemption applies (Pub. Resources Code, § 21080). Under CEQA, the lead agency is responsible for determining whether an EIR, Negative Declaration, or Mitigated Negative Declaration is required for a project (Cal. Code Regs., tit. 14, § 15051). When there is substantial evidence that a project may have a significant effect on the environment and adverse impacts cannot be mitigated to a point where no significant effects would occur, an EIR must be prepared that identifies and analyzes environmental impacts and alternatives (Pub. Resources Code, § 21082.2, subds. (a) & (d)). Significant effects for a proposed project may occur if project activities have the potential to substantially reduce the habitat, decrease the number, or restrict the range of any rare, threatened, or endangered species (Cal. Code Regs., tit. 14, §§ 15065, subd. (a)(1) & 15380). CEQA requires public agencies to avoid or minimize significant effects where feasible (Cal. Code Regs., tit. 14, § 15021); NEPA does not include this requirement. Further, CEQA requires that when a lead agency approves a project which will result in significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall make a statement of overriding considerations in which the agency states in writing the specific reasons to support its action based on the final EIR and/or other information in the record (Cal. Code Regs., tit. 14, § 15093).

7.1.2 Federal Endangered Species Act

The ESA was established in 1973 to conserve and protect fish, wildlife, and plants that are listed as threatened or endangered. The ESA provides a mechanism to add or remove federally listed species, cooperate with states for financial assistance, and develop and implement species recovery. The ESA also provides a framework for interagency coordination to avoid take of listed species and for issuing permits for otherwise prohibited activities. The lead federal agencies for implementing the ESA are the USFWS and NMFS. Federal agencies are required to consult with either the USFWS or NMFS to ensure that actions they undertake, fund, or authorize are not likely to jeopardize the continued existence of any listed species or their designated critical habitat. The federal ESA prohibits the take, import, export, or trade in interstate or foreign commerce of ESA-listed species.

NMFS listed the Southern California Steelhead DPS as endangered under the federal ESA in 1997 as part of the South-Central/Southern California Coast recovery domain and designated critical habitat for that DPS in 2005 (NMFS 2012a). The scope of the DPS is naturally spawned anadromous steelhead originating below natural and manmade impassable barriers from the

Santa Maria River to the U.S.-Mexico border. NMFS's West Coast Region manages recovery planning and implementation for this domain, and in 2012 the region adopted a Recovery Plan for the Southern California Steelhead DPS, which provides the foundation for recovering populations to healthy levels. The listing of the DPS afforded the DPS ESA protections through the consultation provisions of ESA Section 7(a)(2); habitat protection and enhancement provisions of ESA Section 4 and 5; take prohibitions through ESA Sections 4(d) and 9; cooperation with the State of California through ESA Section 6; and research, enhancement, and species conservation by non-federal actions through ESA Section 10.

Section 7(a)(2) of the ESA requires federal agencies to ensure their actions are not likely to jeopardize the continued existence of the species or adversely modify designated critical habitat. The agency requesting consultation will typically produce and submit a biological assessment that documents potential effects on listed species or their habitats to either the USFWS or NMFS. USFWS or NMFS then produces and submits a Biological Opinion to the requesting agency that contains conservation recommendations and actions to minimize any harmful effects of the proposed action. Currently, NMFS spends a significant amount of its resources and time fulfilling Section 7 consultation requirements for federal actions that may impact the Southern California Steelhead DPS (NMFS 2012a). This includes working with agencies to avoid and minimize the potential impacts of proposed actions and to ensure project activities do not jeopardize the species or destroy critical habitat. NMFS has issued Biological Opinions for several large federally owned and operated projects, including the Santa Felicia Hydroelectric Project on Piru Creek (2008), USBR's operation and maintenance of the Cachuma Project on the Santa Ynez River (2000), USBR's construction and operation of the Robles Diversion Fish Passage Facility on the Ventura River (2003), the U.S Army Corp of Engineer's (USACE) Matilija Dam Removal and Ecosystem Restoration Project on Matilija Creek (2007), USACE's Santa Paula Creek Flood Control Project (2013). However, the application of Section 7(a)(2) is limited in scope because it applies only to federal actions and areas under federal ownership, and without a related federal action it does not apply to the significant areas of public and private ownership in southern California (NMFS 2012a).

7.1.3 Clean Water Act and Porter-Cologne Water Quality Act

The CWA was established in 1972 to regulate the discharge of pollutants into the waters of the United States and create surface water quality standards. Section 401 of the CWA requires any party applying for a federal permit or license for a project that may result in the discharge of pollutants into the waters of the United States to obtain a state water quality certification. This certification affirms that the project adheres to all applicable water quality standards and other requirements of state law. Section 404 of the CWA prohibits the discharge of dredged or fill material into the waters of the United States without a permit from the USACE. Activities regulated under this program include fill for development, water resource projects, infrastructure development, and mining projects. Applicants for a 404 permit must demonstrate that all steps have been taken to avoid impacts to wetlands, streams, and aquatic resources and that compensation is provided for unavoidable impacts prior to permit issuance from the USACE.

Since 1969, the Porter-Cologne Water Quality Act (Porter-Cologne Act) has been the principal law governing water quality in California. The Porter-Cologne Act includes goals and objectives that align with those of the federal CWA, such as water quality standards and discharge regulations. The SWRCB and nine regional water quality control boards share responsibility for the implementation and enforcement of the Porter-Cologne Act. These entities are required to formulate and adopt water quality control plans that describe beneficial uses, water quality objectives, and a program of implementation that includes actions necessary to achieve objectives, a time schedule for the actions to be taken, and monitoring to determine compliance with water quality objectives and the protection of beneficial uses of water.

Under Section 401 of the CWA, a federal agency may not issue a permit or license to conduct any activity that may result in any discharge into waters of the United States unless a Section 401 water quality certification is issued or certification is waived. The SWRCB and the regional water quality control boards administer Section 401 water quality certifications in California.

In accordance with Section 303(d) of the CWA, the U.S. Environmental Protection Agency (EPA) assists the SWRCB and the regional water boards in listing impaired waters and developing TMDLs for waterbodies within the state. TMDLs establish the maximum concentration of pollutants allowed in a waterbody and serve as the starting point for restoring water quality. The primary purpose of the TMDL program is to assure that beneficial uses of water, such as cold freshwater and estuarine habitat, are protected from detrimental increases in sediment, water temperature, and other pollutants defined in Section 502 of the CWA. TMDLs are developed by either the regional water quality control boards or the EPA. TMDLs developed by the regional water quality control boards are included as water quality control plan amendments and include implementation provisions, while those developed by the EPA contain the total load and load allocations required by Section 303(d) but do not contain comprehensive implementation provisions. The EPA is required to review and approve the list of impaired waters and each TMDL. If the EPA cannot approve the list or a TMDL, it is required to develop its own. There can be multiple TMDLs on a particular waterbody, or there can be one TMDL that addresses numerous pollutants. TMDLs must consider and include allocations to both point and non-point sources of the listed pollutants.

Approved TMDLs and their implementation plans are incorporated into water quality control plans required by the Porter-Cologne Act of 1969. For a specified area, a water quality control plan designates the beneficial uses and water quality objectives established for the reasonable protection of those beneficial uses. Such beneficial uses may include warm freshwater habitat; cold freshwater habitat; rare, threatened, or endangered species; and migration of aquatic organisms. The beneficial uses, together with the water quality objectives that are contained in a water quality control plan and state and federal antidegradation requirements, constitute California's water quality standards for purposes of the CWA.

Waters within the range of the Southern SH/RT are under the jurisdiction of the Central, Los Angeles, Santa Ana, and San Diego regional water quality control boards. There are many 303(d)-listed impaired waterbodies within the jurisdiction of each of these regional boards, and most waterbodies have more than one pollutant that exceeds water quality standards designed to protect beneficial uses of water, water quality criteria, or objectives. More information on 303(d) listed waters in southern California can be found at: https://www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/2018_integrated_report.html

The National Pollution Discharge Elimination System (NPDES) delegated implementation responsibility for the regulation of wastewater discharges to the State of California through the SWRCB and the regional water quality control boards. In southern California, tertiary wastewater treatment plants commonly discharge treated water into the rivers, streams, and estuaries that support Southern SH/RT. For example, the Tapia Water Reclamation Facility discharges tertiary treated effluent into Malibu, Las Virgenes, and Arroyo Calabasas creeks. While wastewater effluent is often the primary source of streamflow for southern California rivers and streams during the summer months, the potential impacts of wastewater effluent on adult and juvenile life stages are not well understood (NMFS 2012a). The review, assessment, and potential modification of NPDES wastewater discharge permits is a key recovery action in the federal recovery plan for the Southern California DPS to address the threat of urban effluents (NMFS 2016).

7.1.4 Federal and California Wild and Scenic Rivers Act

In 1968, Congress enacted the National Wild and Scenic Rivers Act (WSRA) to preserve certain rivers with outstanding natural, cultural, and recreational values in a free-flowing state. Under the National Wild and Scenic Rivers System, rivers are classified as either wild, scenic, or recreational. Designation neither prohibits development nor gives the government control over private property; recreation, agricultural practices, residential development, and other land uses may continue. However, the WSRA does prevent the federal government from licensing, funding, or otherwise assisting in dam construction or other projects on designated rivers or river segments. Designation does not impact existing water rights or the existing jurisdiction of states and the federal government over waters. In California, approximately 2,000 miles of river are designated as wild and scenic, which comprises about one percent of the state's total river miles. The California Wild and Scenic Rivers Act was passed by the California Legislature in 1972. The state act mandates that "certain rivers which possess extraordinary scenic, recreational, fishery, or wildlife values shall be preserved in their free-flowing state, together with their immediate environments, for the benefit and enjoyment of the people of the state." (Pub. Res. Code, § 5093.50). Designated waterways are codified in Public Resources Code Sections 5093.50-5093.70.

The designated state and federal wild and scenic rivers within the range of Southern SH/RT are the Sisquoc River, Piru Creek, and Sespe Creek. The Sisquoc River, which is a tributary of the Santa Maria River, contains 33 miles of designated water from its origin in the Sierra Madre Mountains downstream to the Los Padres National Forest boundary. Piru and Sespe creeks are both tributaries of the Santa Clara River and encompass a combined 38 miles of designated waters. The downstream end of Pyramid Dam and the boundary between Los Angeles and Ventura counties constitute the start and end points of the designated reach for Piru Creek. The designated reach for Sespe Creek is the main stem from its confluence with Rock Creek and Howard Creek downstream, near its confluence with Tar Creek. Both Sespe Creek and the Sisquoc River have comprehensive river management plans that address resource protection, development of lands and facilities, user capacities, and other management practices necessary or desirable to achieve the purposes of the WSRA (USDA 2003a; USDA 2003b).

7.1.5 Lake and Stream Bed Alteration Agreements

Fish and Game Code Section 1602 requires entities to notify the Department prior to beginning any activity that may "divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake." The requirement applies to both intermittent and perennial waterbodies. If an activity will adversely affect an existing fish and wildlife resource, the Department's Lake and Streambed Alteration Program is responsible for issuing a Lake or Streambed Alteration (LSA) Agreement that includes reasonable measures necessary to protect the resource (Fish & G. Code, §1602, subd. (a)(4)(B)). There are several types of LSA agreements that entities can request from the Department, including standard; general cannabis; gravel, sand, or rock extraction; routine maintenance; timber harvest; and master.

Recently, severe storms during the winter of 2023 in southern California caused flooding, landslides, and mudslides within the watersheds that Southern SH/RT occupy. As a result, multiple emergency actions were conducted to protect life and property. In these circumstances, Fish and Game Code Section 1610 exempts entities that conduct certain emergency work from notification requirements prior to the start of any work activity and instead requires them to notify in writing within fourteen days after the work begins.

In the South Coast Region, legal cannabis cultivation is currently focused in Santa Barbara County, with a concentration of the larger notifications in the Santa Ynez River watershed. The Santa Ynez River and its tributaries are a high priority wildlife resource that supports *O. mykiss*, the Southern California Steelhead DPS listed as endangered under the federal ESA; southwestern willow flycatcher, which is listed as endangered under both the federal ESA and CESA; least Bell's vireo, which is listed as endangered under both the federal ESA and CESA; and California red-legged frog, which is listed as threatened under the federal ESA. There are currently about 453 acres of permitted cannabis in the Santa Ynez watershed. Project water use adjacent to the Santa Ynez River can have significant individual and/or cumulative impacts on Southern SH/RT and other species along this reach and adjacent up- and downstream areas. The predominant water source for these large grows along the Santa Ynez River and within the region are well diversions that can be located within or immediately adjacent to the stream. These diversions have the potential to substantially affect surface flows, hydrology, and vegetation within the Santa Ynez River. Where this situation occurs along the Santa Ynez River, Department staff have included appropriate measures to report on water use in any agreements that have been issued. Such measures include having an established protocol for monitoring and reporting water use throughout the season. Permittees must also abide by the SWRCB forbearance period for diversion of surface water during the dry season, from April 1 through October 1 of each calendar year.

7.1.6 Medicinal and Adult-Use Cannabis Regulation and Safety Act

Regulation of the commercial cannabis cultivation industry under the Medicinal and Adult-Use Cannabis Regulation and Safety Act requires that any entity applying for an annual cannabis cultivation license from the California Department of Food and Agriculture include "a copy of any final lake or streambed alteration agreement… or written verification from the California Department of Fish and Wildlife that a lake or streambed alteration agreement is not required" with their license application (Cal. Code Regs., tit. 3, § 8102, subd. (w)). Waste discharge and water diversions associated with cannabis cultivation are regulated by the SWRCB (Cal. Code Reg., tit. 3, § 8102, subd. (p)).

7.1.7 Federal Power Act

The Federal Energy Regulatory Commission (FERC) implements and enforces the Federal Power Act. FERC has the exclusive authority to license most non-federal hydropower projects that are located on navigable waterways, federal lands, or are connected to the interstate electric grid. The term for a hydropower license granted by FERC is typically 30-50 years. FERC must comply with federal environmental laws prior to issuing a new license or relicensing an existing hydropower project, including NEPA and ESA. Section 10(a) of the Federal Power Act instructs FERC to solicit recommendations from resource agencies and tribes (when applicable) on ways to make a project more consistent with federal or state comprehensive plans. Section 10(j) allows NMFS, USFWS, and the Department to submit recommendations to protect, mitigate damage to, and enhance fish and wildlife resources affected by a proposed project. FERC is not required to incorporate these recommendations into a hydropower license if it determines the recommendations are outside the scope of Section 10(j) or inconsistent with the Federal Power Act or any other applicable law.

Pursuant to Section 401 of the CWA, FERC may not issue a FERC license to a project unless a Section 401 water quality certification is issued to that project or that certification is waived. The SWRCB administers 401 water quality certifications for projects that involve a FERC license.

UWCD owns and operates Santa Felicia Dam, which is the main component of the Santa Felicia Project *(FERC Project Number 2153)*. The project is located on Piru Creek, a tributary of the Santa Clara River, in Ventura County. Santa Felicia Dam, which is located five miles north of the town of Piru, impounds Piru Creek to form Lake Piru Reservoir. Lake Piru has a usable storage capacity of 67,997 acre-feet, and the spillway of the Santa Felicia Dam has a capacity of 145,000 cfs. A small powerhouse located on the west embankment of the dam is capable of producing up to 1,420 kilowatts of energy. UWCD owns two appropriative water rights for the project for the purposes of power, domestic, industrial, municipal, irrigation, and recreational uses. The project currently operates under a 2014 water quality certification that contains provisions to protect fish and wildlife beneficial uses in lower Piru Creek, including a reservoir release schedule to protect Southern SH/RT migration flows each year from January 1 through May 31 (see https://www.waterboards.ca.gov/waterrights/water_issues/programs/water_quality_cert/santafelicia_ferc2153.html for more information).

7.1.8 Sustainable Groundwater Management Act

In September 2014, the Governor signed legislation to strengthen the management and monitoring of groundwater basins. These laws, known collectively as the Sustainable Groundwater Management Act (SGMA), established a timeline and process for forming local

GSAs in designated groundwater basins. GSAs are responsible for developing and implementing GSPs to achieve basin sustainability within a 20-year implementation horizon. DWR is the agency responsible for reviewing and approving individual GSPs, while the SWRCB serves as the regulatory backstop for groundwater basins found to be out of compliance with SGMA. Since 2014, the Department's Groundwater Program has developed multiple documents to assist GSAs in developing and implementing effective GSPs, including a groundwater consideration planning document and a habitat-specific document for wetlands (CDFW 2019). These documents highlight scientific, management, legal, regulatory, and policy considerations that should be accounted for during GSP development. DWR is currently in the process of reviewing GSP plans for critically overdrafted and medium-to-high priority basins. Within the range of Southern SH/RT, there are over fifteen GSPs that are currently being reviewed by DWR. SGMA requires GSAs to submit annual reports to DWR each April 1 following the adoption of a GSP. Annual reports provide information on groundwater conditions and the implementation of the GSP for the prior water year (see https://water.ca.gov/Programs/Groundwater-Management/SGMA-Groundwater-Management/Groundwater-Sustainability-Plans for more information).

7.1.9 State Water Resources Control Board Water Rights Administration

Water rights are a legal entitlement authorizing water to be diverted from a specified source and put to a beneficial, non-wasteful use. Riparian water rights are based on ownership of land bordering a waterway, while appropriative water rights are issued without regard to the relationship of land to water but rather the priority in which the water was first put to beneficial use. The exercise of most water rights (i.e., appropriative water rights) requires a permit or license from the SWRCB. The goal of the SWRCB in making water rights-related decisions is to develop water resources in an orderly manner, prevent waste and unreasonable use of water, and protect the environment. The SWRCB has several other major water rights - related duties, including but not limited to: participating in water rights adjudications; enhancing instream uses for fish and wildlife beneficial uses; approving temporary water transfers; investigating possible illegal, wasteful, or unreasonable uses of water; and revoking or terminating water rights. SWRCB-issued water right permits contain public trust provisions for the protection of instream aquatic resources. While these provisions (i.e., maximum diversion amounts and diversion seasons) are meant to protect aquatic resources, they do not have an explicit regulatory mechanism to implement protections required in other state statutes. Furthermore, prior to recent advancements in groundwater management, the SWRCB generally lacked the authority to regulate groundwater diversions and development. Overlying landowners may extract percolating groundwater without approval from the SWRCB as long as the extracted water is put to beneficial uses and the region in which the groundwater diversion occurs has not been formally adjudicated.

7.1.10 Fish and Game Code Section 5937

Fish and Game Code Section 5937 states "the owner of any dam shall allow sufficient water at all times to pass through a fishway, or in the absence of a fishway, allow sufficient water to pass over, around, or through the dam, to keep in good condition any fish that may be planted or exist below the dam."

7.2 Recovery Plans and Regional Management Plans

7.2.1 Southern California Steelhead Recovery Plan

The Southern California Steelhead Recovery Plan (Recovery Plan) was adopted in 2012 following the listing of the Southern California Steelhead DPS in 1997. The goal of the Recovery Plan is to prevent the extinction of Southern California Steelhead in the wild; ensure the long-term persistence of viable, self-sustaining populations of steelhead distributed across the DPS; and establish a sustainable sport fishery (NMFS 2012a). Generally, recovery of the DPS, which consists of naturally spawned anadromous steelhead originating below natural and manmade impassable barriers from the Santa Maria River to the U.S.-Mexico Border, entails the protection, restoration, and maintenance of a range of habitats in the DPS to allow all life-history forms to be fully expressed (e.g., anadromous and resident). The Recovery Plan outlines key objectives that address factors limiting the DPS's ability to survive and naturally reproduce, including preventing extinction by protecting populations and habitats, maintaining the current distribution of steelhead and restoring distribution to historically occupied areas, increasing abundance, conserving existing genetic diversity, and maintaining and restoring habitat conditions to support all of its life-history stages. NMFS defines a viable population as a population that has a less than 5% risk of extinction due to threats from demographic variation, non-catastrophic environmental variation, and genetic diversity changes over a 100-year time frame (NMFS 2012a).

The Recovery Plan organizes the recovery plan area into five BPGs: Monte Arido Highlands, Conception Coast, Santa Monica Mountains, Mojave Rim, and Santa Catalina Gulf Coast. The BPGs were initially divided based on whether individual watersheds within them are ocean-facing systems subject to marine-based climate inversion and orographic precipitation from ocean weather patterns. Secondarily, population groups were then organized based on similarity in physical geography and hydrology. The rationale for this approach is that steelhead populations utilizing unique individual watersheds have different life histories and genetic adaptations that enable the species to persist in a diversity of different habitat types represented by the BPGs. The Recovery Plan's strategy emphasizes larger watersheds in each BPG that are more capable of sustaining larger and more viable populations than smaller watersheds. Core 1 populations are identified as having the highest priority based on their intrinsic potential for meeting viable salmonid population criteria, the severity of the threats facing the populations, and the capacity of the watershed and population to respond to recovery actions (NMFS 2012a).

Like all federal recovery plans, the Recovery Plan for the Southern California Steelhead DPS contains recovery criteria, recovery actions, and estimates of the time and costs to achieve recovery goals. Recovery criteria are objective, measurable criteria that, when met, would result in a determination that the DPS be delisted. Recovery criteria for the Southern California Steelhead DPS Recovery are based on both DPS-level and population-level criteria. At the population level, criteria include characteristics such as mean annual run-size, spawner density, and anadromous fraction, while the DPS-level criteria are informed by the minimum number of populations that must be restored in each BPG. Recovery actions are site-specific management actions necessary to achieve recovery. Actions for the Southern California DPS are organized based on the BPG and core population approaches. High-priority recovery actions include, but are not limited to, physically modifying passage barriers such as dams to allow natural rates of migration to upstream spawning and rearing habitats, enhancing protection of natural in-channel and riparian habitats, reducing water pollutants, and conducting research to better understand the relationship between resident and anadromous forms (NMFS 2012a).

7.2.2. Forest Plans

Land Management, or Forest Plans, were developed by the United States Department of Agriculture for the southern California National Forests (the Angeles, Cleveland, Los Padres, and San Bernardino National Forests) in 2006 to provide a framework for guiding ongoing land and resource management operations. The southern California Forest Plans contain various protections for Southern SH/RT that occur within national forests. These include, but are not limited to, mitigating the effects of visitor use within watersheds occupied by steelhead, working collaboratively with federal and state agencies and water management entities to restore steelhead trout access to upstream habitat, reducing risks from wildland fires to maintain water quality, and eliminating and limiting the further spread of invasive nonnative species (USDA 2005). For example, in 2014, the Cleveland National Forest initiated an effort to restore Southern SH/RT migratory corridors in the San Juan and Santiago watersheds by removing numerous small, outdated, and non-functional concrete barriers constructed by Orange County to force groundwater to the surface (C. Swift, Emeritus, Section of Fishes Natural History Museum of Los Angeles County, personal communication; Donnell et al. 2017). Thus far, up to 81 passage barriers on Silverado, Holy Jim, Trabuco, and San Juan creeks have been removed. Forest Plans are required to be updated every 10 to 15 years. In recent years, several amendments to the Southern California National Forest Plans have been adopted in response to monitoring and evaluation, new information, and changes in conditions.

7.2.3 Habitat Conservation Plans and Natural Community Conservation Plans

A Habitat Conservation Plan (HCPs) is a planning document that authorizes the incidental take of a federally listed species when it occurs due to an otherwise lawful activity. HCPs are designed to accommodate both economic development and the permanent protection and management of habitat for species covered under the plan. At minimum, HCPs must include an assessment of the impacts likely to result from the proposed taking of one or more federally listed species, the measures that the permit applicant will undertake to monitor, minimize, and mitigate such impacts, the funding available to implement such measures, procedures to deal with unforeseen or extraordinary circumstances, alternative actions to the taking that the applicant analyzed, and the reasons why the applicant did not adopt such alternatives (USFWS 2021).

The Natural Community Conservation Planning Act authorized the Department to develop Natural Community Conservation Plans (NCCPs). NCCPs identify and provide for the regional protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. The development of a NCCP by a local agency requires significant collaboration and coordination with landowners, environmental organizations, and state and federal agencies. Most approved HCP/NCCP documents are joint documents that fulfill the requirements of both Section 10 of the ESA and the Natural Community Conservation Planning Act.

Within the range of the Southern SH/RT, there are at least nine HCP or NCCPs that are either in the implementation phase or the planning phase. The majority of HCP and NCCP plans are for the southern portion of the Southern SH/RT range and include multiple plan subareas. For example, the San Diego County Multiple Species Conservation Program contains six subareas, including the City of San Diego, Poway, Santee, La Mesa, Chula Vista, and South San Diego County. Generally, rivers, streams, and riparian vegetation communities in HCP and NCCP plan areas are considered ecologically important areas that are targeted for conservation. HCP/NCCP plans typically contain provisions to conserve fish and wildlife habitat, including fire management, invasive species control, fencing, trash removal, and annual monitoring.

7.2.4 Other Management and Restoration Plans

The Steelhead Restoration and Management Plan for California is a Department-statewide steelhead management plan that provides guidelines for steelhead restoration and management that can be incorporated into stream-specific project planning (McEwan and Jackson 1996).

https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=3490

7.3 Habitat Restoration and Watershed Management

7.3.1 Fisheries Restoration Grant Program

The goal of the Department's Fisheries Restoration Grant Program (FRGP) is to recover and conserve salmon and steelhead trout populations through restoration activities that reestablish natural ecosystem functions. The FRGP annually funds projects and activities that provide a demonstrable and measurable benefit to anadromous salmonids and their habitat; restoration projects that address factors limiting productivity as specified in approved, interim, or proposed recovery plans; effectiveness monitoring of habitat restoration projects at the watershed or regional scales for anadromous salmonids; and other projects such as outreach, coordination, research, monitoring, and assessment projects that support the goal of the program. Uniquely, the FRGP provides CWA Section 401 certification and CWA Section 404 coverage for all eligible projects funded through the program. In recent years, several FRGP proposals have been funded to support conservation efforts for Southern SH/RT, including the Upper Gaviota Fish Passage Project (2022), Life Cycle Monitoring on Topanga Creek and the Ventura River (2021), Fish Passage Barrier Removal on San Jose Creek, Gaviota Creek, and Maria Ygnacio Creek (2021), and the South Coast Steelhead Coalition (2021) (see https://wildlife.ca.gov/Grants/FRGP for more information.)

7.3.2 Proposition 68 and Proposition 1

The Water Quality, Supply, and Infrastructure Improvement Act of 2014 (Proposition 1) and the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access for All Act of 2018 (Proposition 68) authorized both the Wildlife Conservation Board and the Department to award significant grant funding to restoration projects that are intended to benefit Southern SH/RT. Both entities distribute Proposition 68 and Proposition 1 funds on a competitive basis to projects that specifically address river and stream restoration (Proposition 68; Proposition 1), Southern SH/RT habitat restoration (Proposition 68), fish and wildlife habitat restoration (Proposition 68; Proposition 1), or stream flow enhancements (Proposition 1). Proposition 68 funded projects that benefit Southern SH/RT and their habitat include the Harvey Diversion Fish Passage Restoration Project on Santa Paula Creek, the Matilija Dam Ecosystem Restoration Project on Matilija Creek, and the Santa Margarita River Fish Passage Project and Bridge Replacement. Proposition 1 funded projects include, but are not limited to, *Arundo donax* removal at the Sespe Cienega on the Santa Clara River, the Santa Clara River Riparian

Improvement, and the Integrated Water Strategies Project for Flow Enhancement in the Ventura River Watershed (WCB 2021).

7.3.3 Other Habitat Restoration Funding Sources

In addition to funding provided by the Department and Wildlife Conservation Board, Southern SH/RT conservation projects are also supported by numerous other funding sources. These sources include local, state, and federal sources such as the California Coastal Conservancy, Pacific Coastal Salmon Recovery Fund, the National Fish and Wildlife Foundation, the NOAA Restoration Center, the California Department of Water Resources Integrated Regional Water Management Plan grant program (Proposition 50), the California Natural Resources Agencies Parkways Program (Proposition 40), the CalTrans Environmental Enhancement and Mitigation Program, the Santa Barbara County Coastal Resource Enhancement Fund, and the San Diego Association of County Government TransNet Environmental Mitigation Program (NMFS 2016).

7.3.4 California Steelhead Report and Restoration Card

The California Steelhead Report and Restoration Card program has funded various types of conservation projects since 1993, including instream habitat improvement, species monitoring, outreach and education, and watershed assessment and planning. However, no restoration projects within the Southern SH/RT range were funded between 2015 and 2019, as most funds were granted to projects in more northern watersheds (CDFW 2021c).

7.3.5 Non-Governmental Organization (NGOs) Efforts

Several NGOs contribute funding and staff time to implement restoration projects for the benefit of Southern SH/RT, often with the support of federal, state, or local grants. For example, the South Coast Steelhead Coalition under the guidance of California Trout, has received grant funding from the Department's FRGP to implement several restoration projects that benefit Southern SH/RT, including the Harvey Diversion Fish Passage Project on Santa Paula Creek; the Interstate 5 Trabuco Fish Passage Project on San Juan Creek in Orange County, the Santa Margarita River Fish Passage Project on Sandia Creek in San Diego County; the Rose Valley Restoration Project on Sespe Creek; invasive vegetation removal in the Santa Clara River floodplain; and *O. mykiss* protection in the upper Santa Margarita River, West Fork San Luis Rey River, and upper tributaries to the Santa Clara and Ventura rivers (NMFS 2016). Other NGOs that promote funding and implementation of steelhead recovery actions include the Santa Clara River Steelhead Coalition under the direction of California Trout, the Tri-Counties Fish Team, the Environmental Defense Center, the San Gabriel and Lower Los Angeles Rivers Mountain Conservancy, the West Fork San Gabriel River Conservancy, and the Council for Watershed Health (San Gabriel and Los Angeles rivers). Additionally, there are many other groups or agencies that are also involved in Southern SH/RT conservation efforts: Concerned Resource and Environmental Workers; Heal the Ocean; Santa Barbara ChannelKeeper; Matilija Coalition; Ojai Valley Land Conservancy; Friends of the Ventura River; Friends of the Santa Clara River; Friends of the Los Angeles River; Friends of the Santa Monica Mountains; Heal the Bay; Friends of the Santa Margarita River; San Dieguito River Valley Conservancy; and the Endangered Habitat League (NMFS 2016).

7.3.6 Other Regional and Local Public Institution Efforts

The Southern California Wetlands Recovery Project (SCWRP) consists of directors and staff from 18 public agencies, which collectively coordinate to protect, restore, and enhance coastal wetlands and watersheds between Point Conception and the Mexican Border. The SCWRP, which was founded in 1997, is chaired by the California Natural Resources Agency with support from the California State Coastal Conservancy. The mission of the SCWRP is to expand, restore, and protect wetlands in southern California. The SCWRP is guided by long-term goals, specific implementation strategies, and quantitative objectives articulated in its 2018 regional strategy report (SCWRP 2018).

The Southern California Coastal Water Research Project (SCCWRP) is a public research and development agency whose mission is to enhance the scientific foundation for management of southern California's ocean and coastal watersheds. Since its creation in 1969, the focus of the SCCWRP has been to develop strategies, tools, and technologies to improve water quality management for the betterment of the ecological health of the region's coastal ocean and watersheds. SCCWRP research projects are guided by comprehensive annual plans for major research areas, including ecohydrology, climate change, eutrophication, microbial water quality, and stormwater best management practices (SCCWRP 2022). Currently, the SCCWRP, in cooperation with other local and state agencies, is leading the Los Angeles River Environmental Flows Project. The project's goals are to quantify the relationship between flow and aquatic life, account for flow reduction allowances to the river from multiple wastewater reclamation plants during the summer months and develop flow criteria for the Los Angeles River using the California Environmental Flows Framework.

The City of Santa Barbara supports a Creeks Restoration and Water Quality Improvement Division (Creeks Division), whose mission is to improve creek and ocean water quality and restore natural creek systems through storm water and urban runoff pollution reduction, creek restoration, and community education programs. The Creeks Division's goal for restoration includes increasing riparian vegetation and wildlife habitat, removing invasive plants, and improving water quality through shading, bank stabilization, and erosion control. The Division has completed several restoration projects in Santa Barbara County, including the Mission

Creek Fish Passage project, the Arroyo Burro Estuary and Mesa Creek restoration project, and the upper Las Positas Creek restoration project. The Creeks Division also conducts removal efforts of invasive giant reed from the Arroyo Burro, Mission, and Sycamore Creek watersheds and participates in water quality improvement projects, creek and beach cleanups, and education outreach efforts throughout Santa Barbara County.

The California Conservation Corps Fisheries Program gives U.S. military veterans opportunities to develop skills and work experience by restoring habitat for endangered salmon and steelhead and conducting fisheries research and monitoring. The program, which is a partnership between the California Conservation Corps, NMFS, and the Department, trains participants on a variety of fisheries monitoring techniques, including riparian restoration, dual-frequency identification sonar (DIDSON) techniques, adult and juvenile fish identification, downstream migrant trapping, and instream flow and habitat surveys.

7.4 Commercial and Recreational Fishing

California freshwater sport fishing regulations prohibits fishing in virtually all anadromous coastal rivers and streams in southern California that are accessible to adult steelhead. However, recreational angling for *O. mykiss* above impassable barriers is permitted in many coastal rivers and streams (CDFW 2023a). The Department has expanded its use of sterile "triploid" fish to prevent interbreeding of hatchery fish with native Southern SH/RT (NMFS 2016). The freshwater exploitation rates of Southern SH/RT are likely very low given the Department's prohibition of angling within the geographic range of the Southern California Steelhead DPS listed under the federal ESA (NMFS 2016). Additionally, sport and commercial harvest of Southern SH/RT greater than 16 inches in length in the Department's Southern Recreational Fishing Management Zone is prohibited (CDFW 2023b). All incidentally captured steelhead in the ocean must be released unharmed and should not be removed from the water.

7.5 Research and Monitoring Programs

7.5.1 California Coastal Monitoring Program

The purpose of the CMP is to gather statistically sound and biologically meaningful data on the status of California's coastal salmonid populations to inform salmon and steelhead recovery, conservation, and management activities. The CMP framework is based on four viable salmonid population metrics: abundance, productivity, spatial structure, and diversity (Adams et al. 2011; McElhany et al. 2000). Boughton et al. (2022b) updated the CMP approach for the southern coastal region to address the scientific uncertainty on Southern SH/RT ecology due to lower abundances and a more arid climate compared to more northern populations, for which the original CMP framework was designed.

Currently, the Department leads monitoring efforts in the southern coastal region, with most efforts focused on obtaining abundance estimates for anadromous adults in Core 1 and Core 2 populations (NMFS 2016). As of March 2023, Department CMP staff operate fixed-point counting stations and conduct summer-low flow juvenile surveys, redd surveys, and PIT tagging arrays on the Ventura River, Topanga Creek, and Carpinteria Creek, including the various tributaries to these watersheds. Fixed-point counting stations for anadromous adults are also operated on the Santa Ynez River and its primary tributary, Salsipuedes Creek. Redd surveys and juvenile low-flow surveys also occur in coastal watersheds of the Santa Monica Mountains, such as Big Sycamore Creek, Malibu Creek, Arroyo Sequit Creek, and Solstice Creek. Additionally, the Department conducts spawning surveys in the many watersheds of the Conception Coast, including Jalama, Gaviota, Glenn Annie, San Pedro, Maria Ygnacio, and Mission creeks. Department CMP staff anticipate expanding the number of southern coastal watersheds monitored as landowner agreements and available funding increase (K. Evans, CDFW, personal communication).

7.5.2 Other Monitoring Programs

Several special districts or local governments monitor Southern SH/RT on an annual basis in watersheds that contain federally owned or operated infrastructure. Such monitoring is often required for compliance with monitoring and reporting measures set forth in federal ESA Section 7 Biological Opinions. Although the level of monitoring effort and protocol methods vary between monitoring programs, the data produced by these special districts or local governments are often the longest time-series data available for Southern SH/RT.

The Cachuma Operation and Maintenance Board (COMB) has conducted monitoring within the Lower Santa Ynez River and its tributaries since 1994 as part of the assessment and compliance measures required in the Cachuma Project Biological Opinion. Redd and adult spawner surveys typically occur throughout the winter months, while juvenile snorkel surveys are conducted in the spring, summer, and fall months. Estuary monitoring is also periodically conducted to complement upstream trapping during the migration seasons.

Since 2005, the Casitas Mutual Water District (CMWD) has monitored fish migration at the Robles Fish Passage facility (14 miles upstream from the ocean) on the Ventura River using a VAKI Riverwatcher remote fish monitoring system. CMWD also conducts reach-specific spawner and redd surveys and snorkel surveys at index sites throughout the Ventura River watershed from the winter through late spring (Dagit et al. 2020).

The United Water Conservation District (UWCD) monitors both upstream and downstream migration at the Vern Freeman Diversion Dam (approximately 10 miles upstream from the ocean) using both video-based and motion detection surveillance systems. Monitoring occurs from January to June when streamflow in the Santa Clara River is high enough to maintain water levels at the passage facility (Booth 2016).

The Resource conservation District of the Santa Monica Mountains (RCDSMM) has monitored Arroyo Sequit, Malibu, and Topanga creeks since the early 2000s. Monitoring typically occurs from January through May and includes snorkel surveys, spawning and rearing surveys, instream habitat surveys, and periodic lagoon surveys (Dagit et al. 2019). Since 2016, the South Coast Steelhead Coalition, under the direction of California Trout, has conducted post-rain reconnaissance surveys in San Juan Creek, San Mateo Creek, the Santa Margarita River, and the San Luis Rey River (Dagit et al. 2020).

8. SUMMARY OF LISTING FACTORS

The Commission's CESA implementing regulations identify key factors relevant to the Department's analyses and the Commission's decision on whether to list a species as endangered or threatened. A species will be listed as endangered or threatened if the Commission determines that the species' continued existence is in serious danger or is threatened by any one or any combination of the following factors: (1) present or threatened modification or destruction of its habitat; (2) overexploitation; (3) predation; (4) competition; (5) disease; or (6) other natural occurrences or human-related activities (Cal. Code Regs., tit. 14, § 670.1, subd. (i)). This section provides summaries of information from the preceding sections of this Status Review, arranged under each of the factors to be considered by the Commission in determining whether listing is warranted.

8.1 Present or Threatened Modification or Destruction of Habitat

The decline of Southern SH/RT can be attributed to a wide variety of human activities, including, but not limited to, urbanization, agriculture, and water development. These activities have degraded range-wide aquatic habitat conditions, particularly in the lower and middle reaches of individual watersheds (see Section 6.8). Southern California is home to over 20 million people and 1.8 million acres of urban area (DWR 2021). As a result, the majority of watersheds, currently occupied by Southern SH/RT, are highly urbanized and impacted by surface and groundwater diversions and associated agricultural, residential, and industrial uses.

Although some deleterious activities have been eliminated or mitigated, habitat conditions for Southern SH/RT have continued to deteriorate over time due to numerous stressors associated with human population growth and climate change impacts. Water diversions, storage, and conveyance for agriculture, flood control, and domestic uses have significantly reduced much of their historical spawning and rearing habitat. Water storage facilities, reservoir operations, instream diversions and groundwater extractions have altered the natural flow regime of southern California rivers and streams and have led to warmer water temperatures, shifts in aquatic community structure and composition, and reduced downstream recruitment of gravel and sediments. High road densities and the presence of in-stream artificial barriers have reduced habitat connectivity by impeding and restricting volitional fish passage in many watersheds, especially in the lower reaches. Development activities associated with agriculture, urbanization, flood control, and recreation have also substantially altered Southern SH/RT habitat quantity and quality by increasing ambient water temperatures, increasing nutrient and pollutant loading, degrading water quality, eliminating riparian habitat, and creating favorable conditions for non-native species. Range-wide and coastal estuarine habitat conditions are highly degraded and are at risk of loss and further degradation. Legal cannabis cultivation is a relatively new yet potentially serious threat to Southern SH/RT watersheds if best management practices, instream flow requirements, and diversion season regulations are not complied with. Our review of habitat conditions in southern California supports the conclusions of other review efforts, which conclude that populations continue to be at risk of extinction unless significant restoration and recovery measures are implemented (Moyle et al. 2017; NMFS 2012a).

The Department considers present or threatened modification or destruction of habitat to be a significant threat to the continued existence of Southern SH/RT.

8.2 Overexploitation

Exploitation rates of Southern SH/RT are relatively low across its range (see Section 6.9). While angling-related mortality may have historically contributed to the decline of some small populations, it is generally not considered a leading cause of the decline of the Southern California Steelhead DPS as a whole (Good et al. 2005; Busby et al. 1996; NMFS 1996b). After southern California steelhead was first listed as endangered under the federal ESA as an ESU in 1997, the Commission closed recreational fisheries for Southern SH/RT in California marine and anadromous waters with few exceptions. The closure continues, and there is currently no recreational fishery for Southern SH/RT (CDFW 2023a; CDFW 2023b).

Marine commercial driftnet fisheries in the past may have contributed slightly to localized declines; however, Southern SH/RT are not targeted in commercial fisheries and reports of incidental catch are rare. Commercial fisheries are not thought to be a leading cause of the widespread declines over the past several decades (NMFS 2012a).

