

CALIFORNIA CODE OF REGULATIONS
TITLE 14. NATURAL RESOURCES
DIVISION 1. FISH AND GAME COMMISSION – DEPARTMENT OF FISH AND GAME
SUBDIVISION 4. OFFICE OF OIL SPILL PREVENTION AND RESPONSE

**SECOND 15-DAY COMMENT PERIOD
ILLUSTRATION OF CHANGES**

The California Department of Fish and Wildlife's Office of Spill Prevention and Response is proposing a repeal of the Shoreline Protection Tables dated August 29, 2013 and its associated Purpose and Scope and Glossary.

For the 45-day public comment period, those changes were illustrated entirely in single ~~strikeout~~.

For the 2nd 15-day public comment period, deleted content (the Small Harbor Table) is illustrated in ~~***bold, double strikeout, and italics***~~.

REPEAL

~~SHORELINE PROTECTION TABLES (SP TABLES) FOR VESSEL TRAFFIC IN CALIFORNIA'S MARINE WATERS (Tables Dated August 29, 2013)~~

~~PURPOSE AND SCOPE~~

~~The Shoreline Protection Tables (SP Tables) set forth planning requirements for shoreline protection for vessels in California's marine waters. A vessel owner/operator shall demonstrate through contracts(s) or other approved means (see Sections 815.05(b) or 825.05(a)), the shoreline protection response resources necessary to protect each type of shoreline and all applicable sensitive sites as outlined in the appropriate SP Tables. Based on these Tables the owner/operators will be able to ascertain the type of equipment that must be available for the appropriate response strategies necessary to protect the shoreline types that could be affected. For the purpose of meeting the regulatory requirements, contracts for shoreline protection services can only be made with OSROs Rated by the Office of Spill Prevention and Response.~~

~~The SP Tables are for vessels that transit in California's marine waters. In addition, for the small harbors identified, a Small Harbor Table is included to define preparedness levels for these areas.~~

~~The requirements set forth in these Tables are planning standards and may not reflect the exigencies of actual spill response. However, these are the standards that must be used to determine the amount of equipment and personnel that must be under contract or other approved means. The owner/operator is ultimately responsible for protecting the sensitive sites identified from the entire volume of an actual spill regardless of the planning volume.~~

~~Skimming assets required to execute the strategies listed in the Tables will be included as part of the required on-water recovery capacity, as stipulated in CCR Sections 818.02(e) and 827.02(h), and should not be construed as requiring additional skimming capacity. Sorbent boom requirements included in the first 24 hours of response must be on scene by hour 24, but not necessarily deployed at specific sites. In a few instances (only as indicated in the Tables) up to 2,000 feet of containment boom required to meet the 2-hour on-water containment requirement, can be utilized for shoreline protection.~~

~~An owner/operator may propose alternatives to what is listed in the SP Tables for boats and staff only. The proposal may be tested by the Administrator anytime prior or subsequent to plan approval. The SP Tables shall be reviewed and updated as needed (e.g., to reflect updates to the ACPs, etc.). Updates to the SP Tables will be processed by OSPR staff using the procedures outlined in the Administrative Procedure Act.~~

~~A glossary of terms used in the SP Tables has been included (last page). This glossary explains the terms and abbreviations used in the tables. These are the commonly understood meanings of these terms, and are included here to make the SP Tables comprehensive, stand-alone documents.~~

~~To the greatest extent possible, California has endeavored to be consistent with the scope and intent of the Federal oil spill response regulations and the Area Contingency Plans (ACP) completed by the U.S. Coast Guard, state agencies, and local governments, with public participation, as required by the Oil Pollution Act of 1990 (33 USC 2701, et seq.).~~

REPEAL

Glossary of Terms Used in the BAP Shoreline Protection Tables

August 29, 2013

Anchoring Systems—Anchoring systems refer to anchors, stakes and other devices necessary to secure booms and other mechanically deployed protection measures. When used to identify anchors, whether expressly stated or not, anchoring systems must be sufficient to hold boom in the aggressive currents such as are common to SF Bay and other California estuaries. Typically systems are presented as a number of anchors and minimal weight (e.g., 3/12+ means three anchors of a minimum of 12 lbs each) with at least an equal weight of anchor chain weight whether specified or not; without substantial anchor chain weight, anchors will not hold. To insure successful anchoring, the anchoring system should include: anchors with anchor buoys to control placement, anchor chains which equal or exceed the weight of anchors, enough line to produce adequate scope to hold anchors (rule of thumb is 3:1 (line to depth), but 5-7:1 for high current areas), and a crown buoy between anchor line and boom to keep the anchor from sinking the boom under strong currents.

