

Spider Lake -

On 20 July 1972 Spider Lake was sampled with a monofilament gill net for a period of two hours.

There were no fish caught. The net was set in deep water, and fished on the bottom of the lake.

The net was missing its center two panels and this might explain some of the failure to catch any fish.

There were several fishermen on the lake at the time the net was set. They had caught a few Rainbow trout which were between 10 to 13 inches long. It was their opinion that fishing was slow and that it had been slow for some time.

The lake conditions were good. The water was clear and fairly cold.