Illegal harvest is likely the leading source of exploitation. Southern SH/RT are especially vulnerable to poaching due to their visibility in shallow streams. Estimates of fishing effort from self-report cards for 1993-2014 suggest extremely low levels of angling effort for Southern SH/RT (NMFS 2016; Jackson 2007). Though illegal harvest rates appear to be very low, because of low adult abundance, the removal of even a few individuals in some years could be a threat to the population (Moyle et al. 2017).

The Department does not consider overexploitation to be a substantial threat to the continued existence of Southern SH/RT, but further directed study is warranted to confirm this threat level.

8.3 Predation

Southern SH/RT experience predation in both the freshwater and marine environments, but specific predation rates, particularly in marine environments, are not well understood (see Section 6.5). While Southern SH/RT have evolved to cope with a variety of natural predators, a suite of non-native predators has also become established within its watersheds (Busby et al. 1996; NMFS 2016; Stillwater Sciences 2019; Dagit et al. 2019; COMB 2022). Established populations of non-native fishes, amphibians, and aquatic invertebrates combined with anthropogenic habitat alterations that provide favorable conditions for the persistence of these non-native species have led to increased predation rates in much of its range (NMFS 1996b). Habitat modification and degradation has also likely increased predation rates from terrestrial and avian predators (Grossman 2016; Osterback et al. 2013).

Further directed study is warranted to assess the level of impact of these predation threats on Southern SH/RT.

8.4 Competition

Southern SH/RT populations are subject to competitive forces across their range (see Section 6.6). The extent to which competition impacts the distribution, abundance, and productivity of Southern SH/RT populations is not well understood. Southern SH/RT are the only salmonid that occur in their range. Therefore, the potential for inter-specific competition with other salmonids is unlikely to occur. Interspecific competition with other non-salmonid fishes occurs to varying degrees across the Southern SH/RT range. In addition to competing with juvenile steelhead for food resources, juvenile non-native fish species can limit the distribution and abundance of juvenile steelhead. Non-native fish species can competitively exclude and confine the spatial distribution of juvenile steelhead to habitats such as shallower, higher velocity riffles, where the energetic cost to forage is higher (Rosenfeld and Boss 2001).

Further directed study is warranted to assess the level of impact of competition from non-native fish species.

8.5 Disease

Southern SH/RT survival is impacted by a variety of factors including infectious disease (see Section 6.3). A myriad of diseases caused by bacterial, protozoan, viral, and parasitic organisms can infect *O. mykiss* in both the juvenile and adult life stages (NMFS 2012a). Degraded water quality and chemistry in much of the Southern SH/RT range is likely to increase infection rates and severity (Belchik et al. 2004; Stocking and Bartholomew 2004; Crozier et al. 2008). There is very little current information available to quantify present infection and mortality rates in Southern SH/RT.

The Department does not consider disease to currently be a significant threat to the continued existence of Southern SH/RT, however further directed study is warranted to confirm the level of current and potential future impact.

8.6 Other Natural Occurrences or Human-related Activities

Southern SH/RT populations have evolved notably plastic and opportunistic survival strategies and are uniquely adapted to wide-ranging natural environmental variability, characterized by challenging and dynamic habitat conditions (Moyle et al. 2017). However, combined anthropogenic and climate change-driven impacts may ultimately outpace Southern SH/RT's capacity to adapt and persist, potentially leading to extirpation within the next 25–50-year time frame (Moyle et al. 2017; see Section 6.2). This prediction is underscored by the fact that Southern SH/RT already encounters water temperatures that approach and may, at times, exceed the upper limit of salmonid thermal tolerances, across portions of its current distribution (Moyle et al. 2017). Southern SH/RT has, therefore, been characterized as having potential for severe climate change impacts (Moyle et al. 2017). With increasing exposure to periods of higher water temperatures and flow variability, along with extended droughts, more frequent and intense wildfires, catastrophic flooding and associated sediment movement, sea level rise, and ever-increasing human demands for natural resources, the combined impacts to Southern SH/RT will be interdependent, synergistic, and are expected to intensify without intensive and timely human intervention (NMFS 2012b; Hall et al. 2018; OEHHA 2022).

Human-related activities are considered by the Department to be significant threats to the continued existence of Southern SH/RT.

9. SUMMARY OF KEY FINDINGS

Southern California steelhead (*Oncorhynchus mykiss*) inhabit coastal streams from the Santa Maria River system south to the U.S.-Mexico border. Non-anadromous resident *O. mykiss*, familiar to most as Rainbow Trout, reside in many of these same streams and interbreed with anadromous adults, contributing to the overall abundance and resilience of the populations. Southern SH/RT as defined in the Petition include both anadromous (ocean-going) and resident (stream-dwelling) forms of *O. mykiss* below complete barriers to anadromy in these streams.

Less than half of the watersheds historically occupied by Southern SH/RT remain occupied below complete barriers to anadromy, most commonly with individuals able to express only a freshwater-resident life-history strategy (NMFS et al. 2012). Adult steelhead runs have declined to precariously low levels, particularly over the past five to seven years, with declines in adult returns of 90% or more on major watersheds that historically supported the largest anadromous populations (e.g., the Santa Maria, Santa Ynez, Ventura, and Santa Clara rivers). Additionally, our analysis of resident populations indicates a sharp decline over this same time period.

While recent genetic findings suggest that the anadromous life-history form can be sustained and reconstituted from resident individuals residing in orographic drought refugia, in southern California, nearly all drought refugia habitats are currently above impassable barriers. Therefore, the anadromous phenotype is at an increasingly high risk of being entirely lost from the species within its southern California range, in large part due to the lack of migration corridors between drought refugia and the ocean, and the inability of resident progeny to successfully migrate downstream in years with sufficient rainfall and streamflow.

Southern SH/RT continues to be most at risk from habitat degradation, fragmentation, and destruction resulting from human-related activities. Specifically, dams, surface water diversions, and groundwater extraction activities restrict access to most historical spawning and rearing habitats and alter the natural flow regime of rivers and streams that sustain ecological, geomorphic, and biogeochemical functions and support the specific life history and habitat needs of Southern SH/RT. Agricultural and urban development negatively affect nearby rivers and streams through increased pollution and surface runoff, which degrade water quality and habitat conditions. Furthermore, the rapid rate of climate change and the increasing presence of non-native species present another challenge to the persistence of Southern SH/RT.

Based on the best scientific information available at the time of the preparation of this review, the Department concludes that the Southern SH/RT is in danger of extinction throughout all of its range. Intensive and timely human intervention, such as ecological restoration, dam removal, fish passage improvement projects, invasive species removal, and groundwater management, are required to prevent the further decline of Southern SH/RT. The extinction of Southern SH/RT would represent an insurmountable loss to the *O. mykiss* diversity component in California due to their unique adaptations, life histories, and genetics, which have allowed them to persist at the extreme southern end of the species' West Coast range.

10. RECOMMENDATION FOR THE COMMISSION

CESA requires the Department to prepare this report regarding the status of Southern SH/RT in California based upon the best scientific information available to the Department (Fish & G. Code, § 2074.6). CESA also requires the Department to indicate in this Status Review whether the petitioned action (i.e., listing as endangered) is warranted (Fish & G. Code, § 2074.6; Cal. Code Regs., tit. 14, § 670.1, subd. (f)).

Under CESA, an endangered species is defined as “a native species or subspecies…which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease” (Fish & G. Code, § 2062). A threatened species is defined as “a native species or subspecies…that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by [CESA]” (Fish and G. Code, § 2067).

Based on the criteria described above, the best scientific information available to the Department indicates that Southern SH/RT is in serious danger of becoming extinct in all of its range due to one or more causes including: 1. present or threatened modification or destruction of habitat; and 2. other natural occurrences or human-related activities. The Department recommends that the Commission find the petitioned action to list Southern SH/RT as an endangered species to be warranted.

11. PROTECTION AFFORDED BY LISTING

It is the policy of the State to conserve, protect, restore, and enhance any endangered or threatened species and its habitat (Fish & G. Code, § 2052). The conservation, protection, and enhancement of listed species and their habitat is of statewide concern (Fish & G. Code, § 2051, subd. (c)). If listed, unauthorized take of Southern SH/RT would be prohibited under state law. CESA defines “take” as hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill (Fish & G. Code, § 86). Any person violating the take prohibition would be punishable under state law. The Fish and Game Code provides the Department with related authority to authorize “take” of species listed as threatened or endangered under certain circumstances (see, e.g., Fish & G. Code, §§ 2081, 2081.1, 2086, & 2835). If Southern SH/RT is listed under CESA, take resulting from activities authorized through incidental take permits must be minimized and fully mitigated according to state standards (Fish & G. Code, § 2081, subd. (b)). Take of Southern SH/RT for scientific, educational, or management purposes could be authorized through permits or memorandums of understanding pursuant to Fish and Game Code Section 2081(a).

Additional protection of Southern SH/RT following listing would also occur during required state and local agency environmental review under CEQA. CEQA requires affected public agencies to analyze and disclose project-related environmental effects, including potentially significant impacts on endangered, threatened, and rare special status species. Under CEQA's "substantive mandate," state and local agencies in California must avoid or substantially lessen significant environmental effects to the extent feasible. With that mandate, and the Department's regulatory jurisdiction generally, the Department expects related CEQA review will likely result in increased information regarding the status of Southern SH/RT in California as a result of pre-project biological surveys. Where significant impacts are identified under CEQA, the Department expects project-specific required avoidance, minimization, and mitigation measures will also benefit the species. While CEQA may require analysis of potential impacts to Southern SH/RT regardless of its listing status under CESA, the act contains specific requirements for analyzing and mitigating impacts to listed species. In common practice, potential impacts to listed species are scrutinized more in CEQA documents than are potential impacts to unlisted species. State listing, in this respect, and required consultation with the Department during state and local agency environmental review under CEQA, is expected to benefit the species by reducing impacts from individual projects to a greater degree than may occur absent listing.

CESA listing may prompt increased interagency coordination specific to Southern SH/RT conservation and protection. Listing may also increase the likelihood that state and federal land and resource management agencies will allocate additional funds toward protection and recovery actions.

12. MANAGEMENT RECOMMENDATIONS AND RECOVERY MEASURES

CESA directs the Department to include in its Status Review recommended management activities and other recommendations for recovery of Southern SH/RT (Fish & G. Code, § 2074.6; Cal. Code Regs., tit. 14, § 670.1, subd. (f)). Department staff generated the following list of recommended management actions and recovery measures.

1. Implement comprehensive monitoring in all streams with extant Southern SH/RT populations and produce statistically robust population estimates. Fully implement the California Coastal Monitoring Program and integrate the updated south coastal region monitoring strategy (Boughton et al. 2022b) to resolve the various ecological and methodological factors that currently impede monitoring. The main features of this updated strategy are:

- Estimates of average density for each BPG;
- Research on the location and extent of drought refugia in each BPG;

- Adult steelhead abundance estimates in selected populations that are robust enough to evaluate Southern SH/RT resilience to catastrophic events and the ability to adapt over time to long-term environmental changes;
- Adult *O. mykiss* abundance estimates that are sufficient to develop an estimate for total abundance in the region; and
- Greater emphasis on monitoring methods that are unbiased or can be corrected for bias (NMFS 2016).

2. Support and participate in the development of watershed-specific plans to effectively maintain and restore Southern SH/RT habitat by focusing on the combination of factors currently limiting their distribution and abundance, such as dams, agriculture, and water extraction. This includes continuing to coordinate and collaborate with NMFS, NGOs, state and local governments, landowners, and other interested entities to implement recovery actions identified in the 2012 Recovery Plan for the southern California Steelhead DPS and other management and conservation strategies. High priority actions include (NMFS 2012a):

- Remove manmade passage barriers in all population watersheds and re-establish access to upper watersheds in both small coastal streams and the larger interior rivers within each BPG identified in the federal Recovery Plan;
- Establish fishways or assisted migration practices at manmade passage barriers that cannot be removed in the near-term with an emphasis on re-establishing passage for above-barrier populations that still contain significant native ancestry;
- Complete planning and removal of Matilija Dam on Matilija Creek and Rindge Dam on Malibu Creek;
- Provide ecologically meaningful flows below major dams and diversions in all population watersheds by re-establishing adequate flow regimes and restoring groundwater aquifers in dewatered areas to sustain surface flows in both small coastal streams and large interior rivers;
- Reevaluate the efficacy of existing fish passage structures at instream surface water diversions, dams, culverts, weirs, canals, and other infrastructure in all watersheds historically and currently occupied by Southern SH/RT; and
- Minimize the adverse effects of exotic and non-native plant and animal species on aquatic ecosystems occupied by Southern SH/RT through direct removal and control efforts.

3. Improve and expand suitable and preferred habitat used by Southern SH/RT for summer holding, spawning, and juvenile rearing. Prioritize habitat restoration, protection, and enhancement in Southern SH/RT holding, spawning, and rearing areas. Habitat projects should focus on improving habitat complexity, riparian cover, fish passage, and sediment transport, as

well as enhancing essential deep, cold-water habitats for holding adults. Restoration should also be considered in potential habitats not currently occupied by Southern SH/RT.

4. Continue research on *Omy5* haplotypes and other relevant genomic regions to better understand: the mechanism for anadromy in Southern SH/RT, the impact of migration barriers on the frequency of the "A" haplotype in individuals, and the risk of progressively losing the genetic basis for anadromy over time in above-barrier populations despite the current presence of the "A" haplotype.

5. Continue to investigate the population structure and ancestry of Southern SH/RT at the extreme southern end of the species distribution in southern California, including further research on identifying genetically introgressed populations and the potential benefit of these populations for maintaining the persistence of viable networks of Southern SH/RT, given recent findings of limited native ancestry in the region and the importance of variation in adaptation.

6. Initiate research into Southern SH/RT ecology identified in the Southern California Steelhead Recovery Plan (NMFS 2012a). Important research topics include:

- Environmental factors that influence anadromy;
- The relationship between migration corridor reliability and anadromous fraction;
- Identification of nursery habitat types that promote juvenile growth and survival;
- The role of seasonal lagoons and estuaries in the life history of Southern SH/RT and the extent to which these areas are used by juveniles prior to emigration;
- Investigation on the role that mainstem habitats play in the life history of steelhead, including identification of the ecological factors that contribute to mainstem habitat quality;
- The role of naturally intermittent creeks and stream reaches;
- Determining whether spawner density is a reliable indicator of a viable population;
- Determining the frequency of return adult spawners;
- Recolonization rates of extirpated watersheds by source populations;
- Dispersal rates between watersheds, including interactions among and between populations through straying;
- Intra-and interannual variation in diet composition and growth rate; and
- Partial migration and life-history crossovers.

7. Formalize minimization and avoidance measures on a Department-wide basis to minimize incidental take of the CESA-listed species due to otherwise lawful activities resulting from construction, research, management, and enhancement activities. This includes working with federal agencies to coordinate and develop efficient permitting processes for incidental take authorization for actions that contribute to the recovery of Southern SH/RT.

8. Explore other means of conserving individual populations of Southern SH/RT that may face the risk of extirpation due to catastrophic events, such as wildfires, droughts, and oil spills (e.g., conservation translocations to other existing facilities at academic institutions or museums, or natural refugia habitats). This includes ensuring that translocations of Southern SH/RT conducted by the Department for conservation purposes significantly contribute to species and ecosystem conservation and are planned, executed, and supported in a manner consistent with best scientific practices and the Department's Policy and Procedures for Conservation Translocations of Animals and Plants (CDFW 2017).

9. Strengthen law enforcement in areas occupied by Southern SH/RT to reduce threats of poaching, illegal water diversions, and instream work used for cannabis cultivation.

10. Evaluate current fishing regulations to determine any potential changes that could be implemented for further protection of Southern SH/RT, and update regulations, using clear and transparent communication, in response to restoration actions, such as dam removal projects, that could change the sport fishing regulation boundary (e.g., inland anadromous waters).

11. Conduct a robust outreach and education program that works to engage with tribes and interested parties, including federal, state, local, NGOs, landowners, underserved communities, and interested individuals, to promote and implement conservation actions. This includes developing outreach and educational materials to increase public awareness and knowledge of the ecological and societal benefits that can be gained by recovering Southern SH/RT.

ACKNOWLEDGEMENTS

This Status Review was prepared by Robin Shin in the Department's Fisheries Branch and Vanessa Gusman in the Department's Water Branch, with contributions from Max Fish, Jeff Weaver, Chenchen Shen, and Claire Ingel in the Department's Fisheries Branch.

The Department would like to thank David Boughton, Camm Swift, Alan Byrne, Matt Sloat, and Devon Pearse for providing scientific peer review for this Status Review.

APPENDIX E. COMMENTS FROM TRIBES AND AFFECTED AND INTERESTED PARTIES ON THE PETITIONED ACTION.

Pursuant to Fish and Game Code 2074.4, the California Department of Fish and Wildlife (Department) and the California Fish and Game Commission (Commission) notified Tribes and affected and interested parties and solicited data and comments on the petitioned action to list Southern California steelhead as endangered under the California Endangered Species Act (CESA).

Native American Tribal Engagement

- From July 13, 2022, to July 15, 2022, the Department distributed by email and mail the attached notices to 309 Tribes notifying them of the Southern California steelhead's candidacy and to request information and comments on the petitioned action. From August 17, 2022, to September 1, 2022, the Department sent follow-up emails to 82 Tribes.
- On February 2, 2023, The Department hosted a virtual Tribal listening session.
- The Department responded to 2 requests for government-to-government consultation and 1 request for a meeting presentation.

Public Notification

- On May 11, 2022, the Commission published a Notice of Findings regarding the candidacy and status review of the Southern California steelhead in the California Regulatory Notice Register (Cal. Reg. Notice Register 2022, No. 19-Z, p. 541).
- The Department distributed by email, on July 15, 2022, and mail, on July 20, 2022, the attached public notice to approximately 152 non-governmental organizations, universities, and local, county, state, and federal entities within the range of Southern California steelhead, notifying them of the Southern California steelhead candidacy and to request information and comments on the petitioned action.
- On July 15, 2022, the Department distributed the attached press release to an email listserv maintained by the Department's Office of Communication, Education and Outreach, and posted the press release to the Department's News Room website, notifying the public of Southern California steelhead's candidacy and to request information and comments on the petitioned action.

Summary of Comments Received

The Department received 17 comments from Tribes. The Department received 480 emails from the public, with 464 emails expressing support for the listing of Southern California steelhead under CESA. Of these emails expressing support, 20 were originally drafted non-format letters. The Department received 12 submissions of information, including 35 literature and data sources, and a list of 2 recommended peer reviewers.

All communications are on file with the Department and can be provided on request by emailing SCSH@wildlife.ca.gov.

NOTIFICATION OF STATUS REVIEW FOR SOUTHERN CALIFORNIA STEELHEAD UNDER THE CALIFORNIA ENDANGERED SPECIES ACT

Dear [redacted]:

NOTICE IS HEREBY GIVEN that the California Department of Fish and Wildlife (Department) has initiated a status review for Southern California steelhead (*Oncorhynchus mykiss*) pursuant to Fish and Game Code section 2074.6. The Department is providing this notice pursuant to Fish and Game Code section 2074.4 to solicit data and comments on the petitioned action from your Tribe. The Department is also providing this notice pursuant to the Department's Tribal Communication and Consultation Policy to notify your Tribe of this status review process and offer your Tribe government-to-government consultation.

The Department has initiated this status review following related action by the Fish and Game Commission (Commission). On May 13, 2022, the Commission provided public notice that Southern California steelhead is now a candidate species under the California Endangered Species Act (CESA) and as such, receives the same legal protection afforded to an endangered or threatened species. (Cal. Reg. Notice Register 2022, No. 19-Z, p. 541; Fish & G. Code, §§ 2074.2, 2085.) The listing petition defines Southern California steelhead as all *O. mykiss*, including anadromous and resident life histories, below manmade and natural complete barriers to anadromy from the Santa Maria River, San Luis Obispo County (inclusive) to the U.S.-Mexico Border. The listing petition and the Department's petition evaluation report are available at the following Commission webpage: https://fgc.ca.gov/CESA#SCS.

The Department seeks to understand Tribal interests and work collaboratively to include any data or comments on the petitioned action, including Southern California steelhead ecology, genetics, life history, distribution, abundance, habitat, the degree and immediacy of threats to its reproduction or survival, the adequacy of existing management, or recommendations for management of the species during development of the status review. Please submit such data or comments to the Department via email at SCSH@wildlife.ca.gov and include "Southern California Steelhead" in the subject line. Such data or comments may also be submitted to the Department by mail addressed to "Attn: Southern California Steelhead" at the address in the letterhead of this notification.

The Department has twelve months to review the petition, evaluate the best available scientific information relating to the species, and report back to the Commission on whether the petitioned action is warranted or is not warranted. (Fish & G. Code, § 2074.6.) After the Department transmits the report to the Commission, the Commission will place receipt of the report on the agenda for the next available Commission meeting. The report will be made available to the public for that meeting. Following receipt of the report, the Commission will schedule the petition for further consideration at its next available meeting. Pursuant to Fish and Game Code section 2075.5, the Commission—which is a legally separate entity from the Department—is charged with making the final determination on whether to list a species as endangered or threatened under CESA. The Department serves in an exclusively advisory role to the Commission during this process.

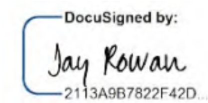
The Department welcomes direct communication and consultation to discuss the status review for Southern California steelhead and to identify any impacts to Tribal interests or cultural resources. The Department is committed to open communication with your Tribe under its Tribal Communication and Consultation Policy, which is available through the Department's Tribal Affairs webpage at: https://www.wildlife.ca.gov/General-Counsel/Tribal-Affairs. If you would like to provide input directly to the final decision makers, the Department encourages you to contact Commission staff about consultation with the Commission and to attend and participate in the Commission's meeting to determine whether to list Southern California steelhead as endangered under CESA. To request formal consultation with the Commission please contact Executive Director Melissa Miller-Henson at [redacted]. For general inquiries and other non-consultation matters, please contact the Commission's Tribal Advisor & Liaison, Chuck Striplen, at [redacted].

To request formal government-to-government consultation with the Department pursuant to the Department's Tribal Communication and Consultation Policy, please contact the Department's Tribal Liaison by email at tribal.liaison@wildlife.ca.gov or by mail at Attention: Tribal Liaison, California Department of Fish and Wildlife, P.O. Box 944209, 94244-2090. Please designate and provide contact information for the appropriate Tribal lead person.

The Department respectfully requests that you respond to this notice expressing your interest in meeting with us or in providing your preliminary input on the petitioned action before September 30, 2022, to allow sufficient time for the Department to evaluate that input in the Department's Southern California steelhead status review. The Department also respectfully requests that if your Tribe intends to request formal government-to-government consultation, your Tribe do so before September 30, 2022. If you would like more information on the status review, please contact Vanessa Gusman, Senior Environmental Scientist (Specialist) at SCSH@wildlife.ca.gov or at the address in the letterhead.

We look forward to your response and input on this status review.

Sincerely,



Jay Rowan, Fisheries Branch Chief

NOTICE OF STATUS REVIEW FOR SOUTHERN CALIFORNIA STEELHEAD UNDER THE CALIFORNIA ENDANGERED SPECIES ACT

NOTICE IS HEREBY GIVEN that the California Department of Fish and Wildlife (Department) has initiated a status review for Southern California steelhead (*Oncorhynchus mykiss*) pursuant to Fish and Game Code section 2074.6. The Department is providing this notice pursuant to Fish and Game Code section 2074.4 to notify affected and interested parties and to solicit data and comments on the petitioned action.

The Department has initiated this status review following related action by the Fish and Game Commission (Commission). On May 13, 2022, the Commission provided public notice that Southern California steelhead is now a candidate species under the California Endangered Species Act (CESA) and as such, receives the same legal protection afforded to an endangered or threatened species. (Cal. Reg. Notice Register 2022, No. 19-Z, p. 541; Fish & G. Code, §§ 2074.2, 2085.) The listing petition defines Southern California steelhead as all *O. mykiss*, including anadromous and resident life histories, below manmade and natural complete barriers to anadromy from the Santa Maria River, San Luis Obispo County (inclusive) to the U.S.-Mexico Border. The listing petition and the Department's petition evaluation report are available at the following Commission webpage: https://fgc.ca.gov/CESA#SCS.

As of May 13, 2022, take of Southern California steelhead (hunt, pursue, catch, capture, or kill, or attempt to do so) is prohibited. (Fish & G. Code, § 86). However, incidental take may be authorized with appropriate permits. (Fish & G. Code, §§ 2081(b), 2080.1, 2089.2 et. seq., or 2086.) Activities conducted for scientific, educational, or management purposes (including research and restoration) that may result in take of this species can be authorized through permits or memorandums of understanding (Fish & G. Code § 2081(a)). For information on potential pathways for authorization to take Southern California steelhead, please contact the Department at SCSH@wildlife.ca.gov.

The Department invites data or comments on the petitioned action, including Southern California steelhead ecology, genetics, life history, distribution, abundance, habitat, the degree and immediacy of threats to its reproduction or survival, the adequacy of existing management, or recommendations for management of the species. Please submit such data or comments to the Department via email at SCSH@wildlife.ca.gov and include "Southern California Steelhead" in the subject line. Such data or comments may also be submitted to the Department by mail addressed to "Attn: Southern California Steelhead" at the address in the letterhead of this notice.

The Department has twelve months to review the petition, evaluate the best available scientific information relating to the species, and report back to the Commission on whether the petitioned action is warranted or is not warranted. (Fish & G. Code, § 2074.6.) After the Department transmits the report to the Commission, the Commission will place receipt of the report on the agenda for the next available Commission meeting. The report will be made available to the public for that meeting. Following receipt of the report, the Commission will schedule the petition for further consideration at its next available meeting.

The Department respectfully requests that you submit any data or comments on the petitioned action before September 30, 2022, to allow sufficient time for the Department to evaluate those data or comments in the Department's Southern California steelhead status review.

If you have any questions regarding this notice, please contact the Department via email at SCSH@wildlife.ca.gov.

NOTIFICATION OF STATUS REVIEW FOR SOUTHERN CALIFORNIA STEELHEAD UNDER THE CALIFORNIA ENDANGERED SPECIES ACT

Dear Mr. Anthony Spina:

The purpose of this letter is to notify the National Oceanic and Atmospheric Administration (NOAA) Fisheries that the California Department of Fish and Wildlife (Department) has initiated a status review for Southern California steelhead (*Oncorhynchus mykiss*) pursuant to Fish and Game Code section 2074.6. The Department is providing this notification pursuant to Fish and Game Code section 2074.4 to notify affected and interested parties and to solicit data and comments on the petitioned action.

The Department has initiated this status review following related action by the California Fish and Game Commission (Commission). On May 13, 2022, the Commission provided public notice that Southern California steelhead is now a candidate species under the California Endangered Species Act (CESA) and as such, receives the same legal protection afforded to an endangered or threatened species. (Cal. Reg. Notice Register 2022, No. 19-Z, p. 541; Fish & G. Code, §§ 2074.2, 2085.) The listing petition defines Southern California steelhead as all *O. mykiss*, including anadromous and resident life histories, below manmade and natural complete barriers to anadromy from the Santa Maria River, San Luis Obispo County (inclusive) to the U.S.-Mexico Border. The listing petition and the Department's petition evaluation report are available at the following Commission webpage: https://fgc.ca.gov/CESA#SCS.

The Department invites NOAA Fisheries to provide data or comments on the petitioned action, including Southern California steelhead ecology, genetics, life history, distribution, abundance, habitat, the degree and immediacy of threats to its reproduction or survival, the adequacy of existing management, or recommendations for management of the species. Please submit such data or comments to the Department contact via email at SCSH@wildlife.ca.gov and include "Southern California Steelhead" in the subject line. Such data or comments may also be submitted by mail addressed to "Attn: Southern California Steelhead" at the address in the letterhead of this notification.

The Department has twelve months to review the petition, evaluate the best available information relating to the species, and report back to the Commission on whether the petitioned action is warranted or is not warranted. (Fish & G. Code, § 2074.6.) After the Department transmits the report to the Commission, the Commission will place receipt of the report on the agenda for the next available Commission meeting. The report will be made available to the public for that meeting. Following receipt of the report, the Commission will schedule the petition for further consideration at its next available meeting.

The Department respectfully requests that you submit any data or comments on the petitioned action before September 30, 2022, to allow sufficient time for the Department to evaluate those data or comments in the Department's Southern California steelhead status review.

If you have any questions regarding this notification or would like more information on the Southern California steelhead status review, please contact Vanessa Gusman, Senior Environmental Scientist (Specialist), at SCSH@wildlife.ca.gov.

We look forward to your response and input on this status review.

Sincerely,

Kirsten Macintyre, CDFW Communications, [redacted]

Public Invited to Comment on Petition to List Southern California Steelhead as Endangered

The California Department of Fish and Wildlife (CDFW) has initiated a status review for Southern California steelhead and invites data or comments on a petition to list Southern California steelhead as an endangered species under the California Endangered Species Act (CESA).

Southern California steelhead (*Oncorhynchus mykiss*) are found in streams from the Santa Maria River at the southern county line of San Luis Obispo County down to the U.S.-Mexico border. Southern California steelhead as defined in the CESA petition include both anadromous (ocean-going) and resident (stream-dwelling) forms of the species below complete migration barriers in these streams.

Major threats to Southern California steelhead include destruction, modification and fragmentation of habitat due to anthropogenic water use (i.e., dams or diversions for the purposes of providing water for human use) and climate change impacts like increased stream temperatures and intensified drought conditions. Southern California steelhead represent an important steelhead diversity component in California due to their unique adaptations, life histories and genetics.

On June 14, 2021, California Trout submitted a petition to the California Fish and Game Commission to list Southern California steelhead as an endangered species under CESA. On April 21, 2022, the Commission accepted that petition for consideration. On May 13, 2022, the Commission provided public notice that Southern California steelhead is now a candidate species under CESA and as such, receives the same legal protection afforded to an endangered or threatened species. The listing petition and CDFW's petition evaluation report are available on the Commission website.

CDFW invites data or comments on the petitioned action, including Southern California steelhead ecology, genetics, life history, distribution, abundance, habitat, the degree and immediacy of threats to its reproduction or survival, the adequacy of existing management or recommendations for management of the species. Data or comments may be submitted via email to SCSH@wildlife.ca.gov. Please include "Southern California Steelhead" in the subject line. Submissions may also be sent to:

CDFW Fisheries Branch

Attn: Southern California Steelhead
P.O. Box 944209
Sacramento, California 94244-2090

Submissions must be received by Sept. 30. CDFW has 12 months to review the petition, evaluate the best available scientific information relating to Southern California steelhead and make a recommendation to the Commission. The Commission will then place receipt of the report on the agenda for the next available Commission meeting. The report will be made available to the public for that meeting, where the Commission will schedule the petition for further consideration.

For more information on the petition, please visit the Commission website.

###

APPENDIX F: PEER REVIEW SUMMARY

Pursuant to Fish and Game Code Section 2074.6, the review process included independent peer review of the draft Status Review by persons in the scientific/academic community acknowledged to be experts on Southern SH/RT and related topics and possessing the knowledge and expertise to critique the scientific validity of the Status Review contents. This Appendix contains the specific input provided to the Department by the individual peer reviewers, the Department's written response to the input, and any amendments made to the Status Review (Fish & G. Code, § 2074.6; Cal. Code Regs., tit. 14, § 670.1, subd. (f)(2)). Independent experts that reviewed the Status Review are listed in Table 1 below.

Table 1. Status Review Peer Reviewers

Name	Affiliation
Dr. David Boughton	National Marine Fisheries Service
Alan Byrne	Idaho Department of Fish and Game
Dr. Devon Pearse	National Marine Fisheries Service
Dr. Matthew Sloat	Wild Salmon Center
Dr. Camm Swift	Emeritus, Section of Fishes, Natural History Museum of Los Angeles County

The following pages of this appendix contain the letters and draft version of this Status Review sent by the Department to peer reviewers. A table of consolidated peer reviewer comments (arranged by page and line number) and Department responses to those comments is also included at the end of this appendix.

Subject: PEER REVIEW OF THE CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE'S REPORT ON THE STATUS OF SOUTHERN CALIFORNIA STEELHEAD

Dear Dr. Boughton,

Thank you for agreeing to serve as a scientific peer reviewer for the California Department of Fish and Wildlife's (Department) draft status review report for Southern California steelhead (*Oncorhynchus mykiss*). The Department seeks your input regarding the assessments and conclusions in this draft status review report based on the best scientific information currently available. Please keep the enclosed report and your review of it confidential until the final report is made public upon receipt by the California Fish and Game Commission (Commission) as an agenda item at a public Commission meeting. Please note that your review will be appended to the final status review report and made public upon receipt by the Commission. **The Department requests your review on or before September 20, 2023.**

The Department seeks your scientific peer review as part of formal proceedings pending before the Commission under the California Endangered Species Act (CESA). The Commission is a constitutionally established entity distinct from the Department, exercising exclusive statutory authority under CESA to add species to or remove species from the endangered or threatened species lists (Fish & G. Code, § 2070). The Department serves in an advisory capacity during CESA listing proceedings, directed by the Fish and Game Code to evaluate the status of the species based on the best scientific information available to the Department and make a recommendation to the Commission as to whether the petitioned action is warranted (Fish & G. Code, § 2074.6).

The Commission first received the petition to list the Southern California steelhead under CESA on June 14, 2021. After considering the Department's evaluation of the petition, the Commission formally accepted the petition for consideration on April 20-21, 2022, thereby designating Southern California steelhead as a candidate for listing as endangered under CESA. As a candidate species, Southern California steelhead currently receives the same protections under CESA as an endangered or threatened species. Formal acceptance of the petition triggered the Department's initiation of the status review.

The draft status review report forwarded to you today reflects the Department's effort to identify and analyze the best scientific information available regarding the status of Southern California steelhead in California. This status review report is not intended to be an exhaustive review of all published literature relevant to the species. Rather, it is intended to summarize the best scientific information available relevant to the status of the species, to provide that information to the Commission, and to serve as the basis for the Department's recommendation to the Commission on whether the petitioned action is warranted.

The Department's preliminary recommendation is that the petitioned action to list Southern California steelhead is warranted. However, we underscore that scientific peer review plays a critical role in the Department's analysis and effort to develop and finalize its recommendation to the Commission as required by the Fish and Game Code. Our analysis and expected recommendation to the Commission may change or be modified following peer review.

During your review, we ask that you assess whether the body of available information supports the Department's listing recommendation. We ask also that you consider CESA and its implementing regulations as summarized in the following paragraphs.

Under CESA, an endangered species is defined as "a native species or subspecies…which is in serious danger of becoming extinct throughout all, or a significant portion of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease" (Fish & G. Code, § 2062). A threatened species is defined as "a native species or subspecies…that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by [CESA]" (Fish & G. Code, § 2067).

CESA's implementing regulations state that a species shall be listed as endangered or threatened if the Commission determines that its continued existence is threatened by one or more of the following components: (1) present or threatened modification or destruction of its habitat, (2) overexploitation, (3) predation, (4) competition, (5) disease, or (6) other natural occurrences or human-related activities (Cal. Code Regs., tit. 14, § 670.1(i)(1)(A)).

Following receipt and consideration of peer review comments, the Department will prepare and submit its final status review report and related recommendation to the Commission. After at least a 30-day public review period, the Commission will consider the petition, the Department's status review, related recommendations including peer review comments, and public testimony during a regularly scheduled Commission meeting prior to making its decision.

For ease of review and for accessibility by the public, the Department would prefer to receive your comments in list form by report page and line number using the enclosed Excel file. Please submit your comments electronically to Robin Shin via email at [redacted]. For

questions, Robin Shin can be reached via email or by phone at [redacted] If there is anything the Department can do to facilitate your review, please let us know.

Thank you again for your contribution to the status review and this important step in the CESA listing process.

Sincerely,

DocuSigned by:

Subject: PEER REVIEW OF THE CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE'S REPORT ON THE STATUS OF SOUTHERN CALIFORNIA STEELHEAD

Dear Alan Byrne,

Thank you for agreeing to serve as a scientific peer reviewer for the California Department of Fish and Wildlife's (Department) draft status review report for Southern California steelhead (*Oncorhynchus mykiss*). The Department seeks your input regarding the assessments and conclusions in this draft status review report based on the best scientific information currently available. Please keep the enclosed report and your review of it confidential until the final report is made public upon receipt by the California Fish and Game Commission (Commission) as an agenda item at a public Commission meeting. Please note that your review will be appended to the final status review report and made public upon receipt by the Commission. **The Department requests your review on or before September 20, 2023.**

The Department seeks your scientific peer review as part of formal proceedings pending before the Commission under the California Endangered Species Act (CESA). The Commission is a constitutionally established entity distinct from the Department, exercising exclusive statutory authority under CESA to add species to or remove species from the endangered or threatened species lists (Fish & G. Code, § 2070). The Department serves in an advisory capacity during CESA listing proceedings, directed by the Fish and Game Code to evaluate the status of the species based on the best scientific information available to the Department and make a recommendation to the Commission as to whether the petitioned action is warranted (Fish & G. Code, § 2074.6).

The Commission first received the petition to list the Southern California steelhead under CESA on June 14, 2021. After considering the Department's evaluation of the petition, the Commission formally accepted the petition for consideration on April 20-21, 2022, thereby designating Southern California steelhead as a candidate for listing as endangered under CESA. As a candidate species, Southern California steelhead currently receives the same protections under CESA as an endangered or threatened species. Formal acceptance of the petition triggered the Department's initiation of the status review.

The draft status review report forwarded to you today reflects the Department's effort to identify and analyze the best scientific information available regarding the status of Southern California steelhead in California. This status review report is not intended to be an exhaustive review of all published literature relevant to the species. Rather, it is intended to summarize the best scientific information available relevant to the status of the species, to provide that information to the Commission, and to serve as the basis for the Department's recommendation to the Commission on whether the petitioned action is warranted.

The Department's preliminary recommendation is that the petitioned action to list Southern California steelhead is warranted. However, we underscore that scientific peer review plays a critical role in the Department's analysis and effort to develop and finalize its recommendation to the Commission as required by the Fish and Game Code. Our analysis and expected recommendation to the Commission may change or be modified following peer review.

During your review, we ask that you assess whether the body of available information supports the Department's listing recommendation. We ask also that you consider CESA and its implementing regulations as summarized in the following paragraphs.

Under CESA, an endangered species is defined as "a native species or subspecies…which is in serious danger of becoming extinct throughout all, or a significant portion of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease" (Fish & G. Code, § 2062). A threatened species is defined as "a native species or subspecies…that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by [CESA]" (Fish & G. Code, § 2067).

CESA's implementing regulations state that a species shall be listed as endangered or threatened if the Commission determines that its continued existence is threatened by one or more of the following components: (1) present or threatened modification or destruction of its habitat, (2) overexploitation, (3) predation, (4) competition, (5) disease, or (6) other natural occurrences or human-related activities (Cal. Code Regs., tit. 14, § 670.1(i)(1)(A)).

Following receipt and consideration of peer review comments, the Department will prepare and submit its final status review report and related recommendation to the Commission. After at least a 30-day public review period, the Commission will consider the petition, the Department's status review, related recommendations including peer review comments, and public testimony during a regularly scheduled Commission meeting prior to making its decision.

For ease of review and for accessibility by the public, the Department would prefer to receive your comments in list form by report page and line number using the enclosed Excel file. Please submit your comments electronically to Robin Shin via email at [redacted]. For

questions, Robin Shin can be reached via email or by phone at [redacted]. If there is anything the Department can do to facilitate your review, please let us know.

Thank you again for your contribution to the status review and this important step in the CESA listing process.

Sincerely,

Subject: PEER REVIEW OF THE CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE'S REPORT ON THE STATUS OF SOUTHERN CALIFORNIA STEELHEAD

Dear Dr. Pearse,

Thank you for agreeing to serve as a scientific peer reviewer for the California Department of Fish and Wildlife's (Department) draft status review report for Southern California steelhead (*Oncorhynchus mykiss*). The Department seeks your input regarding the assessments and conclusions in this draft status review report based on the best scientific information currently available. Please keep the enclosed report and your review of it confidential until the final report is made public upon receipt by the California Fish and Game Commission (Commission) as an agenda item at a public Commission meeting. Please note that your review will be appended to the final status review report and made public upon receipt by the Commission. **The Department requests your review on or before September 20, 2023.**

The Department seeks your scientific peer review as part of formal proceedings pending before the Commission under the California Endangered Species Act (CESA). The Commission is a constitutionally established entity distinct from the Department, exercising exclusive statutory authority under CESA to add species to or remove species from the endangered or threatened species lists (Fish & G. Code, § 2070). The Department serves in an advisory capacity during CESA listing proceedings, directed by the Fish and Game Code to evaluate the status of the species based on the best scientific information available to the Department and make a recommendation to the Commission as to whether the petitioned action is warranted (Fish & G. Code, § 2074.6).

The Commission first received the petition to list the Southern California steelhead under CESA on June 14, 2021. After considering the Department's evaluation of the petition, the Commission formally accepted the petition for consideration on April 20-21, 2022, thereby designating Southern California steelhead as a candidate for listing as endangered under CESA. As a candidate species, Southern California steelhead currently receives the same protections under CESA as an endangered or threatened species. Formal acceptance of the petition triggered the Department's initiation of the status review.

