FENCE CONSTRUCTION DIAGRAMS ........................................ 20
INTRODUCTION

Part of the appeal of living in rural or semi-rural California is the ability to watch wildlife in your own back yard. Deer are especially fascinating to observe, but many homeowners are dismayed to discover that deer can be very destructive to gardens.

In some areas the damage can be seasonal, peaking in the winter when food sources for deer are at their lowest. Other areas, where deer habitat is heavily affected by residential development, may experience problems year-round. Drought, wildfires, livestock grazing and other habitat-altering events also play a role because they affect food sources for deer.

Rural dwellers frequently ask the California Department of Fish and Game how to minimize landscape damage caused by hungry deer. This booklet details three methods:

- the use of landscape plants that deer don’t seem to like;
- application of commercial deer repellents;
- construction of deer-proof fencing.

All of the techniques are considered harmless to deer and other wild and domestic animals.
DEER-RESISTANT" PLANTS

Deer are attracted to many popular garden and landscape plants but avoid others. The following list of deer-resistant plants should be considered a guide rather than the final word. Certain plants may not suffer deer damage in some gardens and landscapes, yet might be completely destroyed in others. This is due in part to the availability of natural food sources and the taste preferences of individual deer. If there is a severe shortage of natural deer browse, deer-resistant landscape plants may suffer damage.

Some of the plants listed are, in addition to being deer-resistant, considered noxious weeds. For example, bamboo is a pervasive grower and can become a significant problem because of its tendency to escape. Alternatively, native plants are better-adapted to the local climate than their exotic counterparts, and should be considered first in landscape planning.

Both native and introduced plants are listed in this booklet. The designation “some native” means some subspecies of the plant are native to California. Always consult a local nursery to select species which best fit your needs and your local climate. The Department of Fish and Game encourages use of native plant species where feasible. For example, most native perennial bunch-grasses would be suitable candidates for deer-resistant landscaping as well as being drought-resistant.

AQUATIC PLANT

Bamboo (noxious)
Bamboo

CROP/ORCHARD PLANTS

Asparagus falcatus
Sickle-thorn asparagus

Clivia miniata
Kaffir lily

Diospyros virginiana
Persimmon

Ficus sp.
Fig

Gymnocladus dioica
Kentucky coffee tree

Helianthus spp. (some native)
Sunflower

Leptospermum sp.
Tea tree

Olea europaea
Olive

Punica granatum ‘Nana’
Pomegranate

Rhubarb sp.
(poisonous to livestock and humans)

DEER REPELLENTS

Various types of devices and chemicals have been used to repel deer including scare devices, over-the-counter repellent sprays and powder, and home remedies. Scare devices such as exploders, radios, lights, and even a dog on a leash have short-term limited effectiveness at best. Home remedies such as hanging bags of hair, soap, rotten eggs or animal urine are not trustworthy, long-term repellents. Over-the-counter repellents have been the most successful deterrent for non-commercial users experiencing light to moderate damage. However, repellents must be applied frequently and vigilantly prior to and during the period of anticipated damage in order to be effective. For example, repellents should be applied to plants prior to planting and reapplied during the growing season.* ‘Hinder,’ which is a mixture of ammonium soaps, and ‘Deer Away,’ made from putrescent whole egg solids have been the most widely used and effective repellent sprays. Other repellents available are:

REPEL ANIMAL REPELLENT

* Consult individual manufacturers for proper spray concentration and application.

** Deer Away is not approved for application on edible crops.
FENCING APPLICATIONS

For nurseries, orchards, pastures, and large gardens, fencing is often the only way to prevent damage from animals. Many of the fencing options discussed on the following pages also work well for small gardens because they are easy to build and very cost-effective. The following fencing designs are the primary methods being used by professional game managers and many state and federal agencies to control damage from both livestock and wild animals.

HIGH-TENSILE WIRE FENCE

By far, the most effective and most maintainable new fencing used are the New Zealand-designed high-tensile wire fences (See FIGURE A, page 19). Although the initial cost is high, this type of fence requires the least maintenance, and thus the cost per ft/yr is the lowest of all discussed. The fence uses smooth wire instead of barbed wire which is tensioned using a ‘strainer’ device. The strength of this type of fencing is in the tension applied. Animals cannot “squeeze” through the fence.

Although construction is somewhat technical, the fence actually takes less labor to install because line posts are only needed every 25-50 ft. Proper construction of the “H-brace” corners is critical since the twelve wires used exert tremendous pressure on the corners (See FIGURE B, page 20). The horizontal wires can be spaced varying distances apart (usually from 4-6 inches) and separated by fiberglass or wooden ‘droppers’ (similar to stays) every five feet. The bottom wire is placed 6 in. off the ground. Tension is applied using a rachet tool and must be periodically adjusted for the fence to function effectively. Because construction is highly specialized, the manufacturer should supply instructions when purchasing materials.

