# Annual Project Performance Report (rev. 7107) 

## 1. State: California

Grant number: F-119-R-5
Grant name: Central Valley Angler Survey
Project number and name: F-119-R, Central Valley Angler Survey
2. Report Period: July 1, 2009 to June 30, 2010

Report due date: September 1, 2010

## Date prepared: September 1, 2010

3. Location of work: Central Valley, California including portions of the Sacramento, Feather, Yuba, American, Mokelumne, and Calaveras rivers, and portions of the Sacramento-San Joaquin Delta within Congressional Districts 1-5, 7, 10-11; Shasta, Tehama, Glenn, Butte, Colusa, Sutter, Yuba, Yolo, Sacramento, San Joaquin, Calaveras, Solano, and Contra Costa counties. The project is based in Sacramento, with a satellite office in Red Bluff.

## 4. Objectives:

a. Conduct an angler survey on the Sacramento River, its associated tributaries, and on a portion of the Sacramento-San Joaquin Delta using a stratified, random sampling design.
b. Analyze collected data and prepare reports describing angler effort, catch, and harvest for all species contacted by anglers. Emphasis is on fisheries involving key anadromous and delta species, including Chinook salmon, steelhead/rainbow trout, sturgeon, striped bass, American shad, and splittail.
c. Estimate the proportionate contribution of hatchery and natural production in the Central Valley sport catch of Chinook salmon. Estimate the age structure of the Central Valley sport catch of Chinook salmon and steelhead. Develop trends in relative abundance and age structure of Central Valley steelhead, based upon returns of spawning adults to Central Valley anadromous salmonid hatcheries.
5. If the work in this grant was part of a larger undertaking with other components and funding, present a brief overview of the larger activity and the role of this project.
The Central Valley Angler Survey is the primary angler survey for anadromous fishes in the Central Valley, California. However, we coordinate aspects of this survey with the striped bass and sturgeon tag-recovery survey being conducted in the Sacramento-San Joaquin Delta (SFRA grant F-51-R, project: \#71: Bay-Delta Sport Fish Resource Assessment Project - Striped Bass) to assist with respective project objectives.
The Central Valley Angler Survey also provides an estimate of Chinook salmon harvest in the Central Valley recreational fishery. This estimate complements Chinook salmon harvest estimates for California ocean commercial and recreational fisheries generated by CDFG's Ocean Salmon Project. Combined, these estimates are used by the Pacific Fishery Management Council to forecast Chinook salmon harvest quotas in ocean
waters off the coasts of Washington, Oregon, and California. The inland recreational harvest component, for Chinook salmon of both hatchery and wild origin, has been lacking throughout most of the management history of Chinook salmon fisheries supported by the Central Valley. The Central Valley Angler Survey fills this essential information gap.

## 6. Describe how the objectives were met.

## Introduction

This is the fifth year of field implementation of the Central Valley Angler Survey. Currently, the geographic scope of the survey is at the full extent of grant obligations (Table 1). In all, 244 survey months were expended from July 2009 through June 2010 (Table 2).

Table 1. Survey section numbers and descriptions for river and delta sections surveyed by the Central Valley Angler Survey, July 2009 through June 2010.

| Section No. Section Description |  |
| :---: | :---: |
| Sacramento River and Delta |  |
| 1 | Carquinez Bridge to Rio Vista Bridge. |
| 1.1 | Suisun Bay, Suisun Cutoff to Middle Grounds. |
| 2 | Rio Vista Bridge to mouth of American River. |
| 3 | American River to Knights Landing (Hwy. 113 Bridge). |
| 4 | Knights Landing to Colusa (River Rd. Bridge). |
| 5 | Colusa to Hamilton City (Hwy. 32 Bridge). |
| 6 | Hamilton City to Red Bluff Diversion Dam. |
| 7 | Red Bluff Diversion Dam to Balls Ferry Boat Ramp. |
| 8 | Balls Ferry Boat Ramp to Keswick Dam. |
| American River |  |
| 9 | Discovery Park to the interstate 80 Bridge |
| 10 | Interstate 80 Bridge to Hazel Avenue Bridge. |
| 10.1 | Hazel Avenue Bridge to Nimbus Dam (aka: Nimbus Basin). |
| Feather River |  |
| 11.1 | Verona to Shanghai Rapids. |
| 11.2 | Shanghai Rapids to Sunset Pumps. |
| 12 | Palm Avenue Riffle to Feather River Hatchery. |
| 12.1 | Thermalito Afterbay Outlet (TAO). |
| 12.2 | Sunset Pumps to Palm Avenue Riffle. |
| Yuba River |  |
| 13 | Marysville to Daguerre Point Dam. |
| 14 | Daguerre Point Dam to 1 mile upstream of Hwy, 20 Bridge. |
| Mokelumne River |  |
| 19 | North Mackville road crossing to Camanche Dam (upper Mokelumne). |
| Calaveras River |  |
| 20 | 1 mile downstream of New Hogan Dam to New Hogan Dam (upper Calaveras). |