The draft status review report forwarded to you today reflects the Department's effort to identify and analyze the best scientific information available regarding the status of Southern California steelhead in California. This status review report is not intended to be an exhaustive review of all published literature relevant to the species. Rather, it is intended to summarize the best scientific information available relevant to the status of the species, to provide that information to the Commission, and to serve as the basis for the Department's recommendation to the Commission on whether the petitioned action is warranted.

The Department's preliminary recommendation is that the petitioned action to list Southern California steelhead is warranted. However, we underscore that scientific peer review plays a critical role in the Department's analysis and effort to develop and finalize its recommendation to the Commission as required by the Fish and Game Code. Our analysis and expected recommendation to the Commission may change or be modified following peer review.

During your review, we ask that you assess whether the body of available information supports the Department's listing recommendation. We ask also that you consider CESA and its implementing regulations as summarized in the following paragraphs.

Under CESA, an endangered species is defined as "a native species or subspecies…which is in serious danger of becoming extinct throughout all, or a significant portion of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease" (Fish & G. Code, § 2062). A threatened species is defined as "a native species or subspecies…that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by [CESA]" (Fish & G. Code, § 2067).

CESA's implementing regulations state that a species shall be listed as endangered or threatened if the Commission determines that its continued existence is threatened by one or more of the following components: (1) present or threatened modification or destruction of its habitat, (2) overexploitation, (3) predation, (4) competition, (5) disease, or (6) other natural occurrences or human-related activities (Cal. Code Regs., tit. 14, § 670.1(i)(1)(A)).

Following receipt and consideration of peer review comments, the Department will prepare and submit its final status review report and related recommendation to the Commission. After at least a 30-day public review period, the Commission will consider the petition, the Department's status review, related recommendations including peer review comments, and public testimony during a regularly scheduled Commission meeting prior to making its decision.

Subject: PEER REVIEW OF THE CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE'S REPORT ON THE STATUS OF SOUTHERN CALIFORNIA STEELHEAD

Dear Dr. Sloat,

Thank you for agreeing to serve as a scientific peer reviewer for the California Department of Fish and Wildlife's (Department) draft status review report for Southern California steelhead (*Oncorhynchus mykiss*). The Department seeks your input regarding the assessments and conclusions in this draft status review report based on the best scientific information currently available. Please keep the enclosed report and your review of it confidential until the final report is made public upon receipt by the California Fish and Game Commission (Commission) as an agenda item at a public Commission meeting. Please note that your review will be appended to the final status review report and made public upon receipt by the Commission. **The Department requests your review on or before September 20, 2023.**

The Department seeks your scientific peer review as part of formal proceedings pending before the Commission under the California Endangered Species Act (CESA). The Commission is a constitutionally established entity distinct from the Department, exercising exclusive statutory authority under CESA to add species to or remove species from the endangered or threatened species lists (Fish & G. Code, § 2070). The Department serves in an advisory capacity during CESA listing proceedings, directed by the Fish and Game Code to evaluate the status of the species based on the best scientific information available to the Department and make a recommendation to the Commission as to whether the petitioned action is warranted (Fish & G. Code, § 2074.6).

The Commission first received the petition to list the Southern California steelhead under CESA on June 14, 2021. After considering the Department's evaluation of the petition, the Commission formally accepted the petition for consideration on April 20-21, 2022, thereby designating Southern California steelhead as a candidate for listing as endangered under CESA. As a candidate species, Southern California steelhead currently receives the same protections under CESA as an endangered or threatened species. Formal acceptance of the petition triggered the Department's initiation of the status review.

The draft status review report forwarded to you today reflects the Department's effort to identify and analyze the best scientific information available regarding the status of Southern California steelhead in California. This status review report is not intended to be an exhaustive review of all published literature relevant to the species. Rather, it is intended to summarize the best scientific information available relevant to the status of the species, to provide that information to the Commission, and to serve as the basis for the Department's recommendation to the Commission on whether the petitioned action is warranted.

The Department's preliminary recommendation is that the petitioned action to list Southern California steelhead is warranted. However, we underscore that scientific peer review plays a critical role in the Department's analysis and effort to develop and finalize its recommendation to the Commission as required by the Fish and Game Code. Our analysis and expected recommendation to the Commission may change or be modified following peer review.

During your review, we ask that you assess whether the body of available information supports the Department's listing recommendation. We ask also that you consider CESA and its implementing regulations as summarized in the following paragraphs.

Under CESA, an endangered species is defined as "a native species or subspecies…which is in serious danger of becoming extinct throughout all, or a significant portion of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease" (Fish & G. Code, § 2062). A threatened species is defined as "a native species or subspecies…that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by [CESA]" (Fish & G. Code, § 2067).

CESA's implementing regulations state that a species shall be listed as endangered or threatened if the Commission determines that its continued existence is threatened by one or more of the following components: (1) present or threatened modification or destruction of its habitat, (2) overexploitation, (3) predation, (4) competition, (5) disease, or (6) other natural occurrences or human-related activities (Cal. Code Regs., tit. 14, § 670.1(i)(1)(A)).

Following receipt and consideration of peer review comments, the Department will prepare and submit its final status review report and related recommendation to the Commission. After at least a 30-day public review period, the Commission will consider the petition, the Department's status review, related recommendations including peer review comments, and public testimony during a regularly scheduled Commission meeting prior to making its decision.

For ease of review and for accessibility by the public, the Department would prefer to receive your comments in list form by report page and line number using the enclosed Excel file. Please submit your comments electronically to Robin Shin via email at [redacted]. For

questions, Robin Shin can be reached via email or by phone at [redacted]. If there is anything the Department can do to facilitate your review, please let us know.

EXECUTIVE SUMMARY

This status review of southern California steelhead (*Oncorhynchus mykiss*) (Status Review) has been prepared by the California Department of Fish and Wildlife (Department) for the California Fish and Game Commission (Commission) pursuant to the requirements of the California Endangered Species Act (CESA; Fish & G. Code, § 2050 et seq.). This Status Review is based on the best scientific information currently available to the Department regarding each of the components listed under Section 2072.3 of the Fish and Game Code and Section 670.1 of Title 14 of the California Code of Regulations. In addition, this Status Review includes a preliminary identification of habitat that may be essential to the continued existence of the species, the Department's recommendations for management activities, and other recommendations for the recovery of the species (Fish & G. Code, § 2074.6.). This Status Review has been independently reviewed by scientific peers pursuant to Fish and Game Code Section 2074.6.

In this Status Review, southern California steelhead are defined as "all *O. mykiss* below manmade and natural complete barriers to anadromy, including anadromous and resident life histories, from and including the Santa Maria River (San Luis Obispo and Santa Barbara counties) to the U.S.-Mexico Border." This range encompasses five biogeographic population groups of *O. mykiss* (from north to south): Monte Arido Highlands, Conception Coast, Santa Monica Mountains, Mojave Rim, and Santa Catalina Gulf Coast. To capture the life history variability that is included in the scope of the CESA listing unit evaluated in this Status Review, "southern California steelhead rainbow trout" (Southern SH/RT) is used to describe the CESA listing unit. While at the species level, *O. mykiss* exhibits similar biological and life history characteristics across the range of Coastal Rainbow Trout from Alaska to Baja California (*O. mykiss irideus*), Southern SH/RT are adapted to the climate and habitat features of the southern California region.

The Department recommends that the Commission find the petitioned action to list Southern SH/RT as an endangered species under CESA to be warranted. The Department further recommends implementation of the management recommendations and recovery measures described in this Status Review.

The scientific data available to the Department indicates a long-term declining trend of Southern SH/RT and low range-wide abundances. The impacts of the most recent prolonged period of drought from 2012 – 2017 resulted in significant reductions in all life-history forms and stages of Southern SH/RT, and few populations have recovered as current abundance estimates remain low relative to pre-drought conditions. The decline of Southern SH/RT can be attributed to a wide variety of human activities, including, but not limited to, urbanization, agriculture, and water development. These activities have degraded range-wide aquatic habitat conditions and limited the amount of suitable and accessible spawning and rearing habitats. Dams and other impediments obstruct access to a significant portion of historical Southern SH/RT habitats in many rivers within the proposed listing area, some of which have multiple major dams on a single mainstem. Climate change projections for Southern SH/RT range predict an intensification of typical climate patterns, such as more intense cyclic storms, droughts, and extreme heat. These projections suggest that Southern SH/RT will likely experience more frequent periods of adverse conditions and continued selection pressure against the anadromous life-history form.

1. INTRODUCTION

1.1 Petition History

On June 14, 2021, the California Fish and Game Commission (Commission) received a petition (Petition) from California Trout to list southern California steelhead (*Oncorhynchus mykiss*) as endangered pursuant to the California Endangered Species Act (CESA; Fish & G. Code, § 2050 et seq.).

On June 23, 2021, pursuant to Fish and Game Code Section 2073, the Commission referred the Petition to the California Department of Fish and Wildlife (Department) for evaluation.

On July 16, 2021, pursuant to Fish and Game Code Section 2073.3, the Commission published notice of receipt of the Petition in the California Regulatory Notice Register (Cal. Reg. Notice Register 2021, No. 29-Z, p. 921-922).

On August 18, 2021, pursuant to Fish and Game Code Section 2073.5, the Commission approved the Department's request for a 30-day extension to complete its petition evaluation report.

On October 29, 2021, the Department provided the Commission with a report, "Evaluation of the Petition from California Trout to List Southern California Steelhead (*Oncorhynchus mykiss*) as Endangered under the California Endangered Species Act" (Evaluation). Based upon the information contained in the Petition, the Department concluded, pursuant to Fish and Game Code Section 2073.5, that sufficient information exists to indicate that the petitioned action may be warranted and recommended to the Commission that the Petition be accepted and considered.

On April 21, 2022, at its public meeting pursuant to Fish and Game Code Sections 2074 and 2074.2, the Commission considered the Petition, the Department's Evaluation and recommendation, comments received, and oral testimony. The Commission found that sufficient information exists to indicate the petitioned action may be warranted and accepted the Petition for consideration.

On May 13, 2022, pursuant to Fish and Game Code Section 2074.2, the Commission published its Notice of Findings for southern California steelhead in the California Regulatory Notice Register, designating southern California steelhead as a candidate species (Cal. Reg. Notice Register 2022, No. 19-z, p. 541).

On October 12, 2022, pursuant to Fish and Game Code Section 2074.6, the Commission approved the Department's request for a six-month extension to complete its status review report.

1.2 Status Review Overview

Pursuant to Fish and Game Code Section 2074.6 and the California Code of Regulations, title 14, Section 670.1, the Department has prepared this status review to indicate whether the petitioned action to list southern California steelhead as endangered under CESA is warranted (Status Review). An endangered species under CESA is "a native species or subspecies . . . which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease" (Fish & G. Code, § 2062). A threatened species under CESA is "a native species or subspecies . . . that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by [CESA]" (*id.*, § 2067). A species' range for CESA purposes is the species' California range (Cal. Forestry Assn. v. Cal. Fish and Game Com. (2007) 156 Cal.App.4th 1535, 1551).

Using the best scientific information available to the Department, this Status Review includes information on each of the following components pursuant to Fish and Game Code Section 2072.3 and title 14 of the California Code of Regulations Section 670.1: population trend(s), range, distribution, abundance, life history, factors affecting the species' ability to survive and reproduce, the degree and immediacy of threats, the impact of existing management efforts, the availability and sources of information, habitat that may be essential to the continued existence of the species, and the Department's recommendations for future management activities and other recovery measures to conserve, protect, and enhance the species.

Southern California steelhead, as defined in the Petition, means all *O. mykiss*, including anadromous and resident life histories, below manmade and natural complete barriers to anadromy from and including the Santa Maria River (San Luis Obispo and Santa Barbara counties) to the U.S.-Mexico Border (CDFW 2021a Petition Evaluation). The Department accepts the taxonomy as published by Behnke (1992) that identifies southern California *O. mykiss* as being included in the range of Coastal Rainbow Trout (*O. mykiss irideus*), which have a broad distribution extending from Alaska to Baja California (Moyle 2002). The Department has long referred to these fish as "steelhead rainbow trout" (Shapovalov and Taft 1954), which captures the life history variability that is included in the scope of this status review for both anadromous and resident forms of the species. Thus, the Department will refer to the Petitioner's proposed listing unit as southern California steelhead rainbow trout (*O. mykiss*;

Southern SH/RT) throughout the remainder of this Status Review. This naming convention is slightly different than what was used by the Petitioner in the Petition, but the Department asserts the importance of recognizing the full scope of life history diversity included in the listing unit.

This Status Review report is not intended to be an exhaustive review of all published scientific literature relevant to the Southern SH/RT. Rather, it is intended to summarize the best scientific information available relevant to the status of the species, provide that information to the Commission, and serve as the basis for the Department's recommendation to the Commission on whether the petitioned action is warranted. Specifically, this Status Review analyzes whether there is sufficient scientific information to indicate that the continued existence of Southern SH/RT throughout all or a significant portion of its range is in serious danger or is threatened by one or a combination of the following factors: present or threatened modification or destruction of its habitat; overexploitation; predation; competition; disease; or other natural occurrences or human-related activities (Cal. Code Regs., tit. 14, § 670.1, subd. (i)(1)(A)).

1.3 Federal Endangered Species Act Listing History

The federal Endangered Species Act (ESA) defines "species" to include "any subspecies of fish or wildlife or plants, and any distinct population segment of any species of vertebrate fish or wildlife which interbreeds when mature" (16 U.S.C. § 1532). In 1991, the National Marine Fisheries Service (NMFS) adopted its policy on how it would apply the definition of "species" to Pacific salmon stocks for listing under the ESA (ESU Policy). Under the ESU Policy, a salmon stock is considered a distinct population segment (DPS) if it constitutes an evolutionary significant unit (ESU) of the biological species (NMFS 1991). In February 1996, the United States Fish and Wildlife Service (USFWS) and NMFS published a joint DPS policy for the purposes of ESA listings (DPS Policy) (NMFS 1996a). Section 3.1 of this Status Review describes the ESU Policy and DPS Policy in greater detail.

In 1997, NMFS listed the Southern California Steelhead ESU as endangered under the federal ESA. The Southern California Steelhead ESU only included naturally spawned populations of anadromous *O. mykiss* (and their progeny) residing below long-term, natural and manmade impassable barriers in streams from the Santa Maria River, San Luis Obispo County (inclusive) to Malibu Creek, Los Angeles County (inclusive) (NMFS 1997). In 2002, NMFS extended the geographic range of the Southern California Steelhead ESU listed under the federal ESA south to the U.S.-Mexico border (NMFS 2002).

In 2001, the United States District Court in Eugene, Oregon, ruled that NMFS improperly excluded certain hatchery stocks from the listing of Oregon Coast Coho Salmon after NMFS had concluded that those hatchery stocks were part of the ESU being considered for listing but not essential for recovery (*Alsea Valley Alliance v. Evans* (D. Or. 2001) 161 F. Supp. 2d 1154, 1162). Based in part on the *Alsea* decision, in 2002 NMFS announced that that it would conduct an updated status review of 27 West Coast salmonid ESUs, including the Southern California Steelhead ESU (NMFS 2006). In 2004, NMFS proposed to continue applying its ESU Policy to the delineation of DPSs of *O. mykiss* and to include resident *O. mykiss* that co-occur with the anadromous form of *O. mykiss* in 10 *O. mykiss* ESUs, including the Southern California Steelhead ESU (NMFS 2006).

In 2005 USFWS wrote to NMFS stating USFWS's "concerns about the factual and legal bases for [NMFS's] proposed listing determinations for 10 *O. mykiss* ESUs, specifying issues of substantial disagreement regarding the relationship between anadromous and resident *O. mykiss*" (NMFS 2006). After discussions with USFWS regarding the relationship between anadromous and non-anadromous *O. mykiss*, in 2006 NMFS decided to depart from their past practice of applying the ESU policy to *O. mykiss* stocks and instead apply the joint DPS Policy (NMFS 2006). Concurrent with that decision, NMFS relisted the Southern California Steelhead ESU as the Southern California Steelhead DPS under the federal ESA (NMFS 2006). As part of its 2006 relisting of southern California steelhead, NMFS concluded that the anadromous life form of *O. mykiss* is markedly separate from the non-anadromous life form of *O. mykiss* within the geographic boundary of the Southern California Steelhead DPS—as well as the geographic boundaries of the other nine *O. mykiss* ESUs that NMFS was relisting as DPSs at that time—due to "physical, physiological, ecological, and behavioral factors" (NMFS 2006). The Southern California Steelhead ESU only includes the anadromous life-history component of *O. mykiss* and is defined as including all naturally spawned anadromous *O. mykiss* (steelhead) populations below natural and manmade impassible barriers in streams from the Santa Maria River, San Luis Obispo County (inclusive) to the U.S.-Mexico border (Table 1) (NMFS 2006).

2. BIOLOGY AND ECOLOGY

2.1 Species Description

The species *O. mykiss* is the most widely distributed of Pacific salmonids, occupying nearly all coastal streams from Alaska to southern California, as well as many lakes and streams above fish passage barriers across California, where they have been widely stocked since the mid- to late-1800s. Steelhead is the common name for the anadromous form of *O. mykiss*, while Rainbow Trout is the common name applied to the freshwater resident form (Behnke 1993; Moyle 2002). *O. mykiss* possess 10–12 dorsal fin rays, 8–12 anal fin rays, 9–10 pelvic fin rays, 11 – 17 pectoral fin rays, and a slightly forked caudal fin (Moyle 2002). They have 9–13 branchiostegal rays and 16–22 gill rakers on each arch (Moyle 2002). Teeth are present on both upper and lower jaws, the tip and shaft of the vomer, as well as on the tip of the tongue (Fry 1973; Moyle 2002). Between 110–180 small, pored scales make up the first row above the lateral line (Fry 1973; Moyle 2002).

The steelhead life history form is thought to be named for the sometimes silvery-metallic appearance of its back and head. The steelhead body profile is fusiform, with typically “bullet-shaped” heads and distinct narrowing at the base of a powerful tail, suited for often-demanding and lengthy upstream spawning migrations. In the marine environment, steelhead body coloration includes a blueish-green dorsum (back) and silver or white coloration over the rest of the body (Fry 1973; Moyle 2002). Black spots typically cover the dorsal, adipose, and caudal fins, as well as the head and back (Fry 1973). When adult steelhead return to spawn in freshwater, their silver sheen fades and a pink or red lateral band develops along the sides and on the opercula, while the silvery-blue coloration on the back transitions to an olive green or brown (Barnhart 1986). These characteristics are very similar to those exhibited by resident Rainbow Trout (Fry 1973); thus, it can be difficult to differentiate the anadromous and resident forms based only on outward appearance. Adult steelhead, however, are generally larger than adult Rainbow Trout in a given stream system since they spend time feeding and growing in the ocean (NWF 2020; USFWS 2020).

Table 1. Common nomenclature for Oncorhynchus mykiss (adapted from Boughton et al. 2022b).

Term	**Description**
Oncorhynchus mykiss	A species of Pacific salmonid composed of both anadromous and freshwater-resident forms, which all spawn in freshwater rivers and streams.
Steelhead	Individuals: *O. mykiss* that are anadromous (individuals that migrate to and spend one or more seasons in the ocean); here used to mean adult steelhead.
Rainbow Trout	Individuals: *O. mykiss* that are freshwater-resident (individuals that complete their life cycle in freshwater), here used to mean adult Rainbow Trout.
Steelhead Rainbow Trout	Population/Evolutionarily Significant Unit (ESU): contain both steelhead individuals and Rainbow Trout individuals.
Juvenile *O. mykiss*	Immature fish whose fate as steelhead or Rainbow Trout cannot yet be established.

Term	Description
Anadromous waters	Stream reaches that are accessible to migrating steelhead (those not blocked by complete natural or artificial barriers). It is important to note that *Oncorhynchus mykiss* individuals, occurring in anadromous waters, may or may not express the anadromous life history type (e.g., smoltification).

Juvenile *O. mykiss* have body coloration similar to that of resident adults, while also exhibiting 5–13 oval parr marks along the lateral line on both sides of the body (Moyle 2002). These parr marks are dark bluish-purple in coloration and are widely spaced, with the marks themselves being narrower than the spaces between them (Moyle 2002). A total of 5–10 dark spots also line the back, typically extending from the head to the dorsal fin. There are usually few to no marks on the caudal fin, and the tips of the dorsal and anal fins are white to orange (Moyle 2002).

After a year or more of development, some *O. mykiss* undergo the transitional process of smolting, which is a series of morphological, physiological, and behavioral changes that prepare the fish for entry into brackish estuaries and then ocean environments (Fessler and Wagner 1969; McCormick 2012). Smolting is the primary characteristic that distinguishes the anadromous life history variant from the resident one within the species. Smolts lose their parr marks and develop silver coloration during the downstream migration process. After entering the ocean, young steelhead will reside in the saltwater environment for 1–4 years while feeding and growing quickly (Moyle 2002). Juvenile Rainbow Trout that do not smolt and remain in freshwater generally lose their parr marks as they grow and develop into adults.

Upon reentering freshwater rivers and streams to spawn, the sexual maturation process for anadromous steelhead involves the development of secondary sex characteristics such as bright coloration and sexual dimorphism, including the development of a hooked snout, or kype, in males. These secondary sex characteristics are typically reabsorbed once spawning is complete, although jaw shape may never fully revert to the pre-spawn condition (Shapovalov and Taft 1954).

Different populations of *O. mykiss* can exhibit variations in growth rate, size, and body shape depending on their life histories and habitats utilized. For example, Bajjaliya et al. (2014) studied morphometric variation between four California steelhead DPSs and found that coastal steelhead (populations with adults migrating less than 160 km from the ocean to their sample site) were significantly larger in size and had a more robust body type than steelhead found in California's Central Valley drainages and the Klamath-Trinity basin (populations with adults migrating more than 160 km from the ocean to their sample site). These morphological differences provided the basis for recognizing “coastal type” and “inland type” steelhead in California (Bajjaliya et al. 2014).

2.2 Taxonomy and Systematics

Steelhead and Rainbow Trout are members of the bony fish class Osteichthyes, in the order Salmoniformes and family Salmonidae. In 1792, J. J. Walbaum classified Rainbow Trout from populations on the Kamchatka Peninsula in Russia as *Salmo mykiss* (Moyle 2002). During the next century, using J. Richardson’s description of Columbia River steelhead as *S. gairdneri* and Gibbons’s description of juvenile steelhead from San Leandro Creek as *S. iridea*, both the biology and fishing communities began referring to resident Rainbow Trout and steelhead as *S. irideus* and *S. gairdneri*, respectively. It was ultimately discovered that Rainbow Trout and steelhead are the same species, and North American scientists applied the original species name, *mykiss*, to North American populations (Moyle 2002).

In the 1970s, analyses of polymorphic proteins, or allozymes, were utilized to determine the degree of species relatedness and evolutionary divergence among salmonids (Quinn 2018). These studies indicated that Coho and Chinook salmon (*O. kisutch* and *O. tschawytscha*, respectively) were most closely related to Pink, Chum, and Sockeye salmon, and that Rainbow and Cutthroat trout were most closely related to each other (Quinn 2018). This phylogeny was assumed until researchers analyzed relatedness by looking at differences in mitochondrial DNA, which showed that Coho and Chinook salmon were related more closely to steelhead than they were to the other three genera of salmon (Quinn 2018). Based on this study, Smith and Stearley (1989) reorganized the taxonomy to reflect both the use of the name *mykiss* for North American Rainbow Trout and the inclusion of Rainbow and Cutthroat trouts in the Pacific salmon genus *Oncorhynchus*, but with their own distinct lineages.

Pacific salmonid lineages continue to be studied using a variety of genetic and statistical methods (Quinn 2018). There has been debate over the relationship between Rainbow and Cutthroat trouts with regards to genetics versus morphology and behavior. Stearley and Smith (1993) and Esteve and McLennan (2007) found that the idea of monophyly (descending from a common ancestor) of these two trout species is not supported by either morphological or behavioral traits, even though mitochondrial DNA suggests otherwise. Esteve and McLennan (2007) attribute this contradiction to hybridization events that have led to a high rate of genetic introgression between the two species (Chevassus 1979). This introgression can dilute the distinctiveness of these close relatives and convolute phylogenetic reconstruction (Esteve and McLennan 2007). Although some uncertainty remains surrounding these evolutionary relationships, it is now accepted that within the genus *Oncorhynchus*, Coho and Chinook salmon have the closest relationship to each other, with Pink (*O. gorbuscha*), Chum (*O. keta*), and

Sockeye (*O. nerka*) salmon in their own group, and Rainbow (*O. mykiss*) and Cutthroat (*O. clarkii*) trout in another group (Kitano et al. 1997; Quinn 2018; Figure 1).

2.3 Range and Distribution

Range is the general geographical area in which an organism occurs. For purposes of CESA and this Status Review, the range is the species' California range (*Cal. Forestry Assn. v. Cal. Fish and Game Com.* (2007) 156 Cal.App.4th 1535, 1551). Distribution describes the actual sites where individuals and populations of the species occur within the species' range.

Oncorhynchus mykiss is native to both coastlines of the Pacific Ocean and spawns in freshwater streams, from the Kuskokwim River, in Alaska, south to Baja California along the eastern Pacific, and from Russia's Kamchatka Peninsula to South Korea, in the western Pacific (Moyle 2002). The species is widely distributed throughout the northern Pacific Ocean during its ocean phase. Coastal steelhead within the state historically occupied all perennial coastal streams, from the Oregon/California border to the U.S.-Mexico border (Moyle 2002). Steelhead are also native to the Central Valley, including both the Sacramento and San Joaquin River basins, and have been found as far upstream as the Pit and McCloud rivers (Moyle 2002). It is likely that most suitable streams in the Sacramento and San Joaquin River basins with ocean access have historically supported runs of steelhead (Moyle 2002).

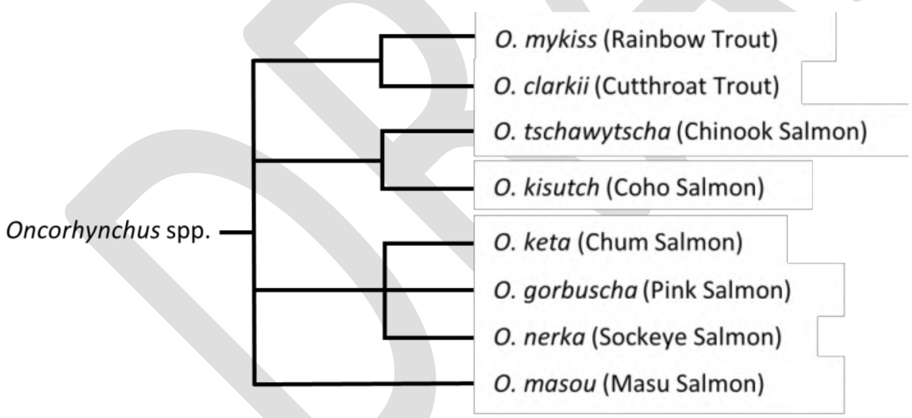

Figure 1. Consensus relationships of Oncorhynchus species from morphological, allozyme, ribosomal RNA, mitochondrial DNA, and short interspersed repetitive elements data across multiple studies. Adapted from Figure 1 in Kitano et al. (1997).

Southern SH/RT currently occupy fluvial habitat from the Santa Maria River at the border of San Luis Obispo and Santa Barbara counties south to the U.S.-Mexico border. This range encompasses five biogeographic population groups (BPGs), collectively described by NMFS as the Southern California steelhead DPS (Boughton et al. 2007; NMFS 2012a). BPGs are steelhead subpopulations within a DPS that occupy contiguous areas that share broadly similar physical geography and hydrology, generally within a single watershed unit. The combinations of these physical characteristics represent the suite of differing natural selective regimes across the watersheds occupied by Southern SH/RT. These varying selective pressures have led to life history and genetic adaptations that enable subpopulations to persist in distinctive and dynamic habitats that have shaped each BPG. The purpose of delineating BPGs for steelhead populations is to ensure the preservation of the range of genetic and natural diversity within each DPS for recovery and conservation purposes (NMFS 2012a). The BPGs that form the Southern SH/RT DPS are (from north to south): Monte Arido Highlands, Conception Coast, Santa Monica Mountains, Mojave Rim, and Santa Catalina Gulf Coast.

While some near-coastal populations of Southern SH/RT are small, there are likely dispersal dynamics that contribute to their stability and persistence (Boughton et al. 2007). The movement of spawning adults between BPGs may be an important mechanism for maintaining the viability of steelhead populations (NMFS 2012a). Dams and other impediments obstruct access to a significant portion of historical Southern SH/RT habitats in many rivers within the proposed listing area, some of which have multiple major dams on a single mainstem. There is evidence that loss of access to upstream habitat has resulted in a northward range contraction of anadromous Southern SH/RT (Boughton et al. 2005), whose study also found a strong correlation between steelhead population extirpations and anadromous barriers, as well as urban and agricultural development.

2.4 Life History

An individual fish's genotype, condition, and a variety of environmental factors influence the expression of anadromy versus stream residency (Sloat et al. 2014; Busby et al. 1996; Pascual et al. 2001; Courter et al. 2013). Juvenile *O. mykiss* prior to the smolting life stage are difficult to distinguish without genetic, morphological, or physiological evaluations (Negus 2003; Beeman et al. 1995; Haner et al. 1995; Pearse et al. 2014). Adult steelhead returning to streams from the ocean are often easier to identify due to their larger size relative to most resident Rainbow Trout adults in the same stream system and their overall steel-gray color (Dagit et al. 2020). While anadromy and residency are the two primary life histories, *O. mykiss* life history expression is notably plastic and can be quite variable (Moyle 2002). For example, individuals may exhibit the lagoon-anadromous life history, spending their first or second summer rearing in seasonal lagoons in the estuaries of streams before outmigrating to the ocean (Boughton et al. 2007).

Unlike other Pacific salmonids, which are semelparous and perish almost immediately after spawning, *O. mykiss* can be iteroparous (Moyle 2002), with the potential to spawn up to four times but typically not more than twice (Shapovalov and Taft 1954). Steelhead that spawn and return to the sea are called “kelts.” These fish can either spawn consecutively, returning the next season after their first spawn, or they may return a year later after spending an extra year at sea (Light et al. 1989). Reportedly, females survive spawning events more frequently than males (Shapovalov and Taft 1954; Ward and Slaney 1988; Busby et al. 1996; Marston et al. 2012), although males can repeat spawn in significant numbers, especially in smaller, near-coastal stream systems (Marston et al. 2012).

Steelhead exhibit two seasonal migratory patterns, or run types: 1) winter, also called “ocean-maturing” or “mature-migrating;” and 2) summer, also called “stream-maturing” or “premature-migrating.” The names of these two runs are reflective of the seasonal timing when adult steelhead reenter estuaries and rivers to reproduce (Busby et al. 1996; Moyle 2002). Only the winter-run form of steelhead occurs in southern California streams, consistent with what is believed to be the historical condition (Moyle 2002). Southern SH/RT typically begin migrating upstream from December through May, with returning adults often reliant upon winter rainstorms to breach sandbars at the mouths of stream estuaries and lagoons, providing seasonal upstream spawning passage (California Trout 2019). Steelhead age-at-maturity is dependent on a number of factors, including time spent in either or both freshwater and marine environments; however, adult returning spawners are usually 3 or 4 years old, having spent 1-3 years in freshwater and 1-2 years at sea (Shapovalov and Taft 1954). Southern SH/RT steelhead spawning runs are dominated by age 3+ fish, with 2 years spent in fresh water and 1 year in the ocean, although many smolt after only 1 year in fresh water (Busby et al. 1996). Shapovalov and Taft (1954) found that the average age of male spawners (about 3.5 years) was lower than that of female spawners (close to 4 years) in Waddell Creek, CA. Non-anadromous Rainbow Trout can mature anywhere between 1 and 5 years but are commonly age 2+ or 3+ years, with a fork length of $\geq$13 cm (Moyle 2002). Rainbow Trout typically spawn during the spring months, from February through June (Moyle 2002).

Spawning usually occurs in shallow habitats with fast-flowing water and suitable-sized gravel substrates, often found in riffles, faster runs, or near the tail crests of pool habitats. When female *O. mykiss* are ready to spawn, they will select a suitable spawning site and excavate a nest, or redd, in which they deposit their eggs to incubate (Moyle 2002). Adequate stream flow, gravel size, and low substrate embeddedness are crucial for egg survival, as these conditions allow oxygenated water to permeate through sediments to the egg (Coble 1961). During redd construction, the female may be courted by multiple males. Following completion of the redd, the most dominant males fight for position alongside the female, depositing milt while the female deposits her eggs (Quinn 2018). Immediately following fertilization, females cover their eggs with gravel (Barnhart 1986). Females dig multiple smaller pits within the broader redd where they deposit a portion of eggs into each pocket until all the eggs are expelled (Shapovalov and Taft 1954; Quinn 2018). Adult steelhead are often accompanied by resident male Rainbow Trout during spawning, as they attempt to participate by quickly swimming, or darting, in and out of steelhead redds (Shapovalov and Taft 1954). These fish are sometimes referred to as “egg-eaters,” although it is generally accepted that the main purpose of their presence is to contribute to spawning rather than consume newly laid eggs (Shapovalov and Taft 1954). If adult steelhead cannot emigrate back to the ocean after spawning, they require large, deep pools that provide refuge during the hot summer months (Boughton et al. 2015).

Fecundity, among other biological and environmental factors, contributes substantially to reproductive success. Egg production is positively correlated with fish length, although there is wide variation in female steelhead fecundity at a given size (Shapovalov and Taft 1954; Quinn 2018). Larger females tend to produce larger and greater numbers of eggs; however, energy demands for gonad development create a physiological tradeoff between the number and size of eggs produced (Quinn 2018). Thus, females generally produce either many smaller eggs or fewer larger eggs. Quinn (2018), referencing multiple sources of data, showed that female steelhead of average size produce slightly over 5,000 eggs. Moyle (2002) provides a range of eggs per female from 200 to 12,000 and states that steelhead generally produce about 2,000 eggs per kilogram of body weight. Rainbow Trout less than 30 cm in total length usually have under 1,000 eggs per kilogram of body weight (Moyle 2002).

Multiple factors contribute to egg development and incubation time; however, eggs generally incubate in stream gravels for up to several months. Temperature has the greatest effect on the incubation period; colder water slows development, and warmer water increases the rate of development (Quinn 2018). Incubation can take from 19 days at an average temperature of 60°F (15.6°C) to 80 days at an average temperature of 40°F (4.4°C) (Shapovalov and Taft 1954). Dissolved oxygen (DO) levels in surrounding waters also influence life stage development rates in Southern SH/RT and other salmonids. Higher DO levels lead to more rapid egg development, while eggs exposed to low levels of DO during incubation produce much smaller alevins (yolk-sac fry) than those exposed to high DO (Quinn 2018). Fry emerge from the gravel 2-3 weeks after hatching, once the yolk sac is fully or almost entirely absorbed, at which time they form schools along stream banks (Shapovalov and Taft 1954). During their first year of life, *O. mykiss* juveniles develop small territories and defend them against other individuals in their age class (Shapovalov and Taft 1954; Barnhart 1986). Juvenile *O. mykiss* generally feed on many different species of aquatic and terrestrial insects, sometimes cannibalizing newly emerged fry (Barnhart 1986). Feeding generally peaks during the summer months and is depressed during the winter months; however, *O. mykiss* in California typically have higher growth rates in the winter and spring than summer and fall (Hayes et al. 2008; Sogard et al. 2009; Krug et al. 2012). As they grow, juveniles will move into deeper, faster water and are often found in riffle or swift-run habitats (Shapovalov and Taft 1954; Barnhart 1986). Larger juvenile *O. mykiss* can outcompete and displace their smaller counterparts from ideal habitats, such as deep pools or run complexes, leaving smaller individuals to often inhabit suboptimal habitats, such as riffles (Barnhart 1986).

Parr will ultimately begin transitioning into smolts and migrate downstream to estuaries and lagoons, where they complete the process of smolting. Smolt outmigration to the ocean typically occurs from March–May in southern California but can vary depending on factors such as connectivity between the ocean and estuary or lagoon and streamflow (Booth 2020). Compared to other Pacific salmonids, steelhead have the greatest variability in the timing and duration of freshwater inhabitance, ocean entry, time spent at sea, and return to freshwater (Barnhart 1986). Resident Rainbow Trout early life stages mirror those of anadromous steelhead, up until their life history strategies diverge (Moyle 2002). Rather than migrating out to the ocean like steelhead, resident *O. mykiss* will reside in freshwater for the remainder of their lives.

Little is known regarding steelhead stock-specific utilization of and distribution in the ocean environment. While much is known about the status and abundance of commercially important ocean stocks of Pacific salmon, steelhead-specific research on this topic is lacking and hampered by the inability to differentiate individual stocks using standard sampling methods (Barnhart 1986; Light et al. 1989; Moyle 2002). Unlike Pacific salmon species, steelhead are rarely captured in the ocean; therefore, information specific to Southern SH/RT ocean distribution is not available. Limited tag recoveries by North American fisheries research and management agencies showed no differences in the ocean distribution of steelhead by stock (Light et al. 1989). Attempts to distinguish steelhead population units from one another in terms of ocean distribution are confounded by findings that all steelhead apparently congregate in shared ocean feeding grounds, regardless of their origin or run type (Light et al. 1988).

Pacific steelhead smolts quickly migrate offshore after entry into the ocean (Daly et al. 2014) and, once in the open water, generally move in a northwestern trajectory from spring to summer and follow a southeastern pattern from fall to winter (Okazaki 1983; Light et al. 1989). In the winter, steelhead are found in the eastern North Pacific (Myers et al. 2016) and tend to be closer to shore than during other times of the year (Light et al. 1989). California steelhead do not appear to migrate any farther west than the Gulf of Alaska (Light et al. 1989), and, overall, steelhead migration patterns appear to be strongly tied to “thermal avoidance.” Migratory-based thermal avoidance involves fish movement patterns that remain within a narrow range of tolerable sea surface temperatures, suggesting that steelhead ocean migration may be largely influenced by physiological responses to temperature (Hayes et al. 2016). Ocean steelhead are typically found within seven meters of the sea surface, within the epipelagic zone, although they have been found at more than three times that depth (Light et al. 1989).

Studies addressing steelhead ocean behavior, distribution, and movement are limited; however, as with other salmonids, steelhead tend to exhibit strong homing behavior to their natal streams, with some exceptions. Evidence of straying has been documented in central California steelhead populations (Donohoe et al. 2021), while genetic population structure analyses suggest that historical (natural) exchange of genetic information occurred between coastal populations of steelhead (Garza et al. 2014).

2.5 Genetics and Genomics

2.5.1 Role of Genetics and Genomics in Evaluating Steelhead Population Structure

To date, most genetic studies focused on quantifying the population structure of salmonid species have used neutral genetic markers (e.g., microsatellite DNA). Neutral markers are not directly linked with a particular life history trait, and it is assumed that they are not under direct selection. This class of genetic marker continues to be used to investigate and define salmonid listing units and population structure (e.g., Busby et al. 1996) in both California and across the Pacific Northwest. These types of markers have also been successfully used for decades to delineate populations and ESUs based primarily on reproductively isolated lineages. These markers remain valuable, in that they are the standard for determining the genetic structure and relatedness of species and, thus, their evolutionary histories.

More recently, the advent and rapid development of “adaptive” genetic markers have provided fishery managers and geneticists with a new suite of tools. Adaptive genetic markers provide putative associations with specific life history characteristics, and the “genetic type”, or “variant” infers information about a phenotype of interest. Specific genes, or genomic regions, within individuals or subgroups may vary from the overall pattern exhibited by a species. Of particular relevance to Southern SH/RT is the role that adaptive genetic variation plays in migratory behavior. This relationship is still being evaluated, and uncertainties remain regarding the level of influence genetics may have on migration phenotype. See Section 2.6.5 for more information.

2.5.2 Patterns of O. mykiss Genetic Population Structure

Geography and local environmental factors influence the genetic structure of *O. mykiss* populations, a pattern referred to as "isolation by distance". Evidence of isolation by distance is shown in *O. mykiss* populations throughout their range. Studies based on neutral mitochondrial DNA analysis have demonstrated a pattern of isolation by distance in populations spanning the western coast of the United States, including among coastal California steelhead populations (Hatch 1990; Reisenbichler et al. 1992; McCusker et al. 2000). Nielsen (1999) found a pattern of isolation by distance when looking at the microsatellite loci of southern California and northern

California steelhead populations. Bjorkstedt et al. (2005) suggested that genetic variation in salmonid populations generally increases with greater distances between watersheds. Pearse et al. (2007) analyzed geographic structure within the Klamath-Trinity River basin and consistently found a positive relationship between geographic distance and genetic relatedness—specifically, that genetic divergence between populations increased as a function of geographic distance.

Garza et al. (2004) evaluated population structure across coastal California populations using microsatellite loci to understand the relationship between genetic distance and the geography of coastal steelhead populations. This study's results included a bootstrap consensus tree showing clustering of geographic locations corresponding to five DPS assignments in coastal California steelhead (Figure 2). The long terminal branches in this consensus tree demonstrate that, while migration is important to the populations in this study, the conflicting evolutionary processes of random genetic drift and local adaptation were likely responsible for the genetic differentiation between the populations. The general isolation-by-distance pattern of genetic diversity is also visually apparent.

