Orion/Barnes – CA Condor Zone Approved Lead Free Hunting Ammunition

Table Legend

- One or more weights in this type/style of projectile are available in this caliber. Please visit our web site, the Orion product line, to see the full selection.

Projectile Types (abbreviations and uses)

- VG** Varmint Grenade. Fragments on contact with soft tissue. VG is certified for appropriate non-game species only (not for any big-game species).
- X** This original "X" design expanding copper bullet has no driving bands. Internal scoring in the hollow point opens into 4 or 6 petals.
- TSX** Triple Shock "X". The standard Barnes hunting bullet. TSX should be the first choice of most hunters.
- TTSX** Tipped Triple Shock "X". Opens more quickly than the TSX, so is used on thinner skinned game animals.
- MRX** Maximum Range "X" bullet. MRX has a heavy tungsten core in the rear of the bullet. Use for longer shots, or with slow rifling twists that can't stabilize the longer TSX or TTSX bullets.

Please note

We're happy to guide you to the right choice for your hunt when there are multiple choices. A good rule of thumb is that the Barnes copper bullet you use should be about one third lower weight than lead bullets you would use for your hunt. As new lead-free projectile/cartridge combinations become available, we will load them.

Pursuant to F&G Code Section 3004.5, the listed projectiles or ammunition are certified as containing 1% or less of lead and may be used for the take of various wildlife species in California. It is the responsibility of the hunter to verify that the individual projectile or ammunition is compliant with the method of take regulations for the individual species or species group.