## Job 1. Angler Survey - Field Component

## Statistical Design

A stratified, random sampling design, based on the design used by Smith (1950) and Wixom et al. (1995), was used to estimate the in-river harvest during the daytime sport fishery. A three-stage creel survey was used consisting of roving counts, roving interview, and access point interviews. Roving counts and access interviews were used to estimate total effort, while roving interviews were used to estimate catch per unit effort (CPUE, as catch/hour). Access interviews were used to construct an effort distribution model, evaluate fish contact rates between roving and access interview types, and to gather completed angler trip data. The effort distribution model determined the proportion of the whole represented by a single angler count. While a night fishery exists on Central Valley rivers, no effort was made during this reporting period to evaluate the harvest by nighttime sport anglers.

A total of 21 sections was surveyed (Table 1). Eighteen of the survey sections ranged in length from 4 to 56 river miles. Three survey sections, that represented unique fishery locations, were approximately one river mile in length. Sampling schedules and data summaries were compiled on a monthly basis. Months were chosen as a convenient time step for survey periods, in part because historical Central Valley angler surveys (e.g., Wixom 1995, Murphy et al. 1999) used a monthly time step, which allows for timebased comparisons.

Generally, each survey section was targeted to be sampled eight randomly selected days per month: on four weekdays and four weekend days, each chosen randomly. Weekdays and weekend days were placed in separate sampling strata because more angling effort is commonly associated with weekend days. Sampling effort was increased from this routine schedule to improve resolution of statistics developed in the late-fall Chinook salmon season (see below).

Each survey section was surveyed by kayak, drift boat, or power boat, the latter both propeller and jet driven. Kayaks and drift boats were used in shallow, upstream reaches that could be routinely surveyed in a downstream direction. Power boats were used in rivers where tides, wind, and waves demanded the use of more seaworthy boats, and where the survey section was to be navigated against the current.

For each section surveyed on the main stem of the Sacramento River, a systematic start time and launch location were chosen. Start times were classified based on systematic sampling of access locations. Launch locations would either be at the upstream or downstream end of the sections to be surveyed. In those sections where kayaks or drift boats were used, the launch location was always at the upstream end of the section and one of three start times representing the start, middle, and end of the day was randomly chosen for a given survey day.
All data collected were linked by river mile. Actual river miles were used for the Sacramento River sections. Each tributary was given a unique number series to identify it from other rivers in the database. The number series assigned to each tributary were as follows: Feather River, 400 series; American River, 500 series; Yuba river, 600 series; Mokelumne River, 1900 series, and the Calaveras River 2000 series. River mile designations were marked in ascending order from downstream to upstream.

## Data Collection

Three sets of field data were required to calculate angler effort and catch: hourly angling effort distribution models by month and survey section, angler counts, and angler catch data through interviews. Effort distribution models provide the proportionate breakdown of hourly angler counts for each month in each survey section. Development of updated effort distribution models from the current survey is incomplete; instead, we used analogous data sets of hourly angler counts for each month and survey section developed by Wixom et al. (1995). Preliminary analysis of updated effort distribution models indicates, however, that angling effort patterns have not changed significantly in the Sacramento River system over the past 15 to 20 years.

On each survey day, a high-speed pass was made through a given survey section, during which anglers were counted. Data collected during the angler count included: time of observation, location by river mile, number of boats, number of boat anglers, and the number of shore anglers. At the end of the angler count, a second pass was made traveling back through the section to conduct angler interviews. Prior to beginning the interviews, the survey crew determined the feasibility of interviewing all anglers counted during the angler count. If it was determined that this was not feasible given time restrictions, then they chose every $N^{\text {th }}$ angler to be interviewed. Once an $N^{\text {th }}$ angler interval was chosen, that interval was maintained throughout the entire survey section for that survey date. Data collected during each interview included: location by river mile, time of interview, fishing method, number of hours fished, number of anglers in the group, target species, zip code, whether the trip was completed, and the number of fish kept and released by species. Access interviews were conducted at popular launch locations and were temporally scheduled to encompass all hours of a virtual day to be used in the effort distribution model, for that survey section, month, and day-type (weekday or weekend) stratum.