Aguilar and Garza (2006) found a significant relationship between geographic distance and genetic distance in coastal *O. mykiss* using both major histocompatibility complex genes, which can be helpful in identifying salmonid population structure, and microsatellite loci. This significant relationship represented isolation through distance. Garza et al. (2014) reaffirmed that genetic variation is associated with isolation by distance using microsatellite loci from samples of coastal California steelhead. Across all coastal California steelhead populations sampled, there was evidence that population structure is dependent on geographic distance. Their phylogeographic trees also suggested that population structure was almost entirely consistent with geographic proximity.

Populations within a watershed, even those disconnected by barriers, have been shown through microsatellite DNA analyses to be more genetically similar than those in adjacent watersheds (Clement et al. 2009; Garza et al. 2014). However, anthropogenic impacts including stocking, barrier construction, and habitat destruction have resulted in weaker relationships between geographic proximity and relatedness in modern *O. mykiss* populations (Pearse et al. 2011).

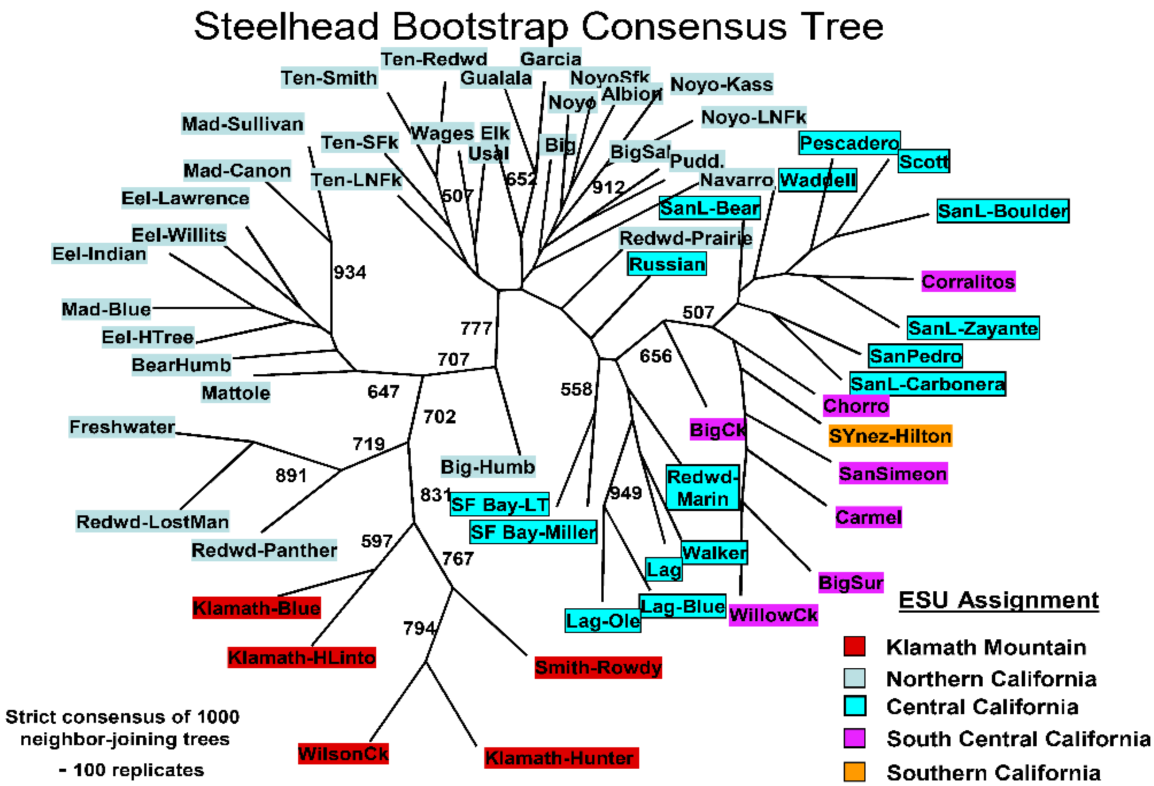

Figure 2. Majority-rule consensus tree, with genetic data bootstrapped 1,000 times, showing chord distances and neighbor-joining trees for 62 coastal California steelhead populations. (from Garza et al. 2004).

2.5.3 Genetics of the Southern California SH/RT

Busby et al. (1996) posited that the extreme environmental conditions found in southern California could result in both substantial local adaptations of and gene flow impediments between *O. mykiss* populations in the region. Nielsen (1999) hypothesized that the substantial interpopulation genetic diversity found in southern California's mostly small and somewhat isolated *O. mykiss* populations could be the result of a transitional ecotone, where two adjacent Pleistocene source populations have met and blended. Allozymes, mitochondrial DNA, and microsatellites have uncovered significant and unique genetic diversity in southern California steelhead, with traits not found in more northern populations. Busby et al. (1996) noted that a mitochondrial DNA type exists in steelhead populations between the Santa Ynez River and Malibu Creek that is rare in populations to the north, and samples from Santa Barbara County were found to be the most genetically unique of any wild coastal steelhead populations analyzed. In general, *O. mykiss* at the extreme southern end of their range have low genetic diversity (Clemento et al. 2009; Pearse et al. 2009; Jacobson et al. 2014; Abadía-Cardoso et al. 2016; Apgar et al. 2017). Loss of genetic diversity is often a consequence of declines in population size (Allendorf et al. 1997), which have been observed in Southern SH/RT populations.

2.5.4 South-Central and Southern California Genetic Relationships

Clemento et al. (2009) conducted a genetic analysis of steelhead populations in California south of Monterey Bay using microsatellite data to elucidate patterns of genetic differentiation and gene flow. In terms of coastwide population structure, the authors found that southern California steelhead populations were grouped with all other steelhead populations south of San Francisco Bay and were well-distanced from populations north of San Francisco Bay. Population genetic structure does not correspond with geographic management boundaries because genetically based population clusters are not separated by current federal-ESA-listed DPS boundaries. Overlap in clustering was detected between populations from nearby watersheds, and genetic differentiation between populations in the South-Central California Coast steelhead DPS and the southern California steelhead DPS could not be detected. Additionally, the construction of phylogeographic trees did not result in the separation of populations from the two DPSs into distinct genetic lineages based on their current ancestry (Figure 3). In populations south of San Francisco Bay, no apparent isolation by distance pattern corresponding with DPS boundaries was detected. This may be a result of metapopulation dynamics occurring between these *O. mykiss* populations. Although a lack of genetic differentiation was observed across these southern DPSs, the Department recognizes other factors that define Southern SH/RT, such as unique regional biogeography, ecology, physiology, and behavior of the population groups (Boughton et al. 2007).

2.5.5 Role of Genetics in Life History Expression

Many *O. mykiss* populations are considered “partially migratory,” meaning they contain both migratory (e.g., anadromous) and non-migratory (e.g., resident) individuals (Chapman et al. 2011). It is widely accepted that migratory behavior and migration-associated traits are heritable in partially migratory populations (Pearse et al. 2014; Hecht et al. 2015; Phillis et al. 2016). In recent years, studies have revealed that important migration-related characteristics in *O. mykiss*, such as maturation, growth, development, and smolting, are linked to specific genomic regions that are under natural selection (Nichols et al. 2008; Martínez et al. 2011; Hecht et al. 2012; Miller et al. 2012; Pearse et al. 2014). Phenotypic expression of anadromy vs. residency has since been found to be strongly associated with a large genomic region on *O. mykiss* chromosome 5 (*Omy5*) (Martínez et al. 2011; Hecht et al. 2012; Pearse et al. 2014; Leitwein et al. 2016; Kelson et al. 2019). This *Omy5* migration-associated region exhibits unique alleles, associated with either anadromy or residency as their phenotypic expression, and these

Omy5 genetic variants are thought to be the result of a chromosomal inversion (Pearse et al. 2014; Leitwein et al. 2016).

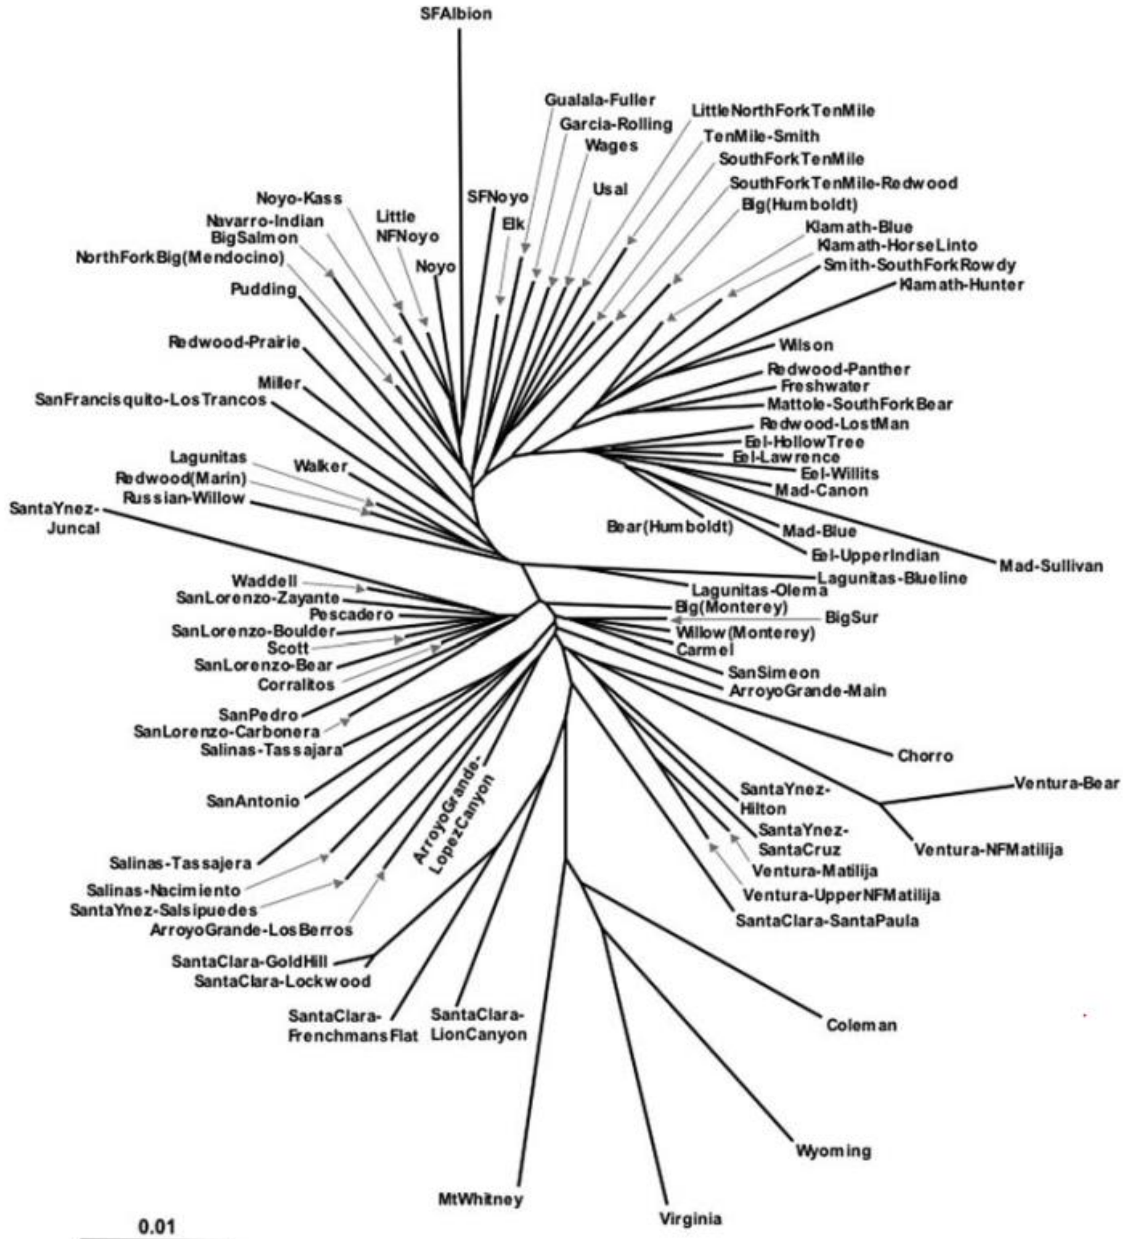

Figure 3. Unrooted neighbor-joining chord distance tree of 84 coastal O. mykiss populations in California (from Clemento et al. 2009).

Chromosome *Omy5* is associated with multiple life history characteristics related to migration vs. residency in *O. mykiss*, explaining morphological and developmental variation between the two life history forms (Nichols et al. 2008; Martínez et al. 2011; Hecht et al. 2012; Rundio et al. 2012). Nichols et al. (2008) used quantitative trait loci analysis to locate specific loci associated with smolting and found several genomic regions that were linked with morphological and physiological smolting indicators. The study was the first of its kind in terms of finding connections between specific genomic loci and the migration characteristics of a species of fish. In addition, Martínez et al. (2011) found multiple microsatellite markers on *Omy5* that were correlated with differential selection between anadromous and resident *O. mykiss*, while Hecht et al. (2012) identified associations between *Omy5*, body morphology, and skin reflectance, which are linked to the smolting process and the anadromous phenotype. Pearse et al. (2014) found that specific *Omy5* loci diverged between above-barrier and below-barrier *O. mykiss* populations that had differing frequencies of the anadromous phenotype.

Populations with a higher population-wide frequency of the anadromous variant of *Omy5* typically have higher proportions of anadromous or migratory individuals compared to populations that have a higher frequency of the resident variant (Pearse et al. 2014; Leitwein et al. 2016). This suggests that utilizing comparative anadromous *Omy5* variant frequency data between steelhead populations may indicate which populations have a higher likelihood of producing anadromous offspring, as well as having utility in identifying above-barrier populations with the genetic potential to support or bolster downstream anadromous populations. Results from Kelson et al. (2020) suggest that the *Omy5* genomic region also regulates physiological traits, such as juvenile growth, which will subsequently influence residency vs. anadromy (Figure 4).

Sex determination has also been genetically linked to the migratory phenotype of *O. mykiss* (Rundio et al. 2012). Migratory ecotype composition within a population is typically female-dominated, a phenomenon that has been observed in multiple salmonid species (Jonsson et al. 1998; Páez et al. 2011; Ohms et al. 2014; Kelson et al. 2019) and may be due to a strong correlation between fecundity and body size (Hendry et al. 2004; Quinn 2018). Female steelhead that migrate to the ocean can grow larger in the highly productive marine environment than their counterparts in the less productive freshwater environment and, as a result, produce greater numbers of embryos. Their genetic traits, which control the anadromous ecotype, are therefore predominant in most populations.

Alternate life history ecotypes within a given watershed are typically more closely related to each other than to their life history stage equivalents in other watersheds (Nielsen and Fountain 1999; Docker and Heath 2003; Narum et al. 2004; Olsen et al. 2006; McPhee et al. 2007; Leitwein et al. 2016). These close genetic relationships indicate some degree of gene flow between sympatric life history forms of *O. mykiss* (Olsen et al. 2006; McPhee et al. 2007; Heath et al. 2008), although the level of gene flow is dependent on environmental, physiological, and genetic factors, such as watershed size and degree of reproductive isolation between life history forms (Heath et al. 2008). Regardless, the close genetic relationships between sympatric populations of steelhead and Rainbow Trout suggest that managing individual fish with different life histories separately is biologically unjustified, and the two life history variants should be considered a single population when found coexisting in streams (McPhee et al. 2007). Additionally, freshwater resident populations can retain alleles associated with anadromy (Nielsen and Fountain 1999; Phillis et al. 2016; Apgar et al. 2017) and can contribute to the viability of anadromous *O. mykiss* populations.

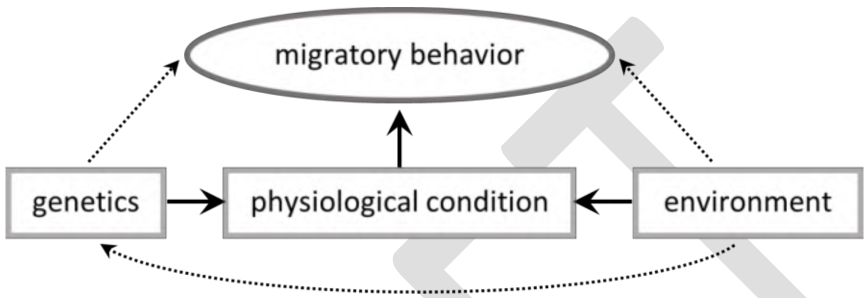

Figure 4. Schematic of indirect genetic control of migratory behavior. Genetic variation and the environment influence physiology, which then impacts migratory behavior (adapted from Kelson et al. 2020).

2.5.6 Above-Barrier vs. Below-Barrier Genetic Relationships

Studies have shown that populations of *O. mykiss,* above and below barriers within the same drainage, are closely related to one another (Heath et al. 2008; Clemento et al. 2009; Pearse et al. 2009; Leitwein et al. 2016; Fraik et al. 2021). Clemento et al. (2009) used microsatellite data to evaluate steelhead population structure above and below barriers in southern California streams and determined that populations separated by barriers are typically a single, monophyletic clade more closely related to each other than to populations in adjacent watersheds, consistent with many previous barrier studies. This relationship had strong bootstrap support, especially for natural-origin steelhead populations. For example, populations from the Santa Clara River formed a monophyletic lineage on the unrooted neighbor-joining tree constructed from samples taken in five main southern California watersheds (Figure 5).

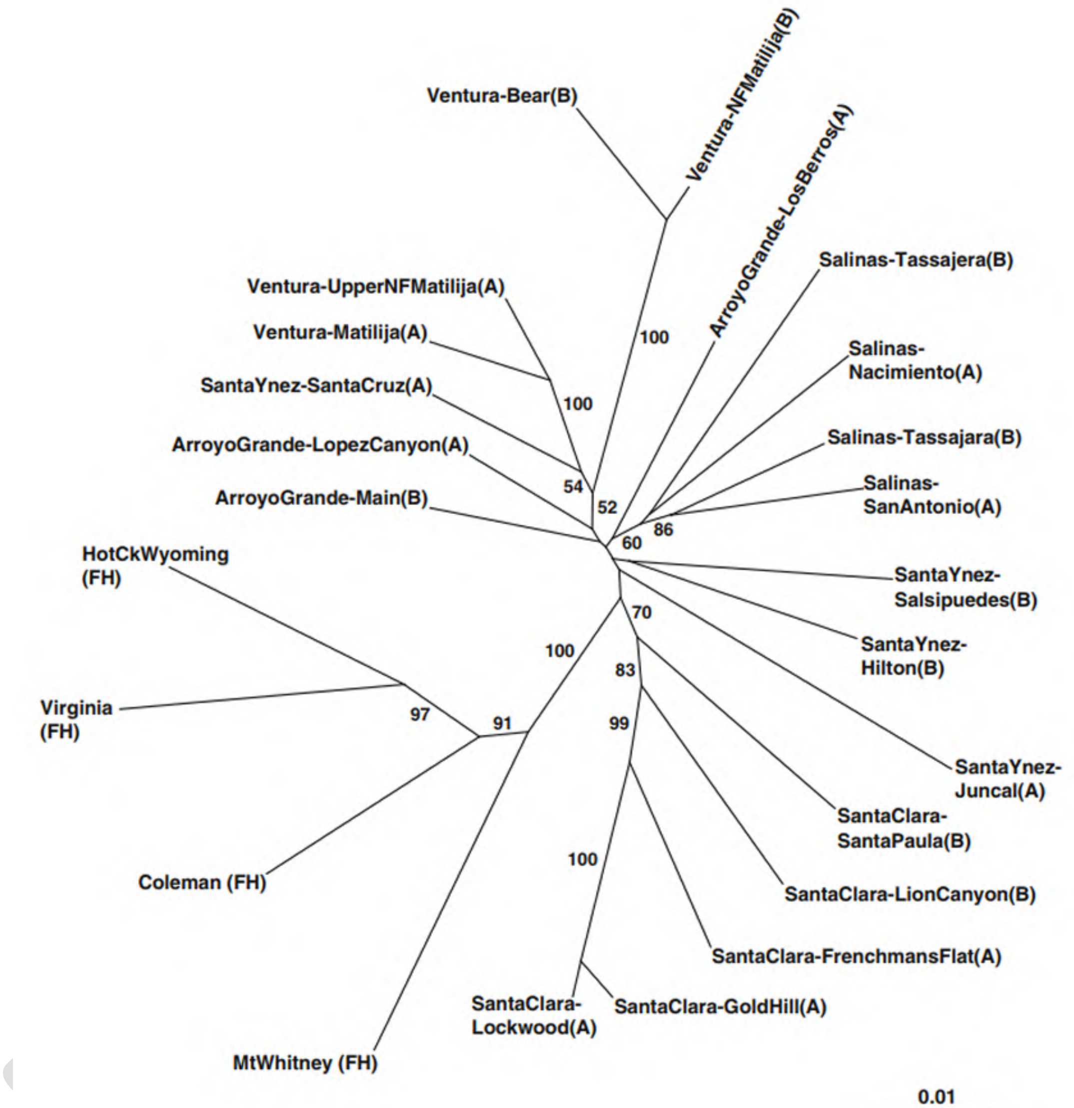

Figure 5. Unrooted neighbor-joining dendogram showing chord distances between 24 sampled naturally spawning populations both above and below barriers, denoted with A and B, respectively. Strains of Rainbow Trout from Fillmore Hatchery used for regional stocking are indicated with FH. Numbers associated with branches indicate percentage >50% of the 10,000 bootstrap replications in which the branch appeared (from Clemento et al. 2009).

Fraik et al. (2021) recently studied patterns of genetic diversity both before and after dam removal on the Elwha River (in Washington state) and determined that populations separated by natural barriers had greater genetic differentiation than those separated by long-standing dams. Following the removal of major artificial dams on the Elwha, they also detected admixture of above- and below-dam lineages and recolonization of upstream areas by steelhead.

While many fish populations separated by barriers within the same watershed have been shown to be closely related (Heath et al. 2008; Clemento et al. 2009; Pearse et al. 2009; Leitwein et al. 2016), major barriers to anadromy, both natural and artificial, have been found to prevent gene flow between populations upstream and downstream of the obstruction (Pearse et al. 2009; Abadía-Cardoso et al. 2019; Fraik et al. 2021). Multiple studies have demonstrated that there is often a discrepancy between life history expression (Nielsen 1999; Pearse et al. 2009) and associated adaptive genetic variation (Leitwein et al. 2016; Phillis et al. 2016; Apgar et al. 2017; Abadía-Cardoso et al. 2019) across major fish passage barriers. In a number of California watersheds, *O. mykiss* populations above major barriers, especially permanent artificial barriers, have shown decreased anadromous allelic frequency when compared with the population below (Leitwein et al. 2016; Phillis et al. 2016; Abadía-Cardoso et al. 2019). Likewise, in San Francisco Bay Area study streams, most above-dam *O. mykiss* populations, have significantly lower frequencies of the anadromous *Omy5* genotype than populations downstream of barriers (Leitwein et al. 2016). Abadía-Cardoso et al. (2019) also found decreased frequencies of anadromous alleles above barrier dams in the American River drainage.

Reduced migratory allelic frequency in fish populations above longstanding natural barriers is the expected condition since the population is fragmented and gene flow is unidirectional. Fish can almost always move, either passively or volitionally, over barriers and downstream, potentially contributing genes to the downstream population. Those that inhabit waters upstream of permanent barriers either assume a resident life history or must migrate downstream, taking migratory alleles with them and further reducing their frequency in the upstream population (Leitwein et al. 2016). It is also important to note that some above-barrier fish populations exhibit less genetic diversity (lower heterozygosity) than their below-barrier counterparts within the same drainage (Martínez et al. 2011). In some cases, however, fish carrying anadromous alleles may not be able to move downstream over barriers, especially large artificial dams and other complete barriers, which may help maintain anadromous *Omy5* variants in some above-dam populations (Leitwein et al. 2016). It also appears that some large, above-barrier reservoirs can act as “surrogate oceans” and may assist in the retention of anadromous genotypes and the expression of the adfluvial life history type (Leitwein et al. 2016).

Apgar et al. (2017) recently investigated the effects of climate, geomorphology, and fish passage barriers on the frequency of migration-associated alleles in *O. mykiss* populations across four California steelhead federal-ESA-listed DPSs (Southern California, South-Central California Coast, Central California Coast, and Northern California). Long-term natural barriers and artificial dams that provide no fish passage had the most pronounced negative impact on migration-associated allele frequency. Southern California DPS populations had the lowest frequency of *Omy5* haplotypes associated with anadromy of all California DPSs sampled. The Southern California DPS also exists in a number of heavily developed watersheds, with the greatest average number of partial and complete artificial barriers of the DPSs sampled. Removal of these barriers was predicted to substantially increase the frequency of anadromous alleles in southern California watersheds (Apgar et al. 2017).

2.5.7 Genetic Impacts of Historical Stocking

Clemento et al. (2009) conducted a genetic analysis using microsatellite loci to elucidate the genetic population structure of *O. mykiss* in southern California, with an emphasis on above- and below-barrier genetic relationships. Their analysis included an evaluation of genetic influences of long-standing Fillmore Hatchery stocking on naturally spawned populations in the region. In regional population structure analysis, Fillmore Hatchery Rainbow Trout strains clustered separately from all other wild populations, both above and below barriers. This dispersal pattern indicates that there was no evidence of hatchery introgression with wild *O. mykiss* within the Southern SH/RT range (Clemento et al. 2009).

More recently, Jacobson et al. (2014) analyzed microsatellite loci and SNP genotypes to determine the ancestry of *O. mykiss* populations in multiple southern California watersheds, expanding the geographic range assessed by Clemento et al. (2009). To the contrary, Jacobson et al. found that southern California steelhead ancestry was of mixed origin, with both hatchery and native coastal steelhead lineages, and most populations had almost complete introgression of hatchery lineages from the Central Valley. Only select populations in the San Luis Rey River, Coldwater Canyon Creek, the Santa Ana River watershed, and the San Gabriel River were found to have significant native coastal steelhead ancestry. Based upon these findings, the authors recommended that conservation planning focus on these populations for the preservation of native coastal lineages. Additionally, although Bear Creek (Santa Ana River) and Devil's Canyon Creek (West Fork San Gabriel River) show signs of strong hatchery introgression, they still have some native ancestry and are self-sustaining populations that could be important sources for restoration and recovery efforts of native southern California *O. mykiss*. The authors noted that introgressive hybridization with hatchery Rainbow Trout in these instances does not necessarily decrease viability and can, sometimes, even enhance adaptive genetic variation in a population exposed to changes in their surrounding environment (the phenomenon known as hybrid vigor). The addition of new alleles to a steelhead population via hatchery genetic lineages can also prevent potential genetic bottlenecks in small populations (Jacobson et al. 2014). However, the trade-off is eventual erosion of the native, ancestral lineage, so it is an option that must be weighed carefully. It is worth noting, however, that most samples collected for this study were from populations above anadromous barriers, which mostly precludes any analysis of Southern SH/RT genetic lineage pertinent to the proposed CESA listing unit, which includes only below barrier *O. mykiss*. It is equally important to note that, while potentially beneficial in some cases, the introduction of genetic variants presented in domesticated hatchery Rainbow Trout may reduce long term viability in wild populations because those genetic variants may be the product of several generations of domestication selection. In the case of southern California *O. mykiss*, the native lineage is much different than the predominant founding lineages of California's domesticated Rainbow Trout strains (e.g., Clemento et al. 2009).

Abadía-Cardoso et al. (2016) used microsatellite and SNP loci to elucidate *O. mykiss* ancestry at the extreme southern extent of its range. Southern California *O. mykiss* populations had lower genetic diversity than more northern populations and, genetically, most resembled hatchery Rainbow Trout. The most northern populations of the Southern SH/RT exist in the Santa Maria, Santa Ynez, and Santa Clara rivers, all of which exhibit genetics associated with the native coastal steelhead lineage, matching the results of Clemento et al. (2009) and Nielsen et al. (1997). Many southern populations have been almost entirely replaced by hatchery produced Rainbow Trout. The southern populations containing significant native coastal Steelhead ancestry were some populations in the San Gabriel River system, Coldwater Canyon Creek in the Santa Ana River, and the West Fork San Luis Rey River. These populations also had shared ancestry with the native coastal *O. m. nelsoni* from Baja California. Secondarily, they identified Bear Creek and Devil's Canyon Creek as high value populations with remnant, detectable levels of native ancestry. Also, in contrast to northern coastal steelhead populations, southern California *O. mykiss* showed low allelic frequency correlated with anadromy at *Omy5* loci, again consistent with extensive introgressive hybridization with hatchery Rainbow Trout and limited opportunities to express the anadromous life history. Low genetic variation, observed in populations with predominantly native ancestry, may not allow them to endure changes in environmental conditions, particularly rapid and dramatic changes like those being driven by escalating climate change impacts to the region. Abadía -Cardosa et al (2016) further recommended a managed translocation strategy between the few remaining southern populations with native ancestry to help slow the erosion of native genetic diversity. They found a high variability in the frequency of alleles associated with anadromy, suggesting that many populations of southern RT/SH maintain the capability to express the anadromous phenotype.

Nuetzel et al (2019) examined population genetic structure of *O. mykiss* populations in the Santa Monica Mountains BPG using a set of SNP markers. Specifically, they conducted genetic analyses of *O. mykiss* from Topanga, Malibu and Arroyo Sequit creeks and compared SNP data to the existing data from the Abadía -Cardosa et al (2016) study, including Omy5 genetic marker data. Their results indicate that Malibu Creek trout are almost entirely of native ancestry. The analysis of Topanga Creek trout was more complex, suggesting that Topanga Creek is a predominantly unique native population with some introgressive hybridization with hatchery

Rainbow Trout. The authors did not have a sufficient sample size from Arroyo Sequit Creek to draw meaningful inferences about the ancestry of that population. Both Malibu and Topanga creeks were also found to have relatively high frequencies of the anadromous Omy5 alleles. Together, both of these populations can be a valuable genetic resource for recovery of southern California native coastal *O. mykiss*.

3. ASSESSMENT OF PROPOSED CESA LISTING UNIT

The Commission has authority to list species or subspecies as endangered or threatened under CESA (Fish and G. Code, §§ 2062, 2067). The Legislature left to the Department and the Commission, which are responsible for providing the best scientific information and for making listing decisions, respectively, the interpretation of what constitutes a “species or subspecies” under CESA (*Cal. Forestry Assn. v. Cal. Fish and G. Com.* (2007) 156 Cal.App.4th 1535, 1548-49). The Department has recognized that similar populations of a species can be grouped for efficient protection of bio- and genetic diversity (*Id.* at 1546-47). Further, genetic structure and biodiversity in California populations are important because they foster enhanced long-term stability (*Id*. at p. 1547). Diversity spreads risk and supports redundancy in the case of catastrophes, provides a range of raw materials that allow adaptation and persistence in the face of long-term environmental change, and leads to greater abundance (*Ibid*.).

Courts should give a “great deal of deference” to Commission listing determinations supported by Department scientific expertise (Central Coast Forest Assn. v. Fish & Game Com. (2018) 18 Cal.App.5th 1191, 1198-99). Courts have held that the term “species or subspecies” includes ESUs (*Id*. at 1236, citing *Cal. Forestry Assn.*, supra, 156 Cal.App.4th at pp. 1542 and 1549). The Commission’s authority to list necessarily includes discretion to determine what constitutes a species or subspecies (*Id.* at p. 1237). The Commission’s determination of which populations to list under CESA goes beyond genetics to questions of policy (*Ibid.*). The Department and Commission’s determinations of what constitutes a species or subspecies under CESA are not subject to the federal ESA, regulations based on the federal ESA, or federal ESA policies adopted by NMFS or USFWS, but those sources may be informative and useful to the Department and Commission in determining what constitutes a species or subspecies under CESA.

The ESU designation has been used for previous Pacific salmon listings under CESA, including the Sacramento River Winter-run Chinook Salmon ESU (Endangered, 1989), the Central Valley Spring-run Chinook Salmon ESU (Threatened, 1999), Southern Oregon-Northern California Coast Coho Salmon ESU (Threatened, 2005), and the Central California Coast Coho Salmon ESU (Endangered, 2005). In 2022, the Commission listed northern California summer steelhead as endangered under CESA. In support of that listing, the Commission determined that the petitioned listing unit qualified as a subspecies under CESA “based on the discreteness (when compared to other ecotypes) and significance of that listing unit within the state of California” (Cal. Fish and G. Com. 2022).

3.1 DPS and ESU Criteria

The federal ESA defines “species” to include “any subspecies of fish or wildlife or plants, and any distinct population segment of any species of vertebrate fish or wildlife which interbreeds when mature” (16 U.S.C. § 1532). In 1991, NMFS adopted its policy on how it would apply the definition of “species” to Pacific salmon stocks for listing under the ESA. Under the NMFS ESU Policy, a salmon stock is considered a DPS if it constitutes an ESU of the biological species. To be considered an ESU, the salmon stock must meet two criteria (NMFS 1991):

1. “It must be substantially reproductively isolated from other conspecific population units; and
2. It must represent an important component in the evolutionary legacy of the species.”

Generally, reproductive isolation does not have to be absolute, but it must be strong enough to permit evolutionarily important differences to accrue in different population units (NMFS 1991). The evolutionary legacy of a species refers to whether the population contributes substantially to the ecological and genetic diversity of the species as a whole (NMFS 1991).

In February 1996, USFWS and NMFS published a joint DPS policy for the purposes of ESA listings. Three elements are evaluated in a decision regarding the determination of a possible DPS as endangered or threatened under the ESA. These criteria are (NMFS 1996a):

1. “Discreteness of the population segment in relation to the remainder of the species to which it belongs;
2. The significance of the population segment to the species to which it belongs; and
3. The population segment’s conservation status in relation to the [federal ESA’s] standards for listing (i.e., is the population segment, when treated as if it were a species, endangered or threatened [under the federal ESA’s standards]).”

A population segment is discrete if it meets either of two conditions specified in the DPS Policy (NMFS 1996a):

1. “It is markedly separated from other populations of the same taxon as a consequence of physical, physiological, ecological, or behavioral factors. Quantitative measures of genetic or morphological discontinuity may provide evidence of this separation.

2. It is delimited by international governmental boundaries within which differences in control of exploitation, management of habitat, conservation status, or regulatory mechanisms exist that are significant in light of Section 4(a)(1)(D) of the [ESA]."

If a population segment is determined to be discrete based on physical, physiological, ecological, or behavioral factors, its significance and status are then evaluated based on several characteristics specified in the joint DPS Policy. These include, but are not limited to (NMFS 1996a):

1. "Persistence of the discrete population segment in an ecological setting unusual or unique for the taxon.
2. Evidence that loss of the discrete population segment would result in a significant gap in the range of a taxon.
3. Evidence that the discrete population segment represents the only surviving natural occurrence of a taxon that may be more abundant elsewhere as an introduced population outside its historic range.
4. Evidence that the discrete population segment differs markedly from other populations of the species in its genetic characteristics."

Under the DPS Policy, if a population segment is found to be both discrete and significant, its status is then evaluated for listing based on listing factors established by the federal ESA.

3.2 Southern SH/RT Evaluation under the Joint DPS Policy

The proposed listing unit (Southern SH/RT) in the Petition is "all *O. mykiss* below manmade and natural complete barriers to anadromy, including anadromous and resident life histories, from and including the Santa Maria River (San Luis Obispo and Santa Barbara counties) to the U.S.-Mexico Border." Southern SH/RT is a subtaxon of the species *O. mykiss*. The anadromous life history of Southern SH/RT is not markedly separate from the non-anadromous life history of Southern SH/RT. To determine whether Southern SH/RT is a subspecies for the purposes of CESA listing, the Department used the joint DPS Policy to determine whether Southern SH/RT is a DPS. The Department evaluated the proposed listing unit by applying the first (discreteness) and second (significance) criteria of the joint DPS Policy but not the third criterion (the population segment's conservation status in relation to the federal ESA's standards). The Department did not apply the third criterion because after using the discreteness and significance criteria to determine whether Southern SH/RT is a DPS and hence a subspecies for purposes of CESA, the Department will assess the listing unit's status in relation to CESA's standards rather than the federal ESA's standards.

In 2006 NMFS concluded that application of the joint DPS Policy to West Coast *O. mykiss*, including the Southern California Steelhead DPS, was logical, reasonable, and appropriate (NMFS 2006). Further, NMFS concluded that use of the ESU Policy, which was originally intended for Pacific salmon, should not continue to be applied to *O. mykiss*, a type of salmonid with characteristics not typically exhibited by Pacific salmon (NMFS 2006). The Department finds that the application of the discreteness and significance DPS criteria from the DPS Policy is appropriate, logical, and reasonable for identifying whether Southern SH/RT is a subspecies for purposes of CESA because the taxon exhibits characteristics that are not typically exhibited by other Pacific salmonids, for which the ESU policy was developed.

3.2.1 Discreteness

Markedly Separate: Yes. The Department considers Southern SH/RT to be markedly separate from other populations of the taxon along the West Coast of North America. Point Conception in southern California is a well-studied biogeographic boundary that separates different physical oceanographic processes and the abundance and distribution of many marine species (Horn and Allen 1978; Horn et al. 2006; Miller 2023). The coastal areas north of Point Conception have cooler water temperatures, stronger upwelling, high nutrient concentrations, and the coastline is generally rocky. Within the southern California Bight, water temperatures are warmer, upwelling is weaker, and the coastline is typically sandy. While intraspecific genetic breaks do not always coincide with biogeographic boundaries near Point Conception (Burton 1998), the Department maintains that the DPS standards for discreteness do not require absolute separation of a DPS from other members of this species, because this can rarely be demonstrated in nature for any population of organisms (NMFS 1996a).

The life history of Southern SH/RT relies more heavily on seasonal precipitation than populations of the same taxon occurring farther north (Busby et al. 1996). Because average precipitation is substantially lower and more variable and erratic in southern California than regions to the north, Southern SH/RT are more frequently exposed to adverse environmental conditions in marginal habitats (i.e., warmer water temperatures, droughts, floods, wildfire) (Busby et al. 1996). Morphologically, anadromous forms of Southern SH/RT are typically longer in length and more streamlined in shape than more northern populations to enable passage through southern California’s erratic and low streamflow watersheds (Moyle et al. 2017).

International Border: No.

3.2.2 Significance

Unique Ecological Setting: Yes. The range of Southern SH/RT represents the southernmost region of the taxon’s entire West Coast Range of North America. Within this range, the watersheds that occur south of the Santa Monica Mountains have a semi-arid climate that is characterized by low precipitation, high evaporation rates, and hot and dry summers (CDFW 2021d). This climate type represents a unique ecological setting for Southern SH/RT relative to most *O. mykiss* populations along the West Coast of North America that occur in Mediterranean climates characterized by summer fog.

The ecological setting for Southern SH/RT is characterized by significant urbanization which is unique among other federally listed steelhead DPSs that occur in coastal regions of California that are not as highly developed or populated. For example, approximately 22 million people reside in the southern California counties of Santa Barbara, Ventura, Los Angeles, Orange, San Bernadino, Imperial, and San Diego, whereas the population in the South-Central coast counties of Santa Cruz, Santa Clara, Monterey, San Benito, and San Luis Obispo is approximately 2.8 million people (NMFS 2012a; NMFS 2013). Furthermore, almost all Southern SH/RT-bearing watersheds contain dams and water diversions that have blocked access to most historic spawning and rearing habitats. Of the four DPSs sampled by Apgar et al. (2017), the Southern California Steelhead DPS contained the highest average number of partial anthropogenic barriers per watershed (n = 4.7) and the highest total number of complete anthropogenic barriers (n = 8). For context, the neighboring, and more northern South-Central Coast DPS contains a significantly lower average number of partial anthropogenic barriers per watershed (n = 1.6) and complete anthropogenic barriers (n = 1). Moreover, nearly all estuary and lagoon ecosystems in southern California have been severely degraded, thereby limiting the ability of juvenile Southern SH/RT to utilize these critical nursery habitats (Moyle et al. 2017). While these anthropogenic threats are not necessarily unique to the southern California coastal area, the region's highly variable and erratic hydrologic cycle and relatively arid climate, combined with the impacts of climate change, make Southern SH/RT increasingly vulnerable to extinction and less resilient to disturbance events and catastrophic events such as major wildfires and floods.

Gap in Range: Yes. The Department believes that the loss of Southern SH/RT would result in a significant truncation of the southern range of the taxon along the West Coast of North America. The range of Southern SH/RT encompasses approximately 12,700 square miles with 25,700 miles of streams (NMFS 2012a).

Only Surviving Natural Occurrence: No.

Markedly Different Genetic Characteristics: No. Individuals from populations of Southern SH/RT have been shown to not be genetically isolated from populations of *O. mykiss* in the south-central California coast (Clemento et al. 2009). Evidence of straying has been documented in steelhead in central California (Donohue et al. 2021), and genetic population structure analyses suggest that there was historical exchange of genetic information between coastal populations (Garza et al. 2014). Although many steelhead populations can be partially isolated, at least a small amount of exchange between different populations of steelhead is to be expected due to natural straying. This connectivity results in a level of genetic similarity, which is more pronounced between neighboring populations, and prevents most populations from being completely isolated (Bjorkstedt et al. 2005; Garza et al. 2014; Arciniega et al. 2016).

