FISH

Cutthroat trout(CT) were separated by size class. The 10" minimum size for is a rough approximation; the primary criteria for an adult is absence of parr marks.

Spring Chinook (S.CK) occurred once in a group of five, but otherwise only as pairs or individuals. Est. sizes: 28"-44". Early run fall chinook were not seen except for one jack on 9/20.

Summer steelhead (S.SH) ranged in est. Size from 20"-28", with the exception of one 36" male.

Half-pounders (1/2'er) or precocious steelhead were stout, light colored fish between 14" and 18".

Residents rainbow trout (Resid.) were stream colored *Oncorhynchus mykiss*, 11" to 15" in size.

Residents had no parr marks remaining, and usually a red stripe along the lateral line.

Suckers were noted in every reach, but were not consistently recorded. These were the only other adult fish seen.

Future counts should include suckers above some minimum size approximating reproductive maturity.