ELECTRIFIED HIGH-TENSILE WIRE FENCE

In areas experiencing persistent and severe deer damage, the same fence discussed above can be electrified using AC current (See FIGURE C, page 21). DC battery or solar/battery chargers are used where electricity is unavailable. The modern-type fence chargers currently available have a strong shocking power (up to 8000 volts) but low impedance. Thus, they are extremely effective but safer than older-type chargers because they don’t cause a burning effect. Construction is similar although insulators are used in lieu of staples, fewer wires are needed, and wires are alternating negative and positively charged (with a positive wire on the bottom and top). This is important in that the animal will always be in contact with the ground-wire even when standing in deep snow or in a mid-air jump. The fence functions as more of a psychological barrier than a physical one after animals have experienced the shock, thus even a low fence (+ or - 24”) can be effective in keeping the majority of animals out. The fence can be baited by tying aluminum foil flags covered with peanut butter on to the charged wire to aid in training animals to the fence.
MODIFIED ELECTRIC
HIGH-TENSILE WIRE FENCE

A nice feature of the above design is that it can be used with an existing fence in a variety of applications, and can be utilized even on a small scale for the average garden grower. The electric high-tensile fence discussed above can actually be constructed on top of an existing fence (such as a square or v-mesh wire or wood fence) using extensions, such as stand-off insulators for a single wire, or a 2" x 4" board attached to the existing post with lag screws for multiple wires. High-tensile fencing manufacturers do not recommend combining electric fencing with barbed wire however as severe injury and fatalities to animals have resulted. With the multiple wire design, positive wires should be alternated with grounded wires.

An advantage to this type of fencing over the completely electrified high-tensile fence is that this one will not often ground out due to vegetation growth and thus will require less maintenance. Much of this equipment can also easily be erected on a temporary basis during the height of the growing season if the problem is only a seasonal one. A disadvantage is that it will probably not be 100% effective in keeping out all animals. 'Polywire,' which is basically an electrified plastic tape can also be used for higher visibility (a bright orange color) and doesn’t require tensioning.

SQUARE-MESH WOVEN-WIRE GAME FENCE

Square-mesh fence has been used primarily to control damage to orchards and nurseries (See FIGURE D, page 22). The fence is constructed similar to the high-tensile design, is considerably lighter than the V-mesh wire fence and is easier to construct. The fence is constructed using 10 ft. posts set 4 ft. in the ground and spaced 20 ft. apart. Wire fencing is available in 6 ft. and 8 ft. heights. This fence design has been proven to repel deer and elk. The fence is also effective against coyotes, pigs and rabbits when the wire is buried one foot in the ground.

V-MESH

The V-mesh wire fences have been used primarily to control damage to haystacks. The V-mesh wire fence is constructed using 10 ft. wood posts set 4 ft. in the ground at 12 ft intervals. The V-mesh wire comes in heights of 42 in. to 96 in. with the 72 in. being the most commonly used to control deer. This fence is difficult to build because of the heavy wire.
CONSTRUCTION

All fence designs utilize double braced corner posts set in concrete or 'tamped' in gravel, with line-posts in between corners and fence-stays in between line-posts to maintain wire position. A construction manual or the fence manufacturer should be consulted on how to build particular fence types. Several are listed on page 25. Cost per foot and fence lengths may vary depending on the manufacturer (See “PLANNING,” page 23). Manufacturers and other pertinent regulatory agencies should be contacted when using any treated wood products, particularly around groundwater. Except where noted, longer posts and taller wire can be used with each design with minor modifications to control elk effectively as well.

PLANNING

* CHECK LOCAL LAWS AND ZONING REGULATIONS REGARDING FENCES AND ELECTRICITY, ESPECIALLY IN URBAN AREAS

* LOCATE HAZARDS AND OBSTACLES SUCH AS POWER LINES, HILLS, DIPS AND WATER

* USE AS FEW CORNERS AS POSSIBLE

* PREPARE A SKETCH OF THE FENCE

* PREPARE A LIST OF MATERIALS

* A WELL-PREPARED FENCE LINE SAVES TIME AND MATERIALS

* INCLUDE SPACE FOR EASY FENCE CONSTRUCTION AND VEHICLE ACCESS

* BUILD THE FENCE AT LEAST FIVE FEET FROM OLD FENCE ROWS, BRUSH LINES OR WOODS

* A CHARGER MUST BE READY BEFORE CONSTRUCTION BEGINS