Nonetheless, allozymes, mitochondrial DNA, and microsatellites have uncovered significant and unique genetic diversity in southern California steelhead, including traits not found in more northern populations. Busby et al. (1996) noted that a mitochondrial DNA type exists in *O. mykiss* populations between the Santa Ynez River and Malibu Creek that is rare in populations to the north, while samples from Santa Barbara County were found to be the most genetically unique of any wild coastal steelhead populations analyzed. Conservation of both neutral and adaptive genetic diversity, such genetic variation associated with migratory life history, is crucial in maintaining the ability of *O. mykiss* populations to adapt to altered environments. Given that Southern SH/RT populations have the lowest frequencies of anadromous genotypes, it is critical to preserve this genetic variation and ensure no more of it is lost.

3.2.3 Conclusion

Southern SH/RT satisfies the first (discreteness) and second (significance) criteria of the joint DPS Policy: i.e., Southern SH/RT is markedly separate and biologically significant to the taxon to which it belongs. Accordingly, the Department concludes that Southern SH/RT is a DPS and hence a subspecies for the purposes of CESA listing.

4. POPULATION TRENDS AND ABUNDANCE

4.1 Structure and Function of Viable Salmonid Populations

In this review, we use the definition of “population” from McElhany et al. (2000): “An independent population is a group of fish of the same species that spawns in a particular lake or stream (or portion thereof) at a particular season and which, to a substantial degree, does not interbreed with fish from any other group spawning in a different place, or in the same place at a different season.” In other words, a population as defined by McElhany et al. (2000) is a group of fish that experiences a substantial degree of reproductive isolation.

Steelhead have strong fidelity to their natal stream, which can lead to substantial reproductive isolation and, as a result, create local adaptation within somewhat isolated populations (Waples et al. 2008). Isolation can expose these local populations to varying degrees of genetic drift as well as different environmental pressures that ultimately lead to the development of genetic and phenotypic differences. Although many steelhead populations can be partially isolated, at least a small amount of exchange between different populations of steelhead is to be expected due to natural straying. This connectivity results in a level of genetic similarity, which is more pronounced between neighboring populations, and prevents most populations from being completely isolated (Bjorkstedt et al. 2005; Garza et al. 2014; Arciniega et al. 2016).

The concept of viable salmonid populations was introduced by McElhany et al. (2000). A viable salmonid population is defined as, “an independent population of any Pacific salmonid (genus *Oncorhynchus*) that has negligible risk of extinction due to threats from demographic variation, local environmental variation, and genetic diversity changes over a 100-year time frame,” and an independent population is defined as, “any collection of one or more local breeding groups whose population dynamics or extinction risk over a 100-year time period are not substantially altered by exchanges of individuals with other populations.”

McElhany et al. (2000) introduced four criteria for assessing viability of salmonid populations: abundance, productivity, population spatial structure, and diversity. These parameters form the foundation for evaluating population viability because they serve as reasonable predictors of extinction risk, reflect general processes important to all populations of species, and are measurable. Abundance is a key parameter because smaller populations are at greater risk of extinction than larger populations. Productivity, which is associated with abundance, serves as an indicator of population growth rate either over an entire life cycle or stage-specific life-history stage. Population spatial structure represents the distribution of individuals in habitats they use throughout their life cycle, as well as the processes that generate that distribution. Spatial structure often reflects the amount of suitable habitat available for a population as well as demographic stability and the level of straying among habitats. Diversity represents variation in traits such as anadromy, run-timing, and spawning behavior and timing. Typically, a more diverse population is more likely to contain individuals that will survive and reproduce in the face of environmental variation (McElhany et al. 2000). In this chapter, we evaluate, to the best of our ability, these four criteria for Southern SH/RT populations.

4.2 Sources of Information

We reviewed many sources of information for this Status Review, including primary research and literature review articles, the CESA listing petition, previous federal status reviews, recovery plans, viability assessments, Department reports and documents, annual reports from ongoing Southern SH/RT monitoring efforts, and historical reports. Agency staff with knowledge of watersheds supporting Southern SH/RT were also consulted for information.

Data limitations and uncertainties associated with historical accounts for Southern SH/RT limits our ability to understand their complete historical abundance and distribution in their range.

The majority of available historical data are in reports, technical memos, and other documents that have not undergone a formal peer-review process. These types of historical sources are not necessarily at a high level of scientific rigor and have not been subject to peer review, but they represent the best information available at the time of this review regarding the historical distribution and abundance of Southern SH/RT populations.

Multiple data sources were used to evaluate viability metrics of Southern SH/RT populations. These data are mostly derived from monitoring reports from several single-basin annual survey efforts. For example, data for the Santa Ynez River population was sourced from monitoring reports developed by the Cachuma Operations and Maintenance Board (COMB). Data for the Ventura River was sourced from annual monitoring reports produced by Casitas Municipal Water District (CMWD), and data contained in Booth (2016) for the United Water Conservation District (UWCD) was used for the Santa Clara River population (See Appendices A – D for full data sources). Although data from these monitoring reports represent the best available scientific information in many southern California watersheds, the data may be derived from different monitoring approaches and designs, contain detection bias, and vary in the level of monitoring effort through time and geographic areas. These constraints may limit the power of statistical analyses to assess trends in viability criteria. Therefore, the results of the analyses conducted in subsequent portions of this chapter should be interpreted in the context of these limitations.

Dagit et al. (2020) describes the occurrences of adult steelhead from 1994-2018 and was also used as a source of peer-reviewed information to provide insight into the abundance trends of Southern SH/RT, particularly for the basins south of Los Angeles where historically no monitoring of steelhead occurred. Additional information on the data sources used in this chapter can be found in Appendices A - D. and Dagit et al. (2020).

4.3 Historical and Current Distribution

This section discusses the historical and current distribution of Southern SH/RT within their range. The section is structured on the five BPGs, which are a federal delineation based on a suite of environmental conditions (e.g., hydrology, local climate, geography) and watershed characteristics (i.e., large inland or short coastal streams) (NMFS 2012a). Separate watersheds within each BPG are considered to support individual populations of southern SH and RT; therefore, single BPGs encompass multiple watersheds and populations (Figure 6). Additional information on southern SH/RT distribution in watersheds not included in this section can be found in Good et al. (2005), Becker and Reining (2008) and Titus et al. (2010). In general, estimates of historical population abundance are based on sparse data and assumptions that are plausible but have yet to be adequately verified or tested. While the following historical estimates are likely biased either upward or downward, the examination of historical records of adult run size in southern California show consistent patterns of abundance that are at least two or three orders of magnitude greater in size than in recent years.

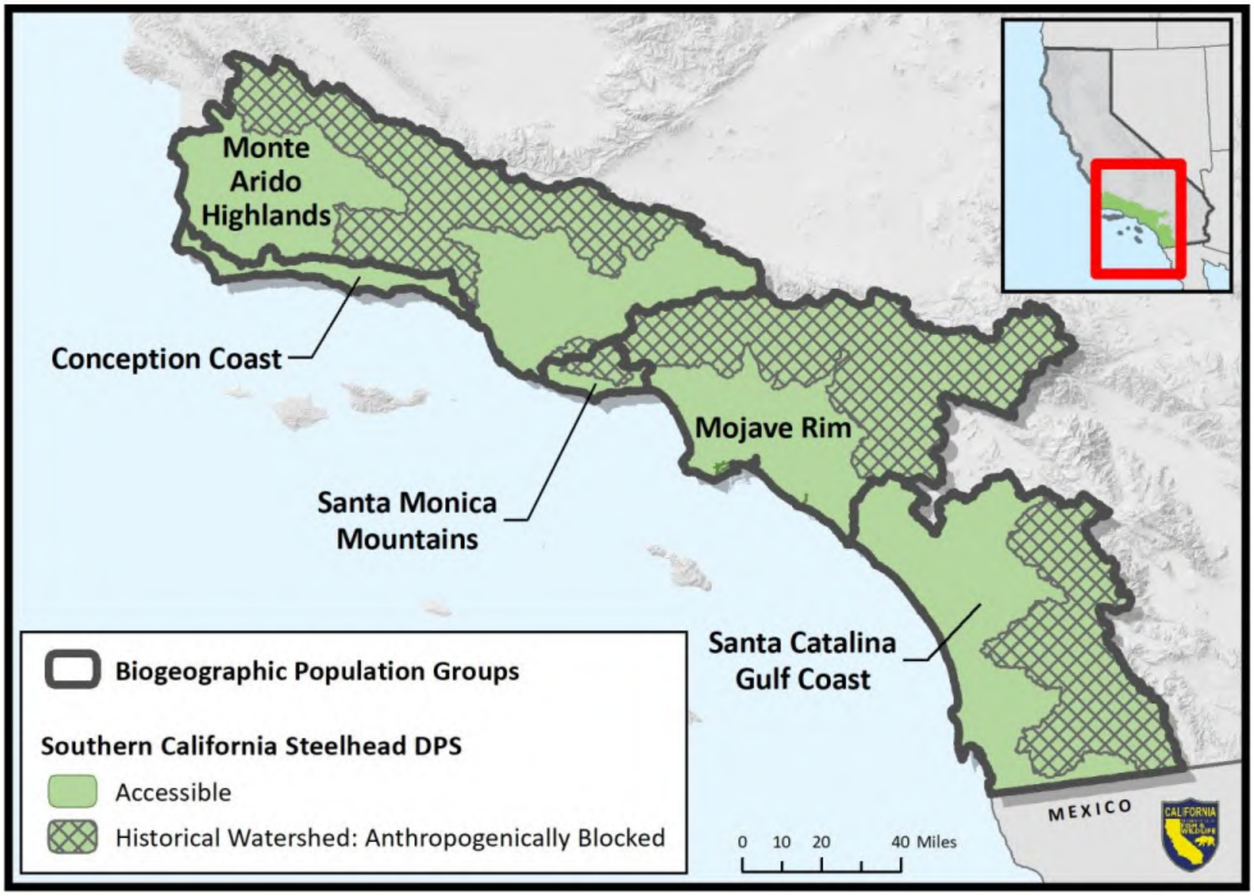

Figure 6. Map of the current and historical distribution of Southern SH/RT. BPGs represented are the Monte Arido Highlands, Conception Coast, Santa Monica Mountains, Mojave Rim, and Santa Catalina Gulf Coast.

4.3.1 Monte Arido Highlands Biogeographic Population Group

The Monte Arido Highlands BPG includes four watersheds spanning San Luis Obispo, Santa Barbara, Ventura, and northern Los Angeles counties draining the west side of the Transverse Range and terminating at the Pacific Ocean (NMFS 2012a; Figure 7). Inland stretches of these watersheds are high in elevation and mountainous, but otherwise the watersheds contain different geographic features. Watersheds in this BPG are susceptible to “flashy” flows with seasonal storms and can also dry during the summer even in mainstem reaches. Perennial flows are mainly found in the upper reaches of tributaries that still retain groundwater connection (NMFS 2012a).

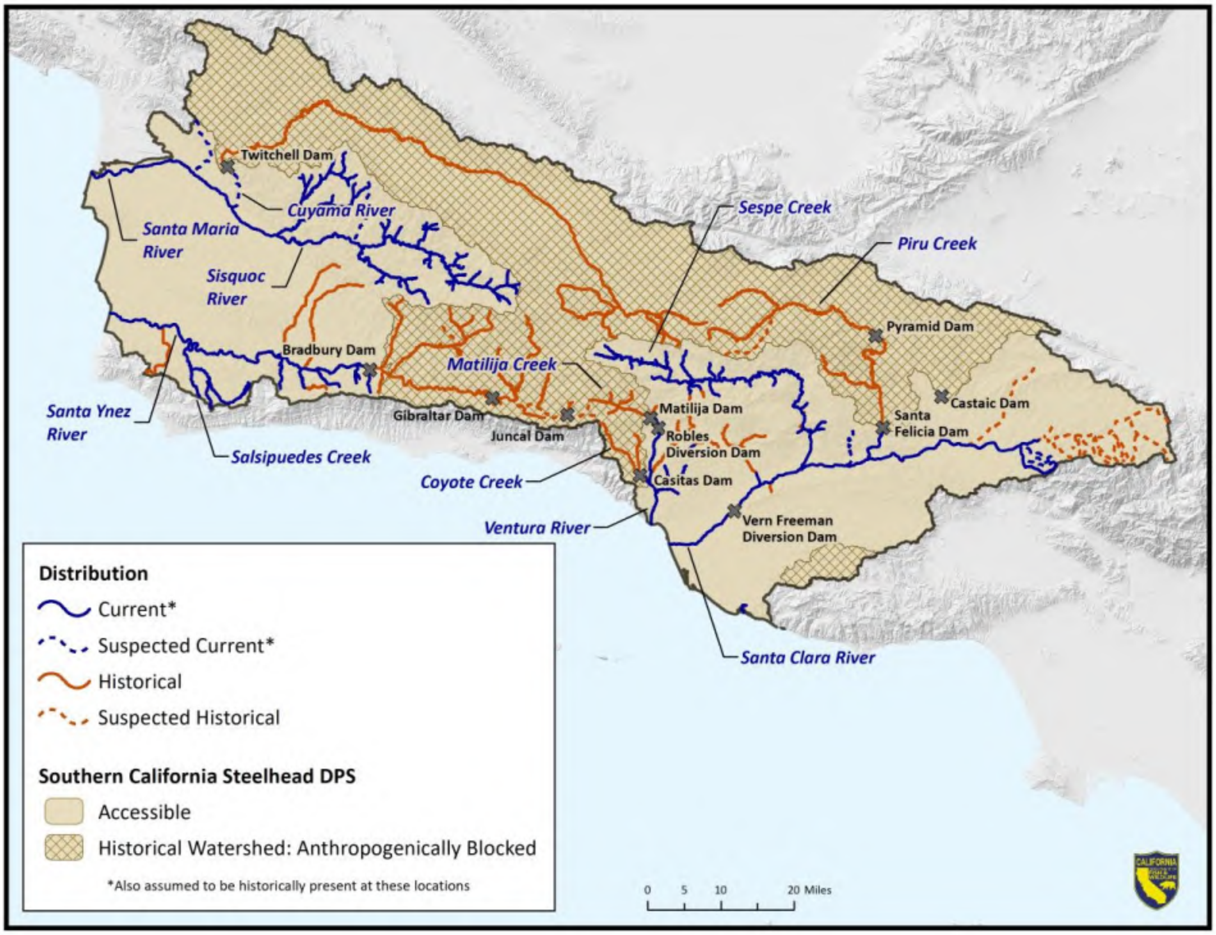

Figure 7. Map of the Monte Arido Highlands BPG depicting known and suspected current and historical distribution.

4.3.1.1 Santa Maria River

The Santa Maria River runs from the confluence of the Cuyama and Sisquoc rivers to the ocean and encompasses 1,790 square miles of watershed (Becker and Reining 2008). Historically, the Santa Maria River served mainly as a corridor for steelhead migrating to and emigrating from the Cuyama and Sisquoc rivers, rather than as habitat for spawning and rearing (Titus et al. 2010).

Hatchery stocking of *O. mykiss* occurred in the early 1930s in the Sisquoc and Cuyama watersheds (Titus et al. 2010). In the early to mid-1940s, juvenile steelhead from the Santa Ynez River were rescued and translocated to the Santa Maria River. Tributaries of the Cuyama River were stocked with Rainbow Trout in the 1940s to support recreational fishing; however, it is unknown if there was a historical run of anadromous Southern SH/RT in the Cuyama River tributaries (Titus et al. 2010). Starting in 1950, there was essentially no steelhead fishery for at least a decade (Titus et al. 2010).

The Sisquoc River had a robust population of resident *O. mykiss* in 1959 (Becker and Reining 2008) and fish were seen in smaller numbers in 1964 (Titus et al. 2010). Southern SH/RT of multiple age classes were also observed in the upper river during the 1990s (Becker and Reining 2008). In 2005, substantial numbers of young-of-the-year (YOY) *O. mykiss*, as well as some older age classes, were observed in the upper Sisquoc watershed during a population survey (Stoecker 2005).

Other smaller tributaries in the Santa Maria watershed, mostly tributaries of the Sisquoc and Cuyama rivers, have had limited historical and present *O. mykiss* observations from surveys, although some anecdotal sightings have occurred (Becker and Reining 2008). The streams include Deal Canyon Creek, Reyes Creek, Beartrap Creek, Tepusquet Creek, La Brea Creek, North Fork La Brea Creek, Manzana Creek, Davy Brown Creek, Munch Canyon Creek, Sunset Valley Creek, Fish Creek, Abel Canyon Creek, South Fork Sisquoc River, White Ledge Canyon Creek, Rattlesnake Canyon Creek, and Big Pine Canyon Creek. Some of these *O. mykiss* observations were made in tributaries of the Cuyama River post-dam construction (Becker and Reining 2008); however, it is possible that anadromous Southern SH/RT were able to access and inhabit these areas historically. Notably, many of these small tributaries were stocked with thousands of hatchery-raised *O. mykiss* in the mid-1900s for fishery supplementation (Titus et al. 2010).

Twitchell Dam was built on the Cuyama River in the late 1950s, almost 8 miles upstream from the confluence with the Santa Maria River. The dam currently impacts hydrologic function of the Santa Maria system by increasing the frequency of “false positive” migration flows in the Sisquoc River, reducing the frequency of downstream passable migration conditions, increasing the number of days with upstream passable flows that are not followed by additional days of passable flows, and reducing the frequency of long-duration migration flows (Becker and Reining 2008; Stillwater Sciences 2012). Twitchell Dam is a complete barrier to anadromy, and historically, water releases have not been regulated to provide instream flows for upstream and/or downstream steelhead migration in the Santa Maria River during the winter and spring migration periods (Stoecker 2005). Following construction of the dam, the Santa Maria and Cuyama rivers continue to have intermittent flows (Becker and Reining 2008). Currently, the lower mainstem of the Santa Maria River, which serves as a migration corridor for Southern SH/RT, is dry most of the year in most years due to managed aquifer recharge in the Santa Maria Valley (NMFS 2012a).

4.3.1.2 Santa Ynez River

The Santa Ynez River is a major watershed spanning approximately 900 square miles and 90 river miles (Becker and Reining 2008). The river is thought to have supported the largest anadromous Southern SH/RT run (Titus et al. 2010). The first record of Southern SH/RT in the Santa Ynez occurred in the late 1800s prior to any stocking of the river with hatchery trout (Alagona et al. 2012). Upstream migration of Southern SH/RT past river km 116 was impeded in 1920 resulting from the construction of Gibraltar Dam (Titus et al. 2010). The reservoir supported landlocked steelhead following dam construction and was stocked in the 1930s with hatchery *O. mykiss* as well as steelhead rescued from the Santa Ynez River in 1939, 1940, and 1944 (Titus et al. 2010).

Upstream migration typically occurred from December to March following precipitation events. Southern SH/RT were seen spawning in all tributaries as well as the mainstem below Gibraltar Dam during the spring in the mid-1930s, though flow was observed to limit suitable spawning habitat (Titus et al. 2010). Most spawning in the Santa Ynez River occurred in the upper reaches between Buellton and Gibraltar Dam as well as the tributaries to the mainstem such as Alisal, Santa Cota, Cachuma, Tequepis Canyon, and Santa Cruz creeks. Fish rescues were required during the summer due to intermittent flows and drying of downstream tributary areas as well as the mainstem (DFG 1944).

Tens of thousands of hatchery *O. mykiss* were stocked in Gibraltar Reservoir in the 1930s, and over 100,000 hatchery-reared juvenile steelhead were planted in the Santa Ynez River from 1930-1935. In the 1940s, about 2.5 million juvenile Southern SH/RT were translocated from various areas of the watershed to the lower river (DFG 1944). An approximate run size of at least 13,000 spawners was inferred by a Department staff member based on comparisons with Benbow Dam counts on the South Fork Eel River, California in the 1930s and 1940s (Becker and Reining 2008; Titus et al. 2010). However, it is possible that the Santa Ynez steelhead population may have increased during this period due to ongoing rescue operations that resulted in lower mean mortality rates during the early to mid-1940s (Good et al. 2005). Nonetheless, these estimates may underestimate historical abundance because they were produced 24 years after a significant portion of spawning and rearing habitat had been blocked by Gibraltar Dam.

Construction of Bradbury Dam, originally named Cachuma Dam, downstream of Gibraltar Dam was finished in 1953. Bradbury Dam forms the Lake Cachuma reservoir, blocks Southern SH/RT access to upstream habitat, and alters natural flow regimes and sediment dynamics (Becker and Reining 2008; Titus et al. 2010). Even before the dam was built, the lack of precipitation limited upstream migration due to the sandbar at the mouth of the river remaining intact (Titus et al.

2010). Steelhead run size declined significantly after 1946 and only small numbers were seen in the stream reaches below Bradbury Dam in following decades (Titus et al. 2010). Anadromous Southern SH/RT were effectively extirpated by 1975 due to lack of flows below Bradbury Dam especially during summer months, though steelhead have occasionally been observed over the past few decades (Becker and Reining 2008).

Recently, Reclamation's permit to operate releases from Bradbury Dam was modified to require releases from the dam for purposes of protecting fishery resources in accordance with the 2000 NMFS Biological Opinion during wetter years. This modification also included additional measures to benefit Southern SH/RT, including opportunities to provide fish passage above and below Bradbury Dam, measures to reduce the impacts of predation, and restoration of stream and bankside habitat (SWRCB 2019).

Department staff have monitored steelhead in Salsipuedes Creek, Hilton Creek, and the mainstem Santa Ynez River and have found that most years can support a small steelhead run. However, zero adult steelhead have been found in the Santa Ynez River since 2012 (Boughton et al. 2022a). COMB has conducted uncalibrated, single pass snorkel surveys each year since the 1990s at multiple index sites to determine *O. mykiss* densities in the Santa Ynez River. Until 2012, fish densities were consistent but declined sharply in the following years due to drought conditions (Boughton et al. 2022a). The past few years have seen numbers rebound somewhat in response to wetter conditions. Similar trends were observed in the migrant traps on Hilton and Salsipuedes creeks and the mainstem Santa Ynez River, which have been in operation since 2001 (COMB 2022).

4.3.1.3 Ventura River

The Ventura River watershed encompasses 228 square miles and 16.5 stream miles (Becker and Reining 2008). Matilija Creek and North Fork Matilija Creek intersect to form the headwaters of the Ventura River. Multiple impassable dams occur in this watershed, altering the natural flow regime and causing negative impacts to Southern SH/RT habitat quantity and quality. About 2 miles downstream of the Ventura River headwaters is the Robles Diversion Dam, which was constructed in 1958 to direct water for storage into Lake Casitas (Becker and Reining 2008; Titus et al. 2010). Both Matilija Dam on Matilija Creek and Casitas Dam on Coyote Creek, are also attributed to population declines of Southern SH/RT on the Ventura River (Titus et al. 2010).

In the 1930s, tens of thousands of juvenile *O. mykiss* were stocked in the Ventura River, as well as thousands of fish that were transplanted from rescues conducted on the Santa Ynez River (Titus et al. 2010). Department staff estimated that the Ventura watershed supported 4,000 to 5,000 steelhead spawners in 1946. In 1973, Department staff estimated a run of between 2,500 and 3,000 steelhead (Becker and Reining 2008). However, the methodologies used to make these estimates were likely based on expert opinion. Similar to the Santa Ynez River, ongoing rescues may have had a small effect on the Ventura River steelhead populations in the 1940s. By the mid-1970s, the steelhead run size was estimated at approximately 100 fish, likely due to limited suitable rearing habitat below Robles Diversion Dam (Becker and Reining 2008).

There are four key tributaries to the Ventura River that historically provided substantial suitable spawning and rearing habitat for *O. mykiss*. These tributaries were Matilija Creek, San Antonio Creek, Coyote Creek, and Santa Ana Creek (Capelli 1974). Coyote Creek likely had a strong run of steelhead with up to 500 adult returns being probable prior to construction of Casitas Dam. Currently, the few returning Southern SH/RT spawners may use the lower reaches of the 13-mile stream for spawning (Becker and Reining 2008; Titus et al. 2010). Matilija Creek, which extends for almost 15 miles from its confluence with the Ventura River, contains ideal spawning and rearing habitat. However, access to the upper reaches of the creek was impeded with the construction of Matilija Dam (Becker and Reining 2008). Before completion of the dam, it is estimated that the creek could have supported runs of 2,000 to 2,500 spawners (Becker and Reining 2008). The removal of Matilija Dam, which is an important element of the Matilija Dam Ecosystem Restoration Project, is currently in the process of environmental review. Tributaries of Matilija Creek contain high quality habitat that continue to support resident *O. mykiss* (Becker and Reining 2008). The removal of Matilija dam will allow access to about 20 miles of stream habitat for Southern SH/RT (MDERP 2022). Historical presence of steelhead in San Antonio Creek is unknown, but the stream is thought to have produced steelhead in the 1980s and 1990s (Titus et al. 2010). Santa Ana Creek was home to *O. mykiss* in the headwater reaches during the 1930s through the 1940s as well as in 1979 (Becker and Reining 2008).

Construction on the Robles Fish Passage Facility, which allows fish passage through the Robles Diversion Dam, was completed in 2006. As a requirement of their federal Biological Opinion, CMWD monitors fish migration through the facility (CMWD 2019). A downstream migrant trap is also operated to evaluate if smolts can pass through the facility without injury (CMWD 2019). A weir trap is then used to evaluate success of smolt migration through the reach downstream of the facility (CMWD 2019). Small numbers of out-migrating smolts have been captured since operation of the weir trap began. However, during the most recent drought (2012-2017), trapping did not occur due to low flow conditions. Since 2017, zero to only a few fish have been observed per year in the vicinity of the passage facility. Presence/absence and redd surveys for *O. mykiss* have also been conducted by CMWD each year and numbers have declined substantially since the beginning of the drought (CMWD 2018).

4.3.1.4 Santa Clara River

The Santa Clara River is a major river that flows into the Pacific Ocean near Ventura, California. The watershed drains an area of approximately 1,600 square miles with 75 stream miles (Becker and Reining 2008). The historical steelhead run was estimated to be around 9,000 fish based on comparisons of habitat suitability metrics produced for the Ventura River (Moore 1980). Numerous instream water diversions have impeded anadromous migration since the 1950s (Becker and Reining 2008; Titus et al. 2010).

Tributaries that intersect the Santa Clara River above the Vern Freeman Diversion historically provided most of the suitable Southern SH/RT spawning and rearing habitat in the watershed. Santa Paula Creek, a tributary to the Santa Maria River, contains high quality suitable *O. mykiss* spawning and rearing habitat. The Harvey Diversion Dam is located on the lower reaches of Santa Paula Creek. While this diversion originally provided fish passage, strong flows rendered the facility irreparable in 2005 (Stoecker and Kelley 2005). More recently, the Harvey Diversion Fish Passage Remediation Project has the goal of restoring fish passage at the facility to reestablish connection to the upstream watershed on Santa Paula and Sisar creeks (California Trout 2018).

Sespe and Piru creeks are the largest tributaries of the Santa Clara River and support higher *O. mykiss* numbers than Santa Paula Creek (Stoecker and Kelley 2005). Sespe Creek contains over 198 km of habitat historically accessible to steelhead and sustains the highest relative abundance of wild *O. mykiss*. It is thought that Sespe Creek offers the highest potential for steelhead recovery because it lacks mainstem migration barriers (Stillwater Sciences 2019). However, Sespe Creek is known to dry in years with low precipitation, leading to a loss of connectivity with the Santa Clara River (Puckett and Villa 1985; Stoecker and Kelley 2005). A recent survey found high abundances of aquatic invasive species throughout most reaches of Sespe Creek downstream of its confluence with Howard Creek, which transports high abundances of invasive species from the Rose Valley Lakes (Stillwater Sciences 2019).

The Piru Creek watershed includes the Santa Felicia and Pyramid Dams. Both dams block access to upstream historical habitat on the Santa Clara River. Reservoir and dam operations also lead to unnatural and diminished flow regimes in the watershed (Moore 1980). Prior to the construction of both dams, adult steelhead were reported to migrate up into Buck and Snowy creeks (Stoecker and Kelley 2005). Piru Creek does not provide spawning and rearing habitat to Southern SH/RT (Moore 1980); however, Aqua Blanca and Fish creeks contain suitable habitat and currently support adfluvial *O. mykiss* populations, which could be important in the future for restoring an anadromous run in this tributary (Stoecker and Kelley 2005).

Various Santa Clara tributaries, including those mentioned above, were stocked in the 1930s through 1950s with hatchery *O. mykiss* as well as those rescued from the Santa Ynez River in 1944 (Titus et al. 2010). Some minor tributaries of the Santa Clara River were also stocked but have no historical records of *O. mykiss* presence. These tributaries include Hopper Canyon, Tom, Pole, and Willard creeks (Titus et al. 2010).

Operations of a downstream migrant trap at the Vern Freeman Diversion Dam began in 1993. Operations typically occur from January to June when flows in the river are sufficient to maintain consistent water levels at the fish trap. A total of 16 adult steelhead and 839 smolts were observed at the Freeman Diversion from 1993-2014 (Booth 2016).

4.3.2 Conception Coast Biogeographic Population Group

Eight small watersheds that are relatively uniform in geographic features comprise the Conception Coast BPG, which spans about 50 miles of the southern California coast (NMFS 2012a; Figure 8). Streams in this BPG run north to south and have steep slopes in the upper portions of their watersheds where there is perennial flow. Precipitation can be much higher in the upper watersheds and can lead to “flashy” flows due to the steep stream gradients (NMFS 2012a). Both the Carpinteria Creek and Gaviota Creek watersheds have been the focus of habitat restoration in recent years, as both provide high-quality spawning and rearing habitat for Southern SH/RT and have high recovery potential (NMFS 2012a).

4.3.2.1 Gaviota Creek

Gaviota Creek is about six miles in length, connecting with the Pacific Ocean just south of Las Cruces, California. Steelhead were documented in Gaviota Creek in the 1930s in the winter (Becker and Reining 2008) and multiple ages of *O. mykiss* were observed in the 1990s and early 2000s (Becker and Reining 2008). Steelhead runs in Gaviota Creek, which were historically present in most years, were likely small (Becker and Reining 2008). Livestock grazing is responsible for reductions in suitable habitat for Southern SH/RT in the watershed (Becker and Reining 2008). In recent years, periodic bankside observations conducted by the Department have observed a range of zero to a few hundred *O. mykiss* and no adult steelhead in Gaviota Creek (K. Evans, CDFW, unpublished data).

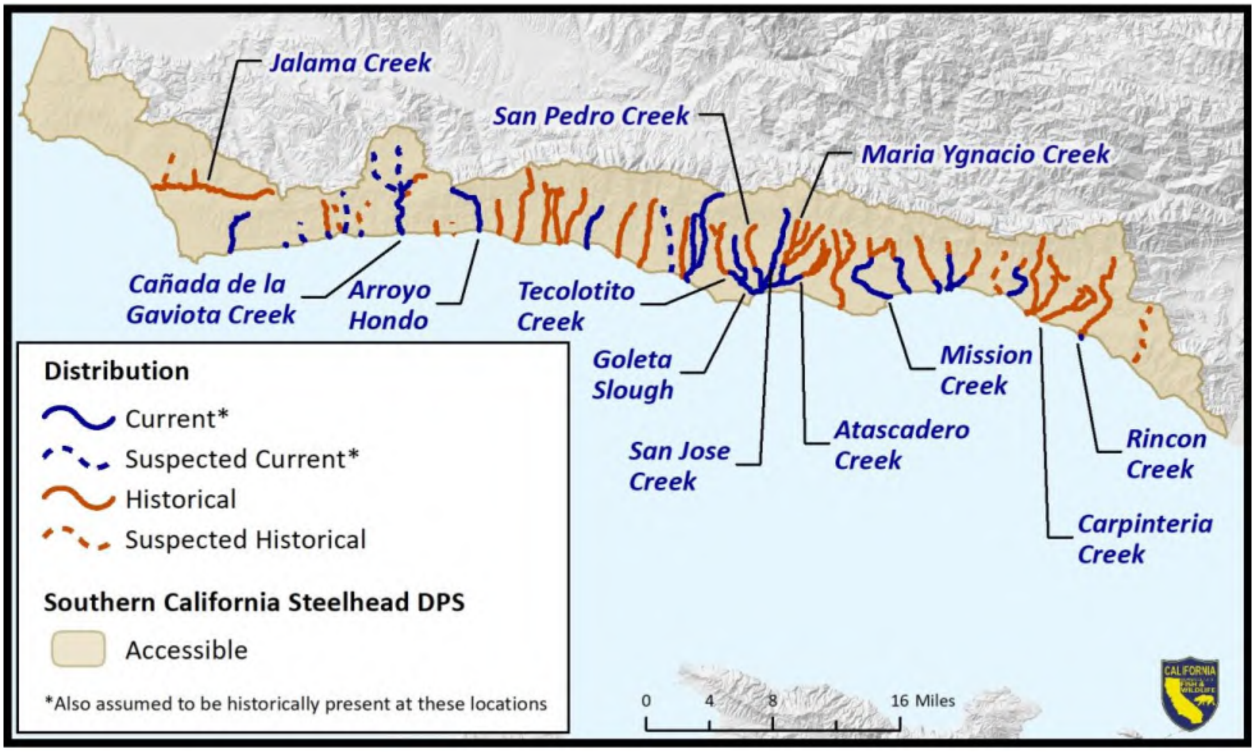

Figure 8. Map of the Conception Coast BPG depicting known and suspected current and historical distribution.

4.3.2.2 Carpinteria Creek

Carpinteria Creek is approximately 6.5 miles long and connects with the Pacific Ocean near Carpinteria, California. Southern SH/RT were observed in the watershed in 1942 (Stoecker et al. 2002) and the stream was understood to have a historical steelhead run (Becker and Reining 2008). Different life stages of *O. mykiss* were seen in the mid-1990s (Becker and Reining 2008) and many were seen in the upper watershed (Becker and Reining 2008) which is known to have suitable habitat (Becker and Reining 2008). A few *O. mykiss* of varying sizes were found in the lower watershed in 2008 (Becker and Reining 2008). In recent years, monitoring conducted by the Department from 2016-2022 have observed few if any individuals of either life-history forms (K. Evans, CDFW, unpublished data).

4.3.2.3 Other Creeks

There are many other creeks flowing into the Pacific Ocean, some of which may have supported Southern SH/RT historically, some where there have been recent observations, and others where *O. mykiss* has not been seen at all. These coastal creeks are typically no longer than 10 stream miles. In addition to Gaviota and Carpinteria creeks, other suitable streams with more recent sightings of Southern SH/RT include Arroyo Hondo Creek and Rincon Creek (Becker and

Reining 2008). Arroyo Hondo Creek contains the least number and severity of threats for Southern SH/RT in the Conception Coast BPG (NMFS 2012a).

4.3.3 Santa Monica Mountains Biogeographic Population Group

There are five watersheds in the Santa Monica Mountains BPG, the majority of which are small with geography resembling that of watersheds in the Conception Coast BPG (NMFS 2012a; Figure 9). Except for Malibu Creek, the headwaters of the streams occur prior to passing through the Santa Monica mountains. Malibu Creek is the largest watershed in the BPG (NMFS 2012a) but is similar to Topanga Creek in stream length (Becker and Reining 2008). There are two substantial anthropogenic migration barriers on Malibu Creek, Rindge Dam and Malibu Lake Dam. Rindge Dam is located a few miles upstream from the mouth and prevents access to nearly all historical Southern SH/RT habitat. The remaining three streams include Big Sycamore Canyon Creek, Arroyo Sequit, and Las Flores Canyon Creek (NMFS 2012a).

4.3.3.1 Malibu Creek

The Malibu Creek watershed encompasses about 105 square miles including 8.5 miles of stream that outflows into the Pacific Ocean at Malibu Lagoon State Beach in Santa Monica Bay (Becker and Reining 2008). Rindge Dam was constructed in 1924 about three miles upstream from the mouth (Becker and Reining 2008; Titus et al. 2010). Before the dam was built, steelhead were able to access spawning habitat in Las Virgenes and Cold creeks (Titus et al. 2010). In 1947, a substantial steelhead run was observed when the sandbar at the mouth was manually opened. At the time, steelhead were able to access about 10-12 stream miles in the basin (Becker and Reining 2008). In the 1970s, steelhead were observed migrating upstream up to Rindge Dam (Becker and Reining 2008). In 1980, a Department employee counted 61 steelhead immediately downstream of Rindge Dam (Titus et al. 2010). Multiple life stages of *O. mykiss* were observed during a study conducted in the winter and spring of 1986. A total of 158 fish was reported though only one was an adult steelhead. Later in 1986 and in 1987, a handful of adult *O. mykiss* were found below Rindge Dam and a few adult *O. mykiss* were seen just below the dam in 1992 (Titus et al. 2010). The quality of spawning and rearing habitat is the best just below Rindge Dam (Titus et al. 2010), which explains the greater use of that area by juvenile *O. mykiss* (Titus et al. 2010). Stocking of hatchery Rainbow Trout occurred in 1984 at Malibu Creek State Park with additional stockings likely occurring frequently (Titus et al. 2010).

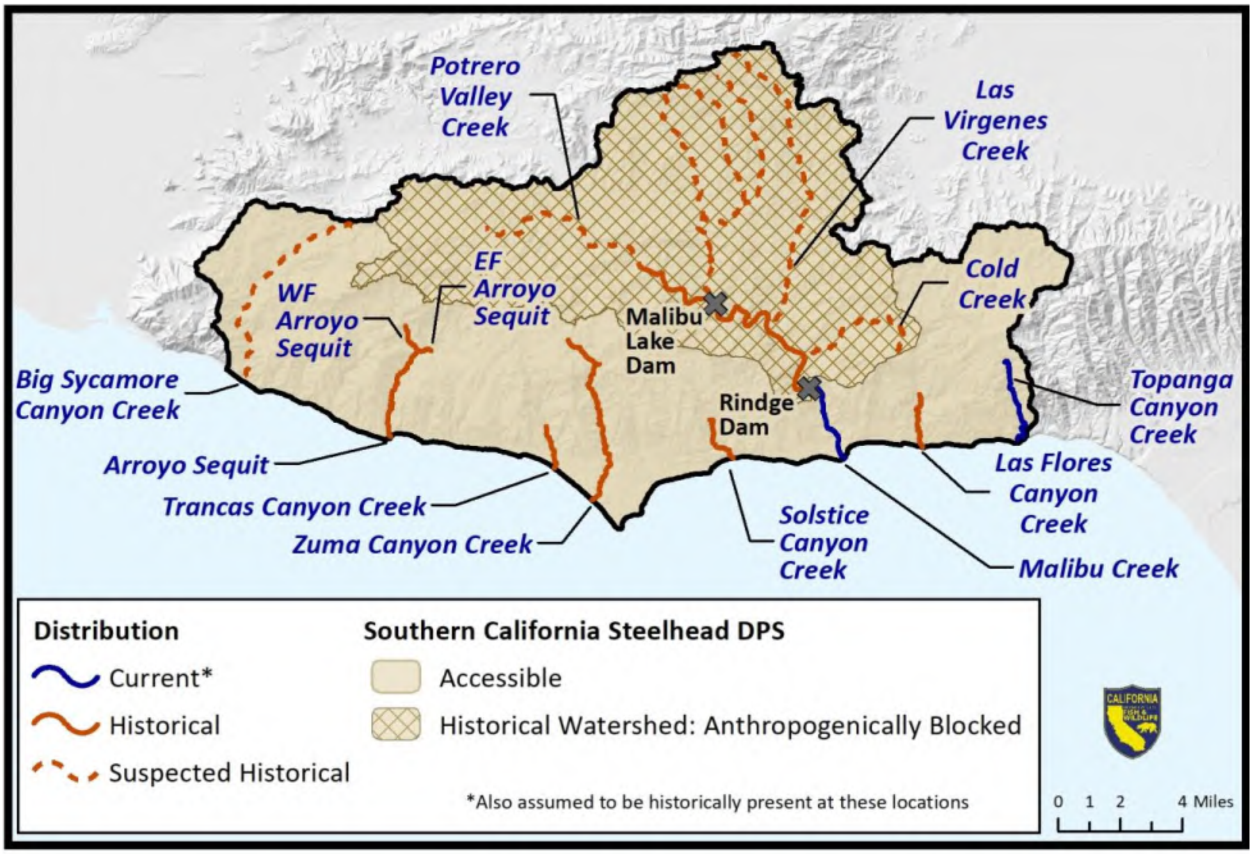

Figure 9. Map of the Santa Monica Mountains BPG depicting known and suspected current and historical distribution. Abbreviations: EF = East Fork, WF = West Fork.

In addition to Rindge Dam and other migration barriers blocking access to historical habitat, the natural flow regime and water quality of Malibu Creek has been modified by operations of the Tapia Water Reclamation Facility (approximately 5 miles upstream from the ocean). Treated water releases from the facility sustain flows in Malibu Creek throughout the year (Titus et al. 2010). Currently, a new recycled wastewater treatment facility is being proposed that would treat effluent from the Tapia Water Reclamation Facility with the purpose of re-distributing the water to the service area rather than releasing it back to Malibu Creek (Las Virgenes-Triunfo Joint Powers Authority 2022). The implementation of this project could lead to less streamflow in Malibu Creek as a result of the repurposing of discharged recycled water that would have previously been released to Malibu Creek.