BBoat—see Boom Boat

Boom Boats—a boat suitable for transporting, towing and deploying large amounts of boom, usually crewed with a helmsman and two crew for deployment. Numbers of such boats usually are referenced in terms of boom boat equivalent (BBE). BBE is the capability of a vessel to transport and deploy 600 feet of Harbor Boom or 1800 ft of Swamp Boom. Actual vessels may be capable of transporting greater or lesser amounts of boom. Boom boats must be capable of grounding without sustaining damage. (Also see Shallow Water Boom Boats and Very Shallow Water Boom Boats.)

Danforth—refers to “danforth anchors” with chain. Northill anchors and other anchor types which “dig in” are equivalent.

FELoader—Front end loader or skip loader: mechanical equipment with mechanical scoop or bucket for moving sediment.

GNOME—General NOAA Oil Spill Modeling Environment

Harbor Boom—an inland waters type boom (greater than 18" and less than 42" overall (flotation and skirt)) of a curtain boom design (skirted boom with solid flotation). Early strategies attempted to clarify boom size by indicating flotation and skirt as follows: 9X9+ which indicated a boom with at least 9" of flotation and 9" of skirt, and would now be interpreted as at least 18" overall. This boom type typically has strength members (steel cable and chain) in both upper and lower margins.

Protect By Hour—the hour after the release when the site must be protected to insure that the site protection is in place before the oil is likely to impact. Generally, this time is about an hour prior to impact, but may be otherwise due to uncertainty of impact time.

Other Boom—is any boom other than harbor boom, swamp boom, or sorbent boom. This term is used to simplify equipment tables. A type designator should be used as well as a length. Type designators include: **TB** or **TBB**—tidal barrier boom or Texas barrier boom **OB**—ocean boom **OS**—oil snare

SWEP—oil sweep: sorbent pads in continuous strips **Shallow Water**—less than three feet of water

Shallow Water Boom Boats—a boom boat capable of working in three feet of water or less, and should be able to withstand stranding without sustaining damage.

Skiff—a small two person craft able to operate in 3 foot waves or larger and capable of delivering personnel and equipment to shores.

Skimmer—refers to a skimming system. A skimming system includes a collection device (such as a weir, rope mop, drum, or other skimming design to separate oil from the aqueous environment), storage for collected material, power supply to power such a system, and all the hoses and connectors necessary for system operation. Types of skimmers refer to the configuration of the deployment of such systems rather than a particular device or manufacturer.

SFS—stationary floating skimmer—a floating platform supporting a skimmer and storage.

SPS—self propelled skimmer—a small to medium sized skimmer with its own propulsion and storage.

SSS—shore side skimmer, includes a skimming unit, such as a rope mop or weir skimmer and its support pack and a storage container such as a vacuum truck, baker tank, or other tank.

SWS—Shallow Water Skimmers—Skimmers capable of operating in less than two feet of water.

Towed Skimming Array—a skimming system with two boats towing collection booms connected to a skimmer (in a “V” formation) to funnel oil to the skimmer and may be referred to with the acronyms TSA and VSA.

TSA—(towed skimming array as above)—a skimming array with two boats towing collection booms which funnel oil to a skimming system, of either SPS or SFS design.

VSA—“V” Skimming Array—Same as TSA

OSRV—Oil Spill Response Vessel. A large self-powered vessel dedicated to oil spill skimming and response

VOSS—Vessel of Opportunity Skimming System—Usually moderate to large vessel which can be equipped

~~with a skimming device and storage to create a mobile on water skimmer capable of operating in local conditions and waters.~~

~~**Sorbent Boom**—sorbents in a boom or sausage like construction with or without a skirt.~~

~~**Strategy or Site Number**—deployments are listed in the Area Contingency Plan by a site number or as a strategy number which includes the site number.~~

~~**Swamp Boom**—a river boom type (less than 18" overall, usually less than 12" overall) of a curtain boom design. Usually this boom has much lighter strength members, commonly only a single chain in the skirt. This boom is suitable for modest currents and locations without waves.~~

~~**VSW**—very shallow water~~

~~**Very Shallow Water**—less than two feet of water~~

~~**Very Shallow Water Boom Boats**—a boom boat capable of working in two feet of water or less, and should be able to withstand stranding without sustaining damage.~~