All common sportfish species found in Central Valley rivers were considered "Target Species." Those species were: Chinook salmon, steelhead, rainbow trout, striped bass, white sturgeon, green sturgeon (as incidental catch), American shad, Sacramento splittail, black bass (all species), sunfish (all species), catfish (all species) and carp.
The number of fish kept and released was recorded separately for each of the 11 target species. All other fish species caught were recorded separately by species in a column labeled "Other."

A length measurement was used to differentiate between steelhead and rainbow trout. All O. mykiss greater than 16 inches or marked externally with an adipose fin clip were considered to be steelhead. For reporting purposes, O. mykiss on the Sacramento River below Colusa, Feather River, and American River were considered to be juvenile steelhead. This length criterion was not used to distinguish target species by steelhead and rainbow trout; it was only applied to reported catch and fish measurements.

## Job 2. Angler Survey Data Analysis and Reporting

A total of 1,949 survey days was completed during the current reporting period. Allocation of survey effort by survey section and month varied somewhat to accommodate different fisheries (Table 3). Overall, though, an average of 8 survey days was expended in each survey section and month. The cumulative survey effort resulted in an estimated 2,277,740 angler hours (Table 4), for an average of 9,335 angler hours per survey section and month.

## Chinook Salmon Fishery

During the current reporting period, the fall-run Chinook salmon sport fishery remained closed due to continued low abundance of Sacramento River fall-run Chinook. Angling for other species continued, however, and the Central Valley Angler Survey followed its normal survey schedule throughout the survey area (Table 2). This provided the opportunity to estimate fishing effort targeting Chinook salmon that occurred out-ofseason during this period, along with resultant catch and harvest.

An estimated 559 hours of fishing effort was directed at Chinook salmon on the lower Sacramento and American rivers during the closed season (Table 5), resulting in an estimated out-of-season Chinook salmon harvest of 25 fish (Appendix Table 2). About $83 \%$ of this fishing effort occurred in a snag and "flossing" fishery in the Nimbus Basin on the lower American River (Section 10.1). The estimated harvest of 25 Chinook salmon was based on the expanded count of one salmon that was kept as an incidental catch in the striped bass fishery on the lower Sacramento River (Section 3) during May 2010. This salmon was adipose-fin clipped and contained a coded-wire tag that
indicated it was a spring-run Chinook salmon produced at Feather River Hatchery. Out-of-season fishing effort for Chinook salmon accounted for about 0.025\% of total fishing effort in the survey area (Table 5).
As in 2008, a limited late-fall-run Chinook salmon fishery was allowed on the Sacramento River between Knights Landing and the Red Bluff Diversion Dam from 16 November 2009 through 31 December 2009. Effort expended in this fishery totaled 75,036 hours, corresponding to about 13,399 fishing trips. The fishery produced an estimated catch of 1,300 salmon, of which only 44 were released, yielding a retention rate of $96.6 \%$. CPUE for the late-fall-run Chinook fishery was 0.02 / hr, the lowest of all the Central Valley sport fisheries surveyed. See Job 3, Stock Assessment, for results on coded-wire tag recovery and analysis in this fishery.

## Steelhead Fishery

The majority ( $78.4 \%$ ) of sport angling effort estimated for steelhead during the current reporting period was expended on the American and Feather rivers (Table 5). The percentage of overall estimated effort on the Yuba, Sacramento, Mokelumne and Calaveras rivers was $11.2 \%, 5.6 \%, 4.5 \%$, and $>0.1 \%$, respectively. An estimated total of 113,416 angler hours targeted steelhead (Table 5), resulting in an estimated harvest of 1,395 fish, and a release of 67,584 fish (Appendix Table 3). Thus, only about $2.0 \%$ of the catch was harvested. The overall CPUE for steelhead was 0.61 / hr which was the second highest catch rate following the American shad fishery.

## Rainbow Trout Fishery

All harvested fish reported as rainbow trout within the lower Sacramento, Feather, and American river survey sections covered were recorded as steelhead, given the strongly anadromous life history of the species in the lower Sacramento River system. Recognized resident rainbow trout fisheries on the upper Sacramento, Yuba, Mokelumne, and Calaveras rivers were surveyed during the current reporting period, and the catch at these locations was characterized based on the length criteria described in Job 1 above.

