Subject: Horseshoe Lake, El Dorado County

One mono gill net was set for two hours on August 15, 1985 and caught no fish. The inlet stream has excellent spawning gravel and the flow was estimated at one cfs. One 13-inch trout (BK?) was observed in the deep channel section near the lake. It is recommended that 1,000 BK be planted in the even years. Fish may winter kill some years but I believe it to be a worthwhile plant.