In more recent years, *O. mykiss* have been seen in Malibu Creek below Rindge Dam (Becker and Reining 2008). A die off of about 250 *O. mykiss* occurred in the creek in 2006 after yellowing of the fish was noticed during snorkel surveys (Becker and Reining 2008). Recent drought conditions starting in 2012 have led to reduced abundances of *O. mykiss* in Malibu Creek based on similar observations on Topanga Creek (Dagit et a. 2017)

4.3.3.2 Topanga Creek

Topanga Creek empties into the ocean at Topanga Beach and contains similar stream mileage to Malibu Creek (Becker and Reining 2008). Some steelhead can access Topanga Creek in years when there is sufficient precipitation (Becker and Reining 2008) and *O. mykiss* of various sizes were observed in the watershed in 1979 (Becker and Reining 2008). Juvenile *O. mykiss* were observed by Department staff in Topanga Creek again in 1982 (Becker and Reining 2008).

The Southern SH/RT population in Topanga Creek was recently monitored from 2001-2007, revealing consistent use by spawning steelhead adults and successful smolt production (Becker and Reining 2008). Bell et al. (2011b) characterized the Topanga population as a satellite population that is supported by other populations in the Southern SH/RT range but provides minimal production to other streams. As a satellite population, Topanga Creek *O. mykiss* support the metapopulation in southern California but are more vulnerable to extirpation (Bell et al. 2011b). The effects of the most recent prolonged drought on Southern SH/RT have been severe. Significant reductions for all life-stages were observed from 2012-2016, leading to reductions of the population from 358 individuals in 2008 to less than 50 individuals in 2016 (Dagit et al. 2017).

4.3.3.3 Other Creeks

Big Sycamore Canyon Creek was surveyed in 1989-1990 but no steelhead were observed (Becker and Reining 2008). NMFS (2005) designated the population as extirpated after another survey in 2002.

Arroyo Sequit Creek was reported to have a small historical steelhead run. Steelhead were seen in a 1989-1990 survey of the stream and again in a 1993 survey. From 2000-2007 steelhead were reported utilizing Arroyo Sequit Creek (Becker and Reining 2008).

Overall, from 2005-2019, monitoring in Arroyo Sequit Creek done by the Resource Conservation District of the Santa Monica Mountains (RCDSMM) has observed few *O. mykiss*, primarily due to two instream barriers that were eventually removed in 2016. Two adult observations occurred after the removal of barriers in 2017 (Dagit et al. 2019). There is also limited documentation of steelhead in the West and East forks of Arroyo Sequit Creek (Becker and Reining 2008). Las Flores Canyon Creek is reported to have suitable steelhead habitat but there is no evidence of historical or present use by steelhead (Becker and Reining 2008; Titus et al. 2010).

4.3.4 Mojave Rim Biogeographic Population Group

There are three relatively large watersheds that make up the Mojave Rim BPG (NMFS 2012a; Figure 10). These watersheds include the San Gabriel, Santa Ana, and Los Angeles rivers. The headwaters of these streams are in the San Gabriel and San Bernardino mountains, which experience greater seasonal precipitation than is seen in the neighboring BPGs. Lower watershed areas span the flat coastal plain of the Los Angeles River, and over time the mouths of these rivers have drifted to different areas along the coast. Currently, the river mouths are each less than 20 miles apart (NMFS 2012a).

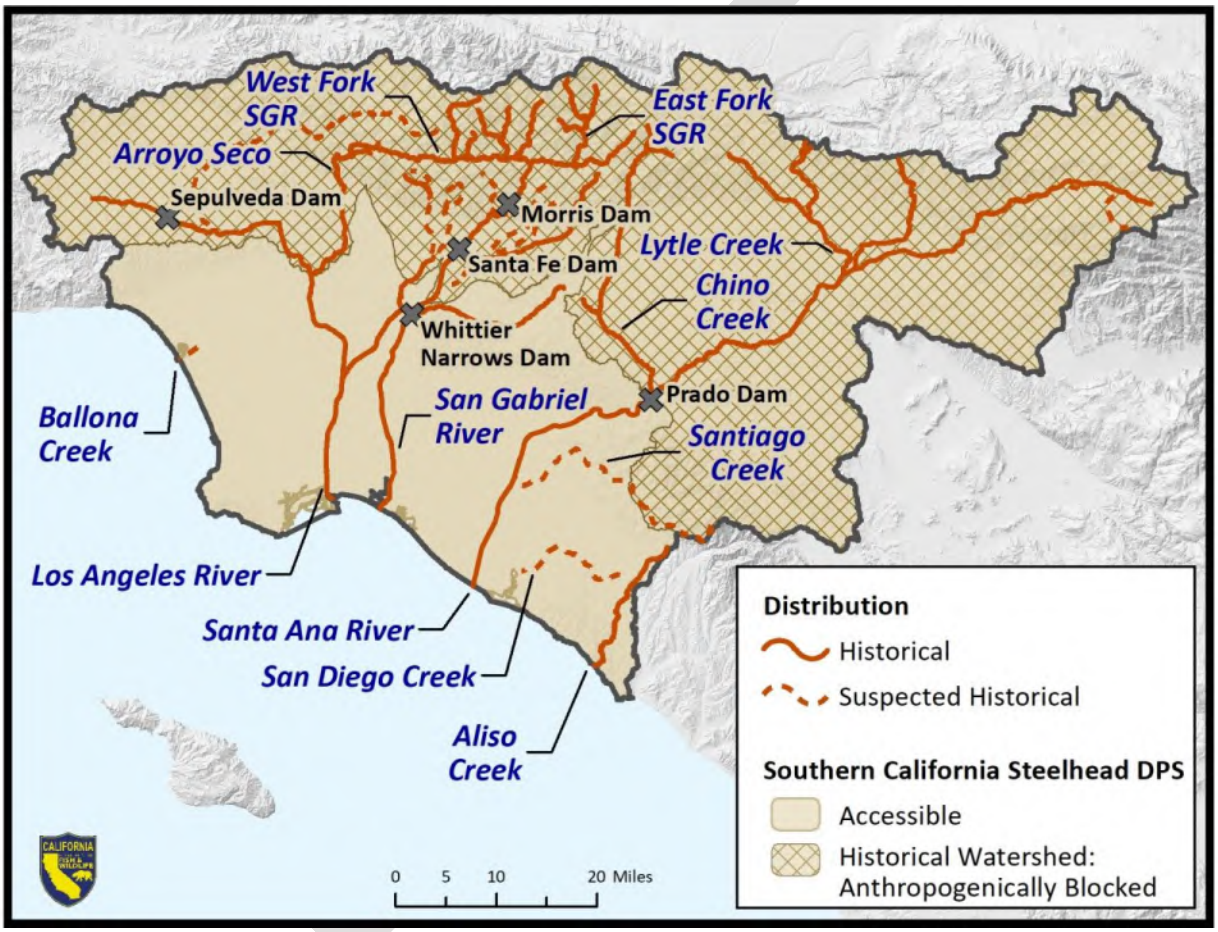

Figure 10. Map of the Mojave Rim BPG depicting known and suspected current and historical distribution. Abbreviations: SGR= San Gabriel River.

4.3.4.1 San Gabriel River

The San Gabriel River encompasses more than 58 stream miles but about half of it is channelized below Santa Fe Dam. Morris Dam and Santa Fe Dam were both constructed in the 1930s (Becker and Reining 2008) and are considered complete barriers to fish migration.

Rainbow trout were seen by Department staff in the 1930s, but the river was also stocked during that time (Becker and Reining 2008). Stocking below Morris Dam also occurred on Little Dalton Creek in 1945 (Titus et al. 2010). Rainbow Trout fishing was good from the late 1930s to late 1940s according to various Department stream surveys and in 1951, Department staff noted that natural production was average (Becker and Reining 2008). Fish Canyon Creek and Robert's Canyon Creek, which are mainstem tributaries downstream of Morris Dam, were observed by Department surveyors to have *O. mykiss* in in the 1940s, 1950s, and 1973 (Titus et al. 2010).

Southern SH/RT historically occurred in a few tributaries of the San Gabriel River such as San Jose Creek. Many tributaries to the San Gabriel River have been channelized and contain fish passage barriers. Most were stocked for recreational angling in the 1930s and 1940s (Becker and Reining 2008). Southern SH/RT remain in tributaries above the two barrier dams and are known to presently inhabit the East Fork. The ancestry of these fish is unclear and may have genetic influence from stocking *O. mykiss* from other watersheds (Nielsen 1999). There is also a remnant historical population of Rainbow Trout just below Morris Dam that appears to self-propagate (Becker and Reining 2008).

4.3.4.2 Santa Ana River

The Santa Ana River is the largest river within southern California at almost 100 miles long (Becker and Reining 2008). Prado Dam, which is located approximately 30 miles upstream of the river outlet, was constructed in 1941 (O.C. Public Works, n.d.). The lower 24 miles of channelized river below the dam outflows to the Pacific Ocean in Huntington Beach (Becker and Reining 2008). Rainbow Trout were observed in the mountainous upper watershed during the 1930s, coinciding with when stocking occurred (Becker and Reining 2008). A steelhead run was historically present in the lower river (Becker and Reining 2008); however, in 1951 and 1955, no *O. mykiss* were observed in any stream reaches below Prado Dam during Department surveys (Titus et al. 2010). Various water uses have highly altered flows in the Santa Ana River and low numbers of fish in the lower river are attributed to limited water releases from Prado Dam (Titus et al. 2010). Southern SH/RT are thought to be extirpated from the Santa Ana River (Nehlsen et al. 1991), but resident *O. mykiss* remain in the upper watershed above natural and manmade impassable barriers (Boughton et al. 2005).

Southern SH/RT were historically present in Santiago Creek below Prado Dam. Many tributaries upstream of where the dam was built were stocked with *O. mykiss* in the 1930s and fish have been observed reproducing naturally in the decades that followed (Becker and Reining 2008).

4.3.4.3 Los Angeles River

The Los Angeles River is approximately 52 miles long and flows to the Pacific Ocean in Long Beach. Like the San Gabriel River, the Los Angeles River is completely channelized with much of the lower mainstem channel paved with concrete for flood control purposes (Becker and Reining 2008; Titus et al. 2010). Southern SH/RT are assumed to have been present in the watershed but there have been no actual observations to confirm this assumption (Titus et al. 2010). Major tributaries to the Los Angeles River were stocked in the 1930s or 1940s (Becker and Reining 2008; Titus et al. 2010) but some of these tributaries were later channelized and no longer support *O. mykiss*. Due to the highly modified nature of the river basin, Southern SH/RT cannot utilize the mainstem Los Angeles River for spawning or rearing (Titus et al. 2010) and are considered extirpated (Nehlsen et al. 1991). However, resident *O. mykiss* have recently been observed in Arroyo Seco, a main tributary to the Los Angeles River, and its tributaries (Becker and Reining 2008). Fish passage by native Southern SH/RT on the creek is obstructed by Devil's Gate Dam. Recently, Department-led fish rescues have transplanted Southern SH/RT from the West Fork San Gabriel River and Bear Creek to Arroyo Seco as a result of the Bobcat Fire (Pareti 2020).

4.3.5 Santa Catalina Gulf Coast Biogeographic Population Group

Multiple medium sized watersheds comprise the Santa Catalina Gulf Coast BPG (Figure 11). Most have their headwaters in the Santa Ana or Peninsular Mountain ranges and flow south over coastal terraces (NMFS 2012a). Many watersheds in the BPG have intermittent flow and are seasonally dry due to limited precipitation. Some smaller drainages within the BPG might occasionally support steelhead. Streams in this BPG have substantial tributary mileage in the upper watershed areas due to the fragmented landscape in the region (NMFS 2012a).

4.3.5.1 San Juan Creek

San Juan Creek is 22-mile stream located in Orange and Riverside Counties. Arroyo Trabuco Creek is a major tributary to San Juan Creek with approximately the same stream length (Becker and Reining 2008). Steelhead were observed in the creek in 1939 (Swift et al. 1993) and in the 1940s as well as in 1968 and 1974 (Becker and Reining 2008). Trout stocking to support fishing in San Juan Creek occurred year-round in 1981 (Becker and Reining 2008) and possibly in other years. San Juan Creek contains suitable habitat for *O. mykiss*, which have been observed in some but not all years in recent decades (Becker and Reining 2008).

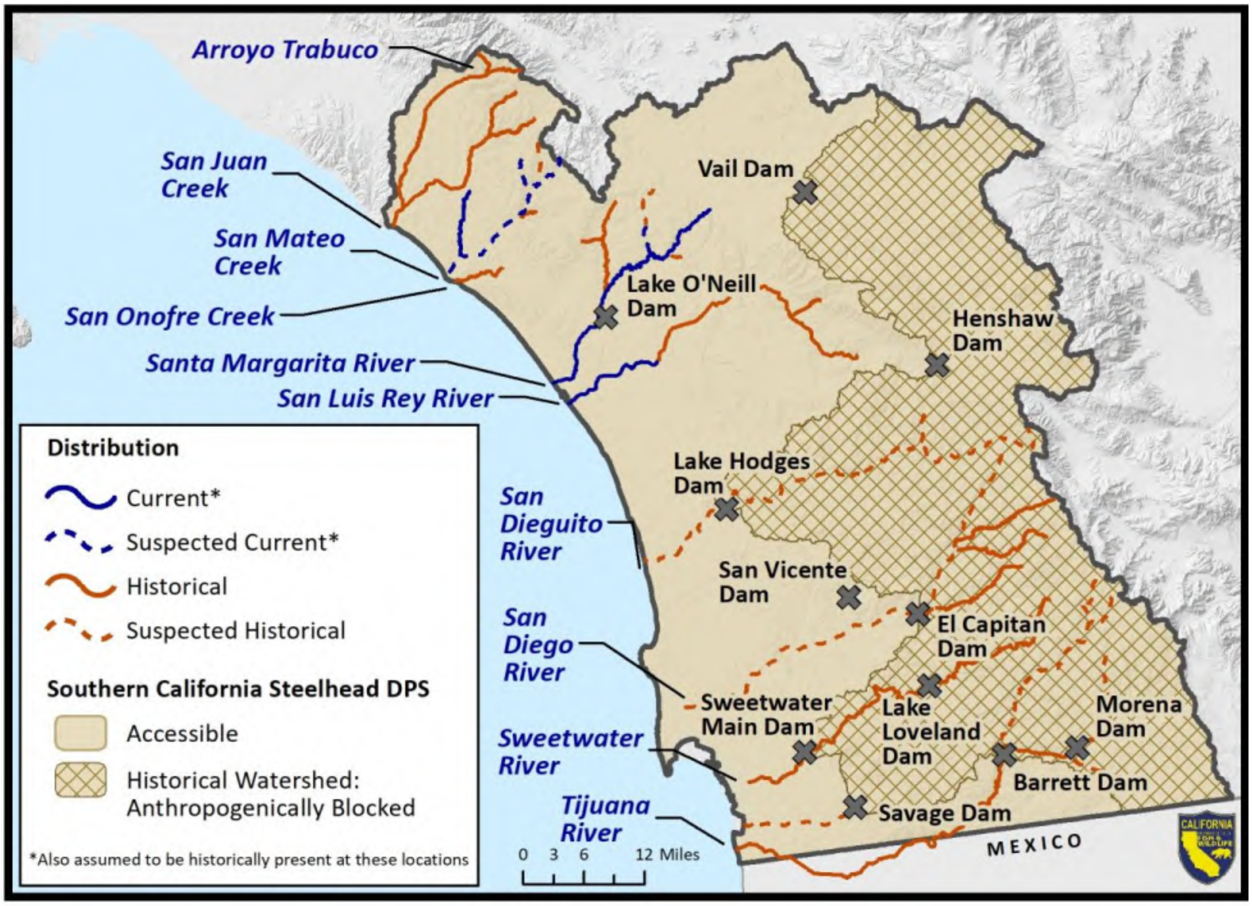

Figure 11. Map of the Santa Catalina Gulf Coast BPG depicting known and suspected current and historical distribution.

Arroyo Trabuco was a historical Southern SH/RT stream; however, there is now a complete barrier to fish migration about 2.4 miles from the confluence with San Juan Creek. Regardless, the stream still appears to contain suitable habitat and steelhead were still believed to be present in 2004 (Becker and Reining 2008). Recently, efforts to remediate fish passage at two total barriers to migration on Trabuco Creek are in progress. Completion of this project would provide access to 15 miles of upstream spawning and rearing habitat.

4.3.5.2 San Mateo Creek

San Mateo Creek, which has a similar stream length as San Juan creek, supported a historical steelhead run (Titus et al. 2010). In the early 1900s, anglers were successful in catching Southern SH/RT of greater sizes than in other regional watersheds (Titus et al. 2010). In 1939, juvenile Southern SH/RT were observed and rescued in the thousands from isolated reaches and transferred to the estuary lagoon (Titus et al. 2010). Stocking of the creek began in 1945 (Becker and Reining 2008). Anadromous and resident Southern SH/RT were thought to persist in 1950 (Becker and Reining 2008), though after that year, Southern SH/RT encounters declined (Titus et al. 2010). In 1999, *O. mykiss* sampled by the Department were surmised to be offspring from anadromous Southern SH/RT because of the lack of a resident population (Becker and Reining 2008). A resident *O. mykiss* population likely does exist in Devil Canyon Creek, a major tributary to San Mateo Creek (Hovey 2004). Habitat quality in the watershed has been degraded by anthropogenic activities and intermittent streamflow has posed migration issues for Southern SH/RT (Titus et al. 2010). Steelhead are thought to be extirpated from San Mateo Creek (Nehlsen et al. 1991). Currently, the San Diego Regional Water Quality Control Board is considered using a draft invasive species Total Maximum Daily Load (TMDL) and plan to certify that actions of other entities will correct impairments to the creek caused by invasive species (Loflen 2022).

4.3.5.3 San Onofre Creek

San Onofre Creek consists of 13 miles of stream in Orange County. Personal observations of annual steelhead runs in the creek prior to 1946 suggest it was a historical Southern SH/RT stream (Becker and Reining 2008). Fletcher Creek, a tributary to San Onofre Creek, was considered a steelhead rearing area in 1950 and *O. mykiss* were observed by Department staff during a survey in 1979 (Titus et al. 2010). By the 2000s, San Onofre Creek was observed to be dry (Boughton et al. 2005), though reaches in the upper watershed may still offer suitable *O. mykiss* habitat (Becker and Reining 2008).

4.3.5.4 Santa Margarita River

The Santa Margarita River is almost 30 miles long, but a diversion weir located approximately ten miles upstream within the boundaries of Camp Pendleton likely acts as a complete barrier to upstream fish migration (Becker and Reining 2008; Titus et al. 2010). This diversion eliminates surface flow during most of the year (Titus et al. 2010). Adult and juvenile steelhead were observed in the river in the 1930s and 1940s and steelhead were thought to migrate upstream to the town of Fallbrook when flows allowed (Becker and Reining 2008). DeLuz Creek, a tributary to the Santa Margarita River, also historically supported steelhead (Becker and Reining 2008). Stocking of *O. mykiss* in the Santa Margarita watershed began in 1941 (Becker and Reining 2008) and occurred most recently in 1984 (Titus et al. 2010). Currently, the reaches downstream of O’Neill Lake do not support Southern SH/RT spawning (Titus et al. 2010) and they are thought to be extirpated (Nehlsen et al. 1991). As part of the Santa Margarita River Conjunctive Use Project, the existing O’Neill weir diversion will be replaced with an inflatable structure that will allow fish passage during most flow events (FPUD 2016). Further upstream, efforts are also underway to replace a fish passage barrier at the Sandia Creek Drive bridge to provide passage to 12 miles of upstream rearing and spawning habitat (Dudek 2021)

4.3.5.5 San Luis Rey River

The San Luis Rey River is a large river in northern San Diego County that runs approximately 69 stream miles from its river mouth near Oceanside, California. Lake Henshaw Dam, which was built in 1924, reduces the downstream flow of the river and blocks steelhead access to the uppermost portion of the drainage (Becker and Reining 2008; Titus et al. 2010). According to Native Americans and other observers of *O. mykiss* in the late 1800s, there was a historical run of steelhead that was able to reach areas above where the dam was constructed (Becker and Reining 2008). Stocking of Rainbow Trout occurred sometime prior to 1946 (Becker and Reining 2008). Although resident Rainbow Trout remain in tributaries of the upper watershed like Pauma Creek and the West Fork San Luis Rey River (Becker and Reining 2008), native Southern SH/RT are extirpated from the lower reaches of the San Luis Rey River (Nehlsen et al. 1991; Becker and Reining 2008).

4.3.5.6 San Dieguito River

The San Dieguito River is a large river in San Diego County that runs for 23 stream miles before entering into the Pacific Ocean north of the City of San Diego. Hodges Dam, which was constructed 12 miles upstream from the mouth in 1918, serves as a complete barrier to anadromy (Becker and Reining 2008). A journal article by Hubbs (1946) mentioned anglers catching possible steelhead in the estuary (Titus et al. 2010). Rainbow trout have been stocked below the dam (Titus et al. 2010); however, those downstream reaches no longer support *O. mykiss* (Becker and Reining 2008). Prior to the construction of the Sutherland Lake dam on Santa Ysabel Creek, a major tributary of the San Dieguito River, Department staff saw *O. mykiss* in a creek upstream of the eventual dam site, though there had been stocking efforts in that creek (Becker and Reining 2008). Black Canyon Creek, another smaller tributary to the San Dieguito River, was also stocked for rainbow trout fishing (Becker and Reining 2008).

4.3.5.7 San Diego River

The San Diego River has a stream length of 52 miles but El Capitan Dam, built in 1934, blocks about 22 miles of historical Southern SH/RT habitat (Becker and Reining 2008). Additionally, channelization of downstream reaches has eliminated suitable habitat below the dam (Titus et al. 2010). Anglers may have caught steelhead historically (Titus et al. 2010) but the population is now thought to be extinct (Nehlsen et al. 1991). Upper watershed tributaries above the dam were stocked in the 1930s and earlier and may still support *O. mykiss* (Becker and Reining 2008; Titus et al. 2010).

4.3.5.8 Sweetwater River

The Sweetwater River is a large river in San Diego County that runs for 55 miles before emptying into San Diego Bay southeast of the City of San Diego. The Sweetwater Reservoir, formed by the construction of the Sweetwater Dam in 1888, serves as a total barrier to anadromy (Becker and Reining 2008; Titus et al. 2010). Although *O. mykiss* were present historically and may still be found in the upper watershed, there are no mentions of a historical anadromous steelhead run in the Sweetwater River (Becker and Reining 2008; Titus et al. 2010). In years leading up to 1946, Cold Stream, a small tributary to Sweetwater River, was stocked with Rainbow Trout and these fish may have continued to naturally reproduce for some time (Becker and Reining 2008).

4.3.5.9 Otay River

The Otay River enters the south end of San Diego Bay near the U.S.-Mexico Border. There are no known historical or current records of Southern SH/RT existing in the Otay River. Fish passage is obstructed by the dam that forms Lower Otay Lake, though there may be *O. mykiss* residing in upper reaches above the reservoir (Titus et al. 2010).

4.3.5.10 Tijuana River

The Tijuana River is the southernmost stream within the Southern SH/RT range and extends for 26 miles from the intersection of Cottonwood Creek (Becker and Reining 2008). Other than one account of few steelhead seen in 1927 by Department law enforcement, there has been no other documentation of historical use of the mainstem river (Titus et al. 2010). Steelhead were present in Cottonwood Creek in the mid-1930s, which was stocked with *O. mykiss* at that time, but Southern SH/RT are no longer able to pass multiple dams within the creek (Titus et al. 2010). If a steelhead run did exist in the Tijuana watershed, it is now assumed to be extirpated (Titus et al. 2010).

4.4 Abundance and Trends

To provide the best scientific information in our evaluation of the candidate species as required by Fish and Game Code Section 2074.6, we analyzed status and trends for Southern SH/RT with annual abundance data compiled from a variety of sources (See Section 4.2 for Sources of Information).

Southern SH/RT, as defined in the Petition, include both anadromous and resident forms of the species below complete migration barriers. To account for both life-history forms in our review, our analyses in Sections 4.4-4.8 examine data on anadromous adult Southern SH/RT (Adult SH) separately from data on *O. mykiss* not identified as anadromous adult Southern SH/RT (Other *O. mykiss*), as most existing monitoring efforts produce datasets that use these two categories. This is because it is possible to distinguish anadromous adult Southern SH/RT in rivers and streams due to their larger size (fork length >400m), greater girth, and steel-gray appearance, but it is otherwise difficult to conclude which life history an individual *O. mykiss* that does not have the identifying characteristics of an adult fish has expressed or will express. (Dagit et al. 2020; Moyle et al. 2017).

The analysis presented below is structured on the five BPGs with an emphasis on Core 1 and Core 2 populations within each BPG (NMFS 2012a; Boughton et al. 2007). The BPGs are a federal delineation based on a suite of environmental conditions (e.g., hydrology, local climate, geography) and watershed characteristics (i.e., large inland or short coastal streams). Core populations are identified as watersheds that exhibit the physical and hydrological conditions that have the highest potential to sustain self-sufficient viable populations of Southern SH/RT (NMFS 2012a). Datasets were reviewed to ensure that they were collected from monitoring conducted below the upper limit to anadromy in each watershed to remain consistent with the geographic scope of the listing unit proposed in the Petition. Where sufficient data were available for a given population, we present and discuss abundance and long-term population trend estimates for each BPG. The Department was unable to analyze core watersheds in the Mojave Rim and Santa Catalina Gulf Coast BPGs in detail due to data limitations. In these instances, as well as in other cases where data was limiting or unavailable, we provide a qualitative discussion, such as a viability assessment, based on the sources identified in Section 4.2 (Boughton et al. 2022a).

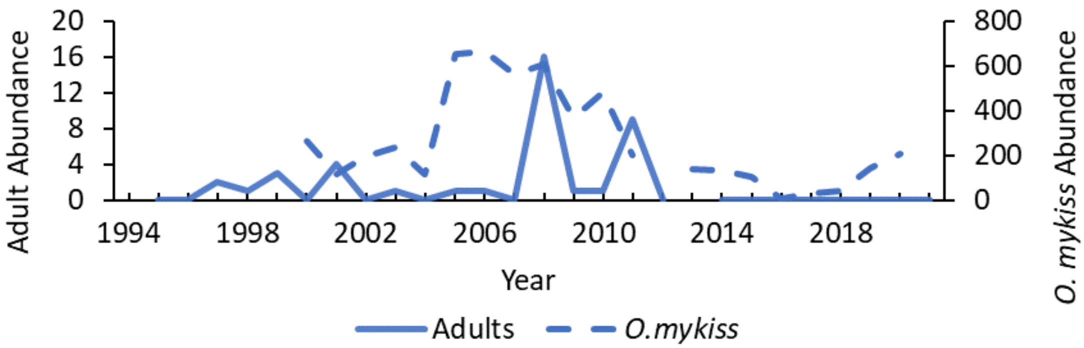
4.4.1 Time Series of Abundance

Southern SH/RT populations in the Monte Arido Highlands BGP have the longest running time-series dating back to the 1990s for the Santa Ynez and Santa Clara rivers (COMB 2022; Booth 2016) and the early 2000s for the Ventura River (CMWD 2005-2021; Dagit et al. 2020) (Figure 12). However, no organized monitoring efforts have been conducted on the Santa Maria River since steelhead were federally listed in 1997. Therefore, no further analysis of the Santa Maria Southern SH/RT populations are conducted in this chapter.

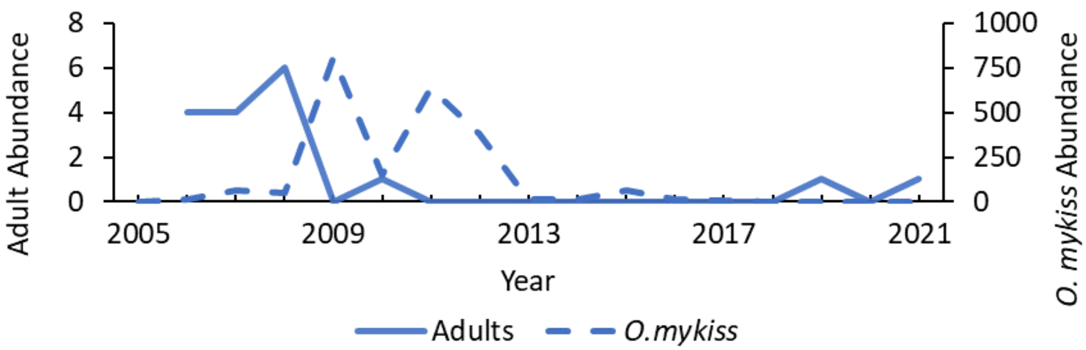
More recently, monitoring has been intermittently conducted on Carpinteria, Mission, and Arroyo Hondo in the Conception Coast BPG by the Department (Boughton et. al 2022a). Malibu, Topanga, and Arroyo Sequit creeks in the Santa Monica Mountains BPG have been actively monitored since the early 2000s (Dagit et al. 2019) (Figure 13). No recent or historical monitoring has been conducted in either the Mojave Rim or Santa Catalina Gulf Coast BPGs.

4.4.1.1 Monte Arido Highlands BPG

A. Santa Ynez River



B. Ventura River



C. Santa Clara River

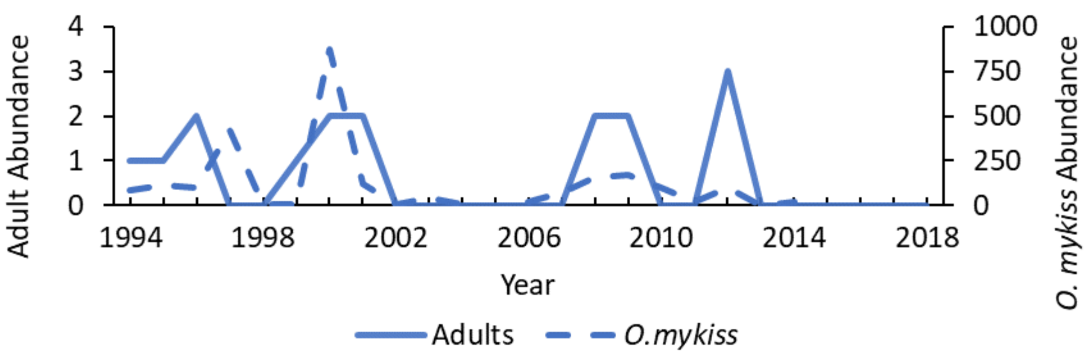


Figure 12. Adult steelhead (Adults) and other O. mykiss (O. mykiss) abundances for the Monte Arido Highlands BPG. A) Santa Ynez River; no data 2013. Biological Opinion Incidental Take provisions have been required since 2014. B) Ventura River. C) Santa Clara River. Adult abundance is on the left -axis with the solid blue line and O. mykiss abundance is on the right axis with the dashed blue line. Note different scales on the Y-axis.

4.4.1.2 Conception Coast BPG

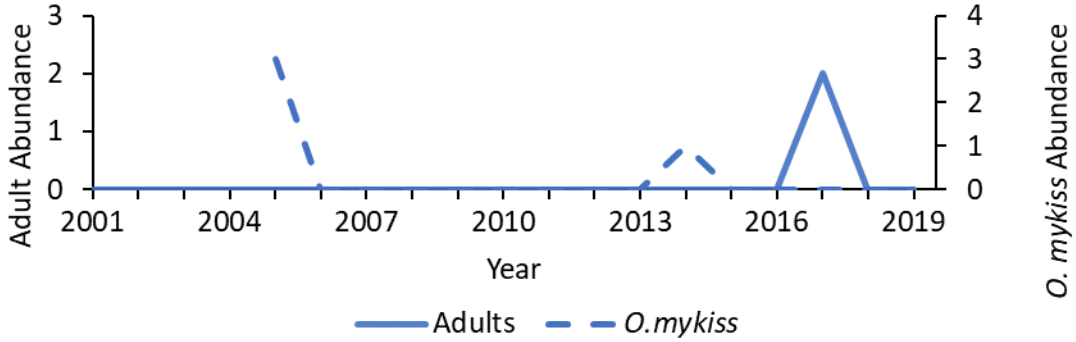
Very few monitoring activities have occurred throughout the Conception Coast BPG, and most of the work that has occurred in more recent years was conducted by the Department. We were unable to develop a full-time series of Southern SH/RT abundance for Conception Coast populations.

Although past monitoring is limited in this BPG, Dagit et. al (2020) documented a total of 42 adult steelhead opportunistic observations from 2000-2018. Two adults were observed in Arroyo Hondo Creek in 2017 and 10 adults were documented in the Goleta Slough Complex with the most recent observation occurring in 2017. For the entirety of Conception Coast BPG, 64% (n=27) of all adult observations occurred in Mission Creek, primarily from 1998-2008. However, from 2018-2022, Department redd and snorkel surveys documented zero adult steelhead in Mission Creek (K. Evans, CDFW, unpublished data). Three adults were observed opportunistically in Carpinteria Creek in 2008 (Dagit et al. 2020); however, from 2008-2019, zero adult steelhead were observed based on recent monitoring conducted by the Department (Boughton et al. 2022a).

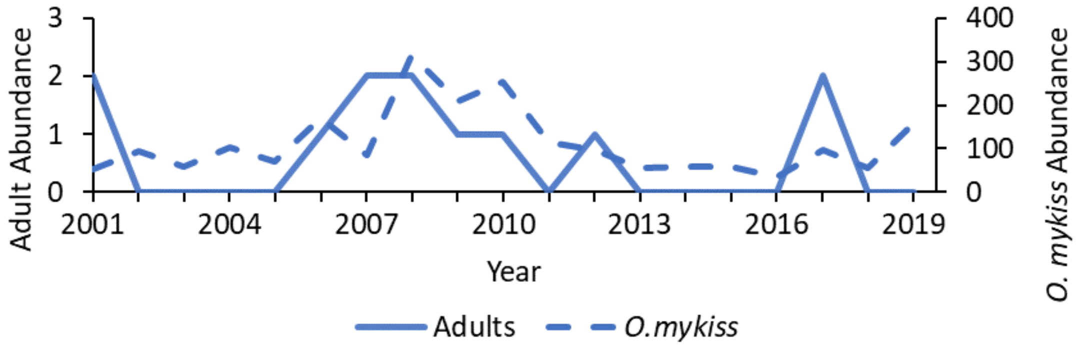
There is also limited data for *O. mykiss* in the Conception Coast BPG. No *O. mykiss* have been documented in Carpinteria Creek since 2016. In Mission Creek, no *O. mykiss* were observed from bankside surveys during the 2018-2019 spawning season (Carmody et al. 2019). In recent years, the largest number of *O. mykiss* observations in this BPG have occurred on Arroyo Hondo Creek, indicating that despite being a small watershed, the creek contains suitable habitat that is relatively undisturbed due to its inclusion in a natural reserve system (NMFS 2012a). Snorkel surveys have documented a total of 2,363 *O. mykiss* in Arroyo Hondo Creek from 2017-2019 (Carmody et al. 2019), while winter redd surveys have documented a total of 12,090 *O. mykiss* from 2015-2022 (K. Evans, CDFW, unpublished data).

4.4.1.3 Santa Monica Mountains BPG

A. Arroyo Sequit Creek



B. Topanga Creek



C. Malibu Creek

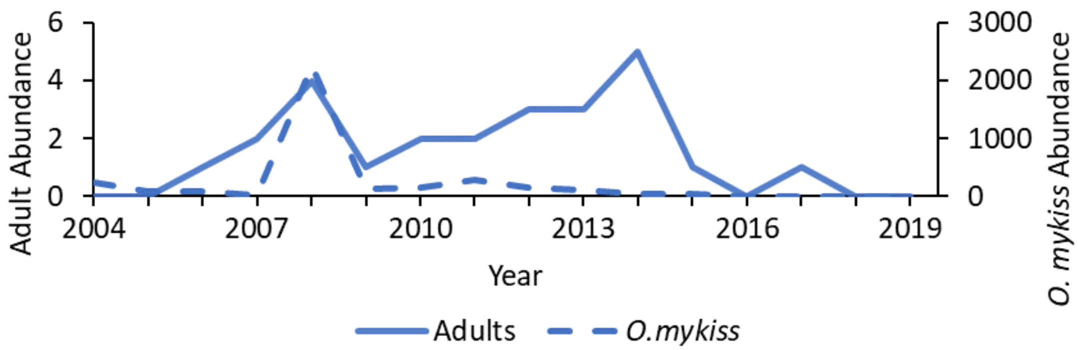


Figure 13. Adult steelhead (Adults) and other O. mykiss (O. mykiss) abundances for the Santa Monica Mountains BPG. A) Arroyo Sequit Creek. B) Topanga Creek. C) Malibu Creek. Adult abundance is indicated on the left -axis and delineated by the solid blue line and O. mykiss abundance is indicated on the right axis and delineated by the dashed blue line. Note different scales on the Y-axis.

4.4.1.4 Mojave Rim BPG

Abundance data is generally not available for this BPG; therefore, we were unable to create a full-time series of Southern SH/RT abundances for the San Gabriel River, Santa Ana River, and Los Angeles River watersheds.

A total of 3 adult steelhead were observed opportunistically in the Mojave Rim BPG from 2000-2018. Two observations occurred on Ballona Creek in 2007, and one observation occurred on the San Gabriel River in 2016 (Dagit et al. 2020). It is generally accepted that all over-summering, rearing, and spawning habitat occurring upstream is no longer accessible to Southern SH/RT due to the presence of extensive physical and velocity related passage barriers located within the lower reaches of each of the three major rivers; therefore, steelhead are not expected to be present in the lower reaches of these watersheds (NMFS 2012a).

4.4.1.5 Santa Catalina Gulf Coast BPG

We were unable to construct a full-time series of Southern SH/RT abundance for these populations because no data series were available to analyze the Santa Catalina Gulf Coast BPG. A total of 15 adult steelhead have been observed in the Santa Catalina Gulf Coast BPG from 2001-2018. Ten of these steelhead observations occurred on either San Juan or San Mateo creeks, and the remainder of observations were distributed throughout the Santa Margarita and San Luis Rey rivers and Los Penasquitos Creek (Dagit et al. 2020).

4.4.2 Geometric Mean Abundance

We calculated the geometric mean of abundance for Southern SH/RT populations (Na) with at least 3-4 generations of data for three time periods. The long-term calculation represents the total available time series. The medium-term calculation represents 12 years or three generations of data, while the short-term calculation is for the most recent 5 years of data. Missing data are noted in the following tables and there was no effort to interpolate or otherwise fill in missing data.

The geometric mean is a useful metric for evaluating species' status because it calculates the central tendency of abundance while minimizing the effect of outliers in the data. Furthermore, the geometric mean is thought to more effectively characterize time series data of abundance based on counts than the arithmetic mean (Good et al. 2005; Spence et al. 2008). We did not calculate arithmetic mean because of its tendency to be overly sensitive to outlier data to a few large counts and can result in the incorrect depiction of central tendency. A range of minimum and maximum abundances were also calculated to provide scale.

Using methods from Spence et al. (2008), we defined the geometric mean of Southern SH/RT abundance as:

$$Na\ (geom) = \left(\prod Na(i)\right)^{1/n}$$

where $Na(i)$ is the total number of adult steelhead in year *i*, and *n* is the number of years of data available.

4.4.2.1 Monte Arido Highlands BPG

Maximum abundance of adult steelhead in the Monte Arido Highlands BPG has remained consistently low since the mid-1990s and early 2000s (Table 2a-2c). For each population examined, maximum counts from the most recent 5-year period are less than either the medium or long-term time frames. For all three watersheds, years in which zero adults were observed have occurred more frequently than years in which at least one fish was observed.

The highest average abundance in this BPG was during the 12-year time frame (2010-2021) on the Santa Ynez River. Both the Santa Clara and Santa Ynez rivers have higher 12-year averages compared to the long-term average. Overall, all three populations have lower 5-year averages when compared to the long-term average and geometric mean abundances remain low across all time frames (Table 3).

Table 2a. Minimum and maximum adult steelhead abundance for the Santa Ynez River over three-time frames: 1995 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year). No data for 2013. Biological Opinion Incidental Take provisions have been required since 2014.

Abundance	**Minimum**	**Maximum**
Long-term	0	16
12-year	0	9
5-year	0	0

Table 2b. Minimum and maximum adult steelhead abundance for the Ventura River over three-time frames: 2006 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year).

Abundance	**Minimum**	**Maximum**
Long-term	0	6
12-year	0	1
5-year	0	1

Table 2c. Minimum and maximum adult steelhead abundance for the Santa Clara River over three-time frames: 1994 to 2018 (long-term), 2007 to 2018 (12-year), and 2014 to 2018 (5-year).

Abundance	Minimum	Maximum
Long-term	0	3
12-year	0	3
5-year	0	0

Table 3. Long-term, medium-term, and short-term geometric mean abundance of adult steelhead in the Monte Arido Highlands BPG.

Population	Years	Long-term Mean	Years	12-year mean	Years	5-year mean
Santa Ynez River[1]	1995-2021	2.1	2010-2021	3.0	2017-2021	0.0
Ventura River	2006-2021	2.1	2010-2021	1.0	2017-2021	1.0
Santa Clara River	1994-2018	1.7	2007-2018	2.3	2014-2018	0

[1] No data long-term 2013; Biological Opinion Incidental Take provisions have been required since 2014.