The rainbow trout fisheries on the Sacramento, Yuba, Mokelumne, and Calaveras rivers
were surveyed over their entire seasonal duration (Table 2). No surveys were conducted on the Calaveras and Mokelumne rivers during their fishing closure periods in November and December 2009 and again in April and May 2010.
An estimated 212,482 angler hours targeted rainbow trout (Table 5), resulting in an estimated harvest of 707 fish, the catch-and-release of an estimated 71,650 fish (Appendix Table 4), and thus a retention rate of less than 1\%. Effort for rainbow trout in survey sections 6, 7 and 8 on the Sacramento River comprised the majority (69.0\%) of the overall effort for rainbow trout throughout the survey area (Appendix Table 4). Effort on the Yuba, Mokelumne, and Calaveras rivers accounted for $15.0 \%, 7.5 \%$ and $2.5 \%$, respectively, of total effort for rainbow trout. The overall CPUE for rainbow trout was 0.34 / hr.

## Striped Bass Fishery

Angler survey work conducted during the current reporting period sampled the core of the striped bass fishery on the Sacramento River system. An estimated total of 1,168,965 angler hours targeted striped bass (Table 5). About 85.3\% of that effort occurred on the Sacramento River from the Carquinez Bridge to the Red Bluff Diversion Dam, $8.0 \%$ on the Feather River, and $6.5 \%$ on the lower American River (Table 5), accounting for $99.8 \%$ of all striped bass angling effort in the survey area. Total angler effort resulted in an estimated striped bass harvest of 58,116 fish, and a catch-andrelease of 342,590 fish (Appendix Table 5). About 14.5\% of striped bass caught were harvested. The overall CPUE for striped bass was 0.34 / hr. The striped bass fishery was the most popular fishery in the survey and accounted for $51 \%$ of total angling effort, surpassing the next largest fishery - that for sturgeon - by 878,829 hours of dedicated effort (Table 5).

## Sturgeon Fishery

An estimated 290,136 angler hours targeted sturgeon during the current reporting period, and essentially all of this effort occurred on the mainstem Sacramento River from the Carquinez Bridge to the Red Bluff Diversion Dam (Table 5; Appendix Table 6). The fishery resulted in an estimated harvest of 2,093 white sturgeon and the catch-andrelease of 9,303 white sturgeon (Appendix Table 6), for a harvest rate of about 18\%. No green sturgeon were reported kept and an estimated 398 were released (Appendix Table 7). Reported catches of green sturgeon occurred mainly in Suisun Bay and on the Sacramento River from Rio Vista to Sacramento (Section 2) and from Hamilton City to the Red Bluff Diversion Dam (Section 6). Anglers had reportedly differentiated between white and green sturgeon for > 99\% of sturgeon released; among those fish, 95.9\% were identified as white sturgeon and $4.1 \%$ as green sturgeon (Appendix Tables $6-8$ ). The overall CPUE for sturgeon was low: about $0.04 / \mathrm{hr}$.

## American Shad Fishery

With the exception of July 2010, nearly the entire 2010 Central Valley American shad fishery was surveyed during the current reporting period. An estimated 132,699 angler hours targeted American shad (Table 5). About 54\% of this effort occurred on the Sacramento River from Rio Vista to the Red Bluff Diversion Dam, 25\% on the lower American River, $17 \%$ on the Feather River, and $4 \%$ on the Yuba River. This effort
resulted in an estimated harvest of 40,038 shad, and the catch-and-release of 44,645 shad (Appendix Table 9), for a harvest rate of about 47\%. The American shad fishery was very successful as reflected in an overall CPUE of $0.64 / \mathrm{hr}$, the highest catch rate among the fisheries monitored in the angler survey, although $36 \%$ lower than that estimated for the 2009 season. The American shad fishery, which accounted for $5.8 \%$ of the total fishing effort in the survey, ranked as the fourth most popular fishery in the Central Valley (Table 5).

## Sacramento Splittail Fishery

About $91.0 \%$ of the Sacramento splittail fishery surveyed during the current reporting period occurred on the lower Sacramento River from Rio Vista to Knights Landing (survey sections $1-3$; Table 5). The remaining $7.2 \%, 0.9 \%$, and $0.8 \%$ occurred on the Feather River from Verona to Shanghai Rapids (Section 11.1), the American River, and on the Sacramento River from Knights Landing to Colusa (Section 4), respectively. We suspect that anglers reporting splittail effort on the American River were in fact fishing for Sacramento pikeminnow, although their catch was not examined. At an estimated total effort of 27,470 angler hours, the Sacramento splittail fishery was the smallest fishery targeted in the angler survey (Table 5). However, with an estimated harvest of 8,071 splittail and a catch-and-release of only 338 splittail (Appendix Table 10), this fishery had the second highest harvest rate of 96.0\%. The overall CPUE for splittail was 0.31 / hr.

## Job 3. Stock Assessment

## Composition of Chinook Salmon Sport Catch

The basis for determining the stock origin (hatchery vs. natural production by run) of Chinook salmon caught in Central Valley sport fisheries is the recovery of coded-wire tags. A fraction (currently $25 \%$ ) of the production of fall-run Chinook salmon from Central Valley hatcheries is coded-wire tagged and identifiable with an adipose fin clip, while 100\% of spring run from Feather River Hatchery, late-fall run from Coleman National Fish Hatchery, and winter run from Livingston Stone National Fish Hatchery is clipped and tagged.
Of the 168 Chinook salmon observed in the catch during the current reporting period, 93 , or $55 \%$, had an adipose fin clip and were thus identified as being of hatchery origin. Anglers surrendered the head from 92 (99\%) clipped salmon and tags were recovered and read from 90 ( $98 \%$ ) heads collected. The proportionate breakdown of coded-wiretag recoveries was $97 \%$ late-fall-run Chinook salmon from Coleman National Fish Hatchery, 2\% winter-run Chinook salmon from Livingston Stone National Fish Hatchery, and $1 \%$ spring-run Chinook salmon from the Feather River Hatchery. The spring-run Chinook salmon was harvested out-of-season as an incidental catch in the striped bass fishery (see Job 2, Chinook Salmon Fishery, above). All remaining coded-wire tag recoveries were made during the open season for late-fall-run Chinook salmon on the Sacramento River.

Scales were collected from 85 (94\%) of the 90 Chinook salmon for which heads were collected and tags recovered. Preliminary ageing by a single reader yielded the following results: Of 16 Chinook salmon from the 2006 brood stock, 15 (94\%) were
aged correctly as 4 -year-olds. Of 62 Chinook salmon from the 2007 brood stock, 43 ( $69 \%$ ) were aged correctly as 3 -year-olds. Of seven Chinook salmon from the 2008 brood stock, six ( $86 \%$ ) were aged correctly as 2 -year-olds. The length-frequency distributions of known-age Chinook salmon caught in the Sacramento River during 2009-10 (Figure 1) indicate a clear distinction between 2 -year-olds and 3 -year-olds, and overlap only in the 80 cm fork-length class between 3 -year-olds and 4 -year-olds.

Figure 1. Length-frequency distributions of known-age Chinook salmon recovered in the Sacramento River recreational fishery during 2009-2010. Ages were determined from coded-wire tags.

## Age Structure of Adult Steelhead

A total of 1,004 scale samples was collected from adult steelhead at state-run Central Valley anadromous fish hatcheries (Feather River, Nimbus, and Mokelumne River hatcheries). Of those, 125 (12.5\%) were steelhead of natural origin, given their lack of an adipose fin clip. Comparative assessment of steelhead age structure and growth rates by origin (hatchery and natural) is underway.
7. Discuss differences between work anticipated in grant proposal and grant agreement, and that actually carried out with Federal Aid grant funds; include differences between expected and actual costs.
N/A.
8. List any publications or in-house reports resulting from this work. Provide citations, including status (indicate if not completed), note any that are included with this report, and note where reports or publications may be obtained.

Data generated by F-119-R for inland recreational harvest of Chinook salmon are being
used by the Pacific Fishery Management Council Salmon Technical Team to develop an index for Sacramento River fall-run Chinook salmon for fishery management purposes, as presented in the following report:

O’Farrell, M. R., M. S. Mohr, M. L. Palmer-Zwahlen, and A. M. Grover. 2008. The Sacramento Index. Report prepared by National Marine Fisheries Service and California Department of Fish and Game for the Pacific Fishery Management Council, Salmon Technical Team.

## 9. Name, title, phone number, and e-mail address of person(s) compiling this report

Compilation and editing by Rob Titus, Senior Environmental Scientist, (916) 227-6390, rtitus@dfg.ca.gov ,
with contributions from Mike Brown, Environmental Scientist, (916) 227-4989, mbrown@dfg.ca.gov ,
James Lyons, Biologist (Marine/Fisheries), (530)529-3295, jlyons@dfg.ca.gov , Erin Collins, Biologist (Marine/Fisheries), (916)227-5029, Ecollins@dfg.ca.gov , and Lea Koerber, Senior Laboratory Assistant, (916) 227-6398, Ikoerber@dfg.ca.gov

## Job 2 Appendix Tables

Appendix Table 1. Expanded estimates of angler hours targeting Chinook salmon, and numbers of Chinook salmon kept and released, by survey section and month, as determined by the Central Valley Angler Survey, July 2009 through June 2010.