Maximum abundances of *O. mykiss* for all populations in the Monte Arido BPG are considerably less when comparing the 5-year time frame to the long-term time frame (Table 4a-4c). On the Ventura River, a maximum of 807 *O. mykiss* were observed during the long-term time frame compared to just nine individuals being observed during the most recent 5-year time frame. Minimum abundances range from zero to five *O. mykiss* for all three time-periods and populations. All three *O. mykiss* populations have lower 5-year averages compared to the 12-year and long-term time frames (Table 5). The Santa Ynez River has the highest average abundance of the three populations for each time frame. Overall, mean abundances of *O. mykiss* in this BPG have declined to low numbers, especially in the last five years.

Table 4a. Minimum and maximum O. mykiss (Other O. mykiss) abundance for the Santa Ynez River over three-time frames: 2001 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year). No data for 2013. Biological Opinion Incidental Take provisions have been required since 2014.

Abundance	Minimum	Maximum
Long-term	5	665
12-year	5	484
5-year	5	205

Table 4b. Minimum and maximum O. mykiss abundance (Other O. mykiss) for the Ventura River over three-time frames: 2005 to 2021 (long-term), 2010 to 2021 (12-year), and 2017 to 2021 (5-year).

Abundance	Minimum	Maximum
Long-term	0	807

4.4.2.2 Conception Coast BPG

We were unable to calculate geometric mean abundance estimates for the Conception Coast BPG aside from the Arroyo Hondo Creek *O. mykiss* population due to the lack of long-term data. Based on bankside *O. mykiss* observations as part of spawner redd surveys, the geometric mean abundance was 581 individuals from 2015-2022, the maximum abundance of 8,614 individuals was observed in 2021, and the minimum abundance of zero individuals was observed in 2022 (K. Evans, CDFW, unpublished data).

4.4.2.3 Santa Monica Mountains BPG

Maximum abundance counts of adult steelhead in the Santa Monica Mountains BPG have remained consistently low since the early 2000s (Table 6a-6c). A total of two adult steelhead were observed in Arroyo Sequit Creek in 2017, coinciding with the removal of all instream barriers on the creek below the Mulholland culvert in 2016; however, no adult steelhead have been observed in this creek since 2017. The maximum abundance of adult steelhead in Topanga and Malibu creeks has not been greater than five individuals for any given year during all time periods. For adult steelhead populations in both Topanga and Malibu creeks, the 5-year average is lower than the long-term average (Table 7). Overall, average abundances of adult steelhead for all three populations remain low across all time frames.

Table 6a. Minimum and maximum adult steelhead abundance for Arroyo Sequit Creek over three-time frames: 2005 to 2018 (long-term), 2007 to 2018 (12-year), and 2014 to 2018 (5-year).

Malibu Creek	2004-2019	1.9	2008-2019	2.1	2015-2019	1

[1] Insufficient data to produce meaningful results.

For all populations in this BPG, maximum abundances of *O. mykiss* for the 5-year time frame are considerably lower compared to the long-term time frame (Table 8a-8c). Since 2005, a total of four *O. mykiss* were observed in Arroyo Sequit Creek with most years recording zero observations (Table 8a). For the Malibu Creek population, a maximum abundance of 2,245 *O. mykiss* was observed from 2004-2019 compared to just 32 individuals during the 5-year time frame (Table 8b). Topanga Creek appears to support a small but consistent population of *O. mykiss* with a long-term maximum and minimum abundance of 316 and 34 individuals, respectively (Table 8c). Topanga Creek *O. mykiss* have also declined in abundance over the three time periods, but this difference is less pronounced than the decline observed for the Malibu Creek population (Table 9).

Table 8a. Minimum and maximum O. mykiss (Other O. mykiss) abundance for Arroyo Sequit Creek over three-time frames: 2005 to 2019 (long-term), 2008 to 2019 (12-year), and 2015 to 2019 (5-year).

4.4.2.4 Mojave Rim and Santa Catalina Gulf Coast BPG

We were unable to calculate geometric mean abundance estimates for either the Mojave Rim or Santa Catalina Gulf Coast BPG due to the lack of long-term data. See Sections 4.3.4, 4.4.1.4, 3.3.5 and 3.4.1.5 for more information on adult steelhead and *O. mykiss* distribution and abundances in these two BPG.

4.4.3 Trend Analysis

Trends were calculated as the slope (β_1) of the regression of log-transformed abundance against years. A value of one was added to the number of Southern SH/RT before the log-transformation to address any zero values if they were present in the dataset [i.e., $ln\ (\bar{N}_a + 1)$]. Using methods from Good et al. (2005), the linear regression can be expressed as:

$$ln\ (\bar{N}_a + 1) = \beta_0 + \beta_1 X + \in$$

Where $\bar{N}_a$ is annual adult steelhead abundance, β_0 is the intercept, β_1 is the slope of the equation, and ∈ represents the random error term. Population trend, *T*, for the specified time series was expressed as the exponentiated slope from the regression above:

$$\exp(\beta_1)$$

with 95% confidence intervals calculated as:

$$\exp(\beta_1) \pm t_{0.05(2),df} s_{b_1}$$

where b_1 is the estimate of the true slope, β_1, $t_{0.05(2),df}$ is the two-sided t-value for a confidence level of 0.95, *df* is equal to *n*-2, *n* is the number of data points in the time series, and s_{b_1} is the standard error of the estimate of the slope, b_1 (Good et al. 2005). We converted the slope to percent annual change (Busby et al. 1996), calculated as:

$$100 * (\exp(\beta_1) - 1)$$

Negative trend values indicate declining abundances over time, whereas positive values indicate growth of the population. Slopes significantly different from zero (P<.05) were noted.

4.4.3.1 Monte Arido Highlands BPG

We calculated adult steelhead and *O. mykiss* population trends for the Santa Ynez, Ventura, and Santa Clara rivers; however, due to lack of monitoring data we were unable to calculate trends for the Santa Maria River adult steelhead and *O. mykiss* populations (Tables 10 and 11). All three adult steelhead populations have declining trends in abundance for their respective data series and the decline in the Ventura River population is statistically significant (p=0.03). Our trend estimates are consistent with other recently reported trend estimates for the Monte Arido Highlands BPG (Boughton et al. 2022a). Similarly, all three *O. mykiss* populations have declining trends in abundance with significant declines observed on the Santa Ynez (p=0.03) and Ventura (p=0.05) rivers (Table 11).

Table 10. Trends in adult steelhead abundance using slope of ln-transformed time series counts for three Monte Arido Highland BPG populations. Missing years of data were eliminated and not interpolated in any way. Bolded trend values were found to be significant (p<0.05).

Population	**Years**	**Trend (%/year)**[1]	**Lower 95% CI**	**Upper 95% CI**
Santa Ynez River[1]	1995-2021	-2.24	-6.12	1.59
Ventura River	2006-2021	**-7.54**	-13.77	-0.86
Santa Clara River	1994-2018	-2.29	-4.99	0.49

[1] No data 2013, Biological Opinion Incidental Take provisions have been required since 2014.

Table 11. Trends in O. mykiss (Other O. mykiss) abundance using slope of ln-transformed time series counts for three Monte Arido Highland BPG populations. Missing years of data were eliminated and not interpolated in any way. Bolded trend values were found to be significant (p<0.05).

Population	Years	Trend (%/year)[1]	Lower 95% CI	Upper 95% CI

4.4.3.2 Santa Monica Mountains BPG

Both Topanga and Malibu Creek populations have a declining but non-significant trend in adult abundance (Table 12). The trend estimates reported here are consistent with recently reported trend estimates for Topanga and Malibu creeks (Boughton et al. 2022a).

The Malibu Creek *O. mykiss* population has experienced a statistically significant (p=0.002) average declining trend in abundance of approximately 26% per year from 2004-2019 (Table 13). The average trend in adult *O. mykiss* abundance for the Topanga Creek population also suggests a decline from 2001-2019; however, the trend is not statistically significant.

Table 12. Trends in adult steelhead abundance using slope of ln-transformed time series counts for the Santa Monica Mountains BPG populations. Missing years of data were not included. Bolded trend values were found to be significant (p<0.05).

Population	Years	Trend (%/year)	Lower 95% CI	Upper 95% CI
Arroyo Sequit[1]	2001-2019	NA	NA	NA
Topanga Creek	2001-2019	-1.70	-5.76	2.54

4.4.3.3 Conception Coast, Mojave Rim, and Santa Catalina Gulf Coast BPGs

We were unable to calculate trends for populations of Southern SH/RT in the Conception Coast, Mojave Rim, and Santa Catalina Gulf Coast BPGs due to lack of available data, with the exception of Arroyo Hondo Creek *O. mykiss*. The analysis of the Arroyo Hondo Creek *O. mykiss* population counts from seven years of bankside observations conducted during winter redd surveys indicate a declining trend in *O. mykiss* abundance, but the trend is not statistically significant (p=0.71).

Many watersheds in the Mojave Rim and Santa Catalina Gulf Coast BPGs likely supported intermittent steelhead populations characterized by repeated local extinctions and recolonization events in dry and wet years, respectively (NMFS 2012a). The sporadic and intermittent nature of these populations preclude the ability to effectively analyze trends in abundance. Furthermore, many populations occurring south of the Santa Monica Mountains are considered severely reduced and, in many instances, extirpated (Boughton et al. 2005).

4.5 Productivity

Productivity or population growth rate provides important information on how well a population is “performing” in the habitat it occupies throughout its life cycle. Productivity is a key indicator of whether a population is able to replace itself from one generation to the next. Productivity and abundance are closely linked metrics as a population’s growth rate should be sufficient to maintain its abundance above viable levels (McElhany et al. 2000).

A population’s cohort replacement rate (CRR) is defined as the rate at which each subsequent cohort or generation replaces the previous one (NOAA 2006). Data for adult steelhead in southern California contain too many years of zero observations to effectively calculate a CRR; therefore, we did not attempt to estimate this ratio. We calculated the CRR for *O. mykiss* populations in the Santa Ynez, Ventura, and Santa Clara rivers, as well as Malibu and Topanga creeks to account for the possibility of some individuals from these populations contributing to the anadromous life-history form. These watersheds were also selected because there was sufficient data (i.e., years with nonzero data) to produce CRR estimates.

The CRR is defined as:

$$CRR = \ln (Nt{+}t4/Nt)$$

Natural log transformed CRRs greater than zero indicate that the cohort increased in size that year in relation to the brood year three years earlier, whereas a CRR less than zero indicates that the cohort decreased in size. This analysis assumes a generation time of four years, which has been determined to be reasonable based off our best understanding of the Pacific steelhead fluvial-anadromous life-history (NMFS 2012a; Shapovalov and Taft 1954).

Over the entire time series, CRR values for the Santa Ynez, Ventura, and Santa Clara River *O. mykiss* populations were more negative than positive (Figure 13). Negative CRRs most frequently occurred from 2013-2018, which coincide with the most recent extreme drought period and associated drought-related low flow conditions. The Santa Ynez River population may be recovering, as indicated by a high CRR in 2021. Topanga Creek had more positive CRRs than negative, however, 89% of the years with positive values occurred prior to 2012. The CRRs on Topanga Creek are consistent with a recent study that found a significant decline of the abundance of all life stages of *O. mykiss* due to the 2012-2017 drought (Dagit et al. 2017). Population growth rates on Malibu Creek appear to be declining as CRR values have been negative since 2012.

4.6 Population Spatial Structure

Population spatial structure refers to the spatial distribution of individuals in the population and the processes that generate that distribution. Population spatial structure is a function of habitat quality, spatial configuration, and dispersal rates of individuals within different habitat types. Spatial structure reflects the extent to which a population's abundance is distributed among available or potentially available habitats at any life stage. All else being equal, a population with low abundance is likely to be less evenly distributed within and among watersheds and is more likely to experience extinction from catastrophic events. Furthermore, populations with low abundance have a reduced potential to recolonize extirpated populations.

Numerous discrete and spatially dispersed but connected populations are required to achieve long-term persistence of Southern SH/RT (NMFS 2012a). Though we cannot specifically classify the spatial structure necessary to maintain Southern SH/RT viability with certainty, examining similarities and differences between the species' historical and current spatial distribution can provide a better understanding of their present extinction risk. Southern SH/RT historically occupied at least 46 watersheds in southern California. Currently, only 37-43% of these watersheds are thought to still be occupied by the species (NMFS 2012a). This finding not only highlights the severe contraction of the distribution and abundance of Southern SH/RT in their range, but also indicates that the species is prone to range-wide extinction due to several factors such as low population growth rate, loss of genetic diversity, and the limited number of sparsely distributed individuals that may be necessary to recolonize extirpated neighboring populations.

The truncated Southern SH/RT spatial structure observed today can be attributed to the presence of numerous dams, artificial barriers, and other instream structures that have long impeded migration and access to high quality upstream habitat throughout southern California (NMFS 2012a). Dams and other barriers not only restrict access to upstream spawning and rearing habitat, but also prevent important ecological and genetic interactions with *O. mykiss* from occurring both upstream and downstream of the total barrier. Isolated *O. mykiss* populations containing ancestry of native Southern SH/RT continue to persist above barriers in approximately 77% of watersheds where the anadromous component has been lost below the barrier (Nielsen et al. 1997; Boughton et al. 2005; Clemento et al. 2009). The impact of dams and other artificial barriers is especially notable on the large rivers and small coastal streams in the northern portion of the species' range. For example, Cachuma, Gibraltar, and Juncal dams on the Santa Ynez River block access to at least 70% of historical spawning and rearing habitat within the watershed. Matilija and Casitas dams located on Matilija and Coyote creeks, respectively, restrict access to 90% of the available spawning habitat in Ventura River watershed. Similarly, Santa Felicia and Pyramid dams on Piru Creek block access to all upstream spawning habitat on this major tributary of the Santa Clara River. On Malibu Creek, the Rindge Dam and Malibu Lake dam blocks access to over 90% of historical anadromous spawning and rearing habitat within the watershed (NMFS 2012a).

Historically, the lower and middle reaches of streams in southern California were mainly used as migration corridors to higher quality upstream habitat. Today, these reaches are the only remaining accessible spawning habitat for Southern SH/RT and are characterized by high urban densities, channelization, impaired stream flows, instream diversions, and habitat that generally favors non-native fishes (NMFS 2012a). Furthermore, habitat loss and fragmentation has led to the loss of habitat diversity (i.e., riparian cover, instream habitat structure), which has prevented fish from utilizing these once connected and intact habitats. Because a population's spatial structure is partly a function of the amount of available suitable instream habitat, the loss of habitat below the barrier to anadromy is also attributed to the reduced Southern SH/RT spatial structure observed today.

The current distribution of Southern SH/RT across its range is inadequate for the long-term persistence and viability of the species (NMFS 2012a). The majority of watersheds in southern California contain dams and artificial barriers that restrict access to high quality upstream spawning and rearing habitat. Barriers to migration isolate and prevent ecological interactions with upstream native *O. mykiss* that would otherwise have the potential to be anadromous. Population level impacts include increased susceptibility to local extirpation due to natural demographic and environmental variation and the loss of genetic and life-history diversity (NMFS 2012a). Range-wide, the historically widespread Southern SH/RT are now sparsely distributed across the landscape with significant reductions in abundance. The degraded spatial structure of Southern SH/RT threatens the viability of the population because extinction rates of individual sub-basin populations are likely much higher than the rate of the formation of new populations from recolonization (McElhany et al. 2000). This is especially relevant for populations occurring in watersheds south of the Santa Monica Mountains; originally these watersheds supported infrequent Southern SH/RT populations that were likely characterized by repeated local extinction and recolonization events in dry and wet cycles.

4.7 Diversity

Diversity refers to the life-history (i.e., phenotypic) and genetic characteristics of a population. Life-history diversity allows populations to utilize a wide array of habitats and confers resilience against short-term spatial-temporal variation in the environment. Genetic diversity affects a population's ability to persist during long-term changes in the environment due to both natural and anthropogenic influences. The variation in the life history characteristics in any given population are typically the result of its genetic diversity interacting with environmental conditions. Populations lacking genetic diversity may not have as many genetic "options" to generate new or modified life history types in the face of changing environmental conditions, since natural selection may favor new or different genetic variants. As such, a genetically depauperate population that may be well adapted to the current steady state could be maladapted to new environmental conditions. The combination of both diversity types in a natural environment provides populations with the ability to adapt to long-term changes and be more resilient to these changes over both short- and long-term time scales (McElhany et al. 2000).

Our analysis in Section 4.4 demonstrates declines in *O. mykiss* populations across much of its southern California coast range and preserving Southern SH/RT life-history strategies and adaptations is a critical component for the recovery of the Southern California Steelhead DPS (NMFS 2012a). Ideally, all three Southern SH/RT life-history types (i.e., fluvial-anadromous, freshwater-resident, lagoon-anadromous) would be expressed within a single population, or the population would harbor the underlying genetic variation to express those life-history types when environmental conditions allow. The freshwater-resident life-history type is still present in many populations of Southern SH/RT; however, this form frequently occurs in the isolated upper reaches of the watershed where opportunities for gene flow with anadromous fish are prevented by barriers to migration. Bond (2006) demonstrated accelerated growth rates of juvenile *O. mykiss* expressing the lagoon-anadromous life-history form. Larger size at ocean entry is thought to enhance marine survival and improve adult returns (Bond 2006); however, it is unlikely that this life-history form is currently viable, because approximately 75% of estuarine habitat in southern California has been lost, and the remaining intact habitats are constrained by agricultural and urban development, highways, and railroads, and threatened by sea level rise (NMFS 2012a). The artificial breaching of lagoons also poses a significant threat to the lagoon-anadromous life-history form as a recent study observed considerable mortality of Southern SH/RT directly after artificial breaching (Swift et al. 2018). As presented in Section 4.4, the anadromous form of Southern SH/RT still occurs in very low abundances in a limited portion of their historical range. The preservation of this life-history component will require substantial habitat restoration and modifications or removal of the numerous artificial barriers that currently restrict access to upstream high-quality spawning habitat (NMFS 2012a).

Several recent studies highlight the important role that genetic factors have in determining the life-history expression of coastal steelhead. Pearse et al. (2014) identified two Omy5 haplotypes linked to the anadromous (“A”) and resident (“R”) life-history forms whereby “AA” and “AR” genotype are more likely to be anadromous than the “RR” genotype (Pearse et al. 2019). Rundio et al. (2021) found that age 1+ juveniles with “RR” and “AR” genotypes experienced higher growth rates than fish with the “AA” genotype, and that overall condition was slightly higher in future resident fish than in future smolts, particularly among resident males. The divergence of the “A” and “R” haplotypes in Southern SH/RT populations is influenced by the presence of numerous artificial barriers in southern California, which act as a strong selection pressure against the “A” haplotype in above barrier populations. For example, on the Santa Clara River, the Vern Freeman Diversion Dam and other instream diversions have restricted fish passage to spawning and rearing habitat on its tributaries, Sespe and Santa Paula creeks (NMFS 2012a). Populations of *O. mykiss* from both tributaries were found to display moderately high frequencies of the “R” haplotype (Pearse et al. 2019). Relative frequencies of the “R” and “A” haplotypes can also be altered in populations that have become introgressed with other strains of Rainbow Trout that may have much different haplotype frequencies.

The recognition of the “A” and “R” haplotypes provide insight on the genetic integrity and viability of Southern SH/RT. The frequency of the anadromous haplotype may substantially decline during periods of adverse conditions due to the low predicted survival of migrating smolts (i.e., “AA” and “AR” individuals). Likewise, “RR” and “AR” residents may be favored during adverse conditions, which could eventually lead to declines of the “A” haplotype over time and the gradual loss of the “AA” genotype from the population. Without considerable restoration of habitat connectivity through the removal of artificial barriers, the “A” haplotype in “AR” individuals in isolated populations above barriers is expected to be slowly lost over time (Apgar et al. 2017). While “AR” smolts may produce “AA” individuals when favorable migration conditions continue and retain the “A” haplotype in resident populations, it is unclear that the resident component can reliably sustain the anadromous component in the long term (Boughton et al. 2022a). Furthermore, climate change projections for Southern SH/RT range predict an intensification of typical climate patterns such as more intense cyclic storms, drought, and extreme heat (NMFS 2012a). These projections suggest that Southern SH/RT will likely experience more frequent periods of adverse conditions and continued selection pressure against the anadromous life-history form.

4.8 Conclusions

This section summarizes the abundance, trends, and productivity analyses. Because quantitative analyses were not conducted for population spatial structure and diversity, we do not provide conclusions for these metrics as we believe the qualitative discussions in Sections 4.6 and 4.7 provide sufficient detail and information.

4.8.1 Abundance and Trends

The data evaluated indicate an overall long-term declining trend of Southern SH/RT with critically low range-wide abundances. In the past decade, adult abundance counts have not been greater than ten for any watershed examined, and most streams have observed no adult returns during this time period. For the Monte Arido Highlands BPG, which is thought to be a potential source population for smaller coastal watersheds such as the Conception Coast BPG, only a single adult has been observed returning in the past five years. For each of the three populations analyzed, the data for this BPG shows a long-term declining trend in adult abundance. The steepest decline occurred in the Ventura River population, for which a statistically significant -7.54% per year was observed.

The data evaluated for the Santa Monica Mountains BPG indicate that these watersheds support small but consistent runs of adult steelhead ranging from zero to five individuals per year. However, like other salmonid-supporting streams in the Southern SH/RT range, few adults have been observed in the past five years, and it is unlikely that these streams historically supported large runs of Southern SH/RT due to their small size. The data also show declining but not statistically significant trends in adult abundance for Malibu and Topanga creeks. The Department's South Coast Region staff have not observed any *O. mykiss* in Malibu Creek since before the Woosley fire in 2018 and believe the watershed to be effectively extirpated below Rindge Dam (D. St. George, CDFW, personal communication). A combined total of five adults have been observed for the Conception Coast, Mojave Rim, and Santa Catalina Gulf Coast BPGs since 2017 (Dagit et al. 2020). Our finding of generally declining trends in the abundance of adult steelhead is consistent with the results of a recent viability assessment for the southern California Coast Domain produced by Boughton et al. (2022a).

O. mykiss trends also demonstrate measurable declines in overall abundance. Maximum abundance and long-term averages of *O. mykiss* have declined in all three Monte Arido Highland populations. Similarly, all populations in this BPG show declining trends in O. *mykiss* abundance with statistically significant declines of -8.81% and -19.39% per year on the Santa Ynez and Ventura rivers, and a non-statistically significant decline of -6.09% on the Santa Clara River. Within the Santa Monica Mountains BPG, both Malibu and Topanga creek *O. mykiss* populations have experienced a long-term decline. The *O. mykiss* population in Topanga Creek appears to be more viable than Malibu Creek as our results indicate only a small long-term decline. Our results indicate a trend of -25.56% per year on Malibu Creek, which is the steepest average annual decline for any of the Southern SH/RT populations that we analyzed.

The most recent prolonged drought from 2012-2017 correlates with significant reductions of all life-history forms and stages of Southern SH/RT. Drought conditions are associated with the loss of suitable spawning and rearing habitat, insufficient instream flows required for migration, diminished water quality, reductions in available food supply, and increases in direct mortality due to predation and stranding (Dagit et al. 2017). Our analyses show a relatively consistent range-wide pattern of higher abundances prior 2012 followed by consecutive years of lower abundances starting at the onset of the drought. It appears that few populations have recovered from the drought as current abundance estimates remain low relative to pre-drought conditions. The ability of Southern SH/RT abundances to recover is likely dependent on *O. mykiss* in perennial refugia streams to successfully produce downstream migrants. However, virtually all refugia populations are currently above impassable barriers. Furthermore, many southern California watersheds do not contain upstream drought refugia. In these instances, recolonization from source populations in other watersheds is likely the only mechanism for these populations to rebound (Boughton et al. 2022a).

Boughton et al. (2007) established a precautionary run size criteria for the southern California Coast Domain of 4,150 spawners per year to provide a 95% chance of persistence of the watershed’s population over the next 100 years. While this goal may not be feasible for many of the smaller coastal watersheds in southern California, NMFS (2012) speculated that this target may be more feasible for the larger watersheds (i.e., Monte Arido Highland BPG). Even if we applied a lower criterion of 834 spawners (Boughton et al. 2022a), the results of our analyses demonstrate that no population is near the criteria necessary to provide resilience from extinction.

It is important to highlight limitations of our analyses. First, our analysis may underestimate the true abundance of adult steelhead because data analyzed for this effort are usually collected during periods of high stream flows and turbidity, making monitoring difficult to conduct (Dagit et al. 2020). Second, the data used in this effort are derived from various single-basin monitoring efforts, each of which utilize different survey designs and approaches. Thus, we were required to interpret the data as reported, while recognizing the potential limitations in making inter-watershed comparisons in instances where the data were from various monitoring efforts that did not necessary meet standards established by the Department’s California Coastal Monitoring Program (CMP). Third, the lack of any monitoring of most watersheds occurring south of the Santa Monica Mountains inhibited our ability to make definitive and comprehensive range wide conclusions on Southern SH/RT abundance and trends. However, it is likely that abundance estimates for many watersheds in the southern portion of the range are so low that obtaining accurate estimates would remain difficult even with increased monitoring.

4.8.2 Productivity

The results of our CRR analysis for *O. mykiss* on the Santa Ynez, Ventura, and Santa Clara rivers show more years of negative than positive CRR values. Negative CRR values were observed during the 2012-2017 drought period for all populations. However, the most recent 2021 estimate for the Santa Ynez population was positive, which may suggest a recovering population. CRR values for Topanga Creek were more positive than negative; however, most positive values occurred prior to the onset of 2012 drought conditions. In recent years, Malibu Creek CRR values have been negative, particularly during the 2012-2017 drought period.

While the CRR values for *O. mykiss* do not necessarily reflect true spawner to spawner ratios due to the high likelihood that many observed fish were not actually part of the spawning cohort during that year, our results demonstrate that *O. mykiss* populations occurring below the barrier to anadromy in these watersheds do not appear to be viable because abundances are too low to sustain positive population growth rate on a yearly basis. This result is especially concerning given that the long-term resilience of the anadromous component of Southern SH/RT likely depends on the production of anadromous juveniles from the freshwater-resident life-history form.

5. HABITAT THAT MAY BE ESSENTIAL TO THE CONTINUED EXISTENCE OF THE SPECIES

5.1 Migration

Southern SH/RT migration into freshwater is linked with seasonal winter and spring high flows that establish connectivity between the ocean and freshwater spawning areas (NMFS 2012a).

Adult steelhead require water depths of at least 18 cm depth for upstream movement; however, 21 cm is considered to be more suitable for upstream passage of all possible sizes of individual fish, because it allows sufficient clearance so that contact with the streambed is minimized (Bjornn and Reiser 1991; SWRCB 2014). Low dissolved oxygen (<5 mg/L) and high turbidity can deter migrating salmonids such as steelhead (Bjornn and Reiser 1991). Delayed migration may also occur when stream temperatures are too high or low (Bjornn and Reiser 1991). Disease outbreaks can occur as a result of extreme high temperatures (Bjornn and Reiser 1991; Spence et al. 1996). Salmonids usually migrate when water temperatures are below 14°C (Spence et al. 1996); however, salmonids can adapt to higher thermal limits when slowly exposed to increased water temperatures over time (Threader and Houston 1983).

Instream structure, like waterfalls, sandbars, and debris jams can act as impediments to upstream fish migration. Steelhead are able to jump a maximum of 3.4 m (Spence et al. 1996) and typically, pool depth must be at least 25% greater than barrier height to achieve the required swimming velocity to pass the barrier (Spence et al. 1996). Pool shape can also influence if a barrier is passable by steelhead. For example, water flow over a steep waterfall into a plunge pool may increase jump height capacity due to upward thrust created by the hydrodynamics within the pool (Bjornn and Reiser 1991). Physical structures such as large woody debris and boulders within streams can offer flow and temperature refuge for resting fish during migration to upstream spawning areas (Spence et al. 1996). Wood structures, overhanging banks, and riparian flora can provide cover to steelhead for protection from terrestrial and avian predators. Deep pools provide important holding habitats for migrating adult salmonids (Chubb 1997).

5.2 Spawning

Habitat attributes necessary for successful spawning include cover, appropriate substrate, cool stream temperatures, and adequate streamflow (Reiser and Bjornn 1979). Salmonids select spawning sites in pool-riffle transitional areas where downwelling or upwelling currents occur that create loose gravel with minimal sediment and litter (Bjornn and Reiser 1991). Rainbow Trout can spawn in a relatively wide range of temperatures, from 2 – 22°C, but may respond to abrupt temperature declines with decreased spawning activity and production (Reiser and Bjornn 1979). Steelhead and Rainbow Trout require gravel substrate of 0.5 – 10.2 cm in diameter to construct their redds and a high proportion of the redd substrate must be comprised of smaller-sized gravel within this range (Reiser and Bjornn 1979). Cover habitat, which offers protection from predation, can include overhanging banks, riparian or aquatic vegetation, large and small woody debris, rocks, boulders, and other instream features. Having access to cover close to a redd is advantageous for Southern SH/RT and may influence spawning site selection (Reiser and Bjornn 1979). Minimum water depth must be sufficient to cover the spawning fish and, depending on individual fish size, is likely to range from 6-35cm (Bjornn and Reiser 1991).

Steelhead and Rainbow Trout have been documented to spawn in water velocities ranging from 21-117 cm/s (Reiser and Bjornn 1979; Bovee and Milhous 1978). Under moderate water velocities, increasing streamflow leads to a greater amount of covered gravel substrate for spawning; however, if water velocities and associated stream flows are too high, the additional suitable spawning habitat becomes unusable for salmonids and stream spawning capacity declines (Reiser and Bjornn 1979; Bjornn and Reiser 1991). Total suitable spawning area within a stream is dependent on the density and size of spawning fish, water depth and velocity, and amount of appropriately sized gravel substrate available (Bjornn and Reiser 1991). These factors combined drive habitat suitability for steelhead and other salmonids (Bjornn and Reiser 1991).

5.3 Instream Residency

Temperature, dissolved oxygen, salinity, water flow, and water depth are all factors that determine stream habitat suitability for *O. mykiss*. Water temperature is especially critical for survival in southern California, as stream temperature can vary drastically within the span of a single day, sometimes peaking at over 30°C during summer months (Sloat and Osterback 2013). For Southern SH/RT, changes in behavior occur above 25°C, such as decreased feeding or movement into refugia (Ebersole et al. 2001; Sloat and Osterback 2013) and the estimated mortality threshold is 31.5°C (Sloat and Osterback 2013), which is marginally higher than that of more northern steelhead populations (Rodnick et al. 2004; Werner et al. 2005). This increased temperature tolerance indicates that Southern SH/RT have acclimated to higher temperature conditions; however, it does not necessarily suggest that they have undergone local adaptation with genetic underpinnings (Sloat and Osterback 2013). Dissolved oxygen levels should generally be at or above 5 mg/L for Southern SH/RT survival (Reiser and Bjornn 1979; Bjornn and Reiser 1991; Moyle et al. 2017) but concentrations greater than 7 mg/L are ideal (Moyle et al. 2017). In cooler temperatures, Rainbow Trout can survive in minimal dissolved oxygen levels of 1.5-2.0 mg/L (Moyle 2002).

Adult Rainbow Trout preferentially select habitat in deeper water and can be found in runs or pools close to swift water (Moyle 2002). In such habitats, fish can move into fast water habitat for feeding and then return to hold and rest in slower water (Moyle 2002). Tobias (2006) found that Southern SH/RT in Topanga Creek exhibited a preference for pools over other habitat types. Trench pools were strongly favored and mid-channel pools and step pools were also selected; however, fish avoided plunge pools, corner pools, and lateral scour pools as well as riffles and cascades. Glides and step runs were neither avoided nor strongly selected.

Resident Rainbow Trout prey on aquatic and terrestrial invertebrates that drift by, both in the water column or on the surface, as well as benthic invertebrates and sometimes smaller fishes (Moyle 2002). Larger stream-dwelling salmonids (>270 mm) often exhibit an ontogenetic niche shift, moving away from consuming invertebrates and depending more on piscivory to achieve efficient growth (Keeley and Grant 2001). Size of invertebrate and fish prey increased with body length (Keeley and Grant 2001). Stomach contents from *O. mykiss* in Topanga Creek revealed that aquatic and terrestrial insects, other invertebrates, and fish comprised most of their diet during fall and spring. Consumption of Arroyo Chub (*Gila orcutti*) by Topanga Creek *O. mykiss* suggests that chub may be an important component of their diet in this stream, particularly during the late fall when aquatic macroinvertebrates may be less available (Krug et al. 2012).

5.4 Egg and Larval Development and Fry Emergence

Many environmental factors influence salmonid embryo incubation success, including dissolved oxygen, temperature, substrate size and porosity, and extra-gravel and inter-gravel hydrodynamics (Bjornn and Reiser 1991). Inter-gravel dissolved oxygen is particularly important to egg development and insufficient oxygen can lead to high mortality. Dissolved oxygen requirements increase as embryos grow and peaks just prior to hatching (Quinn 2018). Intra-gravel oxygen allows for embryo respiration, and oxygen concentrations of 8 mg/l or more contribute to high survival of steelhead embryos (Reiser and Bjornn 1979).

Water velocity is correlated with the amount of dissolved oxygen available to incubating eggs, and lower water velocity leads to higher embryo mortality (Bjornn and Reiser 1991). Reduced flows can also cause redd dewatering, which may result in egg mortality if there is no subsurface flow (Reiser and White 1983). The settling of fine sediment within gravels used to construct redds can prevent the interstitial flow of water and oxygen, and thus smother and kill embryos and post-hatch alevins (Bjornn and Reiser 1991). Finer sediment particles such as ash from wildfires or dust, are most effective at filling interstitial spaces within the redd substrate and can be a contributor to egg asphyxiation and recruitment failure (Beschta and Jackson 1979; Chapman 1988; Bjornn and Reiser 1991).

In addition to negative impacts from sediment deposition, unsuitable temperatures can have negative effects on embryonic development and survival (Bjornn and Reiser 1991). Higher temperatures are correlated with faster embryonic growth and development (Kwain 1975; Bjornn and Reiser 1991); however, if temperatures exceed upper suitability thresholds, mortality increases (Kwain 1975; Rombough 1988; Melendez and Mueller 2021). The ideal temperature range for incubation is 7-10°C (Kwain 1975) and incubation temperatures surpassing 15°C can result in considerable embryo mortality (Kwain 1975; Rombough 1988). Faster development and early hatching resulting from elevated temperatures can manifest in substantial reductions in body mass and length of newly hatched alevin (Melendez and Mueller 2021). These environmentally driven developmental changes could have negative implications for predation response and survival (Hale 1996; Porter and Bailey 2007). Alternatively, extremely cold water can induce mortality (Reiser and Bjornn 1979), although water temperatures that are below steelhead tolerances are likely a rare occurrence in southern California streams. Fry emerge in late spring or early summer and incubation time is dependent on water temperature (Moyle et al. 2017; Quinn 2018). Cold water temperatures, or those above 21.1°C, can decrease survival of emerging fry by restricting their ability to obtain oxygen from the water (McEwan and Jackson 1996).

5.5 Rearing and Emigration

Suitable rearing habitats for juvenile *O. mykiss* require adequate water temperature, flow velocity, water depth, dissolved oxygen concentrations, and availability of prey items. Juveniles generally occupy cool, clear, higher velocity riffles which provide cover from predators (Moyle 2002). Rearing juveniles require habitat with sufficient food production such as riffles with gravel substrate (Reiser and Bjornn 1979). Juvenile *O. mykiss* in southern California have been found to rear in both perennial and intermittent streams (Boughton et al. 2009). Intermittent streams are common in the southern California region and can in some cases benefit native fishes and other aquatic organisms that have evolved within these conditions. By seasonally fragmenting watersheds and disconnecting populations of introduced warm-water tolerant species, intermittent stream desiccation can reduce potential predation and competition from invasives. However, these same conditions can also negatively affect steelhead survival through loss of wetted habitat or degraded water quality conditions, prevent adult spawning migrations or juvenile/smolt emigration, and otherwise isolate subpopulations (Boughton et al. 2009).

Preferred water temperatures for juvenile *O. mykiss* range between 15 and 18°C (Moyle 2002), although they can tolerate temperatures up to 29°C if dissolved oxygen concentrations are high and there is an abundant food supply (Sloat and Osterback 2013). Southern SH/RT have been observed functioning in stream temperatures outside of the preferred range up to the mid to high twenties (Moyle et al. 2017; SYRTAC 2000). For example, the Santa Ynez River was determined to be thermally suitable, albeit thermally stressful, for Southern SH/RT in both normal and warm years, with thermal suitability characterized as a maximum daily temperature below 29°C and a mean daily temperature below 25°C (Boughton et al. 2015). Temporary or intermittent exposure to temperatures above the upper tolerance limit for salmonids can be tolerated in some populations (Johnstone and Rahel 2003), whereas chronic or long-term exposure to high temperatures is typically lethal (Dickerson and Vinyard 1999; Johnstone and Rahel 2003). Additionally, feeding behavior and activity level are generally reduced when fish are temporarily exposed to warmer temperatures that cause thermal stress (Johnstone and

Rahel 2003). However, Spina (2007) found that in Topanga Creek, there were no available daytime thermal refugia available for juvenile *O. mykiss,* yet they were able to tolerate temperatures up to 24.5°C without changes in behavior or activity level. These findings may indicate that Southern SH/RT are acclimated to higher daily stream temperatures than more northern *O. mykiss* populations. Juvenile salmonids acclimated to higher water temperatures, such as those in many Southern SH/RT streams, can sustain higher maximum thermal tolerances than those acclimated at lower temperatures (Lohr et al. 1996).

Metabolic demand increases with higher environmental temperatures. Warmer waters can result in faster growth rates where the forage base is abundant or may slow if food is scarce (Noakes et al 1983.; Brett 1971). Thus, freshwater growth is strongly dependent on primary productivity and food accessibility within the stream (NMFS 2012a). In Topanga Creek, juvenile Southern SH/RT had high growth rates during the summer despite temperatures that frequently surpassed known high temperature tolerances (Bell et al. 2011a).

Thermal refugia are especially important for summer rearing, when Southern SH/RT juveniles must find stream reaches that are sufficiently cool (NMFS 2012a). In southern California streams, higher altitude can provide thermal refuge as well as near-coastal areas that benefit from the ocean acting as a temperature sink (NMFS 2012a). Riparian cover is also important for moderating stream temperatures, as exposed or non-shaded streams are generally warmer than those shaded by riparian canopy (Li et al. 1994). These types of shaded, cool-water stream habitats are most frequently found in headwater reaches within the range of Southern SH/RT (NMFS 2012a).

In Sespe Creek, juvenile Southern SH/RT were observed to occupy the coolest areas of pools during daytime hours in summer months (Matthews and Berg 1997). Fish were consistently found congregating in a seep area that provided cool groundwater during the hottest times of day. The juvenile Southern SH/RT appeared to experience a trade-off between dissolved oxygen and water temperature but chose cooler temperatures, deeper within the temperature stratified pools, over higher levels of dissolved oxygen which were closer to the stream surface. In the spring, *O. mykiss* have been found to emigrate downstream into lower mainstem areas when tributaries may become warmer and/or drier (Spina et al. 2005). As flows increase in the fall and winter, fish may move upstream into tributary habitat to overwinter (Bramblett et al. 2002); however, this behavior has not been confirmed for Southern SH/RT (Spina et al. 2005).

Cover is also an important habitat component for juvenile Southern SH/RT survival, particularly during the winter months. Riparian cover, such as canopy and undercut banks, as well as instream cover like large woody debris (LWD) and deep pools, are important in providing shelter to rearing salmonids (Bjornn and Reiser 1991). Cover quality and availability have been correlated with local instream fish abundance for multiple salmonid species (Bjornn and Reiser 1991). In the mainstem Ventura River, juvenile Southern SH/RT densities were found to be positively correlated with velocity and cover (Allen 2015 p. 133). In western Oregon and Washington streams, juvenile steelhead were found in higher densities in reaches treated with LWD during the winter (Roni and Quinn 2001). Pool formation and enhancement can result from presence of live hardwood or LWD in a stream (Thompson et al. 2008). Instream tree roots can produce scour in high flow conditions leading to long-lasting pools. Trees in the stream channel can also anchor dead LWD and create wood jams. Jams constructed around standing trees are more durable and will last longer in watersheds dominated by hardwood species (Thompson et al. 2008).

Certain substrate types can also provide cover habitat for rearing salmonids. Larger substrate offers interstitial spaces for fish to avoid visual detection from predators. Boulders may be particularly important features in southern California streams, due to the paucity of LWD in these watersheds (Boughton et al. 2009; Tsai 2015). Boulders can assist in the formation of pools and create habitat complexity, which increases habitat suitability for Southern SH/RT (Roni et al. 2006; Tsai 2015). The presence of boulders in streams can also have a significant positive effect on *O. mykiss* survival and abundance due to their role in providing hiding areas and refuge from winter storms and associated flows (Tsai 2015). In contrast, areas with increased stream substrate embeddedness (more compacted stream bottoms) have been associated with lower juvenile salmonid densities (Bjornn and Reiser 1991).

Some Southern SH/RT will remain in freshwater through their life cycle, while those expressing the anadromous life history strategy will begin migrating downstream towards the ocean after two to three years of rearing in freshwater (NMFS 2012a). It is common in southern California for seasonal lagoons to be formed during the summer due to decreased stream flows and the natural accumulation of a sand berm at the point where the stream meets the ocean. Some juveniles take advantage of rearing in the warmer lagoon environment to achieve greater size prior to entering the ocean, which allows them a greater chance of survival (Bond et al. 2008; Hayes et al. 2008).

In Scott Creek (central California), during years when a seasonal lagoon formed, growth rates were 2-6 times greater for steelhead rearing in the estuary-lagoon than those in the cooler, less productive upstream habitat (Hayes et al. 2008). Juvenile *O. mykiss* in central California streams have been observed to exhibit a lagoon-anadromous, or “smolting” twice, life history strategy. These life history variants travel downstream to the closed estuary to rear during the summer, then migrate back upstream into more suitable conditions when the estuary starts to become less hospitable (Hayes et al. 2011; Huber and Carlson 2020). Juvenile *O. mykiss* also preferentially seek out areas with higher water quality when confined within a seasonally closed estuary (Matsubu et al. 2017). However, estuaries in poor condition, including lagoons that do not reconnect to the ocean, may lead to mortality of rearing juveniles if they do not have access to suitable habitat upstream. Seasonal lagoons in southern California typically do not reconnect to the ocean until the first rainfall occurs in the fall or winter (Booth 2020). Juvenile *O. mykiss* benefit from pulse flows initiated by storms and successful emigration is largely dependent on storm flow events matching the timing of *O. mykiss* smolt outmigration (Booth 2020). Smolts in southern California streams, such as the Santa Clara River are largely unable to take advantage of lagoon rearing and its associated benefits due to poor water quality in the estuary and dry reaches upstream (Booth 2020).

5.6 Ocean Growth

Little information exists specific to ocean growth of anadromous Southern SH/RT, but data from other west coast steelhead populations can provide some insight into habitat requirements of this life stage. Steelhead exhibit early ocean migratory behavior that is thought to maximize bioenergetic efficiency (Atcheson et al. 2012). In contrast to other Pacific salmon species, which typically remain relatively close to shore and feed in coastal waters along the continental shelf during their first summer at sea, steelhead quickly leave these productive coastal habitats for the open ocean (Atcheson et al. 2012; Daly et al. 2014). Many California steelhead juveniles spend only a few months feeding in the California Current Ecosystem (CCE) before they migrate northwest to cooler waters offshore (Daly et al. 2014). In the open ocean, steelhead maximize their energy intake by consuming high-energy prey items like fish and squid at moderate rates rather than consuming lower-energy food resources at high rates (Atcheson et al. 2012). Fish and squid make up a substantial portion of the juvenile steelhead diet for those rearing in the Gulf of Alaska, which serves as an important rearing location for west coast steelhead (Atcheson et al. 2012).

While feeding and growing in the ocean, steelhead typically occupy waters within the temperature range of 6-14°C (Hayes et al. 2016; Quinn 2018). Steelhead exhibit strong thermal avoidance, remaining within a narrow range of suitable sea surface temperatures (SSTs) during their ocean foraging and migrations, generally within 20 meters of the surface (Burgner et al. 1992 in Atcheson et al. 2012; Nielsen et al. 2010). Deviations outside of their thermal tolerance have negative consequences for growth and survival in the ocean (Atcheson et al. 2012) and generally poor ocean conditions can negatively affect survival especially during early ocean residence (Kendall et al. 2017). For example, warm SSTs were associated with lower post-smolt survival of Keogh River steelhead off the coast of Alaska (Friedland et al. 2014). In recent years, the CCE experienced a severe marine heatwave (Di Lorenzo and Mantua 2016), which impacted species abundance and distribution at multiple trophic levels, including the prey base for Pacific salmon (Daly et al. 2017; Peterson et al. 2017). During years with anomalously warm ocean conditions, young Chinook Salmon were observed to be much thinner, and their survival rates were depressed compared to years with cooler ocean temperatures, likely resulting from this shift in availability of prey species (Daly and Brodeur 2015; Daly et al. 2017).

Steelhead average a travel distance in the ocean of 2,013 km but have been tracked traveling up to 5,106 km (Quinn 2018). Steelhead are not typically captured in commercial fisheries possibly resulting from their swift movement offshore, and most catches of steelhead in research trawls are in the upper 30 meters of the water column (Moyle et al. 2017; Quinn 2018).

6. FACTORS AFFECTING THE ABILITY TO SURVIVE AND REPRODUCE

6.1 Changes in Ocean Conditions

The long-term relationship between ocean conditions, food web structure, and Southern SH/RT productivity is not well understood; however, these relationships have been examined for steelhead populations in the Pacific Northwest. While the Pacific Northwest coastal rivers are distant from the coastal rivers of southern California in terms of both geography and ecology, these findings still improve our understanding of the relationship between ocean temperatures and the dietary composition and morphology of west coast steelhead populations. Comparisons may also offer insights into similar mechanisms that may potentially influence Southern SH/RT ocean diet compositions. Thalmann et al. (2020) detected significant differences in the prey items consumed by juvenile steelhead during warm ocean years compared to average or cold ocean years. They also found significant interannual variability in stomach fullness, with significantly lower than average stomach fullness associated with warm ocean years. Steelhead sampled during warmer years were thinner, on average, than those sampled during cooler years. In 2015 and 2016, when ocean conditions were anomalously warm, there was limited availability of cold-water prey species with higher energetic and lipid content. Although some level of plasticity was demonstrated in the juvenile steelhead diet, consumption of lower-quality prey items likely led to reduced growth and poorer body condition during those years (Thalmann et al. 2020).

In the North Pacific, the 2013–2020 period was characterized by exceptionally high sea surface temperatures coupled with widespread declines and low abundances for many west coast salmon and steelhead populations (Boughton et al. 2022a). For example, the abundance of southern Chinook salmon and steelhead populations reached very low counts between 2014 and 2019, leading to the designation of many stocks as overfished (PFMC 2020). Increased sea temperatures and associated impacts have resulted in a significant biological response at all trophic levels, from primary producers to marine mammals and birds. For the CCE region, surface water temperatures reached record highs from 2014–2016 (Jacox et al. 2018).

More recently, environmental conditions in 2020–2021 appeared more stable than the previous 5–10 years (NOAA 2022). Coastal productivity in the CCE is driven by upwellings caused by equatorward coastal winds, which drive cold, nutrient-rich water to the surface (NOAA 2022). Upwelling is usually the greatest along the Central California coast, with peaks in June. The vertical flux of water and nutrients in the CCE is measured by the Cumulative Upwelling Transport Index (CUTI) and the Biologically Effective Upwelling Transport Index (BEUTI) (Jacox et al. 2018). Overall, these two indices suggest strong upwelling events occurred in the Southern CCE in 2021, with multiple upwelling events with peaks greater than or equal to one standard deviation above the mean (Figure 15).

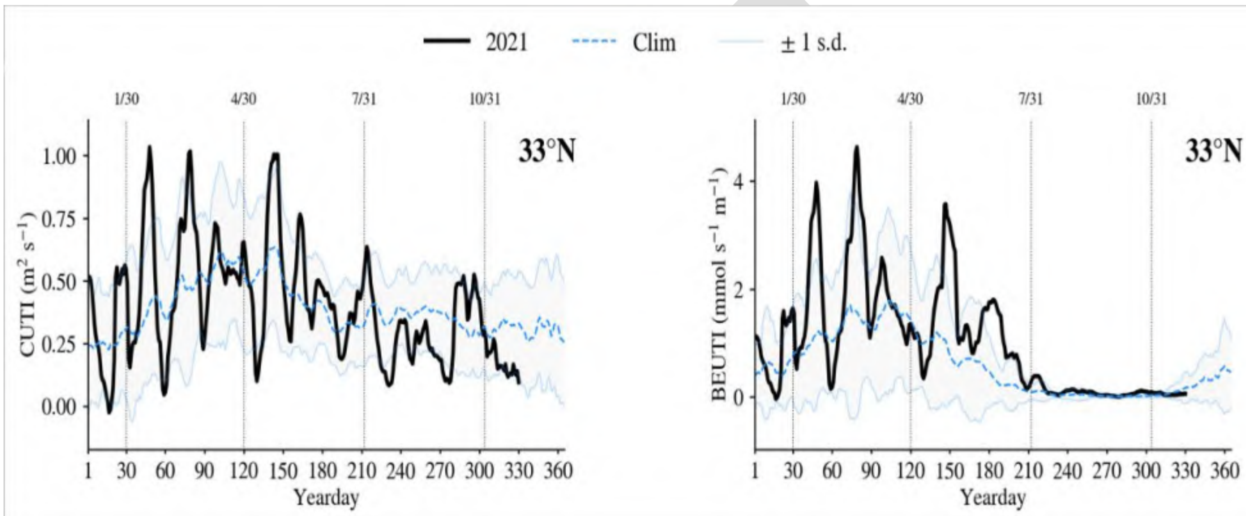

Figure 15. Daily estimates of vertical transport of water (CUTI, left) and nitrate (BEUTI, right) in 2021, relative to the 1988-2021 climatological average (blue dashed line) 1 standard deviation (shaded area) at latitude 33N (San Diego). From NOAA 2022.

Ecological indicators for the CCE suggest average to above-average feeding conditions in 2021, with sustained high abundances of zooplankton, anchovy, and apex predators (NOAA 2022). For the Southern CCE, sea lion production counts and condition at San Miguel Island are positively correlated with prey availability, particularly when prey such as sardines, anchovies, and mackerel are abundant in adult female diets (Melin et al. 2012). The 2021 cohort was the fifth consecutive year of above-average sea lion production, suggesting an abundant availability of prey during the summer months. Southern CCE forage data, which are derived from larval fish surveys, were also characterized by high abundances of anchovies, larval rockfish, and southern mesopelagic fishes. However, similar to previous years, coastal pelagic species such as mackerel and sardine occurred in low abundance. Based on the high abundance of forage fish and sea lions in the Southern CCE, it is likely that ocean conditions are currently favorable for Southern SH/RT and other marine predators.

6.2 Effects of Climate Change

The climate of the United States is strongly connected to the changing global climate (USGCRP 2017), and temperatures are projected to continue to rise another 2°F (1.11°C) to 4°F (2.22°C) in most areas of the United States over the next few decades (Melillo et al. 2014). The waters of the United States are projected to lose between 4 and 20% of their capacity to support cold water-dependent fish by the year 2030 and as much as 60% by 2100 due to climate change and its impacts (Eaton and Scheller 1996). The greatest loss of this important aquatic habitat capacity is projected for California, owing to its naturally warm and dry summer climate (O'Neal 2002; Preston 2006; Mote et al. 2018). The recent multidecadal (2000–2021) "megadrought" in the southwestern U.S., including California, has been the driest 22-year period over the past 1,000 years in this region (OEHHA 2022). Severe drought was documented across much of the southwest during this period, with record-breaking low soil moisture, extended heat waves, reduced precipitation, and intensifying weather extremes (Garfin et al. 2013; OEHHA 2022; Williams et al. 2022). These conditions are expected to continue or increase in the region (Gershunov et al. 2013), with predicted outcomes dependent upon the level and extent of human efforts to address and offset CO_2-driven climate change impacts, both within the United States and across the globe (Overpeck et al. 2013; NMFS 2016; USGCRP 2017; OEHHA 2022).

Since 1895, California has warmed more than both the North American and global temperature averages (NOAA 2021; OEHHA 2022). As such, the state is considered one of the most "climate-challenged" areas in North America (Bedsworth et al. 2018), facing increasingly extreme weather patterns and comparatively rapid shifts in regional climate- and local weather-based averages and trends (e.g., Overpeck et al. 2013; Pierce et al. 2018). California's temperatures have paralleled global trends in terms of increasing at an even faster rate since the 1980s (Figure 16; OEHHA 2022). The past decade has been especially warm; eight of the ten warmest years on record for California occurred between 2012 and 2022 (OEHHA 2022). In general, the portions of California with lower latitudes and elevations will be subject to the greatest increase in duration and intensity of higher air and water temperatures due to climate change (Wade et al. 2013). Thus, the southwestern part of California, which includes the range of Southern SH/RT, will likely face disproportionate climate change-related impacts when compared to other regions of the state. Southern SH/RT are, therefore, likely to face more severe and challenging conditions than their northern salmonid relatives.

The broad-scale climatic factors that appear to primarily shape the habitat suitability and population distribution of Southern SH/RT are summer air temperatures, annual precipitation, and severity of winter storms (NMFS 2012a). These factors and their influences on the landscape are predicted to intensify under long-term, synergistically driven conditions brought about by climate change. They are also expected to exacerbate existing stressors for Southern

SH/RT and other cold water-dependent native aquatic organisms in stream and river systems in southern California (NMFS 2012b). In a comprehensive rating of California native fish species, Moyle et al. (2013) determined southern California steelhead to be “critically vulnerable” to climate change and likely to go extinct by 2100 without strong conservation measures. This was reaffirmed by an analysis conducted by Moyle et al. (2017).

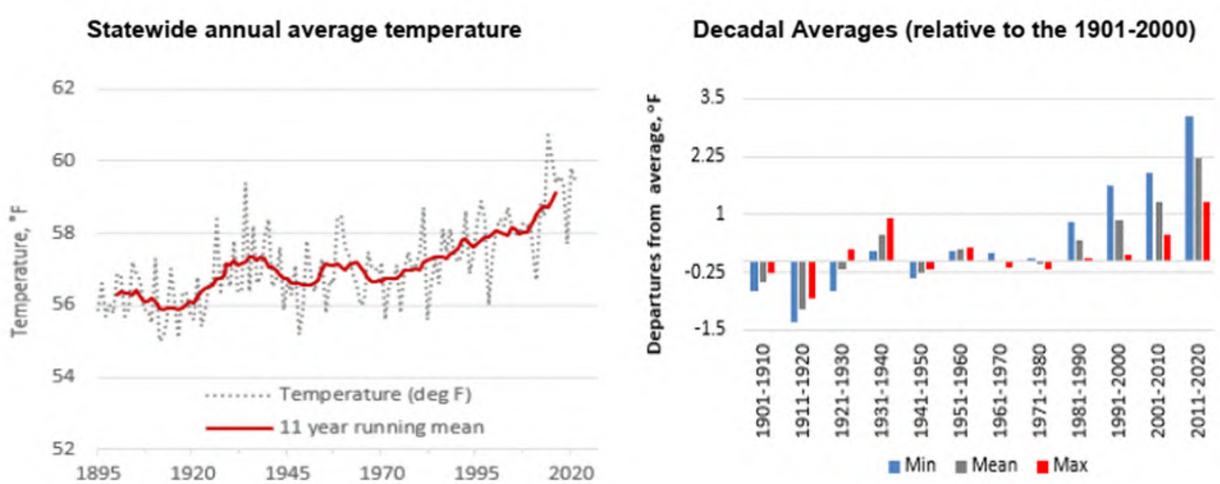

Figure 16. Temperature trend (left) and departure from average (right) graphs for California, from about 1900-2020 (source: OEHHA 2022).

6.2.1 Rising Temperatures

Extreme heat events in California have become more frequent, dating back to the 1950s; however, they have become especially pronounced in the past decade (OEHHA 2022). Heat waves, defined as two or more consecutive heat events (which are characterized by temperatures at or above the highest 5% of historical values), have also become more frequent during this period (OEHHA 2022). For context, over the past 70 years, extreme heat events increased at a rate of about 1 to 3 events per decade at 10 of a set of 14 statewide long-term monitoring sites across California (OEHHA 2022). Further, at several monitoring sites, daytime heat waves increased to as many as 6 events per year, and nighttime heat waves similarly increased to as many as 10 events per year (OEHHA 2022). Long-term regional climate observations for southern California also follow this pattern of long-term, steady temperature increases. Based on analyses of California South Coast National Oceanic and Atmospheric Administration (NOAA) Climate Division temperature records from 1896–2015, He and Gautam (2016) found significant upward trends in annual average, maximum, and minimum temperatures, with an increase of about 0.29°F (0.16°C) per decade. Likewise, every month of the year has experienced significant positive trends in monthly average, maximum, and minimum temperatures, across the same 100-year period (Hall et al. 2018).

Importantly, nighttime temperatures in California, which are reflected as minimum daily temperatures, have increased by almost three times more than daytime temperatures since 2012 (OEHHA 2022). Gershunov et al. (2009) showed that heat waves over California and Nevada are increasing in frequency and intensity while simultaneously changing in character and becoming more humid. This shift toward humid heat waves in the southwestern U.S. is primarily expressed through disproportionate increases in nighttime air temperatures (Garfin et al. 2013). These changes started in the 1980s and appear to have accelerated since the early 2000s (Garfin et al. 2013). Nighttime warming has been more pronounced in the summer and fall, increasing by about 3.5°F (1.94°C) over the last century, and southern California has warmed faster than Northern California (OEHHA 2022). These long-term regional changes will have disproportionate impacts on aquatic habitats due to elevated atmospheric humidity levels and diminished nighttime cooling effects on southern California waterways (Garfin et al. 2013).

In fact, water temperatures in many streams across California have risen for some time and are continuing to do so (Kaushal et al. 2010). Stream temperatures across the state have increased by an average of approximately 0.9–1.8°F (0.5–1.0°C) in the past 20+ years (e.g., Bartholow 2005 in Moyle et al. 2013). While such increases may seem small, they can push already marginal waters over thresholds for supporting cold water-dependent fishes (Moyle et al. 2015; Sloat and Osterback 2013). Summer water temperatures already frequently exceed 68°F (20°C) in many California streams and are expected to keep increasing under all climate change scenarios (Hayhoe et al. 2004; Cayan et al. 2008 in Moyle et al. 2015). Organisms that are adapted to California's traditional nighttime cooling influence on their habitats, including Southern SH/RT, are less prone to recover from extreme and extended periods of excessive daytime heat, particularly when humidity and temperatures remain high at night (Garfin et al. 2013; OEHHA 2022).

6.2.2 Drought

Overall, California has been getting warmer and drier since 1895; as part of this long-term climatic shift, droughts are becoming more frequent, extended, and severe in their impacts (OEHHA 2022). As noted, 2000–2021 was the driest 22-year period in the last millennium in the southwestern United States, including California (Williams et al. 2022). The 2012–2016 drought was one of the warmest and driest on record in California, negatively affecting both aquatic and terrestrial environments across the state (Figure 17; CDFW 2018a). Notable statewide aquatic habitat impacts from this and other prolonged droughts include seasonal shifts in stream hydrographs to earlier peaks with extended summer and fall low flow periods, contraction and desiccation of typically perennial aquatic habitats (Figure 18), poor water quality, elevated water temperatures, changes in migratory cues, spawn timing, and other fish behaviors, stranding, and both direct and indirect mortality of fish, along with estuary and lagoon habitat degradation, among other ecological impacts (CDFW 2018a; Bedsworth et al. 2018).

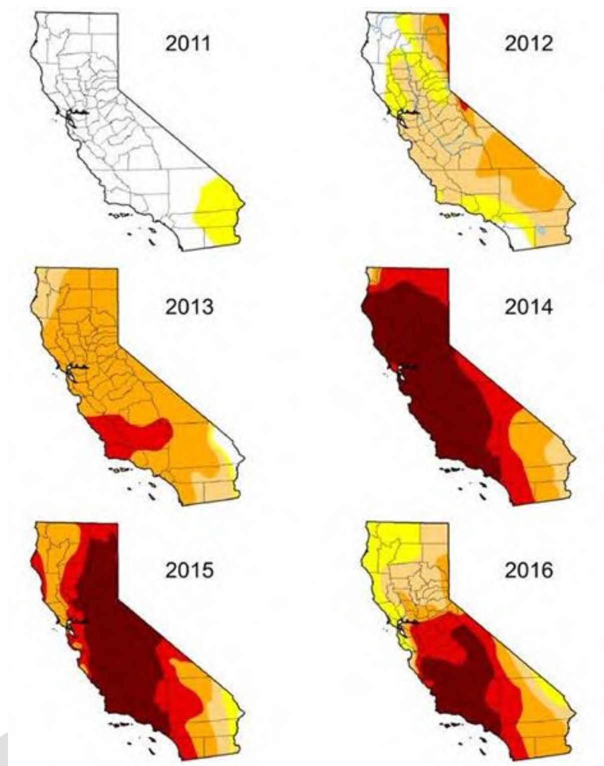

Figure 17. The distribution and progression of drought conditions in California from 2011 to 2016, depicting the level of drought at the beginning of each Water Year (October 1). White indicates no drought conditions, whereas yellow to dark red indicates increasing drought conditions, including duration and intensity (CDFW 2018a, based on U.S. Drought Monitor).

No part of the state has been more impacted by drought than southern California, with significant reductions in precipitation compared to long-term averages, along with record high temperatures, exceptionally dry soils, and low regional snowpack in surrounding mountain ranges in the past decade (Hall et al. 2018). Southern California is naturally arid and already prone to periods of extremely dry conditions (MacDonald 2007; Woodhouse et al. 2010), so increasing drought conditions have amplified many existing ecological stressors while also creating new ones. As an example, during normal water years, many streams in California's south-coastal region maintain perennial flows in their headwaters but become intermittent or dry in lower portions of their watersheds, especially in areas of concentrated urbanization or agriculture. The 2012–2016 drought dramatically exacerbated these conditions, leading to widespread stream drying in this region, even outside of areas that typically experience annual desiccation (CDFW 2018a). Not surprisingly, CDFW (2018) noted that the two most common causes of fish kills in southern California during the 2012–2016 drought were stream drying and reduced dissolved oxygen levels (impaired water quality).

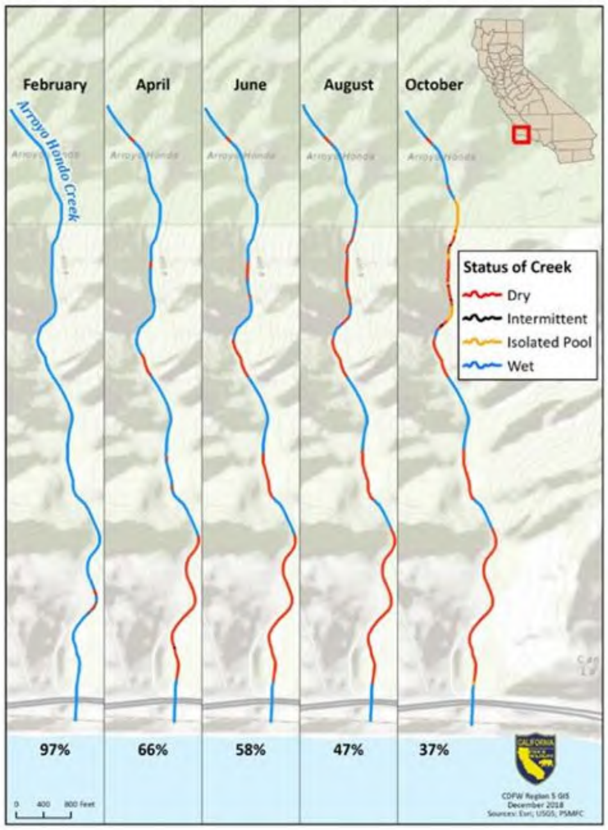

Figure 18. Example southern California stream (Arroyo Hondo Creek, Santa Barbara County), showing seasonal desiccation across 60% of its study area wetted length during February-October 2015 (source: CDFW 2018a). 2015 was a notably bad drought year in California, but the large extent of stream drying in this creek may be an indicator of future climate change-driven conditions in this and other southern California regional streams.

Further desiccation of Southern SH/RT habitats is expected due to climate change, leading to reduced natural spawning, rearing, and migratory habitats for already small and fragmented Southern SH/RT populations. This undesirable future state includes the increasing probability that low-precipitation years continue to align and coincide with warm years, further amplifying the risk of future severe droughts and low snowpack in California, especially in southern latitudes (Difenbaugh et al. 2015; Berg and Hall 2017; Williams et al. 2015).

In their five-year status review, NMFS (2016) concluded that ongoing “hot drought” conditions, among other negative factors, likely reduced salmonid survival across DPSs and ESUs for listed steelhead and salmon in California, including Southern SH/RT. It is likely that these same Southern SH/RT populations, already impacted and diminished in abundance and distribution, will face more frequent and severe drought periods in the future, along with more intense and destructive (albeit less frequent) winter storms, under all predicted scenarios. Both stressors, in combination, will further negatively affect the remaining suitable habitats for Southern SH/RT in California.

6.2.3 Reduced Snowpack

As air temperatures have warmed, more precipitation has been falling as rain instead of snow at high elevations in the western United States, where widespread snowpack declines of 15-30% have been documented since the 1950s (Mote et al. 2018; Siirla-Woodburn et al. 2021). Since 1950, California’s statewide snow-water content has been highly variable, ranging from more than 200% of the average in 1952, 1969, and 1983 to 5% in 2015 in the midst of the 2012–2016 drought (OEHHA 2022). The past decade included years that were among the lowest (2013, 2014, 2015, and 2022) and the highest (2011, 2017, 2019) on record for snowpack (OEHHA 2022). These patterns demonstrate increasing variability in the amount of overall precipitation the state receives, the frequency and intensity of storm systems, and the amount of precipitation received as rainfall versus snowfall. Annual snowpack in the Peninsular Ranges of southern California (e.g., Santa Ana Mountains, San Jacinto Mountains, and Laguna Mountains) is expected to continue to diminish, so future stream flows in the range of Southern SH/RT will be increasingly driven by rainfall events (Mote et al. 2018).

Snowmelt attenuates stream flows in basins that usually receive annual snowpack at higher elevations. An increase in the ratio of rain to snow and rain-on-snow events will result in more peak flows during winter and early spring, along with an increasing frequency of high flow events and damaging flooding. With earlier seasonal peak hydrographs, many southern California streams will experience diminished spring pulses and protracted periods of low flows through the summer and fall seasons (Moyle et al. 2015). These conditions will translate into warmer water temperatures at most elevations, reflecting both increases in air temperatures and reduced base flows (Moyle et al. 2017). Future shifts from snow to rain may also negatively impact overwintering rearing habitat for juvenile Southern SH/RT and reduce the availability of cold-water holding habitats as refuges in rivers and streams during the summer and fall months (Williams et al. 2016). Such abiotic shifts will affect the physical habitat availability and suitability for Southern SH/RT and are also anticipated to change species interactions, generally favoring introduced species with broader environmental tolerances (Moyle et al. 2013).

6.2.4 Increasing Hydrologic Variability – Reduced Stream Flows to Catastrophic Flooding

Climate change is likely to increase the impacts of El Niño and La Niña events, which are predicted to become more frequent and intense by the end of the century (OEHHA 2022). Increasingly dramatic swings between extreme dry years (or series of years) and extreme wet years are already occurring in California and are expected to escalate under various climate change scenarios (Swain et al. 2018; Hall et al. 2018). California’s recent rapid shifts from drought periods (2012-2016, 2020-2022) to heavy precipitation and flooding (winter 2016-2017, winter 2022-23) exemplify “precipitation whiplash” and its potential for widespread natural habitat and human infrastructure damage and destruction (OEHHA 2022). California’s river and stream systems will bear the brunt of these impacts since they are the natural conduits for water conveyance on the state’s landscape.

Such precipitation variability and intensity in California is now increasingly influenced by “atmospheric rivers,” or long, narrow bands of precipitation originating over ocean bodies from the tropics to the poles that transport large amounts of water vapor (USGCRP 2017; Hall et al. 2018). During the winter months, heavy precipitation associated with landfalling atmospheric rivers can produce widespread flooding in most of the southwestern U.S. states (Garfin et al. 2013). California is especially vulnerable to this source of destructive flooding because of its proximity to the Pacific Ocean, where atmospheric rivers are generated (USGCRP 2017). As a result of these changes, southern California stream flows will almost certainly become more variable and “flashy” on an annual basis. Predictions include likely extreme fluctuations in precipitation, with intermittent heavy winters producing high stream flows, coastal impacts, and extensive flooding during otherwise prolonged periods of drought, with low to no flows in many streams. Changes in seasonal flow regimes (especially flooding and low flow events) may also affect salmonid behavior. Expected behavioral responses include shifts in the seasonal timing of important life history events such as adult migration, spawning, fry emergence, and juvenile migration (NMFS 2016). The outmigration of juvenile steelhead from headwater tributaries to mainstem rivers and their estuaries may be disrupted by changes in the seasonality or extremity of stream hydrographs (NMFS 2016; Figure 18). Flood events can also disrupt incubation and rearing habitats due to increased bed mobility (Fahey 2006). Conversely, low flow periods with elevated water temperatures and impaired water quality can cause direct mortality to steelhead across wide portions of southern California’s mountain desert streams (CDFW 2018a). Stream drying can also further isolate and restrict subpopulations, potentially leading to genetic drift, interfering with gene flow and genetic mixing at the larger population/ESU level, and potentially further reducing overall fitness.

6.2.5 Sea Level Rise

Along California’s coast, mean sea levels have increased over the past century by about 8 inches (203 mm) at monitoring sites in San Francisco and La Jolla (OEHHA 2022). For the southern California coast, roughly 1-2 feet (0.3 m – 0.6 m) of sea level rise is projected by the mid-century, and the most extreme projections indicate 8–10 feet (2.4 m – 3.0 m) of sea level rise by the end of the century (Hall et al. 2018). Sea level rise is predicted to further alter the ecological functions and dynamics of estuaries and near-shore environments. Rising sea levels may impact estuary hydrodynamics with increased saltwater intrusion, potentially increasing salinity levels in estuaries and shifting the saltwater/freshwater interface upstream (Glick et al. 2007). Loss or degradation of already scarce estuary habitats in southern California's coastal areas due to sea level rise may negatively affect Southern SH/RT survival and productivity, since estuaries and lagoons serve as important nursery habitats for juvenile steelhead (Moyle et al. 2017). Alternatively, sea level rise may potentially increase the amount of available estuary habitat by inundating previously dry areas or creating additional brackish, tidal marsh, or lagoon habitats, which serve as important rearing habitats for juvenile salmonids (NMFS 2016). Overall, however, predictions indicate substantial reductions in southern California's coastal lagoon and estuary habitats, which may reduce steelhead smolt survival and numbers of outmigrants to the ocean, further constraining populations of Southern SH/RT (Moyle et al. 2017).

6.2.6 Ocean Acidification

Ocean acidification occurs when excess carbon dioxide (CO2) is absorbed from the atmosphere, acidifying or lowering the pH of sea water (CDFW 2021b). Ocean acidification is becoming evident along California's central coast, where increases in CO2 and acidity levels in seawater have been measured since 2010 (OEHHA 2022). Coupled with warming ocean waters and reduced dissolved oxygen levels, ocean acidification poses a serious threat to global marine ecosystems (OEHHA 2022). If left unchecked, ocean acidification could dramatically alter the Pacific Ocean's marine food webs and reduce the forage base for California's salmonids. Forage fish, which are a primary prey source for steelhead in the ocean (LeBrasseur 1966; Quinn 2018), may suffer declines in abundance due to reduced biomass of copepods and other small crustaceans resulting from ocean acidification (Busch et al. 2014). Ocean acidification makes it harder for the shells of ecologically and economically important species, including krill, oysters, mussels, and crabs, to form and potentially causes them to dissolve. Reduced seawater pH has also been shown to adversely affect olfactory discrimination in marine fish (Munday et al. 2009), which could result in impaired homing of Southern SH/RT to their natal streams.

6.2.7 Wildfires

Wildfires are a natural and fundamental part of California's ecological history in many parts of the state. Wildfires are an essential ecological process for the periodic renewal of chaparral vegetation communities (Sugihara et al. 2006), which dominate much of the south-coastal part of California. Historical fires were, therefore, important episodic ecological events with generally lower intensity impacts, at smaller geographic scales, and generally positive long-term outcomes for fish habitats (Boughton et al. 2007).

Euro-American influences and activities on the western landscapes of the U.S., coupled with climate change, have made modern western fires more frequent, severe, and catastrophic in nature (e.g., Gresswell 1999; Noss et al. 2006; and Moyle et al. 2017). Future frequency and size of wildfires in the range of Southern SH/RT is expected to increase, driven by rising atmospheric temperatures and prolonged droughts associated with climate change (NMFS 2012a, OEHHA 2022). Potter (2017) examined satellite data for the 20 largest fires that have burned since 1984 in the central and southern coastal portions of California and found that climate and weather conditions at times of ignition were significant controllers of the size and complexity of high-burn severity fire areas. Since 1950, half of California's largest wildfires (10 of 20) occurred between 2020 and 2021 (OEHHA 2022). One study predicted a nearly 70% increase in the area burned in southern California by the mid-21st century, due to warmer and drier climatic conditions (Jin et al. 2015). This study also evaluated southern California's wildfires in terms of their impacts in the presence or absence of regionally prominent Santa Ana winds. This research found that non-Santa Ana fires which occur mostly in June through August affected higher-elevation forests, while Santa Ana-driven fires which occur mostly from September through December spread three times faster and occurred closer to urban areas (Jin et al. 2015). Recent examples of devastating Santa Ana wind-driven fires include the destructive Thomas Fire (approximately 282,000 acres) in Ventura and Santa Barbara counties (December 2017) and the Woolsey Fire (approximately 97,000 acres) in Los Angeles and Ventura counties (November 2018), both of which were also influenced by preceding record-breaking heatwaves and extremely dry fall conditions (Hulley et al. 2020).

Projected increases in precipitation extremes will lead to increased potential for floods, mudslides, and debris flows (Hall et al. 2018). Wildfires and subsequent debris torrents in southern California were demonstrated to have destroyed Southern SH/RT habitats in 2004, 2006, and 2008 (Moyle et al. 2015). More recent events, including mass wasting and debris flows, such as those in Santa Barbara County in early 2018, resulted from heavy rains preceded by wildfires (Livingston et al. 2018). High-intensity wildfires can accelerate the delivery of sediments to streams (Boughton et al. 2007) by stripping the land of vegetative cover and eliminating stabilizing root structure, thereby degrading spawning habitats for salmonids and other fishes. Increased soil friability greatly increases rates of fine soil mobilization, erosion, transport, and deposition into watercourses affected by fire due to the elimination of vegetation, the input of large amounts of dry ash and charcoal, the lack of soil shading, and the associated increased solar warming and drying of soils (NMFS 2012a). These fine materials often become so dry after a fire that they become hydrophobic, making it much easier for runoff water to mobilize and transport. Fine sediments delivered to streams in large amounts have been shown to cover and smother coarser-grained spawning gravels, which are required for salmonid spawning success (Moyle et al. 2015). Largescale sediment mobilization events can also change the channel characteristics of streams, destroy instream and riparian vegetation, and possibly cause direct or indirect mortality to multiple life history stages of Southern SH/RT, while also facilitating the rapid spread of non-native plant and animal species. High flows and floods in fire scars can also scour redds, depending on their seasonal timing, possibly nearly eliminating a Southern SH/RT subpopulation’s cohort post-spawn if gravels are mobilized and eggs or juveniles are washed downstream.

6.3 Disease

Numerous diseases caused by bacteria, protozoa, viruses, and parasitic organisms can infect Southern SH/RT in both juvenile and adult life stages. These diseases include bacterial kidney disease (BKD), *Ceratomyxosis*, *Columnaris*, *Furunculosis*, infectious hematopoietic necrosis virus, redmouth and black spot disease, Erythrocytic Inclusion Body Syndrome, and whirling disease (NMFS 2012a). Water quality and chemistry, along with warm stream temperatures, influence infection rates. As water temperatures rise and fish become thermally stressed, lower host resistance aligns with higher pathogen growth rates due to shorter generation times and can lead to a sharp increase in infection rates and associated mortality (Belchik et al. 2004; Stocking and Bartholomew 2004; Crozier et al. 2008). There is little current information available to evaluate the potential impacts of these kinds of infections on Southern SH/RT populations.

6.4 Hatcheries

Extensive stocking of hatchery-origin *O. mykiss* has occurred throughout the southern California region to support recreational fisheries, but no efforts have specifically targeted the conservation and supplementation of Southern SH/RT. Historical stocking records dating back to the 1930s occasionally reference the stocking of “steelhead”; however, it appears that these references represent nomenclature being used interchangeably rather than identification of fish from native migratory populations. Hatchery-origin *O. mykiss* were stocked widely for recreational fisheries up until the late 1990s. Stocking was ceased in the anadromous waters of southern California as a protective conservation measure starting in 1999 (J. O’Brien, CDFW, personal communication).

While restricted stocking of *O. mykiss* has continued in the region above barriers to anadromy, potential remains for the inadvertent introduction of hatchery stocks into anadromous waters due to downstream movement or during reservoir spill events. To mitigate the risk of hatchery-origin fish interbreeding with wild fish, the Department shifted to stocking only triploid hatchery-origin *O. mykiss* in waters above anadromous barriers following the adoption of the Hatchery and Stocking Program Environmental Impact Report (EIR) in 2010 (Jones and Stokes 2010). Triploid *O. mykiss* have been used across the western United States to reduce the risks of introgression and hybridization associated with stocking programs that support recreational fisheries. The application of heat- or pressure-induced “triploiding” on salmonid eggs, including *O. mykiss*, has a proven 91-100% sterilization rate, often at the upper end of that range (Kozfkay et al. 2011). Using triploid hatchery-origin *O. mykiss* for recreational fisheries has mitigated some of the inherent risk of potential hybridization and introgression with native and wild stocks, although some risks to Southern SH/RT may still exist. Competition and predation from hatchery stocks remain of concern since the degree to which triploid *O. mykiss* may compete with or prey upon native *O. mykiss* is not well understood.

Hatchery-origin *O. mykiss* have been tagged prior to stocking into select regional reservoirs to attempt to evaluate if and the extent to which they may be escaping these impoundments and entering anadromous waters below dams. No reservoir spills have occurred across the region since tagging began due to the predominance of drought conditions, except for during the winter and spring of 2023. To date, downstream monitoring has not been conducted since the inception of the tagging study (J. O’Brien, CDFW, personal communication). Due to climate change impacts and the decreased frequency with which many southern California reservoirs are filling or overspilling, it is expected that threats from interactions between hatchery-stocked *O. mykiss* and remaining native stocks of Southern SH/RT will be considerably reduced in the future. However, the large number of atmospheric rivers that impacted much of California during the recent winter of 2022–2023, causing some southern California reservoirs to fill and overspill, is a reminder that such events remain possible.

While exclusively triploid hatchery-origin *O. mykiss* are stocked above barriers to anadromy in southern California, historical regional stocking practices of non-triploid fish have led to introgression, or hybridization with hatchery stocks, in some Southern SH/RT populations. Levels of introgression appear to vary across the landscape, differing between populations and watersheds. Some populations retain high levels of native southern California steelhead ancestry, while others are highly introgressed and exhibit high levels of hatchery-origin genetics (primarily Central Valley *O. mykiss* genetics), while some are in between, with genetic signatures from both native and hatchery origins (NMFS 2016; Jacobson et al. 2014). See Section 6.7 in this Status Review for more information.

6.5 Predation

6.5.1 Predation in Freshwater Environments

California’s salmonids have evolved under selective pressure from a variety of natural predators, including many species of fish, birds, and mammals; however, a growing number of non-native aquatic species have also become established within the range of Southern SH/RT (Busby et al. 1996; NMFS 2016; Stillwater Sciences 2019; Dagit et al. 2019; COMB 2022).

Established populations of non-native fishes, amphibians, and invertebrates, combined with anthropogenic habitat alterations that often favor non-native species, have led to increased impacts from predation, competition, and other stressors on Southern SH/RT across much of its range (NMFS 1996b). Stream habitat alteration can also directly affect predation rates by reducing available cover for prey species, creating flow and velocity regimes that favor non-native predators, and creating obstructions to passage that can lead to migration delays and increased exposure to predators (Moyle et al. 2013; Dagit et al. 2017). Further, stream habitat alterations can influence water temperatures, often increasing them, which may then lead to higher metabolic rates for piscivorous fishes and increased predation pressure (Michel et al. 2020). In addition to physical habitat alterations, chemical habitat alterations in the form of contaminants known to alter fish behavior and reduce avoidance or cover-seeking activities are also likely to increase predation rates, particularly from avian predators (Grossman 2016).

Established populations of non-native catfish and centrarchids occur in the lower reaches of many watersheds throughout the range of Southern SH/RT, leading to widespread predation risk (NMFS 2016; Stillwater Sciences 2019; Dagit et al. 2019; COMB 2022). Grossman (2016) found that non-native Channel Catfish (*Ictalurus punctatus*) may be a primary predator of Central Valley steelhead in the San Joaquin River, suggesting they may pose the same level of risk to Southern SH/RT. Non-native centrarchids have been demonstrated to negatively impact salmonid populations through direct predation on rearing juveniles and resident adult *O. mykiss* (Dill and Cordone 1997; Marks et al. 2010; NMFS 2012a; Bonar et al. 2005). In Washington state, non-native smallmouth bass (*Micropterus dolomieu*) have been a major predator of native salmonids (Poe et al. 1991; Vigg el al. 1991; Tabor et al. 1993; Zimmerman 1999). Interestingly, the smallest bass size classes have been shown to have the highest predation rates on juvenile Chinook salmon (Fritts and Pearsons 2006); therefore, small bass can present a major risk of predation on juvenile salmonids. This is especially true since smaller -sized bass can achieve potentially high densities in altered habitats, leading to increased predation rates. Additionally, largemouth bass (*Micropterus salmoides*) are better thermally adapted to higher temperatures than salmonids. They may also consume salmonids at higher rates as the waters warm (McInturf et al. 2022).
